

Průtoková cytometrie a sorting

Karel Souček

Biofyzikální ústav AV ČR, Masarykova Univerzita,
FNUSA-ICRC

Cytometrie

- ▶ Cytometrie je souhrnné označení pro skupinu metod používaných pro měření různých charakteristik buněk. Proměnné, které lze měřit cytometrickými metodami, zahrnují velikost buňky, počet buněk, morfologii buněk (tvar a strukturu), fáze buněčného cyklu, obsah DNA a přítomnost či nepřítomnost specifických proteinů na buněčném povrchu nebo v cytoplazmě. Cytometrie se používá k charakterizaci a počítání krevních buněk v běžných krevních testech, jako je úplný krevní obraz. Podobným způsobem se cytometrie také používá ve výzkumu buněčné biologie a v lékařské diagnostice (například k odhalování rakoviny či AIDS).

- ▶ Průtoková cytometrie
- ▶ Spektrální průtoková cytometrie
- ▶ Hyperspektrální cytometrie
- ▶ Obrazová cytometrie
- ▶ Hmotnostní cytometrie
- ▶ Cytometrie in vivo

Česká společnost pro analytickou cytometrii, z. s.

ČSAC je malou organizací a žije jen aktivitou svých členů.

Co můžete udělat Vy pro ČSAC:

- svým členstvím podpořit aktivity ČSAC
- aktivně nabídnout spolupráci na témaitech, jež se Vás týkají
- zorganizovat seminář na téma, které Vám chybí
- pomoci s obsahem webových stránek (doplnit odkazy, přeložit do angličtiny)

www.csac.cz

Proč být členem ČSAC?

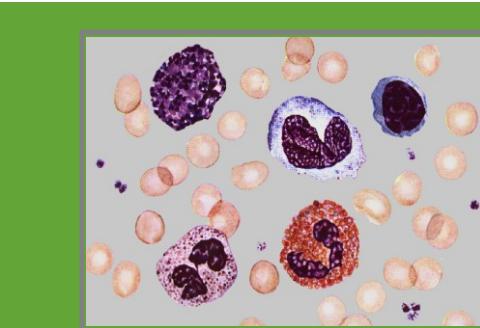

ČSAC pro své členy:

- organizuje konferenci Analytická cytometrie každé dva roky (s účastí vybraných zahraničních rečníků ze všech oblastí cytometrie)
- pořádá vzdělávací akce (např. Motolský Minikurz, B-klub a další)
- podporuje Vámi organizované cytometrické semináře (finančně, organizačně, odborně)
- uděluje ceny v soutěži o nejlepší publikaci s cytometrickou tématikou (cílem je zviditelnit zajímavé práce, poskytnout uznání kvalitním pracím)
- poskytuje cestovní granty ČSAC pro mladé členy na cytometrické akce
- informuje o aktivitách ISAC a ESCCA
- umožňuje kontakt s podobně zaměřenými kolegy a neformální výměnu zkušeností
- podporuje rozvoj cytometrie
- zprostředkovává výměnu zkušeností mezi členy a světovou cytometrickou komunitou

<https://www.csac.cz>

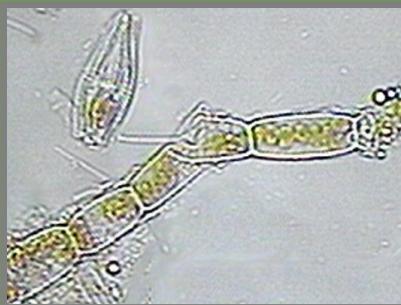

Tyto částice mají něco společného ...

Blood cells

Chromosomes

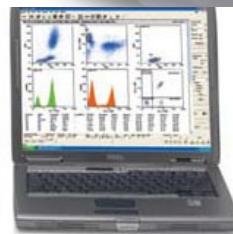

Algae

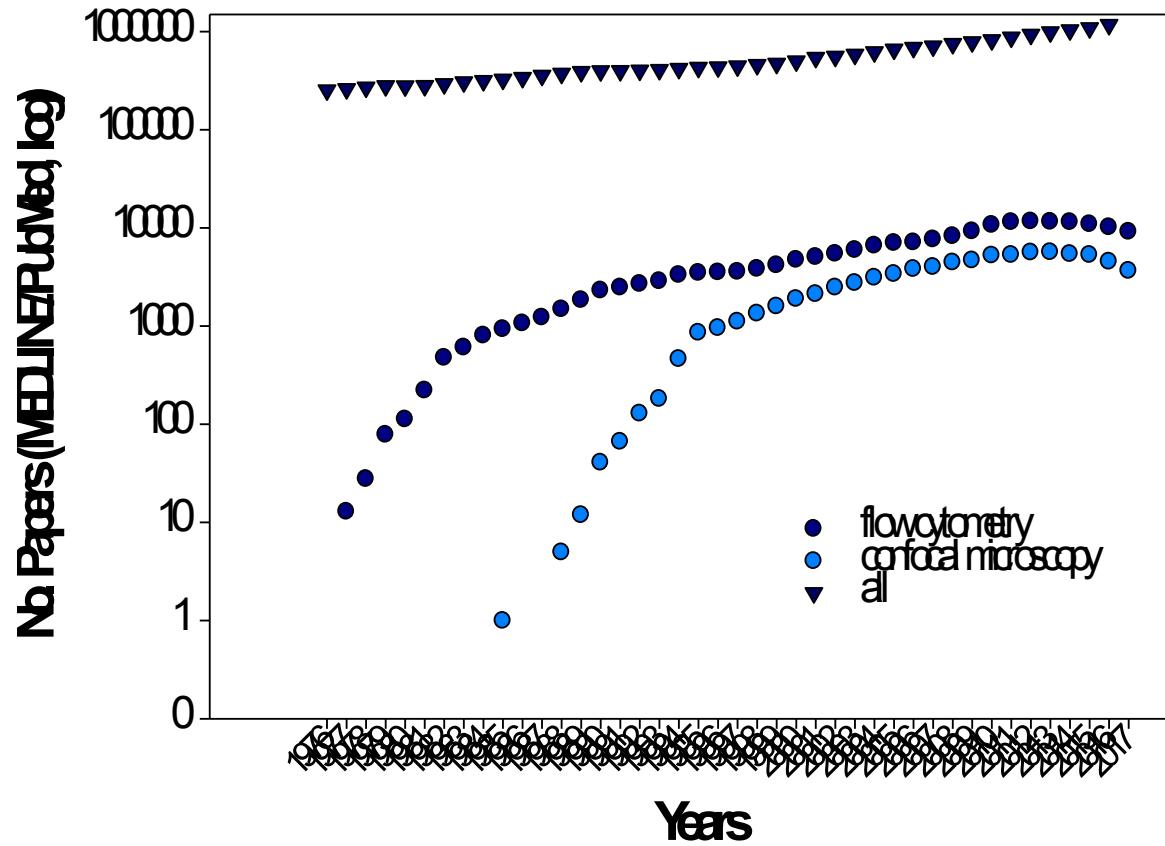

Protozoa

... určité parametry těchto částic mohou být měřeny pomocí průtokové cytometrie.

