

Properness

Theorem. Let M be a model category.

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ \downarrow & & \downarrow \\ X & \xrightarrow{g} & Y \end{array}$$

If all objects are cofibrant then
 f w.e. $\Rightarrow g$ w.e.

Definition. We say that M is **left proper** if the same holds for all objects A, B, X, Y (not necessarily cofibrant), i.e. w.e.'s are preserved by pushouts along cofibrations. Dually, M is **right proper** if w.e.'s are preserved by pullbacks along fibrations.

Example. If all objects of M are cofibrant $\Rightarrow M$ left proper

e.g. $M = \text{Cat}, \text{sSet}$; serious example: Top, Ch .

Dually $M = \text{Cat}, \text{Top}, \text{Ch}$ right proper for free; sSet serious example.

M left proper $\Rightarrow [A^{\text{op}}, M]$ left proper (pushouts and w.e. pointwise, cof \Rightarrow ptwise cof)

Proof. Clearly holds if f is a trivial cofibration $\xrightarrow{\text{Brown}}$ holds also for w.e.'s between cofibrant objects. Not that simple

$$f_*: A/M \rightleftarrows B/M : f^*$$

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ \downarrow & & \downarrow \\ X & \xrightarrow{f_*} & Y \end{array}$$

$$\begin{array}{ccc} A & \xrightarrow{f^*} & B \\ \downarrow & & \downarrow \\ X & \xrightarrow{g} & Y \end{array}$$

preserves & reflects fibrations and weak equivalences (they are determined via cod: $A/M \rightarrow M$) (and f^* commutes with them. $(A \rightarrow X) \mapsto X$)

\Rightarrow derived unit on cofibrant objects

$$\eta^*: 1 \xrightarrow{\eta} f^* f_* \xrightarrow{\text{fract}} f^* R f_*$$

↑ serves equally well

Summary:

when f is a trivial cofibration

then $\text{Ho} f_*: \text{Ho} A/M \rightleftarrows \text{Ho} B/M : Rf^*$

is an equivalence (η^* w.e. $\Rightarrow \varepsilon^*$ w.e.)

2-out-of-3: $\begin{array}{c} f \\ \downarrow \\ h \\ \downarrow \\ g \end{array}$ induces

$$\begin{array}{ccc} \text{cofibrant} & A & \xrightarrow{f} B \\ \text{i.e.} & \downarrow & \downarrow \\ x \text{ cofibration} & X & \xrightarrow{Rf_*} Y \\ \downarrow & & \downarrow \\ \eta & & \end{array}$$

\Rightarrow if η' is a w.e. then so is ε' by the triangle identity:

$$Rf^* X \xrightarrow{1} Rf^* X$$

$$\begin{array}{ccc} \eta^* Rf^* & \xrightarrow{\cong} & Rf^* \varepsilon^* \text{ iso} \\ Rf^* Lf_* Rf^* X & \xrightarrow{\quad} & \downarrow \\ \varepsilon^* \text{ iso} & & \end{array}$$

$$\begin{array}{ccc} & \text{Ho}(B/M) & \\ \text{Ho}(A/M) & \rightleftarrows & \text{Ho}(C/M) \end{array}$$

two equivalences \Rightarrow so is third

Now we can finally apply Brown's lemma \Rightarrow

Now we can finally apply Brown's lemma \Rightarrow

$$\begin{array}{ccc} & \text{int. cof} & \\ i & \nearrow \text{Cylf} & \downarrow \text{triv. cof} \\ A & \xrightarrow{f} & B \\ & \downarrow & \\ & \text{w.e. between cof. obj's} & \end{array}$$

$$\begin{array}{ccc} & i_x \rightarrow i^* \text{ and } j_x \rightarrow j^* & \text{Q.e.} \\ & \downarrow & \\ & f_* \rightarrow f^* & \text{Q.e.} \\ & \downarrow & \\ & p_* \rightarrow p^* & \text{Q.e.} \quad \square \end{array}$$

Remark. A different and still conceptual proof: let $A = \{\cdot \rightarrow ! \leftarrow ?\}$ and equip $[A^{op}, M]$ with the so-called Reedy model structure (see later) in which a span $M_0 \leftarrow M_1 \rightarrow M_2$ is cofibrant iff all M_0, M_1, M_2 are cofibrant and the map $M_1 \rightarrow M_2$ is a fibration (unlike in the proj. model str. where both maps need to be cofibrations)

$$\text{colim} : [A^{op}, M] \rightleftarrows M : \Delta$$

and thus colim preserves w.e. between cofibrant objects. Apply to

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ \uparrow & \uparrow & \\ A & \xrightarrow{!} & A \\ \downarrow & \downarrow & \\ X & \xrightarrow{?} & X \end{array} \quad \xrightarrow{\text{colim}} \quad X \xrightarrow{g} Y$$

Quillen bifunctors, monoidal and enriched model categories

Definition. A **left adjoint bifunctor** is a bifunctor $F: M \times N \rightarrow P$

that, for each $N \in N$, yields a left adjoint functor $F(-, N): M \rightarrow P$
and, for each $M \in M$, yields a left adjoint functor $F(M, -): N \rightarrow P$

and get $G: N^{op} \times P \rightarrow M$ s.t. $P(F(M, N), P) \cong M(M, G(N, P))$
and $H: M^{op} \times P \rightarrow N$ s.t. $P(F(M, N), P) \cong N(N, H(M, P))$

We may call (F, G, H) an adjunction of two variables.

