## Foreword

*Ladies and gentlemen, dear readers,*

*It is a great honour to have the opportunity to address you at the fourth edition of the International Conference on European Integration held biannually in the Moravian-Silesian capital, Ostrava.*

*Looking from the perspective of the Czech Republic, year 2018 is a year of many historical commemorations. We celebrate one hundred years since the foundation of the independent Czechoslovak state, as well as twenty-five years since the day independent Czech Republic emerged as an actor in the European and international relations. Unfortunately, not only celebratory moods are currently apparent in the Czech politics, media and society. The rise of anti-EU sentiments is highly worrying, to say the least.*

*It is without doubt that the EU membership has brought, and will continue to bring, many benefits; not only to us but to the entire Central European region. Sadly, however, the ample benefits are frequently forgotten and neglected, while the current debate generally appears biased. Attention is given to particularities, while the big picture is often forgotten.*

*It is hence very encouraging to see that conferences and events such as this one help to shape the public debate by putting positives and negatives of the EU into broader perspective and maintaining focus on the undeniable advantages of European integration. Unbiased, qualified work with information and promotion of critical thinking are crucial for understanding of the complexity of the EU as well as for its functioning and driving processes. Furthermore, it is only this comprehension that enables clarification of myths, hoaxes and fake news that mislead many and send them on pursuit of a non-existent enemy.*

*That is why I would like to thank everyone involved for organising and participating at this event, which will surely help to "fight the fog" surrounding the debate on the benefits of European integration. Not by sword, but by the power of words, facts and active participation in public debate.*

*Wishing you an inspirational experience,*

*Dana Kovaříková*

*Head of the of the European Commission  
Representation in the Czech Republic*

## Foreword

*Ladies and gentlemen, dear readers,*

*The fourth year of the International Conference on European Integration 2018 (ICEI 2018) is being held just after 60 years since the history of the current European Union started to be written. During the last six decades, the European integration process has brought thousands of families a life in peace and economic welfare and the European Union has become one of the world superpowers. However, while building a prosperous and stable continent, the European Union had to overcome different obstacles. The European Union also currently has its inner troubles and illnesses that it is unable to cover up, but only solve and, in this way, to struggle against disintegration moods in the society. We have to keep the original ideas of the fathers of the European integration process in our minds, because only a strong and uniform European Union at home can also be strong in the world. The European Union has to face new challenges in the global environment to be able to remain among the world leaders in the future.*

*We believe that the conference ICEI 2018 will be a suitable platform for the discussion about the grey areas of the current European integration process and will bring valuable knowledge to all people who are interested in the European integration matters.*

*Wishing you an inspiring experience,*

*Lukáš Melecký*

*Head of Department of European Integration  
Faculty of Economics  
VŠB - TU Ostrava*

### **Abstract**

*In the modern economy investment plays an important role. Investment diversification ensures the development of various markets, including the development of the capital market, which depends on the socio-economic situation of the country and the financial policy. Therefore, it is important to review Georgia's, as a post Soviet country's capital (loan) market with State Securities, which is an important area of alternative investment. According to Georgia-EU Deep and Comprehensive Free Trade Area Agreement (DCFTA) Georgia has taken the obligation to make capital market compatible with the EU market, including the possibility of forming alternative investments and prospects for its development. Therefore, it is important to conduct a comparative analysis with the country of similar data with Georgia within the EU and reveal the possibility of alternative investments development and the supportive factors that may affect the decision of the potential investor.*

**Keywords:** *alternative investments, association agreement, EU capital market, eurobonds, inflation, state securities*

**JEL Classification:** *E20, E22, E27, E44*

### **1. Introduction**

Alternative investments are not confined by shares or bonds; there are various types of investments that can be considered as alternative ones because they do not belong to general characteristic group of investments. For instance, according to Avdiushkin speculation deals on the world product markets, purchase of banking organizations under bankruptcy and restructuring as well as investments in artworks may be assumed as one of the types of investments (Suchkova, et al., 2012, p.1).

The significant characteristic of alternative investments is a circumstance that success in such activities does not depend on market condition and/or trends but investor's qualification, practical skills and experience.

According To Anshin Alternative Investment Market (AIM) has been in operation since 1995 with the London Stock Exchange that ensures financing new, increasing companies and offers them advantage to issue securities and circulate shares (Suchkova, et al., 2012, p.1).

One of the main obstacles met by institutional investors upon assessing alternative investments is policy definition for investor: which alternative investments are to be included in its portfolio and in what proportion. We assess investments, which are typical for an institutional investor and offer to define that policy, which will be based on long-term return of capital in consideration of the nature of the risk, as well as other factors that are unique for alternative investments.

### 1.1 Investment Policy Analysis

Generally, mixed investment policy analysis is based on historic data (Gaurav, et al., 2003). Such approach is acceptable for ordinary assets that are frequently traded and observation on their prices may be carried out based on historic data. But from our point of view, historic data is significant to use for alternative investments for the purpose of political analysis, as those data is available for further assessment.

Return on assets and risk assessment, which is used both in ordinary and alternative investments policy is to be perspective as well as effective and reflect connection of basic economic risks with regard to assets. Historic dynamics of data implies both findings.

While elaboration of distributive policy, ordinary and/or alternative investments are important to use purposefully and assess riskiness of asset taking into account its return ability and various findings (for example, increase of asset price).

It is fact that in institutional investors' portfolio share of alternative investments is not extensional what could be recommended by optimization based on historic data. Such observation and approach is not new. Many authors, such as Brown, Goetzmann and Park [1999] Swensen [2000], and Asness, Krail, and Liew [2001] criticized historic income and risk parameters, which were used during such analysis (Terhaar, et al., 2003, p.102).

In order to define alternative investments, the important method is to define clearly importance of those investments that belong to only alternative. For example, Marc J.P. ANSON, and Donald R offered five types of alternative investments in the book, *An Introduction to core Topics in alternative Investments*”:

1. Real Assets (including real estate, real estate investment trusts, land, and infrastructure);
2. Hedge Funds;

3. Commodities;
4. Private equity (including mezzanine and distressed debt);
5. Structured Products (including credit derivatives) (CAIA Association, et al [online], 2012).

In the modern studies more and more attention is paid to addressing alternative investments in production of ecologically healthy goods. Consequently, investing in agricultural production is considered as one of the important sphere of alternative investments, namely, construction of “green houses” and increasing support from the side of the state makes really attractive that sphere for investments (Kendall, [online], 2016)

It should be mentioned that alternative investments under traditional understanding do not include putting up of money in securities and therefore, type of such capital investment is considered as portfolio investments. But in our opinion, difference in that approach and classification of investment types should be made based on social-economic and historic experience of a specific country. Georgia represents a post-soviet country, where no type of investments had been made till 1993. At the contemporary level, market for making investments is quite limited for local population and enterprises and capital market for securities in the process of formation and improvement. Accordingly, the question is raised in logical order: for those countries as such as Georgia, what can be considered as source of alternative investments? The answer can be controversial and different from traditional approach. Based on the previous year’s data in Georgia the volume of foreign direct investments in the agricultural sector amounted for \$ 5 million US dollars (according to III quarter of 2017 foreign direct investments were \$505 million US dollars). The volume of investments in agricultural production is very low. At the same time, the most spheres to be assumed in traditional alternative investments do not exist in Georgia; for example, Hedge Funds; Private equity (including mezzanine and distressed debt); Structured Products (including credit derivatives). Investments in transport and communication as well as in construction require large amounts that are not optimal capacity and option for most investors (FDI [online], 2017).

**Figure 1: The Largest Foreign Direct Investments According to the Sectors of Economy**

Source: www.geostat.ge, National Statistics Office of Georgia, (2017)

Therefore, we can discuss what should be considered under alternative investments taking into account the Georgian practice and such sphere and object is to be offered for investments, which really will be alternative possibility to putting up of money for the Georgian population

and can involve majority of the active part of the population. From our point of view, in case of Georgia, market for state securities will give such opportunity in consideration of certain changes and additions and the foreign practice.

It should also be noted that according to the Tax Code of Georgia (Article 82.1.T.U), the income received from government securities is exempt from income tax, which is an additional stimulus for investment.

## **2. Problem Formulation and Methodology**

### **2.1 Study Methods**

The study uses statistical and dynamic data from different countries (including the post-socialist countries, which are members of the EU), which represent the development and capacity of the alternative investment market, as well as legislative acts that are important for business entities.

### **2.2 Characteristics of Release-Reporting for Georgia-European Union State Securities**

#### **2.2.1 Georgia**

In Georgia the following types of state securities are used: treasury obligation, treasury and state bonds. Treasury obligation is short-term discount state securities issued by the Ministry of Finance. Issuance of treasury obligation is carried out during the period up to one-year, with discount and covered by nominal value. Treasury bond is mid-term coupon state securities. Currently, treasury bonds are issued with the period of 1-10 years by paying coupon in 6 months. Issuance of state securities is carried out in national currency in intangible form. Nominal value of one state security is 1000 GEL. State securities are sold via auction. Auction is conducted by the National Bank of Georgia at auction dates announced in advance. Owner of securities may be legal and physical persons, residents and non-residents; Purchase of securities is possible for resident and non-resident legal and physical persons through any commercial bank of Georgia. The sum volume of own statement presented in auction by each bank must not exceed 75% of declared emission volume. The sum volume of statement for one client presented by each bank must not exceed 50% of declared emission volume.

Issuance, circulation, reporting and coverage of treasury obligations and treasury bonds by the Ministry of Finance of Georgia are regulated by the relevant provision.

In March 2006, the government of Georgia and the National Bank of Georgia concluded an agreement “on measures to cover indebtedness of the government of Georgia to the National Bank of Georgia”. Based on the agreement, the part of indebtedness within the amount of 832.9 million GEL as of 17 May 2006 will be transformed in bonds on an annual basis, with the period of 16-60 months. Indebtedness will be completely covered in 2030. The bonds may be used by the National Bank for open market operations.

Public offer of state bonds is carried out via auction of state bonds. Commercial banks and resident and non-resident physical and legal persons with the support of commercial banks have the right to participate in auction. Issuance of state bonds is made in national currency. Conduction of auction is based on multiple-price method (State Securities [online], 2018).

Purchase price for one treasury obligation is calculated as follows:

$$\text{Price of purchase} = \frac{\text{Nominal Value}}{1 + \left[ \frac{\text{Interest rate}}{100} \times \frac{\text{Number of days left to coverage}}{365} \right]} \quad (1)$$

Purchase price for one treasury bond is calculated in the following way:

$$P = \frac{F}{\left(1 + \frac{i}{n}\right)^w} \left[ \frac{R}{n} \times \frac{\left(1 - \frac{1}{\left(1 + \frac{i}{n}\right)^N}\right)}{\left(1 - \frac{1}{\left(1 + \frac{i}{n}\right)}\right)} + \frac{1}{\left(1 + \frac{i}{n}\right)^{N-1}} \right] \quad (2)$$

where,

- P – purchase price;
- F – nominal value of treasury bond;
- i – annual interest rate offered by auction participant divided in 100; n – number of coupon payments during year;
- W – number of days between purchase date of treasury bond and next date of coupon payment divided into 7/10 number of days between coupon payments;
- R – interest rate of annual coupon income divided into 100;
- N – number of non-paid coupons left before coverage of treasury bond.

