## 2. Name chemical elements. Complete the gaps in the following list.

Learn names of all chemical elements <a href="http://www.sheppardsoftware.com/periodictable\_L.html">http://www.sheppardsoftware.com/periodictable\_L.html</a>

### 3. Work in small groups to answer these questions

- a) What elements are present in the air? Do you know the percentages? N 78%, O 21%, 1 % other gases (Ar)
- b) Which element is used as rocket fuel and as alternative fuel for cars? H
- c) What elements are present in the human body? COHN, SCHNOPS
- d) What are the three forms of carbon? What are their uses? Coal, diamond, graphite, fullerene, ...
- e) What is an isotope? Do you know any isotopes? Which ones? the same N of el + different N of neutrons, isotopes of C
- f) Do you know any alloys (combinations of metals)? Which ones? What metals are they made of? Bronze (Cu+Sn), brass (Cu +Zn), steel (Fe+C+...alloying elements)
- g) Which elements can be dangerous? How are they dangerous? All; Ss can give any examples

### 4. What do you know about arsenic?

Watch the video and then complete the missing parts in the summary of the uses of arsenic. <u>https://www.youtube.com/watch?v=a2AbKwAvyos</u>

| vocabulary:             |  |
|-------------------------|--|
| sample (n) - vzorek     |  |
| mould (n) – plíseň      |  |
| volatile (adj) – těkavý |  |

damp (adj) – vlhký

Veeebulenu

dispose of (v+prep) – zbavit se feed livestock (v) – krmit dobytek powder (n) – prášek poisonous (adj) - jedovatý vial (n) - lahvička

In the past, arsenic used to be ......more common...... than it is nowadays.

In the 19<sup>th</sup> century, it was used as a ......wallpaper...... which contained copper arsenite.

When the rooms in Victorian houses were damp, .....mould.....mould.....

into volatile compound and .....killed several people.....

Because arsenic is toxic, people used it widely ...to dispose of..... their business partners, husbands, wives and lovers.

Now it is used in ......electronics...... for getting electronic properties of transistors.

Sometimes it is still used as medication to ...chicken... ......livestock......livestock.....

### 5. Comparing the properties of the elements.

#### Circle the answer that best completes the statement according to the chart.

| Metal           | Specific Gravity                            | Melting Point<br>(°C) | Boiling Point<br>(°C) | Atomic Radius<br>(Å)                    | Ionic Radius (Å)                                  |
|-----------------|---|-----------------------|-----------------------|---|---|

The Physical Properties of Six Metals

#### **Task 8. The Wonder Metals**

The study of metals began in the Middle Ages when alchemists searched for a technique to convert "base metals", like lead, to gold. They never succeeded in making gold but at least by experimenting with the metals (in contrast to the ancient Greeks, who only speculated about them) they made discoveries.

All but 20 of the over 100 elements identified to date are metals but only 7 of these are common in the earth's crust. Iron, the most widely used metal, is rarely found in the free state (not combined with other metals) and must be extracted from naturally occurring compounds (ores) such as hematite, magnetite, and pyrite. The beautiful colors of rocks are due to these iron compounds. In fact, iron pyrite is often called fool's gold because of the similarity of its color to gold. Iron is very strongly magnetic, and the fact that the earth is a magnet itself tipped scientists off to the fact that iron is a major component of the earth's core, or centre.

Pure iron is a relatively soft, silvery metal that is very active chemically (that is, it combines with oxygen to corrode or form rust). It is usually mixed with other elements or compounds to form alloys such as steel, stainless steel, or cast iron, which are more durable and rust resistant than pure iron.

Aluminum is the most abundant metal, but it was not used until a century ago because it is so active chemically and difficult to extract. Like iron it is soft, but in contrast to iron and steel, aluminum is very light and more resistant to corrosion. These qualities make it useful for airplanes, trains, automobiles, and rockets.

In the 1940s, magnesium emerged as an important metal. Although it is less abundant in the earth, more chemically active, and harder to extract than aluminum, it is present in sea water and that means there is almost an endless supply of it.

In the space age, the extraordinary properties of titanium have made it the new wonder metal. Lighter and stronger than steel, it is more resistant to corrosion and able to withstand heat.

The remaining major metals are sodium, potassium, and calcium, all too active chemically (they react violently with water) for use in construction.