Definition. A **left Quillen bifunctor** is a left adjoint bifunctor such that for each cofibration $i: A \rightarrow B$ in M and $j: K \rightarrow L$ in N the map $F_{\downarrow}(i, j): F(A, L) +_{F(A, K)} F(B, K) \longrightarrow F(B, L)$ as in

pushout
corner
map

$$\begin{array}{ccc} F(A, K) & \xrightarrow{F(i, 1)} & F(B, K) \\ F(1, j) \downarrow & \nearrow & \downarrow F(1, j) \\ F(A, L) & \xrightarrow{F(1, 1)} & F(B, L) \end{array}$$

$$\begin{array}{ccc} G(N, P) & & F(G(N, P), N) \xrightarrow{\epsilon_N} P \\ \uparrow \exists! & & \uparrow \epsilon_N \\ G(N^!, P) & & F(G(N^!, P), N) \xrightarrow{F(1, F)} F(G(N^!, P), N^!) \\ & & \text{mate } F \Rightarrow F' \quad G' \Rightarrow G \end{array}$$

is a cofibration that is trivial if at least one of i, j is.

We may write this as:

$$\begin{aligned} F_{\downarrow}(\mathcal{E}, \mathcal{E}) &\subseteq \mathcal{E} \\ F_{\downarrow}(\mathcal{W} \cap \mathcal{E}, \mathcal{E}) &\subseteq \mathcal{W} \cap \mathcal{E} \\ F_{\downarrow}(\mathcal{E}, \mathcal{W} \cap \mathcal{E}) &\subseteq \mathcal{W} \cap \mathcal{E} \end{aligned}$$

set: $A \subseteq B \quad K \subseteq L \quad F = x$
 $(A \times L) +_{A \times K} (B \times K) \longrightarrow B \times L$
 x is left Q. bifunctor

Remark. If M, N are cofibrantly generated, it is enough to check this for the generating cofibrations and trivial cofibrations.

This also applied to the case of Quillen functors (easier).

Remark. This easily generalizes to n variables giving as special cases:

- $n=1$: left Quillen functor
- $n=2$: left Quillen bifunctor

Lemma. F is left Quillen $\Leftrightarrow G$ is right Quillen, i.e.

$$\begin{aligned} G_r(\mathcal{E}, \mathcal{F}) &\subseteq \mathcal{F} \\ G_r(\mathcal{W} \cap \mathcal{E}, \mathcal{F}) &\subseteq \mathcal{W} \cap \mathcal{F} \\ G_r(\mathcal{E}, \mathcal{W} \cap \mathcal{F}) &\subseteq \mathcal{W} \cap \mathcal{F} \end{aligned}$$

here I decided to denote fibrations in N^{op} by \mathcal{E} since they are cofibrations in N

Proof. This boils down to $F_{\downarrow}(i, j) \sqsubseteq P \Leftrightarrow i \sqsupseteq G_r(j, P)$

that must be checked and is tedious but completely elementary. \square

Definition. A **monoidal model category** is a category with \otimes is a left biadjoint

$$\begin{array}{c} A \otimes B \xrightarrow{\quad} C \\ \dashv \quad \vdash \\ \dashv \quad \vdash \end{array}$$

Definition. A **monoidal model category** is a category with

- a closed monoidal structure, i.e. \otimes is a left biadjoint with right adjoints hom_r and hom_e
- a model structure

$A \otimes B \rightarrow \text{hom}_r(B, C)$
 $B \rightarrow \text{hom}_e(A, C)$

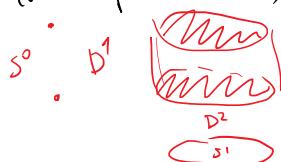

symmetric for us $\Rightarrow \text{hom}_r = \text{hom}_e = \{\}, \}$

such that

- the unit of the monoidal structure S is either cofibrant or, more generally, the cofibrant replacement $S^c \xrightarrow{\sim} S$ tensors with all cofibrant objects to w.e.s
- $S^c \otimes X \xrightarrow{\sim} S \otimes X = X$
- $X \otimes S^c \xrightarrow{\sim} X \otimes S = X$
- this does not depend on the choice of the cofibrant replacement in view of
- the tensor product bifunctor $\otimes: \mathcal{V} \times \mathcal{V} \rightarrow \mathcal{V}$ is left Quillen.
- cat of compactly gen. (weak) Hausdorff spaces

Examples. All $\text{Cat}, \text{Ch}, \text{Top}, \text{sSet}$ are monoidal model categories.

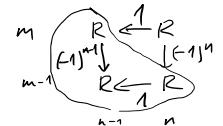

(with cofibrant unit)

$$\begin{array}{l} i_n: S^{n-1} \rightarrow D^n \\ j_0: \cdot \rightarrow I \\ j_n = j_0 \otimes_{\perp} i_n \end{array}$$

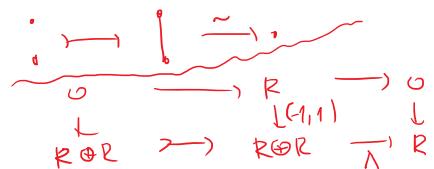

$$\begin{array}{l} i_n \otimes_{\perp} i_m \\ j_n \otimes_{\perp} j_m \\ i_n \otimes_{\perp} j_m \end{array}$$

$i_n \otimes_{\perp} i_m$ is a cofibration
 $j_n \otimes_{\perp} j_m$ are trivial cofibrations

A functorial cylinder object for cofibrant objects: pick a cylinder object for the unit $S \in \mathcal{V}_c$: $S + S \rightarrow \text{Cyl } S \xrightarrow{\sim} S$ and tensor it with $A \in \mathcal{V}_c$ to obtain

$$\begin{array}{ccc} (S + S) \otimes A & \rightarrow & \text{Cyl } S \otimes A \xrightarrow{\sim} S \otimes A \\ \parallel & & \parallel \text{def} \\ A + A & \rightarrow & \text{Cyl } A \xrightarrow{\sim} A \end{array}$$

Finally a path object is $\{\text{Cyl } S, X\}$.