Noncompetitive statements will be satisfied with average weighted percent, which will be calculated in the following way:

$$C = \frac{\sum(N \times P)}{\sum(N)} \quad (3)$$

where:

- C – average weighted percent;
- E – sum;
- N – nominal value of competitive statement satisfied in auction;
- P – interest rates of satisfied statements;

Coupon to be paid will be calculated as follows:

$$Q = N \left( \frac{P}{2} \right) \quad (4)$$

Where:

- Q – price of coupon;
- P – coupon rate;
- N – nominal value of treasury bond (Provisions [online], 2015).

Comparative analysis between profitability of state securities with different terms and inflation (table 2) showed that the practice of Georgia does not consider state (treasury) obligation and correction of bonds with regard to inflation rate, what by itself does not make attractive securities for potential investors (State Securities Emissions [online], 2017).

**Table 2: State Securities Emissions in 2017**

Source: www.mof.ge, Ministry of Finance of Georgia, (2017)

Since 2009 the regimen of monetary policy of the National Bank of Georgia implies inflation targeting. During this regimen targeted rate of inflation is determined in advance that is to be maintained in middle term period. Targeted rate of inflation is defined by the National Bank of Georgia and then approved by the Parliament of Georgia. Inflation targeting regimen is a relatively new practice and has been appeared quite successful in fight against inflation since the 90s. This regimen was introduced for the first time by the central bank of New Zealand in 1990 (Inflation targeting [online], 2018). Targeted rate of inflation in 2017 was 4%, but in 2018

it was 3%. With regard to real inflation in 2017, it amounted to 6.7%, which 67.5% shift from targeted rate, at the same time, as it is seen from table 2, average weighted interest rate on state securities was 7.940%, but taking into account inflation rate, then real profitability on the mentioned securities is respectively low  $-7,940-6,7=1,340$ . In respect of average weighted interest rate for treasury securities, for the last 6 years it has been revealed in the following way (Statistics of Internal Debt [online], 2017):

**Figure 2: Average Weighted Interest Rate for Treasury Securities**

Source: www.mof.ge, Ministry of Finance of Georgia, (2017)

As we've seen average weighted beneficial interest rate on state securities is relatively high, at the same time, while doing historic-comparative analysis, we can conclude that in 2012-2013 interest rate was declining, then it is increasing up to 2018, which is attractive for investors. But inflation rate is to be taken into account, which changes from targeted rate that makes an impact on real profitability of securities.

Unfortunately, we could not obtain information from the National Bank and the Ministry of Finance about what subjects participate in auction of state securities and what can be share volume of physical persons in purchase of state securities. This would give us a real picture about involvement and provision of information for population in alternative investment.

Like Georgia, Latvia uses state-owned securities as source of alternative investment from post-socialist and EU countries. The comparative analysis will give us an opportunity to reveal and evaluate the ways of perfection. Comparative analysis is based on variables and features, such as the types of state securities, the peculiarities of their release, realization and redemption, and diversification of attracted financial resources.

### 2.2.2 Latvia

First issuance of state securities in both Latvia and Georgia took place at the end of 1993. In the following years governmental financing was increasing and internal market of securities developed. Long-term securities were offered for investors. There are short-term treasury obligations from 6 to 12 months, midterm bonds-from 3 to 5 years and long-term bonds with the period of 10-11years. Emissions of securities in Latvia as well as Georgia are carried out by the Ministry of Georgia. Governmental securities of Latvia sells on the initial marker if securities. Auction date is announced in advance by the Treasury Service. There are two types of auctions:

Competitive multiple-price auction is organized by the Treasury Service at NASDAQ OMX Riga Stock Exchange. Auction takes place on Wednesdays and applications are received until 12:00.

Noncompetitive fixed rate is organized by the Treasury Service at NASDAQ OMX Riga Stock Exchange. Auction takes place on Wednesdays after receipt of applications at competitive auction until 3:00.

All state securities are registered in the Central Depositor of Latvia. Since 10<sup>th</sup> August 1999 state securities of Latvia, which are sold at initial market via auction, have been subject to registration in the official list of NASDAQ OMX Riga Stock Exchange. Physical persons and legal entities can participate in auction through dealers, which are commercial banks:

1. **ABLV Bank** (with regards to primary and secondary market issues);
2. **Citadelebanka** (with regards to primary and secondary market issues);
3. **DNB banka and DNB bankas** (DNB banka with regards to primary market issues and DNB bankas with regards to secondary market issues);
4. **SEB bankas** (with regards to primary and secondary market issues);
5. **Swedbank** (with regards to primary and secondary market issues).

Internal debt of the Central Government of Latvia is 1 506 million euro, external debt- 8 223 million euro (Government Domestic Securities [online], 2017).

The following types of investors participated in purchase of state securities at the second markets as of June 2017 (Central Government Debt Management [online], 2017):

**Figure 3: Purchase of State Securities by Investors**

Source: [www.kase.gov.lv](http://www.kase.gov.lv), Treasury Republic of Latvia (2017)

Since 19 June 2013 the Treasury service issued saving bonds for physical persons. The purpose for issuing saving bonds is to offer the population additional investment possibility and crediting of the government may be carried out that ensures economic growth. Distribution channel is online internet portal available for 24 hours, on any day of week. The internet portal is managed by the Central Depositor of Latvia. Any physical person having an account in any commercial bank of Latvia is able to purchase saving bonds via internet banking. Records on saving bonds for physical persons are kept to the Central Depositor that also make payments.

The main characteristics of saving bonds are:

- Validity period for saving bonds is 6 months, 12 months, 5 or 10 years.
- Coupon benefit- is fixed and determined by the Treasury Service that takes into accounts state obligations and profitability of bonds and other factors.
- Nominal value -1 euro.
- Minimal volume of investment -50euro.
- Maximum volume of investment -100 000 euro.
- Second market-not exist
- Early redemption-is possible at any time with nominal value, but penalty is also used.

Based on the experience of other countries, the Treasury service of Latvia aims that participation of physical persons in state debt volume in the form of saving bonds may achieve 2% in middle-term period (from 3-to 5 years). Emission of saving bonds ensures diversification of debt of central government and enhances conservative segment with regard to internal investors (Savings bonds [online], 2017)

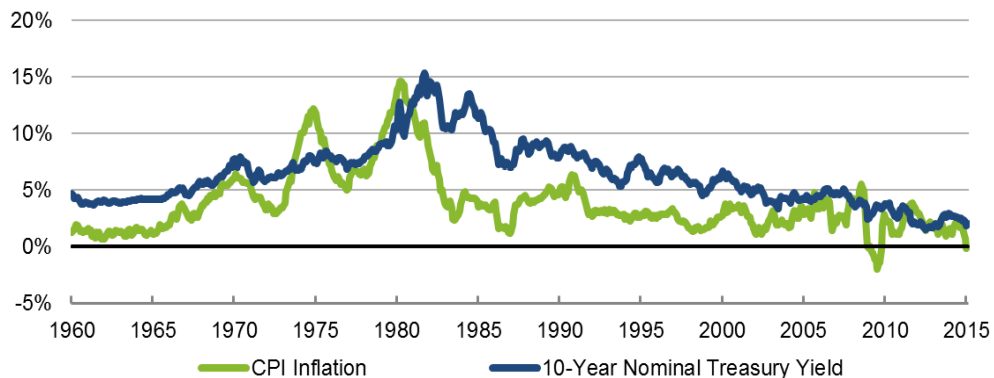

### 2.3 Specific Character of Formation of Interest Rate in Different Countries

The study proves that interest rates in various countries on short-term and long-term securities are low. The USA can borrow some amount within 2% for 10 years, but in case of 30-year bonds –approximately within 2.5%. Interest rate in other industrial countries is much lower. For instance, in Germany interest rate on 10-year state bonds amounts to 0.2%, in Japan-0.3% and Great Britain-1.6%.

Low interest rate –it is a part of not short-term, but long-term tendency. As drawing 1 reveals, profitability in US 10-year bonds in 1960 was low, but in 1981 it increased to maximum and achieved 15% and after that it has continued declining. This regularity is somehow explained by increase and decrease of inflation. In other equal conditions, investors require high profitability, when inflation is high to compensate with purchase power of dollar. Nowadays, incomes received from bonds are not protected from inflation. Real or corrected interest rate on 5-year US bonds amounts to inflation rate minus 0.1% (Bernanke, 2015).

**Figure 4: Interest Rate on 10-Year Bonds and Inflation in The USA**

Interest Rates and Inflation

Source: [www.brookings.edu](http://www.brookings.edu), Federal Reserve Board, BLS, Bernanke Ben, (2015)

In order to understand why interest rates are so low, it is important to use the conception called balanced real interest rate (frequently called Wicksellian interest rate). Balanced interest rate is a real rate, which envisages work force and volume of capital resources and its correction is possible after a while. Many factors have impact on balanced rate, which may be changed in time. In rapidly grown dynamic economy, it is expected that balanced interest rate will be high, in other equal conditions, as the expectation exist that it will be high perspective on return of investment. But in slowly grown or recession economy (for example Georgia and post-soviet countries), presumably balanced interest rate will be low, as investment possibilities are low or unfavorable. State costs and tax policy also has an effect on balanced interest rate. Big deficits increase balanced interest rate, as loans received by the government make economy be away from private investments. If the Federal Reserve System (FRS) wants to analyze the volume of capital market and working resources, the task will be to use its power to establish such level of interest rates that comes closer balanced rate. If FRS establishes higher market interest rate than balanced rate is, then growth of economy declines (it is possible to have recession), capital investments will not be attractive. FRS established such rates that do not cover expected potential profitability of investors.

If FRS tries to establish low interest rates compared to balanced rate, economy starts “overheating” causing inflation-unfavorable and instable situation. Therefore, it is important to define that a country’s economy and not FRS determined real interest rate, which may be taken by savers and investors. FRS can have certain influence on market rates, but not indefinitely.

### **3. Problem Solution**

In case of Georgia source for alternative investments is to be considered investments in state securities and not in Hedge Funds, in immovable property and goods, because it gives investors equal possibilities for optimal investment. At the same time, it should be mentioned that only one stock exchange is operating in Georgia and commercial banks take leading positions with regard to volume of deals made there that by it impedes development of this market.

Georgia, based on association agreement with the European Union, takes the obligation to develop capital market, which is to be closer to stock exchanges of the countries of the European Union. One of the reasons for emission of state securities is to develop capital market, but simultaneously, it should be a market with equal opportunities for any interested investors. According to the applicable provision, which regulates purchase and reporting rules of state securities, we cannot meet state securities that will be oriented on resources attracted by physical persons.

The forecasting becomes impossible as the state bodies do not provide information on the volume of state securities according to types of investors and their supervision analysis. It would be better if the Ministry of Finance and the National Bank write in their quarterly reports classification of investors purchasing securities according to physical persons and legal entities. Elaboration-assessment of those data will give the possibility to make conclusions on sharing experience of the European Union with regard to physical persons (example of Latvia) that would enable diversification of state internal debt.