Cytometry Publications/Year

Buněčné znaky

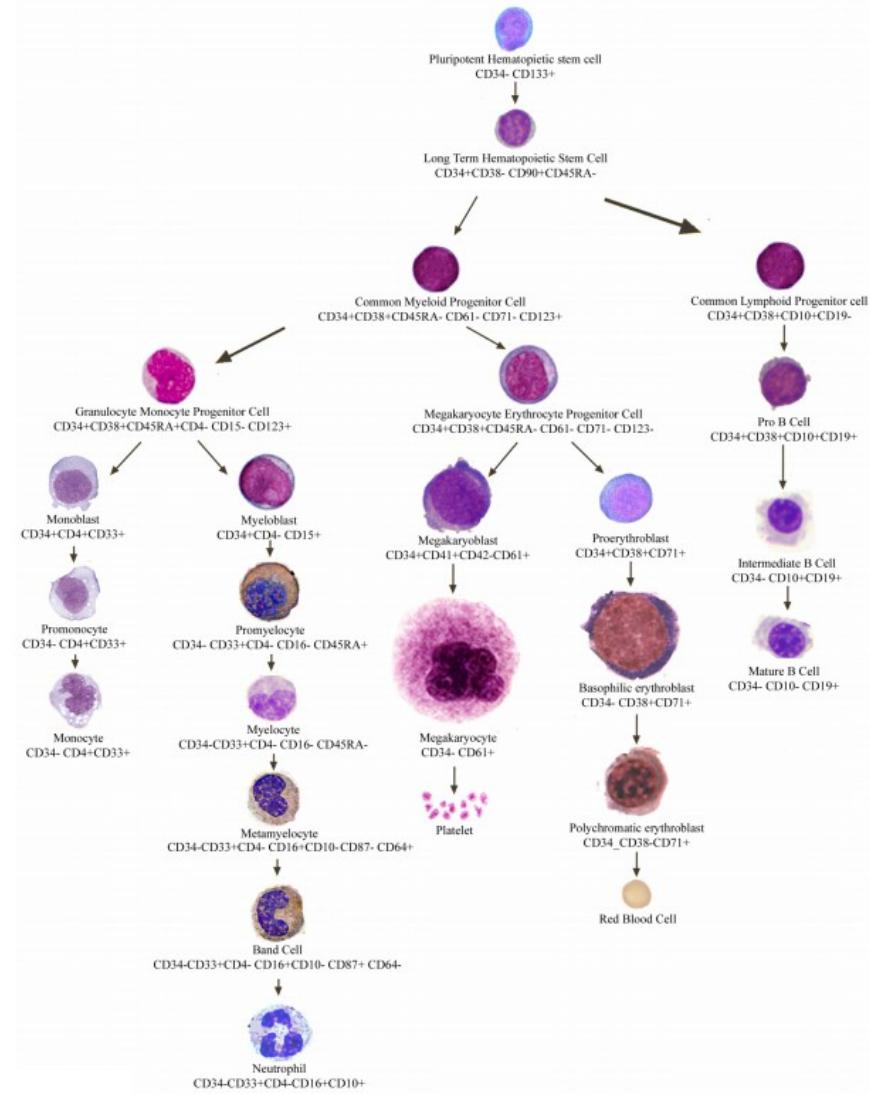

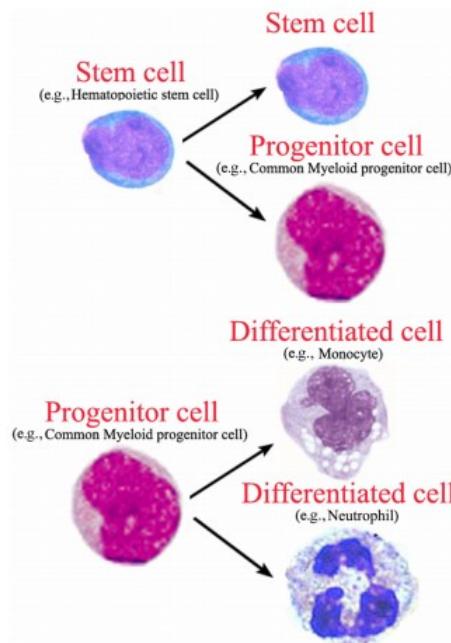

What Is Cluster of Differentiation

- 1 Cluster of differentiation (CD) is a surface marker that identifies a particular differentiation lineage recognized by a group of monoclonal antibodies.
- 2 CD antigens are molecules originally defined as being present on the cell surface of leucocytes and recognized by specific antibody molecules, but now including some intracellular molecules and molecules present on cells other than leucocytes.
- 3 Physiologically, CD antigens do not belong in any particular class of molecules.