Remark. tensor-hom adjunction

$$\begin{array}{c} A \otimes B \rightarrow C \\ A \rightarrow \text{Hom}(B, C) \end{array}$$

sets of maps

$$\mathcal{V}(B, C) \in \text{Set}$$

better: objects of maps

$$\begin{array}{ccc} \text{Hom}(A \otimes B, C) & \leftarrow \text{works since} \\ \text{Hom}(A, \text{Hom}(B, C)) & \end{array}$$

$$\begin{array}{c} X \rightarrow \text{Hom}(A \otimes B, C) \\ X \otimes A \otimes B \rightarrow C \\ X \otimes A \rightarrow \text{Hom}(B, C) \\ X \rightarrow \text{Hom}(A, \text{Hom}(B, C)) \end{array}$$

If M is enriched over \mathcal{V} , this can be generalized:

$$M(K \otimes M, N) \cong M(M, \{K, N\}) \quad \{ \rightarrow : \mathcal{V}^{\text{op}} \times M \rightarrow M$$

$$\cong \mathcal{V}(K, M(M, N)) \quad \leftarrow \text{two different Hom's} \quad \Delta$$

Associativity: $\begin{array}{c} \uparrow \quad \uparrow \quad \uparrow \\ M(-, -) : M^{\text{op}} \times M \rightarrow \mathcal{V} \end{array}$

$$M(K \otimes (L \otimes M), N) \cong \mathcal{V}(K, M(L \otimes M, N)) \cong \mathcal{V}(K, \mathcal{V}(L, M(M, N)))$$

$$\cong \mathcal{V}(K \otimes L, M(M, N)) \cong M((K \otimes L) \otimes M, N)$$

$$\Rightarrow K \otimes (L \otimes M) \cong (K \otimes L) \otimes M$$

Unit $S \otimes M \cong M$

Definition. A \mathcal{V} -category M is said to be tensored if

$$\mathcal{V}(K, M(M, N)) \cong M(K \otimes M, N) \quad \text{naturally}$$

This gives a functor $\otimes: \mathcal{V}_0 \times M_0 \rightarrow M_0$, (in fact a \mathcal{V} -functor $\mathcal{V} \otimes M \rightarrow M$) that makes M_0 into a "module" over \mathcal{V}_0 . Dually, M is cotensored if

$$\mathcal{V}(K, M(M, N)) \cong M(M, \{K, N\}) \quad \text{naturally}$$

This gives a functor $\{\cdot\}: \mathcal{V}_0^{\text{op}} \times M_0 \rightarrow M_0$

Together with the hom-functor $M(-, -): M_0 \times M_0 \rightarrow \mathcal{V}_0$

these yield an adjunction of two variables.

If $S \otimes A \xrightarrow{\sim} S \otimes A \cong A$ for $A \in M_c$ and this adjunction is Quillen, we say that M is a **model \mathcal{V} -category**.

Again $\text{Cyl } S \otimes A$ is a cylinder object for $A \in M_c$

$\{\text{Cyl } S, X\}$ is a path object for $X \in M_f$.

Left adjoint \mathcal{V} -functors preserve these cylinder objects (they are colimits), right adjoint \mathcal{V} -functors preserve these path objects (they are limits).

Deriving bifunctors

$F: M \times N \rightarrow P$ left Quillen bifunctor

$\Rightarrow F: M_c \times N_c \rightarrow P_c$ preserves weak equivalences:

$$\begin{array}{ccc} 0 & 0 \\ \downarrow & \downarrow \\ M & N \end{array} \rightsquigarrow \begin{array}{ccc} F(0, 0) & \longrightarrow & F(M, 0) \\ \downarrow & \searrow & \downarrow \\ F(0, N) & \longrightarrow & F(M, N) \end{array}$$

$$\begin{array}{ccc} M' & 0 \\ \downarrow & \downarrow \\ M & N \end{array} \rightsquigarrow \begin{array}{ccc} F(M', 0) & \longrightarrow & F(M, 0) \\ \downarrow & \searrow & \downarrow \\ F(M', N) & \longrightarrow & F(M, N) \end{array}$$

Remark. A small \mathcal{V} -cat st.

$A(A, B) \in \mathcal{V}_c$, M cof-gen. model \mathcal{V} -cat \Rightarrow $[A, V]$ is a cof gen. model. \mathcal{V} -cat

$$F_{\downarrow}(M, N): 0 \longrightarrow F(M, N)$$

$$F_{\downarrow}(i, N): F(M', N) \xrightarrow{\sim} F(M, N)$$

now apply Brown's Lemma

Thus we get $\mathbb{L}F: \mathcal{H}_0(M) \times \mathcal{H}_0(N) \rightarrow \mathcal{H}_0(P)$

$$\text{induced by } M \times N \xrightarrow{F(Q \times Q)} P$$

$$\begin{aligned} \mathbb{L}F(M, N) &= F(QM, QN) \\ &= F(M^c, N^c) \end{aligned}$$

In particular, for a monoidal model category \mathcal{V} , we get

$$\otimes^L: \mathcal{H}_0(\mathcal{V}) \times \mathcal{H}_0(\mathcal{V}) \longrightarrow \mathcal{H}_0(\mathcal{V})$$

making the homotopy category into a monoidal closed category

$$(K \otimes^L L) \otimes^L M \stackrel{?}{=} K \otimes^L (L \otimes^L M)$$

$$\Downarrow$$

$$QM \otimes K \otimes QL \otimes QM \qquad \Downarrow$$

$$QK \otimes Q(QL \otimes QM)$$

unit again S

the "weird" axiom: $X \in \mathcal{V}_c$

$$\begin{array}{ccc}
 & \parallel & \\
 Q(QK \otimes QL) \otimes QM & & QK \otimes Q(QL \otimes QM) \\
 q \otimes 1 \downarrow \cong & & 1 \otimes q \downarrow \cong \\
 (QK \otimes QL) \otimes QM & \equiv & QK \otimes (QL \otimes QM)
 \end{array}$$

the "weird" axiom : $X \in V_c$

$$\begin{array}{c}
 QS \otimes X \longrightarrow S \otimes X \cong X \\
 \cong \uparrow 1 \otimes q \quad \cong \nearrow q \otimes q \\
 QS \otimes QX \quad || \\
 S \otimes^L X \quad \text{unit iso}
 \end{array}$$