For developing countries it is characteristic high level of interest rate on state securities, and Georgia in not exclusion. For the last 7 years minimum interest rate has not been less than 7.5%. However, inflation expectations should be taken into account, which really decline profitability range. Inflation targeting regimen is in Georgia, by which inflation rate of current year is defined in advance. But historic statistical dynamics gives the possibility to see that significant shift for targeting rate takes place, which increases risk for investments. The way

to solve this problem is insure profitability to be expected from state securities in case of shift of targeting rate.

#### 4. Conclusion

We have established legislative shortcomings that impede the functioning and development of the capital market. It is also proposed to introduce different types of government securities, Which includes EU member country with a similar productive and territorial scale such as a Georgia. It is also proposed to adjust the current state securities revenue by different methods that will give an additional stimulus to the business entity for the purchase of such securities and will facilitate the development of alternative investment markets, as investor's inflation risk will be cleared.

### **Abstract**

*This paper deals with Balassa-Samuelson (BS) effect in Central and East European (CEE) countries. This theory claims that higher growth of productivity in tradable sector leads to growth of prices in non-tradable one. Lately, we can see price convergence between former members of European Union (EU15) and new members of European Union (CEE countries). BS effect is one of possible explanations of this fact. The aim of this paper is to estimate this effect in 10 CEE countries. We try to investigate whether growth of productivity in CEE countries leads to their price convergence to EU15 or not. We use OLS regression in 1995Q2-2017Q1 periods. We find out that BS effect is important in most of CEE countries. Unlike other studies, some traditional assumptions of this theory are tested in this one. We find out that (i) PPP theory is not valid in CEE countries and that (ii) wages in tradable and non-tradeable sectors tend to be equalized. Therefore, the estimated model is corrected according to these conditions.*

**Keywords:** *Balassa-Samuelson effect, catching up effect, CEE countries, economic convergence, European Union*

**JEL Classification:** *C22, E31, P20*

### **1. Introduction**

It can be seen that countries with lower initial output per capita reach lower price level. On the other hand, inflation rates of these countries grow faster compared to developed countries. In this case, we speak about convergence of price levels. The Balassa-Samuelson (BS) effect is one of the popular explanations of price level convergence.

BS effect was formally described in the 1960s (Balassa, 1964 and Samuelson, 1964). The theory has become popular again in the 1990s. A lot of Central East European (CEE) countries switched from central planning to market economy and they started to negotiate about membership in common monetary union. Although the convergence process of these countries has become, the differences in the price level can be seen even today. Countries joining common monetary union must fit Maastricht convergence criteria. One of them says that inflation rate shall not exceed inflation rates in the 3 EU member states with the lowest inflation plus 1.5 percentage points. On the other hand, another criterion says that country should not have devalued the central rate of their euro-pegged currency during at least two years before joining monetary union. The idea that changes in productivity can affect inflation rate had not been accounted for while these criteria were designed. In the case that BS theory was valid, the countries, which have to maintain both price stability and currency stability, would have problems to fulfil (at least) one of these criteria. Many empirical papers were

written about BS effect in CEE countries in from 1999 to 2005 (see part 1.1). The interest of this theory fell down after most of CEE countries joined European Union (EU) in 2004. We can find few empirical papers written in last 10 years.

The aim of this paper is to assess the role of BS effect in 10 CEE countries. Moreover, the theory of BS effect is based on some (relatively strong) assumptions. In this paper, we try to investigate whether these assumptions are valid or not. Particularly, we test (i) whether Purchasing Power Parity (PPP) theory is valid for tradable sector or not and (ii) whether wages tend to be equalized across tradable and non-tradable sector or not.

### ***1.1 Review of Empirical Literature***

In this paper, we try to estimate role of BS effect in some CEE countries. There are a numerous empirical papers, which deals with BS effect in CEE countries. Most of them are papers from the late 90s and early 2000s and they usually claim that BS effect is one of the major determinants of inflation in these countries (see the surveys by Breuss, 2003 and Blaszkiewicz et al., 2004). Halpern and Wyplosz (2001) provide direct estimates of BS effect for all the transition economies for the period 1991 to 1999. They estimate that BS effect contribute 3 percentage point to inflation every year. Lojschova (2003) tries to measure BS effect in the Czech Republic, Slovakia, Poland and Hungary. Unlike previous studies, she tries to relax some assumptions of BS model (the validity of PPP theory and homogenous and completely mobile labour). She finds strong evidence of BS effect in these countries in most of models. Egert (2002) deals with BS effect in the Czech Republic, Hungary, Poland, Slovakia and Slovenia in 1991:Q1 - 2001:Q2 periods. He also confirms that BS effect is significant in these countries. On the other hand, he claims that the size of BS effect does not endanger the fulfilment of the Maastricht inflation criteria. Based on these papers, the contribution of BS effect to inflation rate of these countries varies about 2-3 % per year. On the other hand, there are papers such as Mihaljek and Klau (2004) or Egert (2005) that find lower or even zero contribution of BS. Meanwhile in the late 90s and early 2000s BS effect was discussed a lot in the case of CEE countries, there is no such a big interest in it today. Miletic (2012) deals with BS effect in nine CEE countries in 1997-2010 periods. She finds that BS effect is stronger in economies with a stronger convergence process (but it is less than 1.5 percent in average). Konopczak (2013) investigates BS effect in the Czech Republic, Slovakia, Poland and Hungary. She claims that the catching-up driven inflationary pressure is a non-negligible issue in the context of the CEE countries. Mihaljek and Klau (2008) test domestic and international BS effect in 11 CEE countries. They find that BS effect significantly increases the inflation rate in these countries compared to euro area, which can influence the fulfilment of Maastricht criteria (especially in the case of Hungary, Lithuania, Slovakia and Slovenia).

## **2. Problem Formulation and Methodology**

We provide mathematical formulation of BS effect in the first part of this Section. The second part is focused on data description.

### ***2.1 Model***

Traditional model (labelled as Baseline model in this paper) is described in the first part of this section. This model is based on some (relatively strong) presumptions (described below). There is serious discussion whether these assumptions are valid (especially in the case of CEE countries) or not. Nevertheless, most empirical studies neglect this discussion and simply

presume that these presumptions are valid. In this paper, we provide empirical evidence of validity of these conditions in the second part of this section. Our Adjusted model is therefore constructed according to the results of econometric tests and it is introduced in the last part of this section.

### 2.1.1 Baseline Model

While computing BS effect, at first, the price levels ( $P$ )<sup>1</sup> are decomposed into traded ( $P^T$ ) and non-traded ( $P^N$ ) components in domestic and foreign (\*) countries:

$$p_t = \alpha p_t^T + (1 - \alpha) p_t^N, \quad (1)$$

$$p_t^* = \alpha^* p_t^{T*} + (1 - \alpha^*) p_t^{N*}, \quad (2)$$

where  $t$  denotes time and parameter  $\alpha$  is a share of traded components in consumption basket. The real exchange rate ( $q$ ) can be expressed as the relative price of goods produced abroad to those produced in domestic country:

$$q_t = (e_t + p_t^*) - p_t, \quad (3)$$

where  $e$  stands for nominal exchange rate. By substituting equations (1) and (2) into (3), the changes of real exchange can be written as:

$$\Delta q_t = (\Delta e_t + \Delta p_t^{T*} - \Delta p_t^T) + [(1 - \alpha^*)(\Delta p_t^{N*} - \Delta p_t^{T*}) - (1 - \alpha)(\Delta p_t^N - \Delta p_t^T)], \quad (4)$$

PPP claims that prices of tradable goods can be expressed as:

$$\Delta p_t^T = \Delta e_t + \Delta p_t^{T*}, \quad (5)$$

If it was true, the first term on the right side of equation (4) would disappear:

$$\Delta q_t = (1 - \alpha^*)(\Delta p_t^{N*} - \Delta p_t^{T*}) - (1 - \alpha)(\Delta p_t^N - \Delta p_t^T). \quad (6)$$

Using Cobb-Douglas production function, it can be proved (see Lojschova, 2003 or Mihaljek and Klau, 2004) that ratio of non-tradable to tradable prices ( $p^{N/T}$ ) can be written as:

$$p^{N/T} = p_t^N - p_t^T = c + (a_t^T - a_t^N), \quad (7)$$

where  $a$  represents productivity and  $c$  denotes constant including interest rates and factor intensities.

By substituting equation (7) into equation (4), we can estimate BS effect in particular country ( $D$ ) compared to euro area ( $EA$ ) as:

$$(\Delta p^D - \Delta p^{EA})_t = \beta_1 \Delta e_t^D + \beta_2 [(1 - \alpha^D)(\Delta a_T^D - \Delta a_N^D)_t - (1 - \alpha^{EA})(\Delta a_T^{EA} - \Delta a_N^{EA})_t] + \varepsilon_t. \quad (8)$$

Throughout this paper, the second term in the right side of equation (8) related to coefficient  $\beta_2$  is labelled as  $bs_{it}$ . Equation (8) represents the Baseline model in this paper. This

---

<sup>1</sup> Lower-case letters represents logarithm forms throughout this paper.

specification of BS effect is the most common in other papers. There are two (relatively strong) assumptions in this model:

1. PPP theory is valid for tradable sector,
2. Wages tend to be equalized across tradable and non-tradable sector within country.

If (1.) PPP theory was not valid (equation (5) does not hold), the estimated model should be written as:

$$(\Delta p^D - \Delta p^{EA})_t = \beta_1(\Delta p_T^D - \Delta p_T^{EA})_t + \beta_2[(1 - \alpha^D)(\Delta a_T^D - \Delta a_N^D)_t - (1 - \alpha^{EA})(\Delta a_T^{EA} - \Delta a_N^{EA})_t] + \varepsilon_t \quad (9)$$

If (2.) wages ( $w$ ) do not tend to be equalized across tradable and non-tradable sector within country, the additional term:

$$\beta_3[(1 - \alpha^{EA})(\Delta w_T^{EA} - \Delta w_N^{EA})_t - (1 - \alpha^D)(\Delta w_T^D - \Delta w_N^D)_t] \quad (10)$$

should be added into equation (8) or (9), see Lojschova (2003) for mathematical proof.

### 2.1.2 Testing of assumptions of the theory

#### Validity of PPP theory

Acaravci and Ozturk (2010) or Égert (2005) claim, that if PPP theory was valid, the development of real exchange rate would be stationary. Therefore, we use ADF and PP test on real exchange rate data to assess whether this assumption is valid or not. The real exchange rate is given by equation (3). There are a few possibilities, which price index can be used to compute it (see Driver and Westaway, 2005 for detail discussion). In this paper, we use PPI in manufacturing (which corresponds with our definition of tradable sector the most). Then, we use ADF and PP tests to test stationarity of real exchange rate. The null hypothesis of both tests is that there is a unit root in time series. If the null hypothesis cannot be rejected, we claim that PPP theory is not valid in particular country.