Buněčné znaky

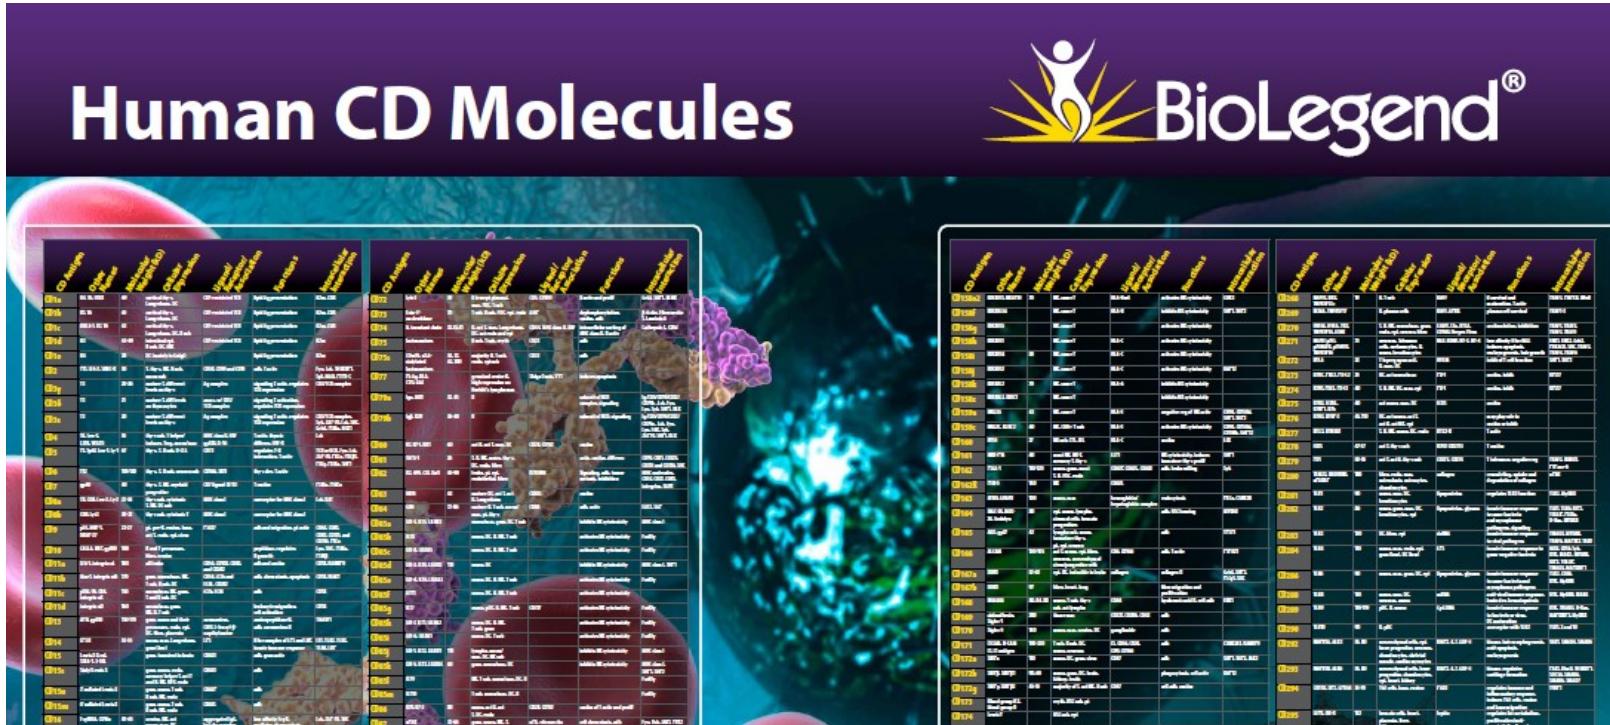

CYTOKINETIKA

Buněčné znaky

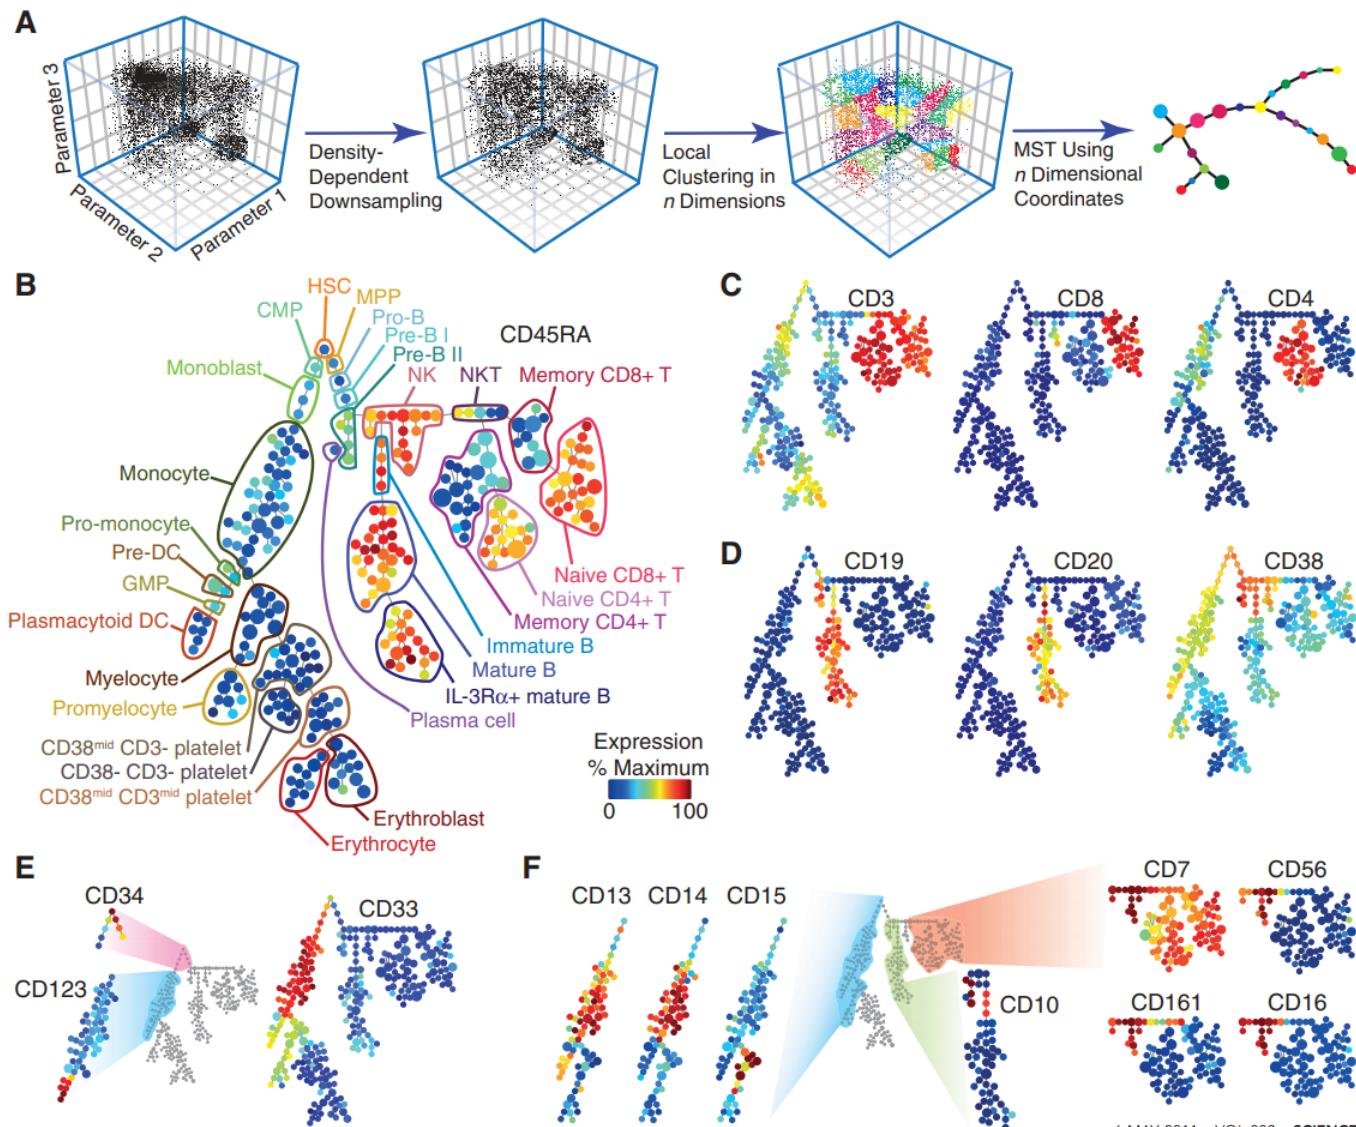

Human CD Molecules

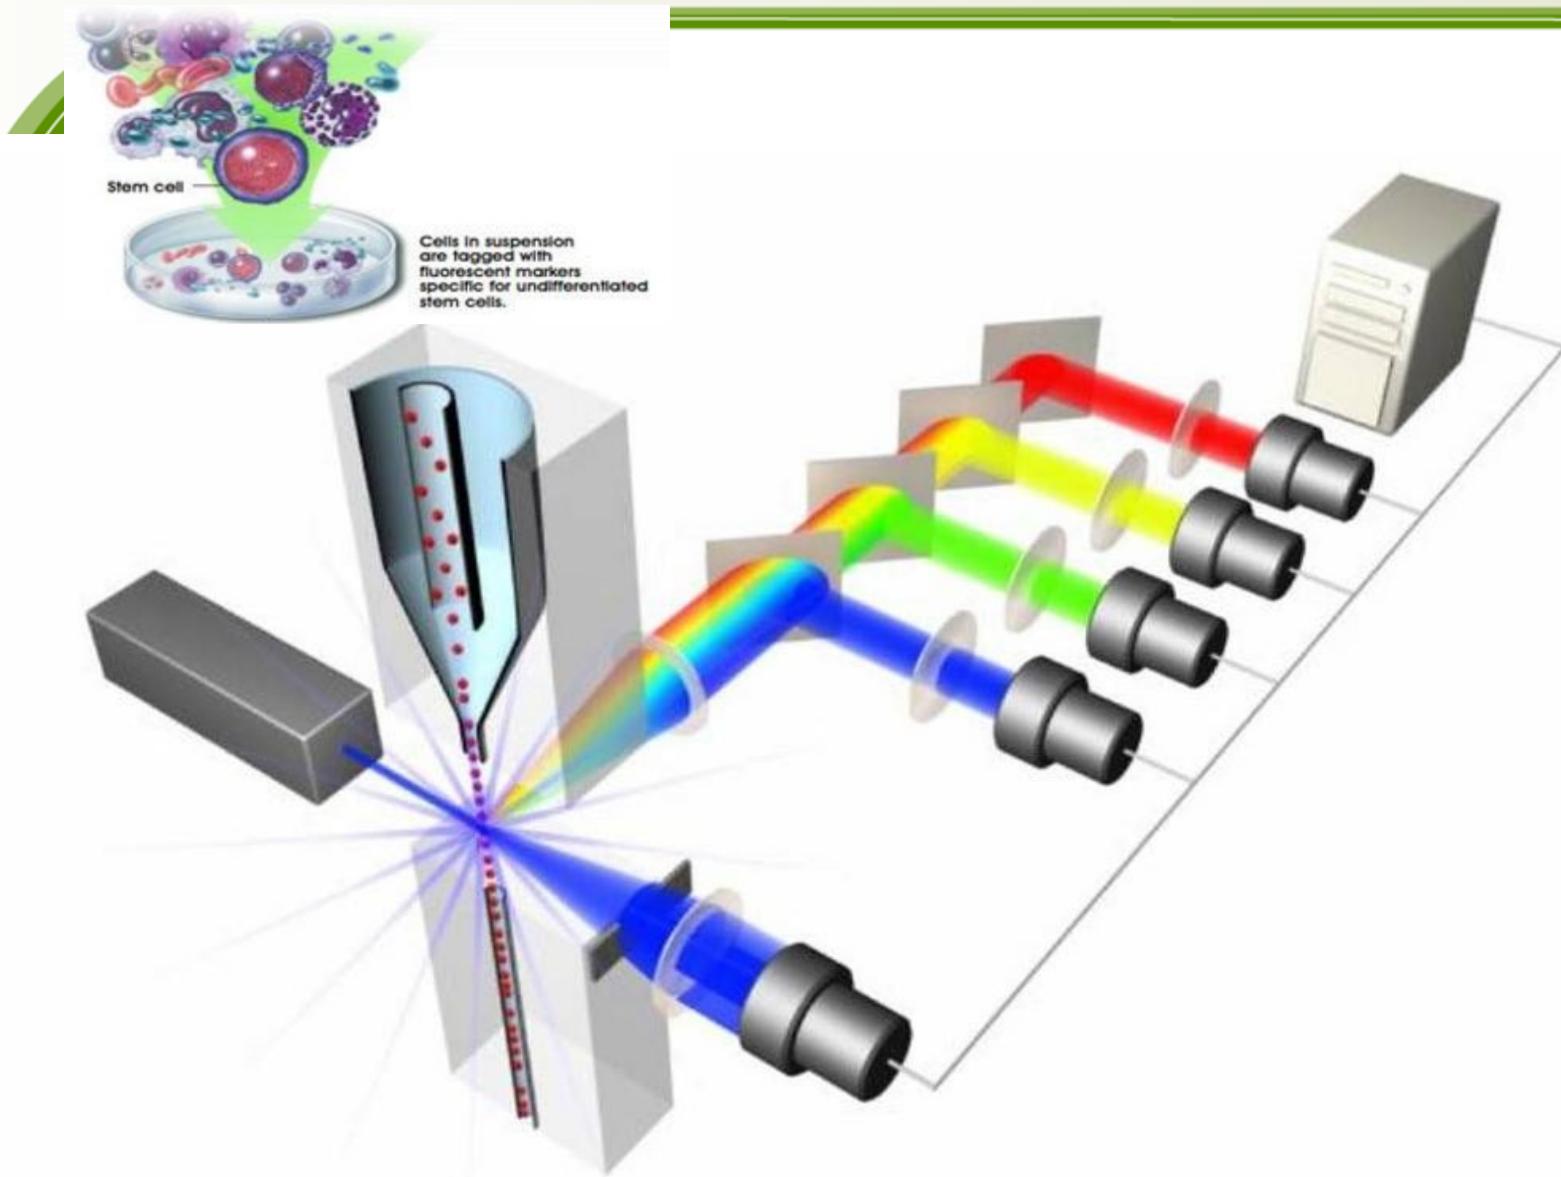

The image displays four rectangular panels, each containing a table of Human CD Molecules. The first panel on the left shows a table with approximately 40 rows of data, including columns for CD number, name, and function. The second panel in the center also contains