More generally, if M is a model V -category, then $\text{Ho}(M)$ is

- a category enriched in $\text{Ho}(V)$
- tensored and cotensored

} need to derive the Hom's
 $M^R(-, -)$, $\{-, -\}^R$

$$\otimes^L : \text{Ho}(V) \times \text{Ho}(M) \rightarrow \text{Ho}(M)$$

Weighted colimits

tensor adjunction (or any other)

$$\text{Hom}_R(K, \text{Hom}(M, N)) \cong \text{Hom}(K \otimes_R M, N)$$

$$V(K, M(M, N)) \cong M(K \otimes M, N)$$

$\downarrow \quad \downarrow$
replace by diagrams

e.g. abelian groups and their \otimes_R ?
how about \oplus_R ?

$$V_R \xrightarrow{\text{reg. hom.}} M \xrightarrow{\text{End}(M)}$$

R -module $\leftarrow R \rightarrow \text{Ab}$ left

weight $W: A^{\text{op}} \rightarrow V$ $D: A \rightarrow M$ diagram

$$[A^{\text{op}}, V](W, M(D, N)) \cong M(W \otimes_A D, N)$$

$A^{\text{op}} \xrightarrow{\text{Dor}} M^{\text{op}} \xrightarrow{M(-, N)} V$

$$R = \bigcup_R \quad R^{\text{op}} \rightarrow \text{Ab} \quad \text{right}$$

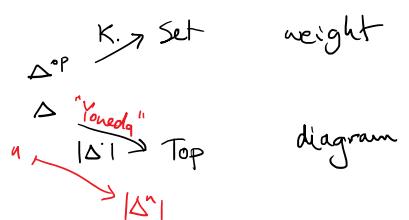

$\text{Hom}_R = \text{hom in } [R^{\text{op}}, \text{Ab}]$

Definition. The weighted colimit $W \otimes_A D$... the colimit of D weighted by W is the object representing $[A^{\text{op}}, V](W, M(D, -))$ as above.

Example. The tensor product of R -modules

- The tensors ... take $A = \bigcup_S$ were $S \in V$ is the unit $W \ast = K$
- The geometric realization $\text{Set}(K, \text{Top}(P, X)) \cong \text{Top}(K \cdot P, X)$ make Δ - indexed

$$\text{Set}(K, \underbrace{\text{Top}(|\Delta|, X)}) \cong \text{Top}(\underbrace{K \cdot \Delta}_{SX} |\Delta|, X)$$

- The ordinary colimits: $V = \text{Set}$ $W = \Delta^\ast$

$$[A^{\text{op}}, \text{Set}](\Delta^\ast, M(D, N)) \cong M(\Delta^\ast \otimes_A D, N)$$

$$\text{cone}(D, N) \quad \Delta^\ast(A): DA \rightarrow N$$

The general weighted colimits can be translated to ordinary colimits

$$W \otimes_A D = \underset{E \in W}{\text{colim}} D_P$$

$$E \in W \xrightarrow{P} A \xrightarrow{D} M$$

"take DA multiple times - once for each element of W^\ast "

$$A \quad W^\ast = K$$

Another point of view:

- $[A^{\text{op}}, V](W, M(D, N)) \cong M(W \otimes_A D, N)$
 $\text{take } W = A(-, A) = A^\ast$ representable functor
 \Rightarrow get on the left $M(D, N)(A) = M(DA, N)$ by Yoneda
 $\Rightarrow A^\ast \otimes_A D = DA$

$$\begin{aligned} \Delta_n &= \Delta(n, -) \\ \Delta^n &= \Delta(-, n) \end{aligned} \quad *K \times \left\{ \begin{array}{c} \vdots \\ \vdots \end{array} \right\} \quad E \in W$$

- clearly $W \otimes_A D$ preserves colimits (ordinary or weighted) in the W -variable \Rightarrow for $V = \text{Set}$ any weight = presheaf is a colimit of representables \Rightarrow weighted colimits can be replaced by colimits (over the cat of elements)
 $\rightarrow V = \text{Ab}, A = \underset{a \in A}{\text{a}} \xrightarrow{\cong} b \xrightarrow{\cong} \underset{a \in A}{\text{a}}$ $\Rightarrow [A, M] = \text{arrows of } M$