#### Validity of wage equalization

Égert (2005) claims, that if wages tend to be equalized across tradable and non-tradable sector, the development of their ratio should be stationary. Therefore, we computed variable wages ratio ( $W$ ) as ratio of wages in tradable sector ( $W^T$ ) and wages in non-tradable sector ( $W^N$ ). Once again, we use ADF and PP tests to assess whether there is a unit root in time series or not. If there is a unit root (time series is not stationary) the assumption of wage equalization is not valid.

## 2.2 Data

Ten CEE countries (Bulgaria, the Czech Republic, Estonia, Croatia, Hungary, Latvia, Lithuania, Poland, Slovakia and Slovenia) are included into the sample. All of these former socialists countries are new members of EU (Romania is not included in because of lack of available data). All models are estimated rather as an individual time series than a panel to capture individual country effects. Data description, frequency and sources are depicted in Table 1.

There are serious discussions about assessing which economy activity should be considered as tradable and non-tradable (see Tica and Druzic, 2006, who provide survey of empirical papers). This paper uses manufacturing as approximation of tradable sector and the rest of economic activities as an approximation of non-tradable sector.

All models are estimated using OLS with heteroscedasticity consistent estimator to avoid problems with heteroscedasticity and autocorrelation. Quarterly data covers 1995Q2–2017Q1 periods. All variables used in the model in Section 3.2 were tested for stationarity using ADF test. There is no unit root in any of the variables on better than 0.01 significance level. Eviews 7 software was used for all calculations.

**Table 1: Data Description**

Variable	Description	Frequency	Source
$A$	Productivity computed as $VA/EMP$	Quarterly	-
$\alpha$	Ratio of tradable to non-tradable sector (measured as their value added)	Quarterly	Eurostat (2017a)
$E$	Nominal (bilateral) exchange rate Country currency/EUR	Monthly	Eurostat (2017b)
$EMP$	Thousands of Hours worked, seasonally and calendar adjusted	Quarterly	Eurostat (2017)
$P^N$	Prices (GDP deflator) in non-tradable sector (rest of economic activities)	Quarterly	Eurostat (2017a)
$PPI$	Producers Price Index in manufacturing	Monthly	Eurostat (2017c)
$P^T$	Prices (GDP deflator) in tradable sector (manufacturing)	Quarterly	Eurostat (2017a)
$VA$	Value added in particular sector, constant prices, seasonally and calendar adjusted	Quarterly	Eurostat (2017a)
$WAGES$	Ratio of wages in tradable to non-tradable sector	Quarterly	-
$WAGES^T$	Wages in non-tradable sector	Quarterly	Eurostat (2017b)
$WAGES^N$	Wages in tradable sector	Quarterly	Eurostat (2017b)

### 3. Problem Solution

This section is divided into two parts. We test the assumptions of BS theory in the first of them. Then, we modify our model based on the results in the first part and estimate it.

#### 3.1 Results of Presumption Testing

As it was mentioned, the development of real exchange rate is computed by equation (3). The results of ADF and PP tests are depicted in Table 2. It is obvious that null hypothesis can be rejected (on 5% probability level) only in the case of Slovakia and Hungary. In Slovakia, nevertheless, time series is too short to provide significant results. Therefore, we claim, that PPP theory is not valid in CEE countries.

Results of both ADF and PP tests of variable wages ratio ( $W$ ) are shown in Table 2. We can reject null hypothesis of both tests in most countries (the Czech Republic, Estonia, Latvia, Poland and Slovakia on 1% and Hungary on 10 % probability level). In the case of Lithuania, we can reject null hypothesis using PP test. From the development of wages ratio, we can see, that results are influenced by the value in 2009Q1. If we do not take this observation into account, we can reject null hypothesis by both ADF and PP test on 1% probability level. Similarly, we can reject null hypothesis in the case of Croatia, when the first year (2003) is not included in. Therefore, only country, where we cannot reject null hypothesis is Slovenia. On the other hand, time series in Slovenia is stationary in 1995 to 2007 periods. Generally, we can say that development of time series of wages ratio is stationary in CEE countries and we can presume that wages tend to be equalized across tradable and non-tradable sectors.

**Table 2: Results of Presumptions Testing**

Country	Observations		ADF p-value		PP p-value	
	PPP	WAGES	PPP	WAGES	PPP	WAGES
<b>Bulgaria</b>	210	X	0.880	x	0.897	x
<b>Czech Republic</b>	210	88	0.389	<0.001	0.551	<0.001
<b>Estonia</b>	107	87	0.387	0.008	0.344	<0.001
<b>Croatia</b>	209	54	0.510	0.390	0.377	0.001
<b>Latvia</b>	167	78	0.711	<0.001	0.730	0.004
<b>Lithuania</b>	178	86	0.127	0.128	0.484	<0.001
<b>Hungary</b>	210	82	0.003	0.053	0.007	0.099
<b>Poland</b>	210	59	0.100	<0.001	0.100	<0.001
<b>Slovenia</b>	83	88	0.812	0.734	0.812	0.886
<b>Slovakia</b>	71	87	0.016	0.010	0.013	<0.001

Source: own calculations

### 3.1 Estimate of Adjusted Model

It was found out that (i) PPP theory is not valid for tradable sector and (ii) wages tend to be equalized across tradable and non-tradable sector within country. Based on these facts, we should estimate BS effect using equation (9) in the case of CEE countries. According to Mihaljek and Klau (2008) we added lagged dependent variable into our model as well to capture persistence in inflation differential. The results are depicted in Table 3. Time series are not same long due to lack of observations in some countries. The first observation is depicted in the second column of the Table 3. The last observation is 2017Q1 in all countries. We can see that lagged depended variable is significant in most cases form the third column of Table 3. We use it even in those cases, where it is not significant in order to measure persistence in inflation rate differentials during time and in order to have comparable results for all countries. We expected that coefficients related to Prices of tradable goods would be positive and significant. We prove this presumption in all countries (see fourth column of Table 3). The key variable – Contribution of productivity growth – is depicted in the fifth column of the Table 3. It is obvious that it is statistically significant with 1% probability in eight out of the

ten states. It is statistically significant with 10% probability in the case of Croatia. Nevertheless, there is no statistical significance in the case of Estonia. It is important to realise that if we want to compute BS effect, the values of the coefficients should be multiplied by original average productivity (the sixth column of Table 3). Therefore, average BS effect in each quarter is computed in the last column of the Table 3. It can be seen that BS effect is the strongest in Poland, Slovakia and Slovenia. BS effect is strong and significant also in other CEE countries (Bulgaria, Czech Republic, Lithuania and Hungary). A special situation can be seen in the case of Latvia. It is the only country, where the productivity growth was smaller than in the euro area<sup>2</sup>. As concerns Croatia, we can see that BS effect is only around 0.07 p.p. of inflation differential. Nevertheless, this value is statistically significant and therefore Estonia is the only country with no evidence of BS effect.

**Table 3: Estimation of BS Effect in CEE Countries in 1995 to 2017 Periods**

Country	First obs.	Lagged dependent variable $p_i^{D/EA}_{t-1}$		Prices of tradable goods $pt_i^{D/EA}_t$		Contribution of productivity growth $bs_{it}$		Average growth of productivity <sup>1</sup>	BS effect <sup>2</sup>
<b>Bulgaria</b>	2001Q2	-0.323	***	0.259	***	0.175	***	1.626	0.285
<b>Czech. rep</b>	1996Q2	0.067		0.315	***	0.203	***	2.394	0.486
<b>Estonia</b>	2000Q2	-0.551	***	0.366	***	0.046		0.911	0.042
<b>Croatia</b>	2000Q2	-0.187	**	0.434	***	0.108	*	0.641	0.069
<b>Latvia</b>	1995Q2	-0.227	**	0.473	***	0.469	***	-0.659	-0.309
<b>Lithuania</b>	1995Q2	-0.191	*	0.629	***	0.434	***	1.520	0.660
<b>Hungary</b>	1995Q2	0.058		0.563	***	0.351	***	1.410	0.495
<b>Poland</b>	2002Q2	-0.306	***	0.249	***	0.303	***	2.632	0.797
<b>Slovenia</b>	1995Q2	0.023		0.605	***	0.417	***	1.738	0.725
<b>Slovakia</b>	1995Q2	-0.297	***	0.211	***	0.253	***	2.943	0.745

<sup>1</sup> Average growth of productivity is computed from equation  $(1 - \alpha^D)(\Delta a_T^D - \Delta a_N^D)_t - (1 - \alpha^{EA})(\Delta a_T^{EA} - \Delta a_N^{EA})_t$  for each country ( $D$ ) in given period. <sup>2</sup> BS effect is computed as a contribution of productivity growth multiplied by average growth of productivity. \*\*\*, \*\*, \* denotes 1%, 5% and 10% probability level. All models are estimated using heteroscedasticity consistent estimator.

Source: own calculations

#### 4. Conclusion

In this paper, we try to estimate BS effect in 10 CEE countries. Unlike other papers, we test two traditional assumptions of BS theory – the validity of PPP theory and wage equalization in both sectors. It was found that PPP theory is not valid and wages tend to be equalized across sectors in CEE countries. Therefore, we estimate adjusted model according to these conditions.

<sup>2</sup> See negative value in the sixth column of Table 3, note that negative values of this variable does not necessarily mean that productivity growth was negative, it only means that the growth of productivity was smaller than in the euro area

We found that BS effect is important in most CEE countries. We found the strongest BS effect in Poland, Slovenia and Slovakia.

### **Abstract**

*The structure of municipalities in regions represents a factor having impact on spatial development. Municipalities of different size usually offer different factors of localization and condition the localization of companies and population. Large municipalities with material (firms) and human capital concentrated and with a built-in infrastructure seem to be more attractive for firms, companies and for the population living in there. Large municipalities become the points of regional development and due to their link to small municipalities they are able to radiate initiating impulses into small municipalities or villages. Due to the area of Slovakia and the number of population, the country as a region in the European Union belongs to the number of rural countries with a structure of scattered municipalities. Based on the experience gained in EU countries the objective of the paper is to design settlements that can fulfill the function of the poles of development in the region.*

**Keywords:** *development pole, peripheral communities, rural settlements, settlement structure of the countries of the European Union, urban settlements*

**JEL Classification:** *O18, R12, R20, R21*

### **1. Introduction**

With Juan Infante-Amate, an Associate Professor at the University Pablo de Olavide in Spain who focuses his research on the environmental and rural history of the Mediterranean from the eighteenth century onwards it can be said that scattered settlements started to develop in the nineteenth century and that the reasons behind the expansion of scattered settlements are institutional and demographic changes. The dispersed, scattered settlements as a sub-type of rural settlement has historically been significant as an element of the landscape which has allowed territory to be managed and has created different architectural forms and complex social relationships. Also Nemeč and Imrovič (2017) are defending their view that other European countries have been dealing with the issue of the scattering structure of settlements and their links to public administration for a couple of decades. Transformation processes in the former Eastern bloc countries are closely related to the social-economic development that was initiated in the countries. According to Jeřábek, Čapošová (2016), the transformation processes resulting in the change of the system created not only new political, but mainly economic and administrative situations that have impact on development of settlements. Evaluating the development there is a need to consider the different base-point situations in long-term democratic conditions of West European countries and the operation of decentralized public administration. On the contrary, this problem is more complex in the states of the Eastern bloc, characterized by non-democratic and centralized system of control, as stated by Šramel (2017). Their preceding development was typical by forced and violent

integration, and by the consolidation of municipalities' network. According to Vrabková, Vaňková (2015), the aim was not the economic effectiveness of municipalities by services providing, but rather the centralization of political power. The transfer to democratic control system and the decentralization process of public administration can be evaluated as the transformation process with significant structural changes taking place since 1990's until present.