a table with similar data. The third and fourth panels on the right show tables with more extensive lists of molecules, likely including additional details such as isoforms or specific ligands. Interspersed between these panels are three-dimensional molecular models, including a purple protein structure, a yellow and brown complex, and a green and blue complex.

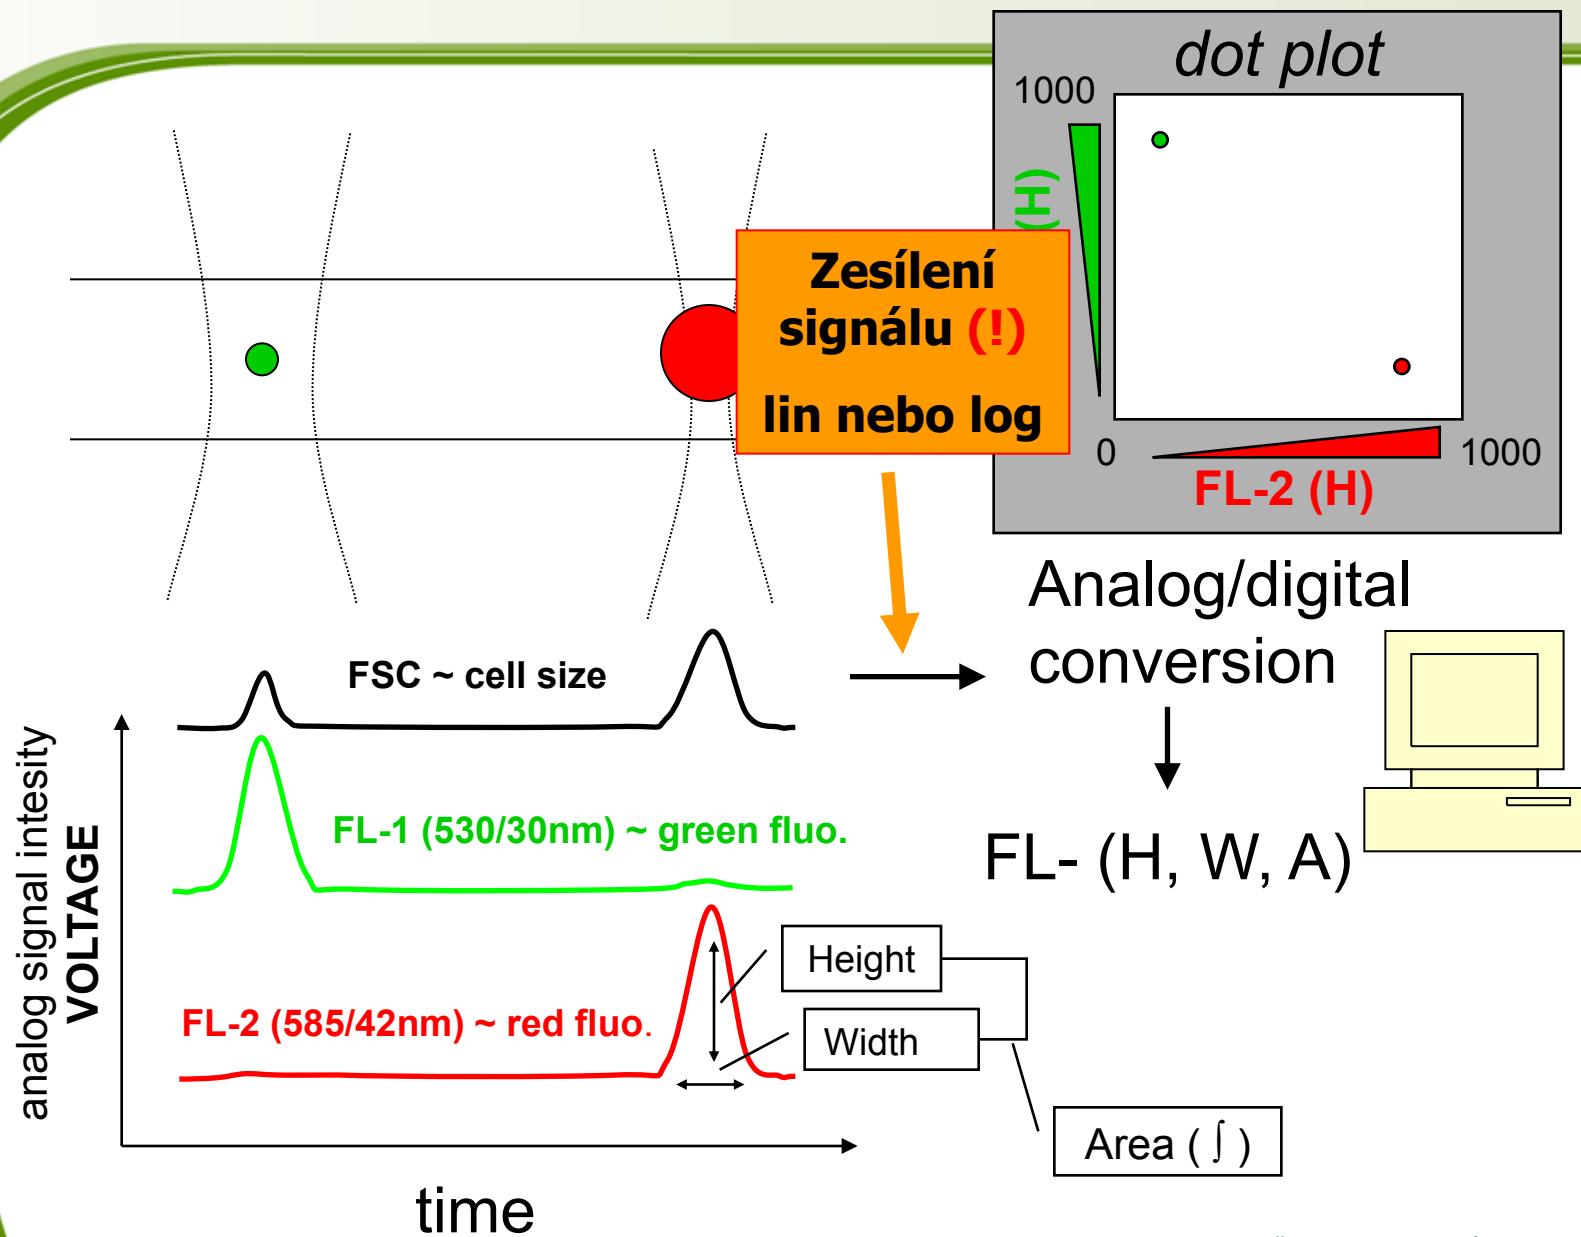

Buněčné znaky

Co je průtokový cytometr?