$$\begin{aligned}
 & \rightarrow \mathcal{D} = Ab, \quad A = \begin{matrix} \mathbb{Z} \cdot 1 \\ a \xrightarrow{\cong} b \end{matrix} \xrightarrow{\mathbb{Z} \cdot 1_b} \Rightarrow [A, M] = \text{arrows of } M \\
 & A \rightarrow [A^{\text{op}}, Ab] \quad \text{in } (\downarrow)^0 \\
 & \begin{array}{c} A^a \\ \downarrow f \\ a \end{array} \quad \begin{array}{c} A^a \\ \downarrow \text{in} \\ A^b \end{array} \quad \text{colimit} \quad \begin{array}{c} A^a \\ \downarrow \\ A^b/A^a \end{array} \\
 & \begin{array}{c} A^a \\ \downarrow \\ A^b \end{array} \quad \begin{array}{c} A^a \\ \downarrow \\ A^b \end{array} \\
 & A^a = \mathbb{Z} \leftarrow 0 \\
 & \underline{A^b = \mathbb{Z} \leftarrow \mathbb{Z}} \\
 & A^b/A^a = 0 \leftarrow \mathbb{Z} \\
 & \rightsquigarrow \begin{array}{l} A^a \otimes D = Da \\ A^b \otimes D = Db \\ \hline A^b/A^a \otimes D = \text{coim}(Da \rightarrow Db) \end{array} \\
 & \text{coeq's: } a \xrightarrow{\begin{smallmatrix} f \\ g \end{smallmatrix}} b \quad \begin{array}{l} A^a = \{1\} \leftarrow \emptyset \\ A^b = \{fg\} \subseteq \{1\} \\ \hline \text{coeq} = * \subseteq * \end{array} \\
 & \text{pushouts: } a \rightarrow b \quad \Delta x = \text{colim}(x^a \rightarrow A^a + A^b) \\
 & \downarrow \quad \begin{array}{c} K \leftarrow x \\ \uparrow \\ x \end{array} = \text{colim} \begin{pmatrix} x \leftarrow \emptyset & (x \leftarrow x) \\ \uparrow & \uparrow \\ \emptyset & x \end{pmatrix}
 \end{aligned}$$

- The canonical colimits = the ordinary colimits in the underlying category M_0 : $\cdot S: \text{Set} \rightleftarrows V_0; V_0(S, -)$ tensor-hom adjunction
 - \vdash an ordinary category
 - \Rightarrow $\vdash S$ or V -category that admits a canonical weight $\Delta^* \cdot S = DS$

$[A^{op}, \mathcal{V}_0](\Delta S, M(D, N))$ this is almost saying that

$$[(A.S)^{\text{op}}, V]_o(\Delta S, M(D, N)) \quad \Delta^* \dashv D = \Delta S \otimes_{AS} D$$

up to the index 0

Lemma. If M has cotensors, this works in the enriched sense.

Proof. We need $\bar{[}(A \cdot S)^{\circ}, v]\}(\Delta S, M(D, N)) \cong M(D^* \times D, N)$

$$\begin{array}{ccc}
 \xrightarrow{\text{Yoneda}} & \mathcal{V}_0(K, [(\mathcal{A}S)^{op}, V] (\Delta S, M(D, N))) \cong \mathcal{V}_0(K, M(\Delta^* \cdot_A D, N)) \\
 & \text{Sok} \quad \parallel \quad \parallel \\
 & \mathcal{V}_0(S, [(\mathcal{A}S)^{op}, V] (\Delta S, M(D, N^k))) \quad \mathcal{V}_0(S, M(\Delta^* \cdot_A D, N^k)) \\
 & \parallel \quad \parallel \\
 & [(\mathcal{A}S)^{op}, V]_0 (\Delta S, M(D, N^k)) \quad M_0(\Delta^* \cdot_A D, N^k) \quad \square
 \end{array}$$

Summary: ordinary colimits $\stackrel{\text{often}}{=}$ conical colimits \leq weighted colimits \geq tensors

Construction. $W \otimes_A D$ can be constructed as the coequalizer of

$$\sum_{BC} WC \otimes A(B, C) \otimes DB \xrightarrow[\text{1 act}]{\text{act}} \sum_A WA \otimes DA$$

like $M \otimes_R N$
 the coend $[X^P, U](F_G)$

Explanation: $[A^{\text{op}}, V](W, M(D, N))$ is the equaliser of

$$\prod_A v(w_A, M(d_A, N)) = \boxed{12}$$

$$\begin{array}{l} \boxed{\prod_{BC} \{ A(BC), \vee(WC, M(DB, N)) \}} \xrightarrow[Wc \longrightarrow]{\quad} \xrightarrow[mc \longrightarrow]{\quad} \\ | / 2 \\ \prod M / \vdash_{Wc \wedge A(BC) \wedge DB . N} \end{array}$$

A

[12]

$$\prod_A M(WA \otimes DA, N)$$

BC

[12]

$$\prod_{B,C} M(WC \otimes A(B,C) \otimes DB, N)$$

obtained from the parallel pair from the construction upon applying $M(-, N)$ that turns colimits into limits. \square

Example. M a simplicial category; then

the **geometric realization** is a functor $| - | : sM \rightarrow M$ given by $|X| = \Delta \otimes_{\Delta} X$; the colimit weighted by $\Delta : \Delta \rightarrow sSet$ "Yoneda embedding"

We will see that Δ is Reedy cofibrant.

The $- \otimes_{\Delta} - : [\Delta, sSet] \times [\Delta^{\text{op}}, M] \rightarrow M$ is left Quillen w.r.t. Reedy structures \Rightarrow $| - |$ homotopy invariant on Reedy cofibrant diag's

E.g. for $M = sSet \Rightarrow |X| = \text{diag } X$

$$|X| = \int^n \Delta^n \otimes X_n$$

$$\int^k \Delta^k \otimes X_k$$

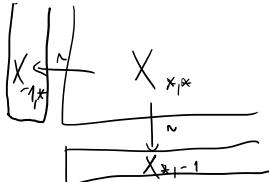

$$= \int^{n,k} (\Delta^n \times \Delta^k) \otimes X_{nk}$$

$$= \int^{n,k} \Delta \times \Delta (\text{diag}_{-1}(n,k)) \otimes X_{nk}$$

$$= X \circ \text{diag}$$

$$\begin{array}{c} \Delta^{\text{op}} \xrightarrow{\text{diag}} \Delta^{\text{op}} \times \Delta^{\text{op}} \xrightarrow{X} \text{Set} \\ \searrow \quad \swarrow \\ \Delta^{\text{op}} \end{array}$$

X diag

"balancing"

Further interesting topics. Restriction and extension of scalars

$$F_! : [A, M] \rightleftarrows [B, M] : F^*$$

$$F : A \rightarrow B$$

$$\begin{array}{l} \text{Lan}_F \\ \hookrightarrow \\ (B(-, F) \otimes_A -) \\ \hookrightarrow \\ {}_R S_R \otimes_R - \end{array}$$

$$B(F_! -) \otimes_B -$$

$${}_R S_R \otimes_R -$$

Reedy model categories, framings

$$M(M, N)$$

Motivation. Any model category M is in some weak sense enriched over $sSet$ and, as a result, $\text{Ho}(M)$ will be enriched over $\text{Ho}(sSet)$.