## **2. Problem Formulation and Methodology**

In the context of the research of consolidated and scattered local structures diverse criteria need to be considered. Confirming or rejecting the effect of consolidation is impossible. Economic results favour consolidated structures especially in countries with governments preferring functionality and competitiveness in favour of large municipalities not only in the country, but also in the European Union.

### **2.1 Problem Formulation**

Opinions of experts and politicians in developed European countries concur in the fact that consolidated settlement structure (formation of larger municipalities) is able to adopt greater range of rights and powers, and liabilities with adequate financial resources. Such opinion, mainly from politicians, does not apply completely in the states of Central and Eastern Europe (Nižňanský, 2009). Despite economic views prefer consolidation reforms of settlement structures, several sociological researches point out strong identification of municipalities' residents, although very small ones, with their settlement units, and preservation of scattered settlement structures (Swianiewicz, 2010).

If we looked at the 60 years development in the countries of Western Europe, we can see many countries, in which there is the tendency to prefer various integration and consolidation trends related with the relationship to the local settlement structure. Klimovský (2010) states that this is the long-term trend consisting of several relatively easily distinguishable phases, e.g. in Denmark, or the long-term continual process without clearly defined conclusion, e.g. in Netherlands.

Denmark is introduced in this matter as the exemplary case of the country, which has successfully implemented the consolidation reform. At the beginning of 1960's, approximately 80% of all Danish municipalities belonged to the size-category of municipalities with the population not reaching the number of 3000 inhabitants. Nowadays, only one municipality belongs to this category (Albæk et al., 1996).

Netherlands belongs to countries, where the consolidation reform takes place continually. In 1950, there were 1014 municipalities, which have gradually consolidated into 440 municipalities in 2009. During recent years, consolidated are municipalities, of which population does not reach the limit of 20 000 inhabitants (Klimovský, 2010; Smith, Kvaloy, Schefold, 2005).

According to Klimovský (2010), during recent years, we can see consolidation and integration reforms of settlement structure also in Central and Eastern Europe. In his publication, the author describes the process of consolidation reforms in the countries, such as Lithuania and Macedonia. Reforms results in Lithuania are compared to the most consolidated European countries; current population size of municipalities is on the level of approximately 60 000 inhabitants, and their number forms 60 municipalities. Interesting experience with the consolidation reform can be seen in Macedonia (Kreci, Ymeri, 2010). During the first

decentralization reform in 1995, the number of municipalities has increased on its territory from original 30 to current 123 municipalities. However, the position of such municipalities within the creation of public policies was rather weak, as stated by Horváth, Mikuš (2016). 10 years later, there was implemented the consolidation reform and subsequent decrease of municipalities number to 84. At the same time, we could see its competence strengthening and increasing of its autonomy in the area of income allocation.

## **2.2 Methodology**

The question of the settlement structure and its relation to public affairs administration is dealt by experts and politicians. Examples from many European countries and from countries outside Europe prove that consolidated settlement structure, or larger municipalities, are able to adopt greater range of rights and powers, and to ensure higher effectiveness of provided services and their performance. Universal determination of optimal size of the municipality does not exist, which can be seen on several European examples. Settlement structure depends on economic, political, geographical, and other conditions within the country.

The objective of the paper is to suggest settlements on the basis of selected countries of the European Union, which can have the function of development poles within the region, which could mean at least partial consolidation of scattered settlement structure of the region, on the model area of Trenčín region.

The Slovak Republic is divided into eight regions. The structure of settlements, municipalities in all regions is almost identical, consisting of many parts, no region is distinct from the others in its structure of settlements. Due to the fact, that processing the design of a consolidated structure for all regions is a time consuming process and is more suitable for a large paper, our attention is focused only on Trenčín self-governing region as an example of a structure. Results that have been gained can be applied to other regions as well.

Researched object was the settlement structure of Trenčín region in the period 1996 – 2017. The settlement structure was evaluated:

- through total number of settlements and their division on towns and villages;
- through relative representation of urban and rural settlements and permanently living inhabitants in urban and rural settlements;
- through the representation of municipalities and inhabitants living there according to following settlement sizes: up to 500 inhabitants, up to 2000, up to 5000, up to 20 000, up to 50 000, up to 100 000;
- through the division of municipalities from the point of view of their spatial organization and locational-functional characteristics, and possible administrative function, according to Christaller's method by the use of parametric analysis for the evaluation of municipalities of Slovakia by authors Bašovský, Švecová [2002] into 3 types of municipalities: peripheral municipalities, municipalities able to fulfill the function of development poles within the microregion, and municipalities as regional cores (urban settlements).

By processing of this problem, we have used the methods of scientific abstraction, analysis, synthesis, deduction, and the method of computer and cartographic processing.

### 3. Problem Solution

„The self-governing region of Trenčín is the result of the process of introduction of regions, which is connected or as the case may be is the result of transformation processes that started in 1989“, state Bočáková, Kubičková, (2015).

The settlement structure of Trenčín region was formed of 276 settlements, from which 18 had the character of urban settlement and 257 were considered as rural settlements (villages). Trenčín region settlement structure can be characterized as rural settlement.

**Table 1: Trenčín Region Settlement Structure**

Municipality type	Year 1996				Year 2017			
	Mun. no.	Mun. share (%)	Population	Population share (%)	Mun. no.	Mun. share (%)	Population	Population share (%)
<b>Towns</b>	18	6.55	356 003	58.35	18	6.52	341 847	56.9
<b>Villages</b>	257	93.45	254 132	41.65	258	93.48	257 984	43.1
<b>Total</b>	275	100	610 135	100	276	100	599 831	100

Source: ŠÚ SR, Regional database, Author's calculations

In the course of the monitored period, the settlement structure has not changed. Size structure of Trenčín region municipalities was more favorable in the relationship to the development, than in Slovakia as a whole, because Trenčín region had higher settlement density. Small villages up to 500 inhabitants had the share of 30% in the settlement structure, and there lived only 4.5% of regional population.

**Table 2: Size Structure of Trenčín Region Municipalities According to the Population**

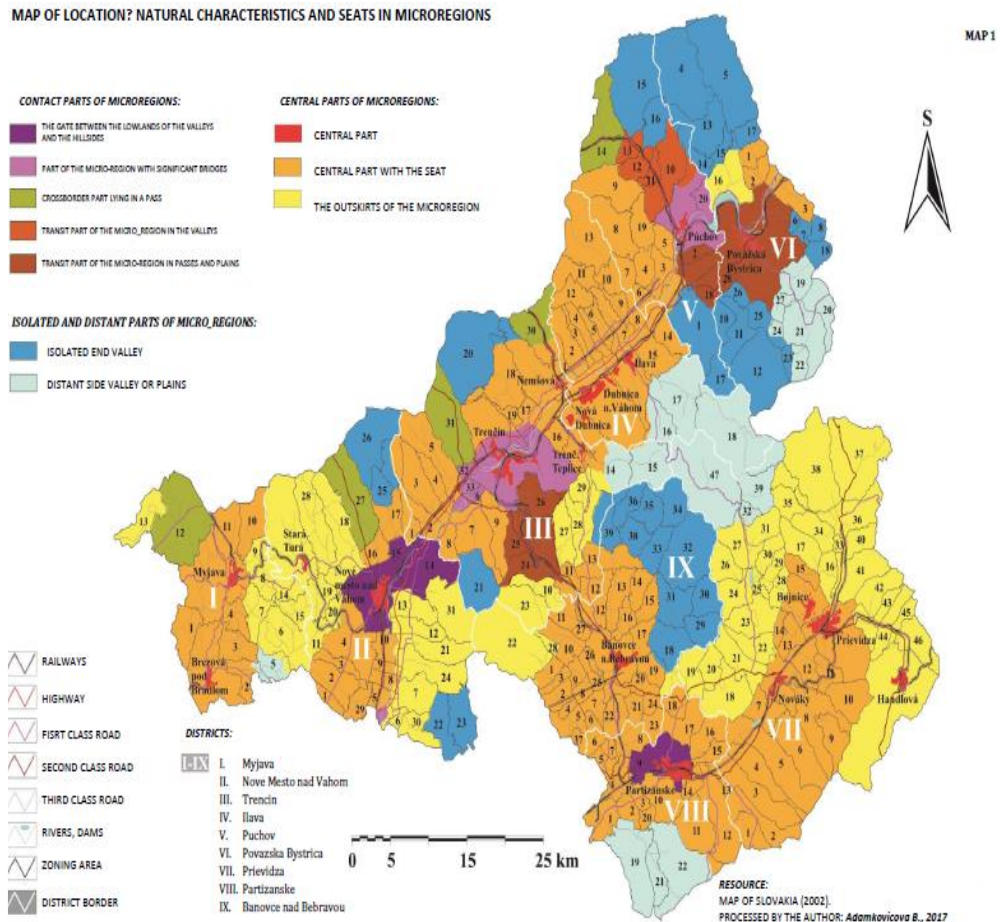

Municipalities' size structure	Year 1996				Year 2017			
	Mun. no.	Mun. share (%)	Population	Population share (%)	Mun. no.	Mun. share (%)	Population	Population share (%)
<b>50000-100000</b>	2	0.73	113 434	18.59	2	0.72	107 678	18.06
<b>20 000-50 000</b>	5	1.82	137 669	22.56	5	1.81	123 641	20.93
<b>5000-20 000</b>	10	3.64	102 010	16.72	9	3.26	93 947	15.9
<b>2000-5 000</b>	28	10.18	83 034	13.61	29	10.51	93 014	15.74
<b>500-2 000</b>	147	53.45	148 349	24.31	149	53.99	145 709	24.66
<b>less than 500</b>	83	30.18	25 639	4.2	82	29.71	26 834	4.54
<b>Total</b>	275	100	610 135	100	276	100	599 831	100

Source: ŠÚ SR, Regional database, Author's calculations

In mid-sized and large municipalities lived almost 96% of Trenčín region rural population. The domination of urban settlements had the concentration up to 20 000 inhabitants. The development pole of Trenčín region is the city of Trenčín with 58 000 inhabitants. Large urban settlements within the region with the population in the range of 20 000 to 50 000 has 5 settlements (Považská Bystrica, Nové Mesto nad Váhom, Púchov, Partizánske, Bánovce nad Bebravou). However, if we looked at the localization of urban municipalities in the area of Trenčín region, we have to say that it is not suitable for creation of more intense connections between the city and rural municipalities, with the exception of districts Prievidza (3 urban settlements), Ilava (3 urban settlements) and Myjava (2 urban settlements). Large areas of regions Považská Bystrica, Púchov, Bánovce nad Bebravou have only 1 urban settlement. Their localization within the region have very favorable central position.