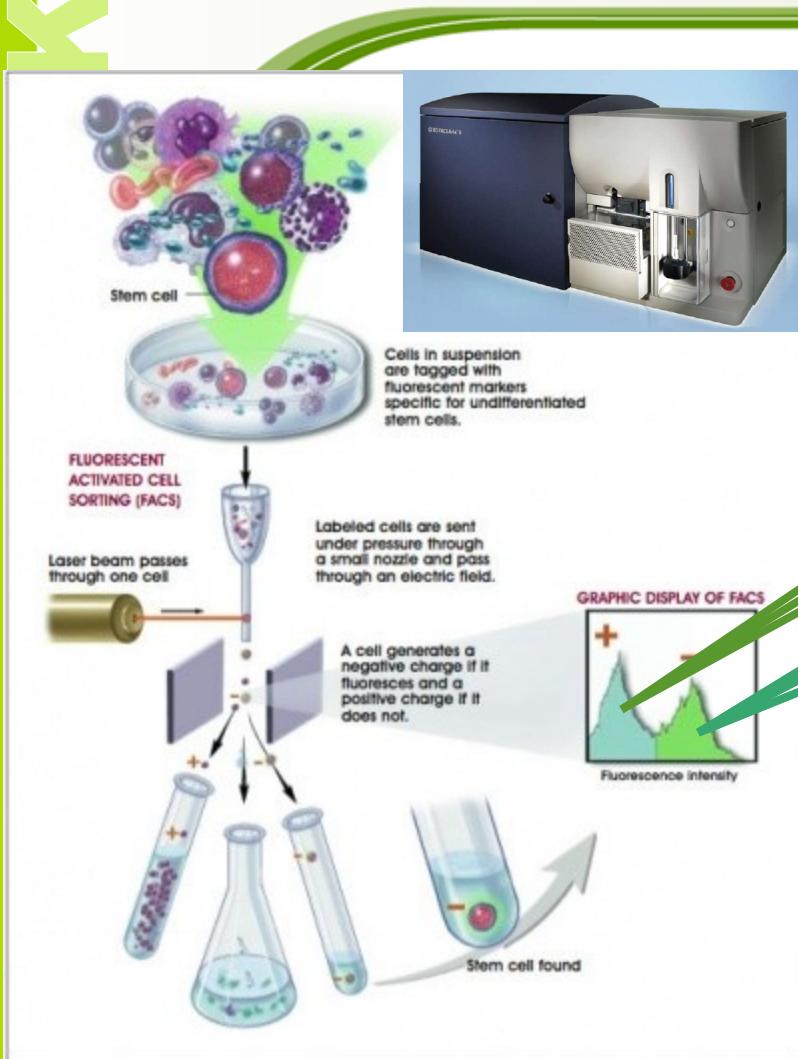

Signal processing

Co můžeme analyzovat pomocí průtokové cytometrie?

- ▶ Počítat částice v suspenzi
- ▶ Oddělit živé částice od neživých
- ▶ Hodnotit 10^5 až 10^6 částic za méně než 1 minutu
- ▶ Kvantifikovat rozptyl světla, a intenzitu fluorescence pro jednotlivé buňky (částice)
- ▶ Fyzicky separovat jednotlivé částice (populace) pro další analýzu

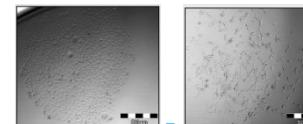

KA new automatic cell cloning assay (ACCA) for determination of clonogenic capacity of CSCs

single cell/well
up to 384 well plate

re-culture after sorting (2D, 3D)

analysis: CyQuant, ATP, xCelligence, microscopy

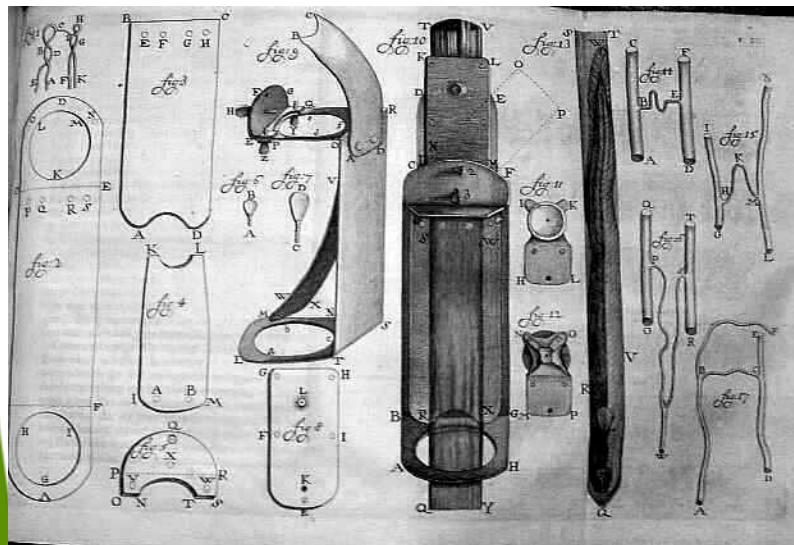

Jaké jsou principy?

- Rozptyl světla (Light scatter) pomocí laseru nebo UV lampy
- Detekce/kvantifikace specifické fluorescence
- Hydrodynamicky zaostřený proud částic
- Elektrostatická separace částic
- Možnost multivariační analýzy dat

Historie barvení biologických materiálů

Až do poloviny 19. století – *byly používány pouze přírodní barviva*

Anton van Leeuwenhoek použil v roce 1719 šafrán na obarvení svalových buněk

Rozptyl světla

- ▶ Hmota rozptyluje světlo vlnových délek které není schopna absorbovat
- ▶ Viditelné spektrum je 350-850 nm proto malé částice a molekuly ($< 1/10 \lambda$) spíše viditelné světlo rozptylují
- ▶ Pro malé částice byl popsán tzv. **Rayleighův rozptyl (scatter)** jehož intenzita je \sim stejná všemi směry
- ▶ Rozptyl větších částic charakterizuje tzv. **Mieův rozptyl**. Jeho množství je větší ve směru v jakém dopadá světlo na ozářenou částici \Rightarrow *na tomto principu je založeno měření velikosti částic pomocí průtokového cytometru*

George Gabriel Stokes (1819 – 1903)

Anglický fyzik a matematik
působící na univerzitě v Cambridge

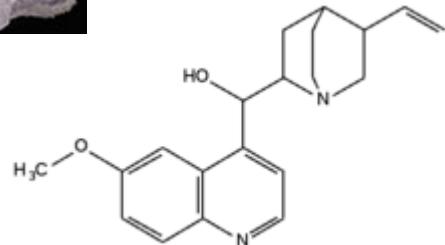

1852 – popsal fluorescenci

Název vznikl z anglického slova *fluospar*
(fluorit, kazivec = nerost CaF_2)

- ke svému pozorování použil roztok
chininu, jako zdroj světla sluneční
paprsky, jako excitační filtr sloužilo tmavě
modré okenní sklo a jako emisní filtr byla
použita sklenice bílého vína

<http://www.nndb.com/people/131/000097837/>

G. C. Stokes „*On the Change of Refrangibility of Light*“ Philosophical Transactions of the Royal Society of London, 1852, vol. 142, p. 463.)

[463]

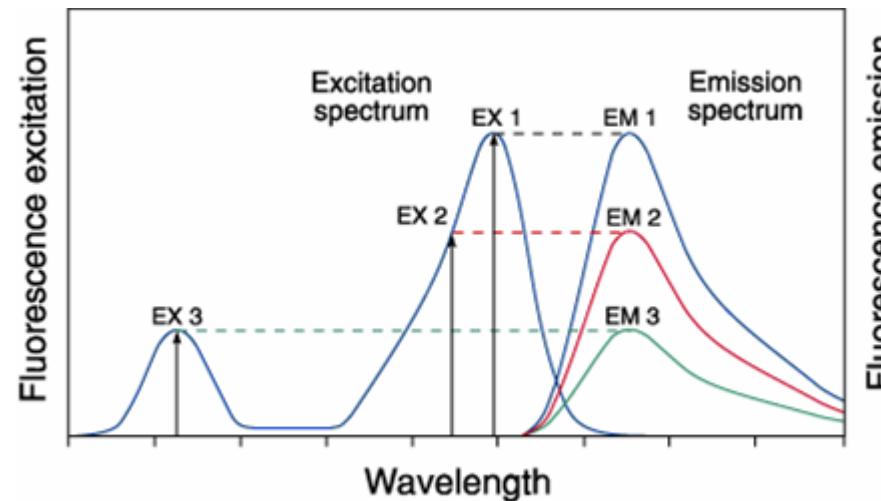

XXX. *On the Change of Refrangibility of Light.* By G. G. STOKES, M.A., F.R.S.,
Fellow of Pembroke College, and Lucasian Professor of Mathematics in the
University of Cambridge.

Received May 11,—Read May 27, 1852.

Fluorescenční spektra

Fluorescenční proces je cyklický.

Kromě fluorochromu nevratně zničeného (photobleaching - „vysvícení“) může být opakovaně excitován.

Excitation of a fluorophore at three different wavelengths (EX 1, EX 2, EX 3) does not change the emission profile but does produce variations in fluorescence emission intensity (EM 1, EM 2, EM 3) that correspond to the amplitude of the excitation spectrum.