Start with an honest set-model category = simplicial model category

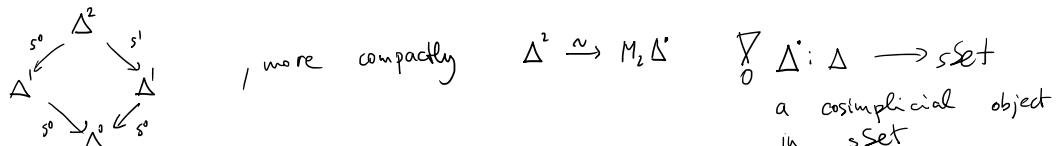

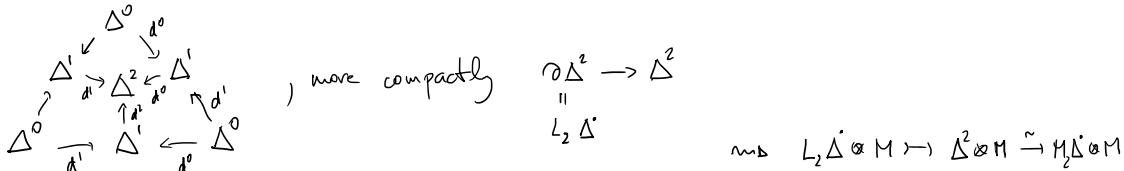

- since $K \in \text{Set}$ is a colimit $K = \underset{(n: \Delta^n \rightarrow K)}{\text{colim}} \Delta^n$

we have $K \otimes M = \operatorname{colim} (\Delta^n \otimes M)$ and it is enough to give $\Delta^n \otimes M$

- clearly $\Delta^0 \otimes M \equiv M$, since Δ^0 is the monoidal unit
 - what is the essential property of $\Delta^1 \otimes M$?
it is a cylinder? ... at least for $M \in M_0$:

$$\Delta^\circ + \Delta^\circ \xrightarrow{[d^\circ, d^\circ]} \Delta^1 \xrightarrow{\frac{s^\circ}{\sim}} \Delta^\circ \quad \rightsquigarrow \quad M + M \longrightarrow \Delta^1 \otimes M \xrightarrow{\sim} M$$

- what about $\Delta^2 \otimes M$?

- need some calculus of such diagrams $\Delta \rightarrow \text{Set}$ $\rightsquigarrow \Delta \otimes M : \Delta \rightarrow M$
 \rightarrow Reedy categories, Reedy model structures $\Delta \rightarrow M$ a cosimplicial object in M

A Reedy category has two kinds of maps (like direct and inverse in Δ)

Definition: A **direct category** is a category \mathcal{A} together with a functor $\deg: \mathcal{A} \rightarrow \lambda$ that satisfies $f: A \rightarrow B \Rightarrow f = 1 \Leftrightarrow \deg A = \deg B$

An inverse category is a dual notion, i.e. a category A together with a functor $\deg : A^{\text{op}} \rightarrow X$ satisfying $f^{-1} \leftrightarrow \deg f = \deg A = \deg B$.

A **Reedy category** is a category \mathcal{A} together with two subcategories

A^+ , A^- and a function $\deg: \text{ob } A \rightarrow \lambda$ that

- makes A^+ into a direct category
 - makes A_- into an inverse category
 - any morphism has a unique decomposition

$$\sum_{A \in \mathcal{A}} \mathcal{A}^+(A, C) \times \mathcal{A}_-(B, A) \xrightarrow{\text{def}} \mathcal{A}(B, C)$$

as a composition of an inverse and a direct morphism

The Yoneda lemma gives $X \cong A(-, -) \cdot_A X$ and we will describe a way of building X by decomposing $A(-, -)$. The axioms actually give (but only of functors)

$$A(-,-) = \sum_{A \in \mathcal{A}} A^+(-,-) \times A^-(-,A) = \sum_{A \in \mathcal{A}} A_A^+ \times A_A^- \quad (\text{but only } \text{of functors } A_A^{\text{op}} \times A^+ \rightarrow \text{Set } \nabla)$$

but in order to understand $A(-, -)$ we factor it into
 $\text{sh}_n A(-, -)$ --- maps that factor through some A of degree $\leq n$
and clearly we have

$$A(-, -) = \underset{n \in \mathbb{N}}{\text{colim}} \text{sh}_n A(-, -)$$

so that it remains to study the difference between $\text{sh}_n A$
and $\text{sh}_{n+1} A$ or, better for n limit, $\text{sh}_n A = \underset{i \in \mathbb{N}}{\text{colim}} \text{sh}_i A$.

Quite clearly, we have a pushout square

$$\begin{array}{ccc} 0 & \longrightarrow & \text{sh}_n A \\ \downarrow & & \downarrow \\ \sum_{A \in \Delta_n} A^+ \times A^- & \longrightarrow & \text{sh}_{n+1} A \end{array}$$

with A ranging over all
objects of degree n

However, it will be crucial to express this in terms of
representable functors on A , rather than on A^+, A^- .

Examples.