Different view on Trenčín region settlement structure can be seen, if we have considered also the geographical conditions, accessibility of settlements, their potential arising from the geographical location and nodality. These factors significantly influence the formation of connections among the settlements of different size type (nodal regions or microregions).

**Map 1: Map of Location Natural Characteristics and Seats in Microregions**

Source: Author's work

For such view, it was possible to use Christaller's method, according to which Bašovský, Švecová (2002) evaluated the Slovak municipalities. They have determined hierarchical categories of settlements, which indicate the position of municipalities (nodality) according to following criteria: population, number of work opportunities, population growth, number of commuting workers, employees and students, functions of services from the point of view of their regional reach, the size and significance of the industry, the size and significance of the transportation and available facilities. Arising from authors and by-them-used method, we can divide settlements of Trenčín region into three main groups, which, at the same time, characterize their function within the development process, and also possible administrative-controlling function:

- 1 Fringe municipalities** (settlements localized in isolated and peripheral valleys), from the point of view of accessibility and trafficability, there are presented settlements with the lowest locational potential. On the other hand, they also represent least touched natural environments with high potential for the agriculture, forestry, recreation, and tourism. Mostly, they are located outside main urban routes with relatively low offer of work opportunities, with lower number of inhabitants, and lower possibility of business activities realization.
- 2 Settlements**, which can fulfill the function of **development poles within the microregion**. Here, we can include municipalities with higher concentration of the population and business subjects with relatively central location towards the base, lying on the transportation routes, and able to ensure basic civil services (education, health care, social care). They have the precondition of new nodal connections and specific regional development, for the development of branches falling into the secondary sector, and for the development of services. This type of settlements also includes municipalities of peripheral parts of microregions with lower level of nodality. However, they do not belong directly to the peripheral settlements.
- 3 Settlements as regional cores**, which have direct connection to urbanization routes, represent the development poles typical by great nodality, i.e. the relationship of rural area towards central settlements, with complexly built social infrastructure providing civil services of higher level (high schools, hospitals of 2<sup>nd</sup> type) and higher concentration of business subjects providing more diversified offer of goods and services. In this group, there are mostly urban settlements.

In Trenčín region, according to the introduced categorization, there are 53 peripheral settlements, 18 urban settlements, and 205 settlements with the ability to fulfill the function of the development poles within the microregion. Trenčín region settlements classification is introduced in the Table 3. Urban settlements, and settlements with the ability to fulfill the function of the development poles within the microregion form up to 80.8% from the total number of settlements in Trenčín region. As it was already mentioned, 18 of them is of urban type. The settlements with the ability to fulfill the function of the development poles within the microregion have, from the point of view of locational potential, the precondition of new nodal connections, and specific regional development is 205 settlements, which is 74.3% from the total number of settlements. The question, which rural settlement has the precondition to become the central settlement, is rather difficult. Settlements we suggest, and which in the future could possibly fulfill the function of development poles within the microregion, were determined on the basis of the number of permanently living inhabitants (higher than 1 000), geographical location (locational potential), base formed by the connections with smaller settlements, distance and transportation availability to catchment settlements of urban type, which are the development pole in the region.

**Table 3: Trenčín Region Municipalities Classification According to Locational-Functional Characteristics and Nodality**

<b>District</b>	<b>Fringe municipalities</b>	<b>Municipalities: city, town</b>	<b>Municipalities with possible function of development poles in the microregion</b>
<b>Bánovce nad Bebravou(IX)</b>	18-Uhrovec, 35-Šípkov, 31-Žitná, 29-Uhrovské Podhradie, 34-Čierna Lehota, 33-Trebichava, 30-Omastiná, 32-Kšinná, 36-Slatinka nad Bebravou	Bánovce n. Bebravou	18-Uhrovec, 22-Rybany

Source: Author's work

One of possible ways to solve the issue of municipalities' development is merging of small villages and dissolution of representation authority offices in original municipalities, and also associating of municipalities into larger self-governing units for the purpose of ensuring common administrative and public services with preserving the representation authority offices in original municipalities. Introduced categorization of settlements in Trenčín region is one of very important factors from the point of view of the perspective of further socio-economic development of settlements and regions.

#### 4. Conclusion

Our paper aims at the Trenčín self-governing region as a model area (an example area). The results can be utilized for other Slovak regions and the regions located in the Czech Republic, which, from the point of view of local settlement structure, belong to the European countries with the most scattered settlements structure.

In the course of monitored period, the settlement structure almost did not change. The only exception could be seen in the division of integrated municipality Pruské, where there was created one additional rural settlement – Bohunice. Changes in the settlement structure can be achieved only in long-term period of several decades. Trenčín region settlement structure can be characterized as rural. Size structure of Trenčín region settlements is more favorable in the relationship to the development, than in Slovakia as a whole, because Trenčín region settlements are denser. Small villages up to 500 inhabitants had 30% representation within the settlements structure. Localization of urban settlements in the area of Trenčín region is not favorable for the creation of more intense connections between the city and rural municipalities, although their localization within the region have favorable central position.

Different view was provided, when we have considered the locational-functional characteristics of settlements, which gave us the opportunity of subsequent division of Trenčín region settlements into three groups, which, at the same time, characterize their function in the development, as well as possible administrative-controlling function. Authors have suggested 22 possible settlements with the ability to fulfill the function of the development poles within the region.

Modern, rational organization of the settlement structure belongs to current government program priorities arising from the principles of cohesive policy of the European Union 2014-2020 and realization of the Strategy Europe 2020. This fact is determined mainly by effective use of public resources on the local level.

### **Abstract**

*There is a common belief that the Visegrád countries (the V4) they have benefited enormously from being part of the Internal Market. Nowadays, the EU Internal Market faces new, extraordinary challenges: the processes of servitization and digitalisation, which have exerted unquestionable impact upon the intra-EU trade. This paper is aimed at identifying trends in the evolution in intra-EU exports of the Visegrád countries vis à vis selected EU Member States. To this end we have selected 28 manufacturing and service sectors of the EU Internal Market and analysed values and changes in RCA and TBI indices of the aforementioned countries in 2010-2016. On the basis of our research we can state, that the V4 countries enjoy a strong and strengthening position in intra-EU trade in industrial goods, with the exception of high-technology products, while their performance in trade in services within the EU market is much less impressive, even though some of them tend to specialise in certain sectors.*

**Keywords:** EU Internal Market, intra-EU trade, manufacturing, revealed comparative advantage, servitization

**JEL Classification:** F10, F13, F15

### **1. Introduction**

In 2019 the Visegrád countries (Hungary, Poland, The Czech Republic, Slovakia – hereinafter – the V4) will celebrate the fifteenth anniversary of their membership in the European Union (EU). Over this period of time, they have made incredible steps to bring the structure of their economies, including trade, closer to that of modern market economies of the old Member States. Nowadays, their successes are commonly attributed to the benefits of free trade in goods and services within the Internal Market. However, at the same time, the latter has been changing dramatically due to huge competition pressure from third countries; evolution of consumer preferences from the economy of ownership to the economy of access (to services, including information) and servitization process. It seems that without a new kick off from services (within the framework of servitization), some manufacturing sectors will face even harder price competition from third countries and the process of offshoring and moving away from the EU to third countries will intensify. Our recent research (Ambroziak, 2015; 2017) reveals that the EU, as a whole, follows the latest trends and tackles these issues. Nonetheless, the EU is not a homogeneous organism, and the EU Member States' structure of economy and trade can vary dramatically. This may also apply to Central and East European countries, including the V4.

There are many research on changes in trade patterns of the Visegrád countries that have taken place following their EU accession, however, they focus either on effects observed in

individual countries (Fojtíková, 2014), in selected sectors (Melikhova et.al, 2015; Stefaniak-Kopoboru, Kuczevska, 2016) or results of intra-industry trade (Grančay et. al., 2016). Moreover, there are also other studies addressing the transformation and openness of the V4 economies in the EU (Majerová, Nevima, 2016), as well as the impact of the Common Commercial Policy of the EU on their export performance (Akhvlediani, Śledziewska, 2017) and consequences of the crisis (Kovarnik, 2017). However, apparently there is a niche for research on the scope and scale of the similarity of the structure of trade in goods and services between the V4 countries and the EU leading economies in recent years.

Considering all the aforementioned remarks, the aim of the paper is to identify trends in changes in intra EU trade of the Visegrád countries vis á vis three major economic leaders in the EU trade: UK, Germany and France (hereinafter – the B3) in 2010-2016. We assume that after twelve years of the EU membership, the trajectory along which the V4 countries' intra-EU trade developed should follow trends observed in the EU. To verify this hypothesis we will analyse changes in the V4 specialisation patterns (in terms of revealed comparative advantage and trade balance) in intra-EU trade in selected sectors broken down by their technological advancement.

The paper is constructed as follows: in the next part we discuss selected indices concerning trade specialisation (revealed comparative advantage and trade balance), showing their pros and cons, the methodology of selection and classification of the sectors, then we consider data limitations, next we present and discuss our research findings in terms of structure and specialisation of intra-EU exports of the V4 countries. Finally, we conclude and comment on the position of the V4 countries in the EU Internal Market, as well as similarities they bear to the economic and trade leaders in the EU.

## **2. Methodology, Data, Sectors Selection and Classification**

To achieve the aim of the paper, we have selected 28 manufacturing and service sectors of the EU Internal Market and analysed specialisation indices: values and changes in RCA and TBI indices of the aforementioned countries in 2010-2016.

### ***2.1 Selection and Classification of Sectors***

We decided to focus our research only on business oriented activities, which are directly linked to the concept of the EU Internal Market. Therefore, we selected 11 manufacturing sectors and 17 service sectors (according to NACE Rev. 2), excluding services, especially public ones, not dedicated and intended to be offered across European borders. Then, following Lall (2000) concept, we classified them into subgroups broken down by their technological advancement: resource-based manufacturing (RBM), resource-based and low-technology manufacturing (LTM/LTS), low-technology manufacturing/services (LTM/LTS), medium technology manufacturing/services (MTM/MTS), high-technology manufacturing/services (HTM/HTS) (Table 1).

Data for trade in goods and services were obtained from the Eurostat database. The research is focused on 2010-2016 as years following the economic crisis being a kind of a breakpoint for changes in the economy and intra-EU trade, as well due to the availability of data. As for France and Slovakia due to the data limitations years to be covered are 2011-2016 and 2013-2016 respectively. Presented results reflect weighted averages of indices calculated for selected sectors within a given category of sectors technology advancement.

## 2.2. Specialisation Indices

Many researchers have attempted to approximate specialisation in international trade, using different indicators. We decided to examine two of them together in order to verify whether a given country has a comparative advantage in exports and a positive/negative trade balance.