Detekce fluorescence

Vybavení pro fluorescenci

- (1) zdroj excitace
- (2) fluorochrom
- (3) vlnové filtry pro izolaci emitovaných fotonů od excitovaných
- (4) detektory pro registraci emitovaných fotonů

Fluorescenční přístroje

- spektrofluorometr měří průměrné vlastnosti objemu vzorku v kyvetě.
- fluorescenční mikroskop popisuje fluorescenci jako jev v prostorovém systému souřadnic
- flow cytometer měří fluorescenci v proudícím toku, umožňuje detektovat a kvantifikovat subpopulace uvnitř velkého vzorku

Fluorescenční signál

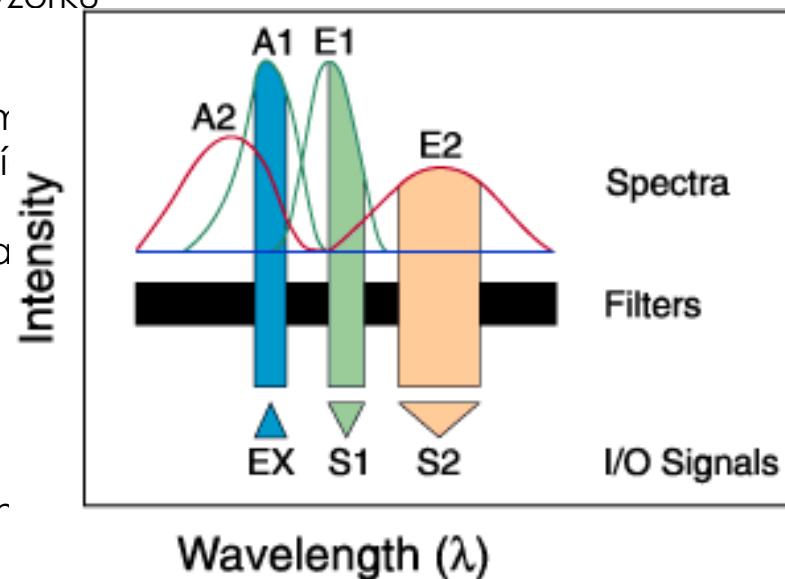

- spektrofluorometr je flexibilní, umožňuje následovat kontinuální spektrum excitačních a emisních vlnových délek
- flow cytometr potřebuje fluorescenční značky s charakteristickou excitovatelností a určitou vlnovou délkou.

Fluorescence pozadí

- endogení složky - autofluorescence
- nenávazané nebo nespecificky vázané zrny - reagenční pozadí

Vícebarevné značení

- dvě a více značek, zároveň monitoruje různé funkce
- nutné: vhodně zvolit značky zdroj excitace a separační filtry

Wallace Coulter

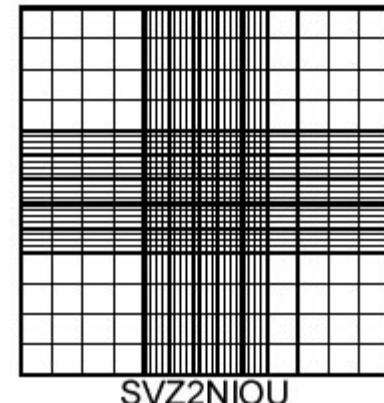

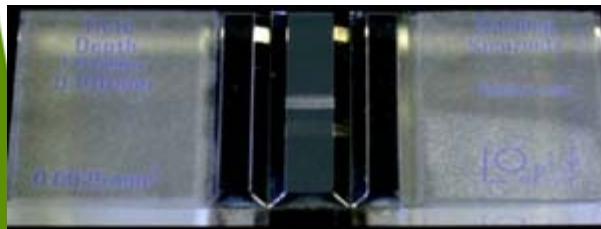

- ▶ Wallace Coulter - Coulter orifice - 1956 -
- ▶ (patent 1953) – měření změny vodivosti během průchodu buněk v suspenzi malým otvorem

Originální patentová aplikace W.Coultera 1953

Jak počítat buňky?

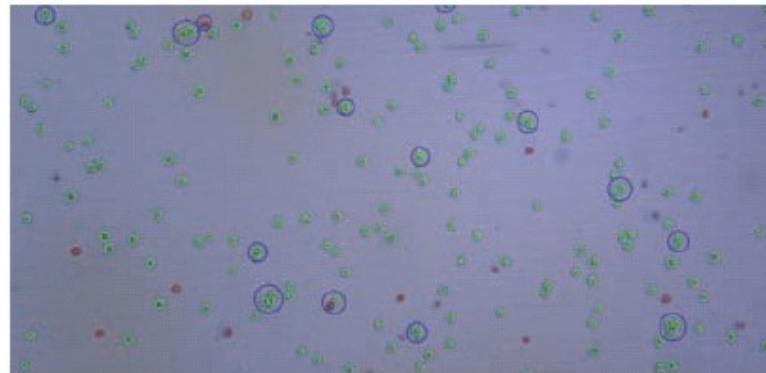

- ▶ Hemocytometer (Bürkerova komůrka) byla standardem pro počítání buněk do ~ 1950
- ▶ Rozměry jsou 3x3x0.1 mm. Obvykle jsou červené krvinky ($1 \times 10^6/\text{mm}^3$) počítány po naředění 1:200
- ▶ Leukocyty ($5 \times 10^3/\text{mm}^3$) jsou ředěny 1:10 v roztoku lyzujícím červené krvinky
- ▶ Statistická chyba:
 - ▶ koeficient variance (CV) je při 500 spočítaných buňkách 4.4%
 - ▶ chyba pipetování a ředění je ~ 10%

Mack Fulwyler- sorter

Mack Fulwyler - sorter 1965 - Los Alamos National Labs – jeho sorter separoval částice na základě elektronicky měřeného objemu (stejný princip jako Coulter counter) a separoval pomocí elektrostatického vychýlení.

Cílem bylo sortovat červené krvinky, protože u nich byla naměřena bimodální distribuce buněčného objemu. Princip separace byl založen na principu inkoustové tiskárny Richarda Sweeta ze Stanfordu (1965)

Po té co bylo objasněno, že bimodalita červených krvinek je artefakt byla tato skupina schopna separovat **neutrofily a lymfocyty** z krve.

Richard Sweet

Richard Sweet vyvinul elektrostatickou inkoustovou tiskárnu jejíž princip využil Mack Fulwyler pro svůj buněčný sorter.

FLOW CYTOMETRY TECHNICIAN

Oceanography, MIT

The Chisholm Laboratory at MIT (<http://web.mit.edu/chisholm/www/>) is seeking a full-time flow cytometry technician to participate in research involving oceanic cyanobacteria. The position requires a Bachelors degree in science or engineering and two years experience. Applicants must have a solid background in and experience with flow cytometry, including extensive knowledge of hardware, data analysis, and experimentation. Duties include maintenance of flow cytometry instruments, experimentation, and assisting other lab members with flow cytometry as needed. Must be able to work as a member of a multidisciplinary team. Opportunities for travel to field sites in Hawaii and Bermuda, and participation in oceanographic research cruises.

Please send a resume and 3 letters of recommendation to Dr. Marcia Osburne (mosburne@mit.edu), or Dr. Marcia Osburne, MIT, 15 Vassar St. rm 48-336B, Cambridge, MA 02139

Flow Cytometer Research Technician

Flow Cytometer - Research Technician

The Ocean Biogeochemistry Laboratory at Bigelow Laboratory of Ocean Sciences is seeking an energetic and motivated technician to join our research group. The primary responsibility of the successful candidate will be operating and maintaining flow cytometry cell sorters in support of oceanographic research. This technical position requires extensive knowledge of cytometric principles, ability to troubleshoot and maintain analytical instrumentation, prior experience in method development, a willingness and capability of going to sea to operate the flow cytometer (cruises from 1 to several weeks), and a high degree of self-confidence and independence. A wide diversity of sample types are analyzed ranging from enumerating and sorting single cells from oceanic samples to quantification of cellular rate processes employing fluorogenic assays to combining isotopic methods with flow sorting.

The successful applicant must have at least a B.Sc. degree and 2+ years of demonstrated experience with flow cytometric cell sorters as a primary operator. The successful applicant must also be highly organized, have a strong ability to multi-task, be self-confident and independent. This position will initially be for one year with continuation for additional years based upon successful job performance.