- any ordinal is a direct category
- $\begin{array}{c} \nearrow + \\ \swarrow + \end{array}$ is a direct category
- $\begin{array}{c} \leftarrow - \\ \rightarrow + \end{array}$ is a Reedy category
- Δ^+ is a direct category (non-empty finite ordinals + monos)
- Δ_- is an inverse category (non-empty finite ordinals + epis)
- Δ is a Reedy category

Notation.

We denote

- $A_A = A(A, -) \in [A, \text{Set}]$ the covariant representable
- $A^A = A(-, A) \in [A^{\text{op}}, \text{Set}]$ the contravariant representable ... think Δ^n

We further define two subfunctors

- $i_A: \text{DA}_A \subseteq A_A$ of maps that factor through an object of lower degree.
- $i^A: \text{DT}^A \subseteq A^A$ of maps that factor through an object of lower degree.

In the decomposition

$$\begin{aligned} A_A = A(A, -) &= \sum A^+(B, -) \times A_-(A, B) \\ \text{DA}_A &= \sum A^+(B, -) \times \text{DT}_-(A, B) \end{aligned}$$

↑ only 1 is excluded

This means that there is a pushout (coproduct)

$$\begin{array}{ccc} 0 & \longrightarrow & \text{DA}_A \\ \downarrow & \lrcorner & \downarrow i_A \\ A^+ & \longrightarrow & A_A \end{array}$$

Dually, we get

$$\begin{aligned} A^A = A(-, A) &= \sum A^+(B, A) \times A_-(-, B) \\ \text{DT}^A &= \sum \text{DT}^+(B, A) \times A_-(-, B) \end{aligned}$$

and a pushout (coproduct)

$$\begin{array}{ccc} 0 & \longrightarrow & \text{DT}^A \\ \downarrow & \lrcorner & \downarrow i^A \\ A_- & \longrightarrow & A^A \end{array}$$

Putting these together yields that

$$\begin{array}{c} 0 \times 0 \\ \lrcorner \quad \lrcorner \end{array}$$

each square pushout

$$\text{DA}_A \times \text{DT}^A$$

$$\begin{array}{c} O \times A^A \\ \downarrow \quad \downarrow \\ O \times A^A \quad A_A^+ \times O \\ \downarrow \quad \downarrow \\ A_A^+ \times A_A^A \end{array} \quad \text{gives as a pushout} \quad \begin{array}{c} \Rightarrow \\ \partial A_A^+ \times A_A^A \quad A_A^+ \times \partial A^A \\ \downarrow \quad \downarrow \\ A_A^+ \times A_A^A \end{array}$$

Now we get a diagram

$$\begin{array}{ccc} O & \longrightarrow & \sum_A \partial A_A^+ \times A^A + A_A^+ \times \partial A^A \longrightarrow \operatorname{sk}_n A(-1-) \\ \downarrow & & \downarrow \sum_A i_{A^+} i_A^* \\ \sum_A A_A^+ \times A_A^A & \longrightarrow & \sum_A A_A^+ \times A^A \longrightarrow \operatorname{sk}_n A(-1-) \end{array} \quad \begin{array}{l} \text{sums range over } A \in \Lambda \\ \text{with } \deg A = n \end{array}$$

in which the outer square is a pushout \Rightarrow so is the one on the right
Upon applying $- \cdot X$, we denote:

$$\begin{array}{ccc} \partial A^A \cdot X & \xrightarrow{i_A^* \cdot X} & A_A^+ \cdot X \\ \parallel \text{def} & & \parallel \\ L_A X & \xrightarrow{\partial_A X} & X_A \end{array}$$

Example. $A = \Delta^\infty$, $M = \text{set}$
 $\Rightarrow L_n X \subseteq X_n$ the subset of deg. n implies
(needs a bit of work).
 $O = \operatorname{sk}_{-1} X$

Theorem. For any $X \in [A, M]$ we get $X = \operatorname{colim} \operatorname{sk}_n X$ and

$$\begin{array}{ccc} \sum_A \partial A_A^+ \cdot X_A + A_A^+ \cdot L_A X & \longrightarrow & \operatorname{sk}_n X \\ \downarrow i_A^* \cdot \partial_A X & & \downarrow \\ \sum_A A_A^+ \cdot X_A & \longrightarrow & \operatorname{sk}_n X \end{array}$$

Important special case.

When A is direct, we have $\partial A_A = 0$ and, consequently,

$$\begin{array}{ccc} \sum_A A_A^+ \cdot L_A X & \longrightarrow & \operatorname{sk}_n X \\ \downarrow & & \downarrow \\ \sum_A A_A^+ \cdot X_A & \longrightarrow & \operatorname{sk}_n X \end{array}$$

so that: $HAGA: \partial_A X : L_A X \rightarrow X_A$ cofibration

$\Rightarrow X$ is cofibrant in the projective model structure

More generally, for $f: X \rightarrow Y$ we denote $\partial_A f = i_A^* \cdot j_! f$, i.e. the pushout corner map in

$$\begin{array}{ccc} L_A X & \longrightarrow & L_A Y \\ \partial_A X \downarrow & \nearrow \downarrow \partial_A Y & \downarrow \partial_A f \\ X_A & \longrightarrow & Y_A \end{array} \quad \begin{array}{ccc} \partial A^A & & X \\ \downarrow i_A^* & & \downarrow \\ A^A & \xrightarrow{j_A} & Y \end{array} \quad X = \operatorname{sk}_{-1} Y$$