A country's comparative advantage in foreign trade for a certain good is traditionally based on Balassa index (Balassa, 1965), which shows the level of a country's export specialization in a given product compared to the world average (in our case to other Member States within the EU Internal Market, thus hereinafter indices used in our research implicitly assume that companies of the country  $i$  compete with firms from the EU internal market rather than with companies that export to the EU from the third countries). Its equation can be written as follows:

$$RCA(B)_{inEUex;y}^i = \frac{x_{inEUex;y}^i / \sum x_{inEUex;y}^i}{x_{inEUex;y}^{EU} / \sum x_{inEUex;y}^{EU}} \quad (1)$$

where  $RCA(B)_{inEUex;y}^i$  represents revealed comparative advantage of country  $i$  for group of products  $j$ ;  $x_{inEUex;y}^i$  denotes value of intra EU export of sector  $y$  of country  $i$ ; and  $x_{inEUex;y}^{EU}$  reflects value of intra EU export of sector  $y$  of the EU. In our case, it compares the weight of exports of certain goods or services in total intra-EU exports from a given country with the weight of the same category at the EU level against intra EU trade.

The value of the index ranges from 0 to infinity: if  $RCA(B)_{inEUex;y}^i$  is greater than one the country  $i$  has comparative advantage in group of products  $j$ , while in contrast, if  $RCA(B)_{inEUex;y}^i$  is less than one, country  $i$  has comparative disadvantage in a given group of products  $j$ . As observed by many researchers, Balassa index in its original form produces values that cannot be compared on both sides of one, it can take extreme values and its distribution is highly unstable. Therefore many researchers proposed some changes in standard Balassa's RCA (e.g. a symmetric RCA by Laursen (1998); a RCA index divided on the index average across products by Proudman and Redding (2000); additive RCA with a stable mean by Hoen and Oosterhaven (2006)). Finally, following Laursen's (1998) advice that the index under analysis should always be made symmetric, we apply Vollrath's (1991) concept and take the logarithm of Balassa index:

$$RCA_{inEUex;y}^i = \ln(RCA(B)_{inEUex;y}^i) \quad (2)$$

Traditionally, RCA index is interpreted as a quantification of the commodity-specific degree of comparative advantage enjoyed by one country vis-à-vis any other country. However, there are at least two other interpretations according to which it provides a commodity-specific ranking of countries by the degree of comparative advantage or a demarcation between countries that enjoy a comparative advantage in a particular commodity (Balance et al, 1987). Other researchers observed that Balassa's RCA yields information about the pattern of international specialisation insofar as it evaluates an economy's export share in an individual sector relative to a benchmark – the economy's average export share in all sectors (Proudman and Redding, 2000).

The standard Balassa's index does not account for import trade flows (see more Kunimoto, 1977). This problem can be addressed by the index, which reflects the importance of export and import flows to the country - net trade. Based on Michael (1965) research, Trade Balance

Index (Lafay, 1992) allows examining if a country specialises in exports of a specific group of products:

$$TBI_{inEU;y}^i = \frac{(x_{inEU;y}^i - m_{inEU;y}^i)}{(x_{inEU;y}^i + m_{inEU;y}^i)} \quad (3)$$

where  $TBI_{inEU;y}^i$  denotes trade balance index of country  $i$  for group of products  $j$ ;  $x_{inEU;y}^i$  represents the value of intra-EU exports of sector  $y$  of country  $i$ , and  $m_{inEU;y}^i$  shows value of intra-EU imports of group of products  $y$  of country  $i$ . Values of the index range from -1 to +1. It means that TBI clearly indicates whether a country specialises in exports (as net-exporter) or imports (net-importer) of a specific group of products.

### 3. Specialisation of the V4 Countries in the Intra-EU Exports

Following Widodo (2009) “products mapping” we used two crucial variables to analyse the V4 and the B3 countries’ comparative advantage: international competitiveness/specialisation (logarithmic) Balassa index and Trade Balance Index (Fig. 1). Consequently, we were able to distinguish four groups (A, B, C, D) of sectors, depending on the levels of both their comparative advantage (RCA) and export specialisation (TBI) in intra-EU exports in 2016 (Fig. 1).

The V4 countries recorded revealed comparative advantage and positive trade balance in intra-EU exports in products of MTM/HTM, MTM (with the exception of Poland) and LTM (with the exception of Hungary) (Table 2). They also noted positive specialisation indices in RBM/LTM, however with a close to neutral TBI (group A and B). It means that the V4 countries, as net-exporters, specialised in trade in low and medium technology goods. In years 2010-2016, they recorded an increase in both indices, with the exception of MTM/HTM group, in 2016 compared to 2010. It means, that they have improved their position vis-à-vis other EU Member States, as the UK and France have become net-importers with comparative disadvantage in intra EU trade (group D) and trade indices for Germany, which nevertheless continues to maintain its strong position, have worsened in recent years.

Reverse tendencies were found out in intra-EU trade in highly advanced products (HTM). Both the UK and Germany were part of group A or B due to their revealed comparative advantage and being respectively a net-exporter and a net-importer. In contrast to them, France and the V4 countries did not specialise in trade in these goods: as net importers (with the exception of Hungary) they noted comparative dis-advantage (group D). However, in the period selected for the research, the V4 countries improved their indices for HTM, in some cases even substantially, which may suggest there is still space for their development.

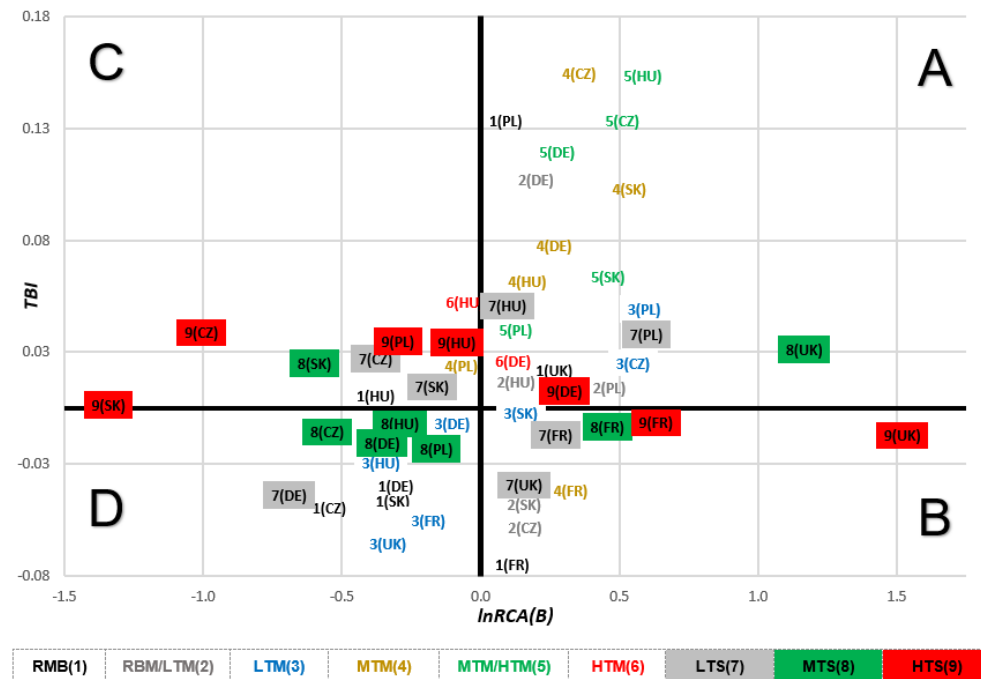

As regards RBM products, only Poland and the UK, among countries in the research sample, recorded both comparative advantage and export-specialisation in trade in RBM products (group A). However, we need to stress that while Poland focused on (and improved its position in) its export in agri-food goods, the UK remained a strong net-exporter of petroleum products.

Our findings for intra-EU trade in services produced a different picture. The V4 countries noted comparative dis-advantage in intra-EU exports in all types of services with one specific exception of Poland for LTS (especially due to growth of warehousing, construction, transport and its related activities – group A). At the same time, they were net-exporters in all categories of services (with the exception for Poland and the Czech Republic for MTS) (group C). It means, that although they did not exhibit a comparative advantage in intra-EU exports, they successfully entered the EU Internal Market of services. Moreover, only Hungary improved its indices in all categories of services, followed by Poland, who developed comparative

advantage in LTM and MTS. Both the Czech Republic and Slovakia recorded a decrease in their specialisation indices.

In opposition to that, the UK and France retained their comparative advantage in low and high technological advanced services, although as net-importers (group B). At this same time, their performance in LTS deteriorated, while it improved in HTS in 2016 as compared to 2010. In the period under research Germany’s trade in LTS and MTS recorded neither comparative advantage nor export-specialization in trade in services (group D), showing some positive trends in HTS (group A).

**Figure 1: Revealed Specialisation Position of the V4 Countries in Intra-EU Exports in 2016 (lnRCA(B) and TBI)**

Note: in order to make the chart readable, the positions of the following sectors have not been marked in group D: 2(FR), 2(UK), 4(UK), 5(UK), 5(FR), 6(SK); 6(PL); 6(CZ), 6(FR) and in group B: 5(FR). Different colours represent different manufacturing or service sectors, while numbers correspond to technology advancement of goods or services (see Tab. 1).

Source: own calculations based on Eurostat

#### 4. Conclusion

Based on our research findings, we can confirm that the structure of the intra-EU exports of V4 countries substantially differs from that of the United Kingdom and France, while many similarities have been traced between the V4 and Germany. Beyond any doubt we may argue that the V4 countries have comparative advantage and are net-exporters in intra-EU exports in industrial goods (with the exception of high technologically advanced products). Moreover, they improved their performance in recent years which can be interpreted as a confirmation of a strong position and a broad network of cooperative linkages their industry has developed

within the EU Internal Market. The only source of concern is the most important sector of high technology products. On one hand, the V4 countries were net-importers and did not have comparative advantage in intra-EU exports in this sector, however, on the other hand, they substantially improved their indices in the period under research, which may be indicative of a positive trend.

Slightly different picture was observed in intra EU trade in services. Definitely, it is impossible to formulate any universal remarks concerning all V4 countries. In many sectors, although they did not have comparative advantage in trade in selected service sectors, they remained being net-exporters. It means they provided services to other Member States, while seeking to ensure that their domestic demand is substantially satisfied by domestic service providers. That can suggest that if the V4 countries improve their performance of comparative advantage, they will be able to offer more services in the EU Internal Market, which should produce more added value to their economies. Moreover, a big variety of trade positions (net exporters and net-importers), differences in comparative advantage (or dis-advantage), as well as differences in directions in which the aforementioned indices evolve for trade in all service sectors can suggest, that two of the V4 countries, Hungary and Poland, seek for the niche to expand their trade.

Summing up we can state that, unlike in intra-EU exports in industrial goods, the V4 countries tend to specialise only in selected service sectors. Apparently, these tendencies, if a free movement of services is ensured within the EU and manufacturers from the V4 countries join the servitization process, can bring some benefits to the V4 economies, including the building up of a very powerful industry in terms of its position in intra-EU trade, which calls for further, more in-depth analysis.