Send CV, cover letter, and contact information for 3 references to jobs@bigelow.org. Please reference (RT-2012-4) in the subject line. Review of applicants will begin immediately and continue as applications are received until the position is filled. The preferred starting date is no later than 1 January 2013, but this may be negotiated. Salary will be commensurate with prior experience. Bigelow Laboratory is an Equal Opportunity Employer.

CYTO

Cell cycle analysis

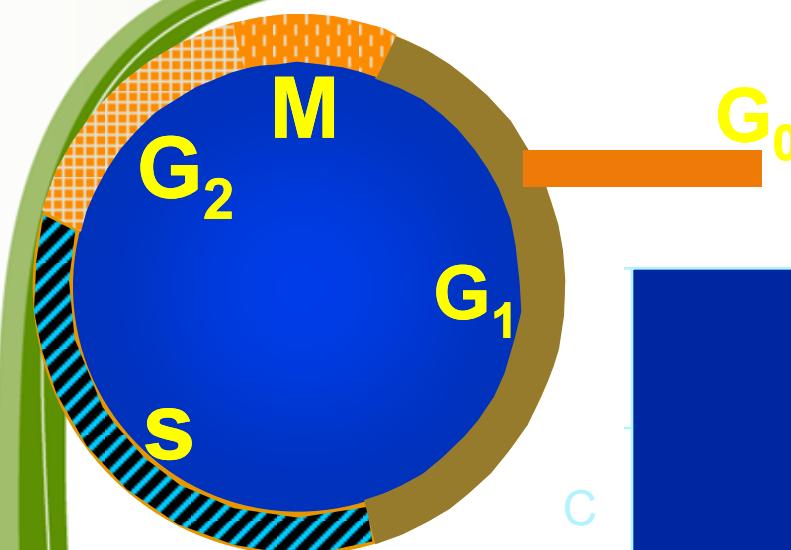

- One of the oldest applications of flow cytometry, analysis of the cells in cell cycle phases based on the quantification of DNA
- flow cytometry is a convenient method for quick and relatively precise determination of cell cycle
- DNA is simply labeled using fluorescent dye specific for DNA
 - Propidium iodide
 - 4',6-diamidino-2-phenylindole (DAPI)
 - fluorescence increases after binding to DNA. Membranes have to be permeabilized.
 - Hoechst 33342
 - Vybrant® DyeCycle™
 - DRAQ5
 - Quaternary benzo[c]phenanthridine alkaloids (QBAs)

I. Slaninova, J. Slanina and E. Taborska, "Quaternary benzo[c]phenanthridine alkaloids--novel cell permeant and red fluorescing DNA probes," *Cytometry A*, vol. 71, no. 9, pp. 700-708, 2007.

CONTROL

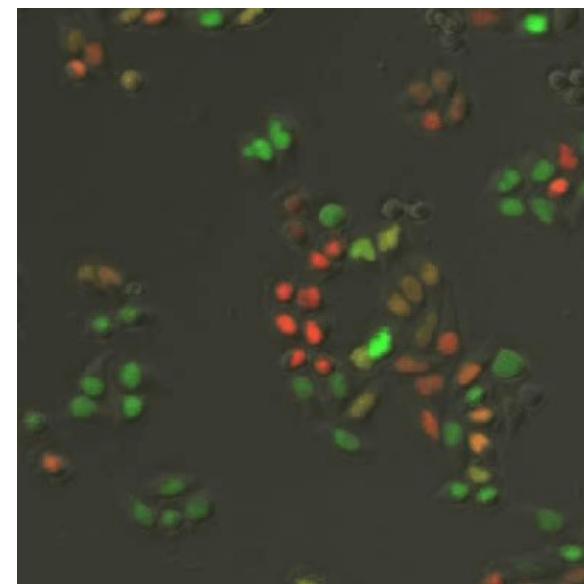

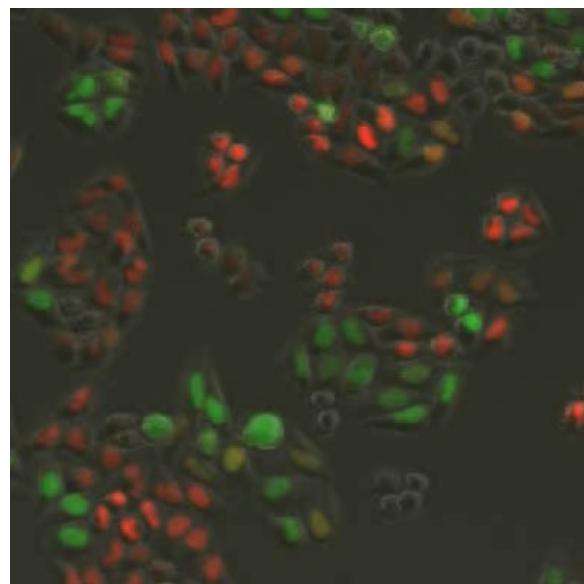

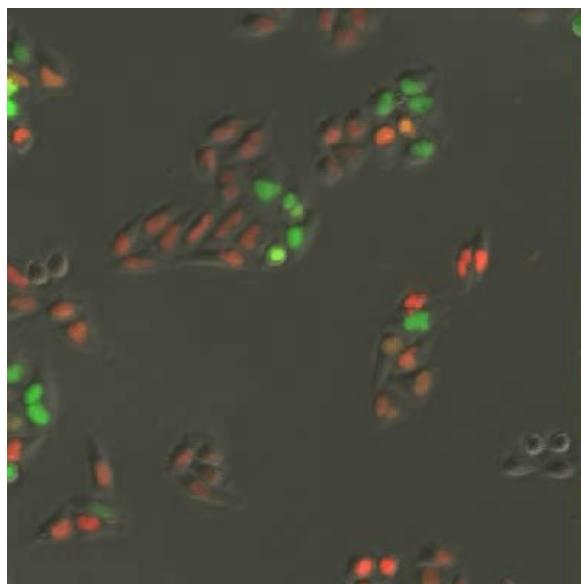

SCH900776

MU380

VEHICLE

GEMCITABINE

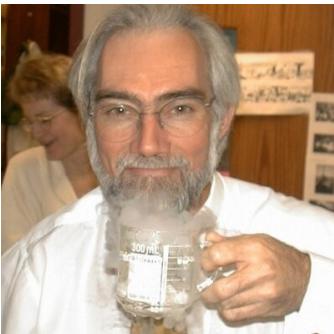

Summary

- ▶ **DNA analysis**
 - ▶ Require fine sample preparation, debris elimination, sw tool for precise analysis of histograms
 - ▶ It is possible to combine with analysis of other parameters e.g. DNA synthesis
- ▶ **Cell division enumeration**
 - ▶ Mostly for synchronized populations
- ▶ **Fluorescent proteins**
 - ▶ Fucci – elegant tool for *in vitro* a *in vivo* experiments

The SP6800 Spectral Analyzer is Sony Biotechnology Inc.'s newest innovative life science system fundamentally expanding the way cell and biomarker analysis can be performed. This system incorporates a unique optical bench, Blu-ray™ disc technology, and advanced algorithms to deliver some of the most accurate and precise data available.

The SP6800 Spectral Analyzer also introduces new Flow Point technology to analyze core stream and sample event location within the flow cell. To improve accuracy of data, this system also provides unique functions to display and analyze cellular autofluorescence and allows the user to easily automatically remove.