Theorem. For any map $f: X \rightarrow Y$ of $[A, M]$ we get $Y = \operatorname{colim}_{n \in \mathbb{N}} \operatorname{sk}_n^X Y$ and

$$\begin{array}{ccc} \downarrow \sum i_A^* \cdot \partial_A f & \longrightarrow & \operatorname{sk}_n^X Y \\ \downarrow & & \downarrow \\ \sum i_A^* \cdot \partial_A f & \longrightarrow & \operatorname{sk}_n^X Y \end{array} \quad \begin{array}{ccc} O & & X \\ \downarrow & & \downarrow f \\ \operatorname{sk}_n A(-1-) & \xrightarrow{j_!} & Y \\ \downarrow & & \downarrow \\ A(-1-) & & Y \end{array} \quad \begin{array}{c} X \\ \downarrow \\ \operatorname{sk}_n^X Y = \operatorname{sk}_n Y + \operatorname{sk}_n X \end{array}$$

Theorem. For a map $f: X \rightarrow Y$ of $[A, M]$ TFAE

- $\forall A: \partial_A f$ is a (trivial) cofibration

- $f \in \text{coll.}\{i_{A^+}, i \mid A \in \Delta, i \in M \text{ a (trivial) cofibration}\}$

$$\begin{array}{ccc} \partial A_A \cdot L_A + \partial A_A \cdot K_A & & \\ \downarrow & & \\ A_A \cdot I_- & & \end{array}$$

- $\forall A : \partial_A f$ is a (trivial) cofibration

- $f \in \text{cell} \{ i_A : i \mid A \in \mathcal{A}, i \in M \text{ a (trivial) cofibration} \}$

These maps are called **Reedy (trivial) cofibrations**.

Proof. The implication " \Downarrow " is the previous theorem.
For the implication " \Uparrow " observe that ∂_A commutes with all cellular constructions so that it is enough to study $\partial_A(i_B \rightarrow i)$:

$$\begin{array}{ccc} \partial_A^A & \xrightarrow{i_A} & \left(\begin{array}{ccc} \partial_A B & \rightarrow & K \\ \downarrow i_A & \downarrow & \downarrow i \\ A_B & \rightarrow & L \end{array} \right) \\ \downarrow & & \end{array} = \left(\begin{array}{ccc} \partial_A^A & \partial_A B & K \\ \downarrow i_A & \times_{A_B} & \downarrow i \\ A^A & A_B & L \end{array} \right) \rightarrow \begin{array}{c} K \\ \downarrow i \\ L \end{array}$$

either iso for $A \neq B$

$A_{\neq 1}(B, A) \hookrightarrow A(B, A)$ for $A = B$

pushout of $\circ \rightarrow 1$

pushout of i

II

Dually, we denote

$$M_A X = \{ \partial_{A+1} X \}_A$$

$$\delta_A X \uparrow \quad \uparrow \varepsilon_{A+1, X}$$

$$X_A = \{ A_{+1} X \}_A$$

and more generally for $f: X \rightarrow Y$:

$$\delta_A f = \{ i_A, f \}_{A+1} = \text{pullback corner map in}$$

$$\begin{array}{ccc} X_A & \longrightarrow & M_A X \\ \downarrow & & \downarrow \\ Y_A & \longrightarrow & M_A Y \end{array}$$

Theorem. TFAE

- $\forall A \in \mathcal{A} : S_A f$ is a (trivial) fibration

- $f \in \text{cocell} \{ \{ i_A, p \} \mid A \in \mathcal{A}, p \in M \text{ a (trivial) fibration} \}$

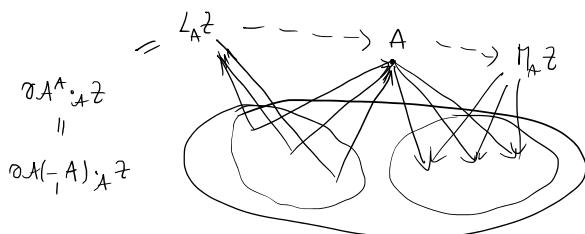

→ **Reedy (trivial) fibrations**.

Theorem. There is a model structure on $[\mathcal{A}, M]$, called

the **Reedy model structure** with $C =$ Reedy cofibrations,
 $F =$ Reedy fibrations, $W =$ pointwise weak equivalences.

Proof. We need to show that $W \cap C$ are exactly the **Reedy cofibrations**. Easily $i_A \dashv j \dashv f \Leftrightarrow j \dashv \{ i_A, f \}_{A+1}$.
 \dashv trivial cofibration \dashv fibrations by definition

The factorizations are produced inductively using the following idea:

to give an extension of z
from A_{n-1} to A_n we need

$\forall A$ of degree n to factor

$$\begin{array}{ccc} L_A z & \longrightarrow & Z_A \longrightarrow M_A z \\ & & \nearrow \text{obtained from } Z_{A_{n-1}} \end{array}$$

Now

$$\begin{array}{ccccc}
 L_A X & \longrightarrow & L_A \mathbb{Z} & \longrightarrow & L_A Y \\
 \downarrow & \swarrow & \downarrow & & \downarrow \\
 X_{\Delta} & \longrightarrow & Z_A \cong \bullet & \longrightarrow & Y_{\Delta} \\
 \downarrow & & \downarrow & & \downarrow \\
 M_A X & \longrightarrow & M_A \mathbb{Z} & \longrightarrow & M_A Y
 \end{array}$$

L_A \cong M_A
 obtained from $\mathbb{Z} \mathbb{I}_{\text{tn}}$

□

Application. • Properness in M_c / M_f differently.

• Given $A \in M_c$ consider $\text{cst } A \in [\Delta, M]$ and consider its Reedy cofibrant replacement $A^* \in [\Delta, M]$

$$O \rightarrow A^* \xrightarrow{\sim} \text{cst } A$$

- we may achieve that $A_0^* = A$ and then A^* is called a **cosimplicial frame** on A . Any two are related by a zig-zag of cosimplicial frames. Thus for $X \in M_f$

$$M(A^*, X) \in \text{sSet}$$

Dually $M(A, X_{\Delta}) \in \text{sSet}$ via a simplicial frame on X .