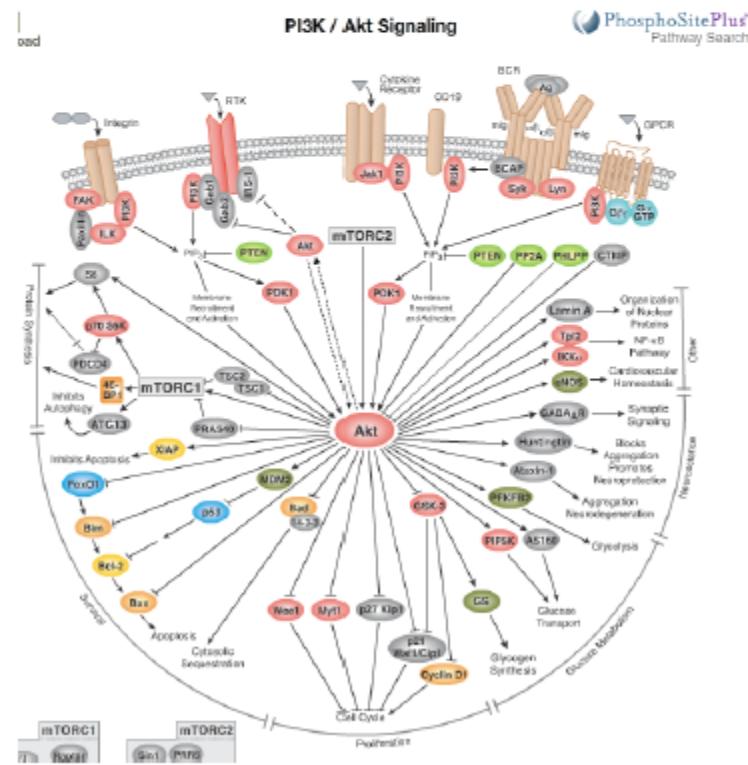

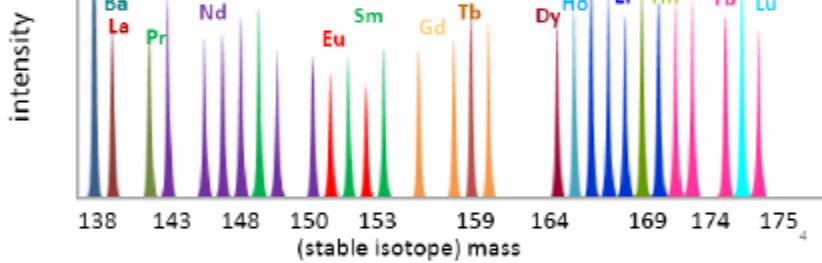

Conventional vs. spectral analysis

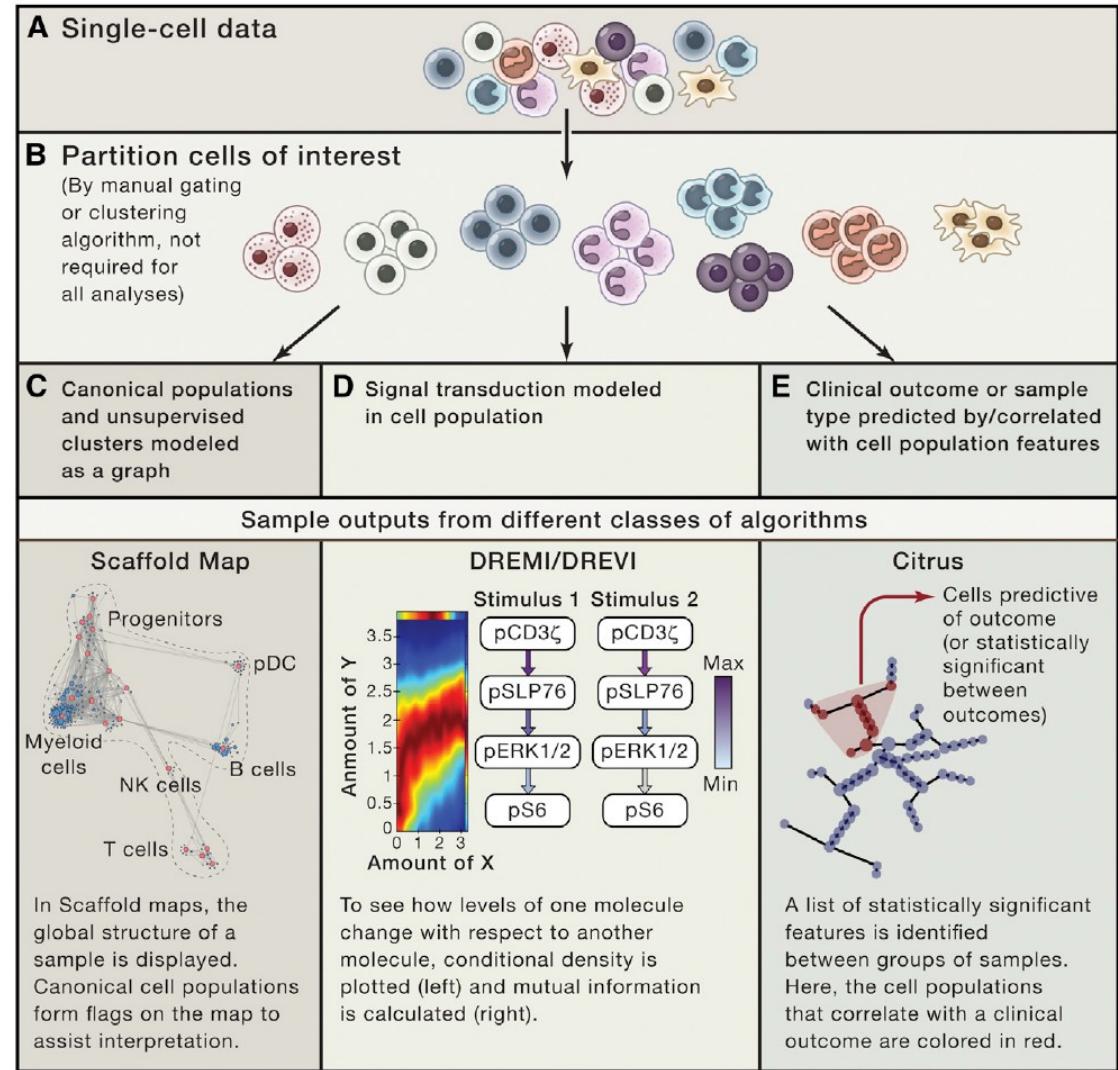

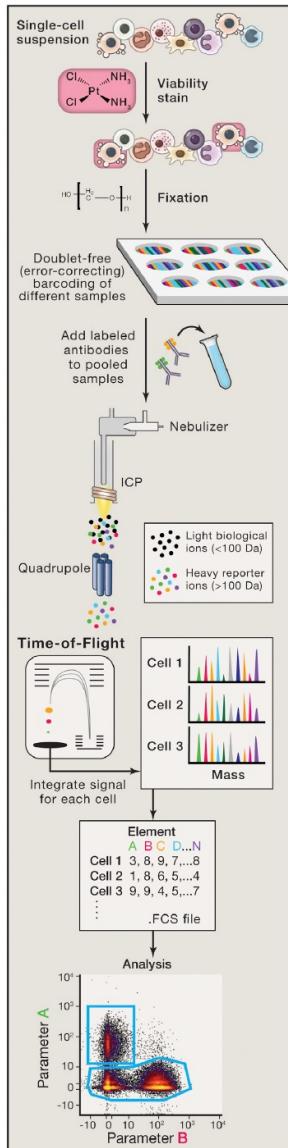

Why Mass Cytometry?

- Highly multi-parametric, on a single cell basis
- Facilitates exploration of complex pathways
- Enables discovery of cellular relationships, responses, and developmental pathways
- Allows deep-profiling of your cell system of interest

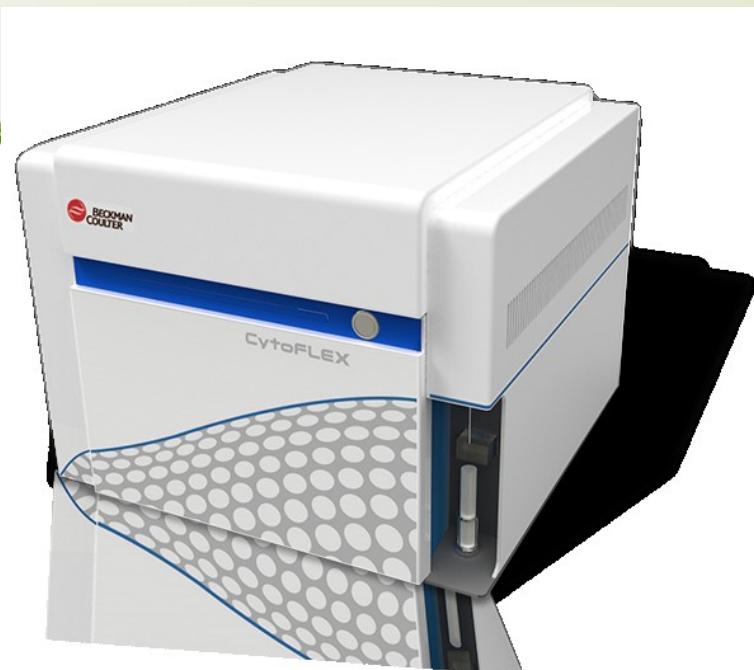

Single Cell Mass Cytometry

Shrnutí přednášky

průtoková cytometrie:

- ▶ nabízí široké spektrum aplikací;
- ▶ rychlý způsob analýzy a separace heterogenních populací;
- ▶ separace populací;
- ▶ multiparametrové analýzy.