## **Abstract**

*The transatlantic economy has been a crucial backbone of the global economy for decades. Despite relatively integrated relations, tariff and non-tariff barriers remain a burden. Studies estimate that further liberalization of trade between the EU and US could bring additional savings and could contribute to the enabling of untapped potential in bilateral trade. However, protectionist tendencies and new approaches toward trade are bringing a U-turn to multilateral and bilateral trade liberalization. This has in the transatlantic context resulted in putting trade talks on hold and the future of the traditional EU-US economic partnership is being questioned. The paper analyses the main challenges for relations in the light of recent developments that eventually could further nature of the mutual trade ties. It argues that not only protectionist tendencies, but also the experience with Transatlantic Trade and Economic Partnership (TTIP) negotiations show that support for further fostering of the relations can be perceived as an obstacle.*

**Keywords:** EU-US Trade, FDIs, transatlantic economic relations, TTIP

**JEL Classification:** F150, F13, F53

## **1. Introduction**

Transatlantic economic relations are in terms of their volume and nature often described as a backbone of the global economy. The EU-US generates approximately 30% of the world GDP in terms of purchasing power. No commercial artery in the world is as large as the investment artery forged between the United States and Europe: total transatlantic foreign affiliate sales topped an estimated \$5.5 trillion in 2015. (Hamilton, Quinlan, 2017). In terms of trade, despite rising markets such as China, for the EU, and the US, mutual trade remains significant. No other entities enjoy more bilateral trade between each other and no other relations have such a complex nature.

However, EU-US economic relations have in history experienced both setbacks and high points. Despite the gradual removal of trade barriers, particularly through mutual recognition agreements and relatively low tariff barriers in mutual trade, there is still some potential that could be untapped by complex trade liberalization. In 2013, trade negotiations on creating a transatlantic free trade agreement were launched. This was on the one hand welcomed by the business community, which was keen on the removal of additional trade barriers and particularly on possible regulatory cooperation, which is the core issue in EU-US trade. On the other hand, the trade talks were met with criticism from the public in some EU member states, where EU citizens expressed their fear over lowering current European standards, incorporating unfair practices through the Interstate Dispute Settlement and other issues.

## 2. Problem Formulation and Methodology

The issues of world order and the positioning of the EU and US in international relations have been a scope for research in many works in the past. Kagan (2003) argues that the EU has been working on establishing an order based on treaties and common institutions and has very limited interest in investing in the military, whereas the US want to maintain military capacities able to operate in various regions of the world. The two approaches are so different that the Americans seems to be from Mars and the Europeans from Venus. In later debate, Kupchan (2012) points out that the world order is not based on strong hegemonic positions and the world will be a world of no one. The West's leading nations are stumbling both economically and politically. The EU is struggling due to the 'renationalization of politics', while the US ability to provide steady leadership is hampered by partisan polarization. To revive its power, "The West will have to rise to the occasion on two fronts. It will have to recover its political and economic vitality and retain its cohesion even as its era of primacy gradually comes to an end." (Kupchan, 2012).

However, looking at transatlantic economic relations closer, despite various trade disputes in the past (bananas, Boeing-Airbus, chlorinated chickens and many others), economic ties remain stable and crucial to both entities. In the light of the frozen trade talks and the new US administration, it leads to the question of how current transatlantic economic relations can be described. What are the main challenges and risks for preserving the importance of the relations for both sides of the Atlantic? Do the main risks arise from domestic policies?

By using descriptive analysis, the first part of this paper focuses on the nature of EU-US economic relations and describes the trends and main features of economic cooperation. Furthermore, the current focus and approach of US trade policy is analysed. The paper argues that not only can the new approach of the Trump administration be seen as a threat to economic relations but the experience from the 15 rounds of the currently frozen trade negotiations between the EU and the US also shows how a lack of public support can be an obstacle in the future fostering of the EU-US partnership.

### *2.1 Some Selected Drivers of the Transatlantic Economic Ties*

The stable business environment, purchasing power and particularly historical ties have contributed to the massive volume of trade and investment flowing from one side of the Atlantic to the other. Despite the dynamic growth of the bilateral trade of both entities with emerging markets and their rising role in the global economy, where in the case of the EU, the US remain the most important trading partner in total EU trade with a share of 17.8%, just before China with a share of 14.9%. (European Commission, 2016). However, the intensity and volume of trade is only part of the power of bilateral economic ties. The transatlantic economy generates 5.5 trillion EUR in total commercial sales and employs approximately 15 million people in mutually "on-shored" jobs on both sides of the Atlantic" (Hamilton, Quinlan 2017). Nonetheless, the EU has been enjoying a trade surplus with the US for years and in 2016 the surplus reached 112.9bn EUR (Eurostat, 2017). The backbone of the relations are FDIs, which show the integration of the mutual ties. At the end of 2012, EU residents had foreign direct investments in the United States valued at \$1,647.6 billion, or 62.2% of total foreign direct investments in the United States. (Cooper, 2014). In the EU, US FDI represents approximately 40% of all incoming FDI. The volume of FDIs also reflects the number of jobs which US foreign affiliates have created in Europe. In 2014, US companies employed approximately 4.5 million workers in the EU. Hamilton and Quinlan estimate that in 2015 the number increased by 140 000 to approximately 4.7 million jobs. (Hamilton, Quinlan, 2017).

Transatlantic economic ties heavily benefit from investments that are oriented on high value added, such as portfolio investment, banking claims, trade and affiliate sales in goods and services, mutual R&D investment, patent cooperation, technology flows, digital trade, and sales of knowledge-intensive services. (Hamilton, Quinlan, 2017)

## ***2.2 Trump Trade Policy and its Implications for the EU-US Relations***

Uncertainty about the preservation of the highly integrated transatlantic economy started to be mentioned in the light of the candidacy of Donald Trump in the presidential elections of 2016. In his campaign, Donald Trump presented restrictive measures in trade with the EU as a possible way to reduce the trade deficit and bring lost jobs back to the US. Trump's "America First" message, as one of the key topics of his campaign, raised many questions and doubts about its possible implementation and implications for other countries and also the EU.

The "America First" approach of the new US administration is built on trends and developments that resulted in negative effects on the US economy, mainly through job losses. Their losses have, according to Schneider-Petsinger (2017), several causes. First, the changing pattern of the global economy and rising role of China has also had a direct impact on the US economy. Autor, Dorn and Hanson (2016), claim that the growing imports from China to the US between 1999 and 2011 resulted in the loss of more than 2.4 million jobs. Schneider-Petsinger (2017) also sees the introduction of automation and new technologies in manufacturing as a crucial reason that might be behind the job cuts in the US.

As mentioned above, trade is an essential point but not the most significant in cutting jobs. Global developments together with slow adjustment and ineffective policies stand behind the new challenges that the US economy is facing. Schneider-Petsinger argues that trade deficits are not the key problem and cannot be blamed for job losses in the US.

Nevertheless, the rhetoric and campaign of Donald Trump was built on blaming trade liberalization and globalization for jobs losses and moving businesses from the US to countries with lower labour costs.

As a part of the new US administration's strategy, the government started to reconsider bilateral trade agreements and seek ways to prefer the "America First" commitment made in the campaign. This has been in contradiction to the previous administration, where B. Obama supported trade liberalization and initiatives as an instrument helping the US to preserve its role as a superpower in the world economy. One of such initiatives was the Trans-Pacific Partnership, a trade pact that includes 11 countries, and represents approximately 40% of global GDP. The aim of the TPP was to open markets with agriculture products, services and high-end manufacturing. Furthermore, the pact had to react to the new challenges which trade faces, such as the digital economy, rule-based trade and the investment system. (Meltzer, 2015)

The commitments of the new US administration described above resulted in the dropping of US participation in the Trans-Pacific Partnership.

Another very crucial step which followed the commitments of D. Trump in his campaign was launching a renegotiation process for NAFTA - with Canada and Mexico. The US government saw the current agreement from 1993 as harmful for the US, as "trade deficits have exploded, thousands of factories have closed, and millions of Americans have found themselves stranded, no longer able to utilize the skills for which they had been trained" (USTR, 2017).

The trade deficit which the US administration is worrying about in NAFTA is perceived as the main reason for the trade deficit and the cause of moving factories to Mexico and Canada. Renegotiation should support the businesses that benefit from cheaper labour in Mexico to

move their production back to the US. However, the talks have not achieved much so far. No progress has been made on the crucial parts, such as dispute settlements, the automotive industry (origin rules, supply chains), agriculture (supply management), and public procurement. The countries remain very divided. The proposal of a “sunset clause”, which suggests an expiration of NAFTA after 5 years if the parties do not agree to extend it, also remains controversial.

### **2.3 Launching and Freezing of TTIP**

Transatlantic economic relations have been enjoying a high volume of trade and investment through low tariff barriers (in almost all areas) since the beginning of the 1990s.

A new breath into the idea of complex trade liberalization in the transatlantic space was brought by the US administration under B. Obama, which was based on the results of the bilateral High Level Working Group on Jobs and Growth. In 2013, B. Obama, M. Barosso and H. Van Rompuy announced the launch of negotiations on a free trade agreement, known as the Transatlantic Trade and Investment Partnership. In the light of frozen WTO multilateral negotiations, the spaghetti bowl (Bhagwati, 1995) with regional trade agreements became a strong instrument for bilateral trade liberalization.

The trade negotiations on liberalization between the US and the EU started in 2013, with an ambition to remove most tariff barriers, but particularly to focus on non-tariff impediments that would stimulate EU-US trade and support the potential which, due to various measures, could not be fully realized. The business community had particularly been calling for further trade liberalization in the past. However, none of these attempts had been successful in the past. As the EU was experiencing sluggish economic growth and a growing voice from the business community on both sides of the Atlantic started to call for a trade agreement between the EU and the US, it seemed logical that trade negotiations would have support to be launched. Through TTIP, both sides also wanted to confirm the power of the transatlantic partnership in a changing world economy, where the traditional powers and democratic values traditionally represented by the US and the EU were declining.

Kupchan points out that despite the fact that TTIP could be seen as a “golden opportunity” to expand economic growth and jobs and as an anchor of liberal values, the transatlantic partnership, given its economic size and democracy-based rules, has a strong voice that must actively contribute toward shaping an international system and keep its eyes on the prize and work with emerging powers to fashion a new rules-based system for the twenty-first century” (Kupchan, 2015).

Despite the well-developed architecture of bilateral cooperation through various political and expert bodies which identified issues in trade, the negotiations were expected to be hard and long for several reasons. One of the most complicated areas lie in regulatory divergences.

Within the three parts of the trade talks concerning market access there included areas such as public procurement (where the US was still to very limited extent open to EU companies), removal of tariff barriers, and issues such as regulation of services or rules of origin.

In the area of regulatory cooperation, both entities have worked on adopting mechanisms and mutual recognition agreements that could remove additional burdens coming from dual standards. Nevertheless, these attempts have not always been successful. The autonomy of legislators and certification authorities on the US side and different views on the EU side touch standards and main principles which both entities preserve and cannot be subject to a trade agreement. In general, the approaches of both entities differ in perception of and management

of risks. The US on one hand prefers the formula of “innocent before proven guilty”, where the science-based approach to risk analysis is likely to protect the vested interests of producers, manufacturers and distributors rather than the legitimate interests of consumers (Grmelová, 2016). The EU, on the other hand, with the use of the so-called precautionary principle “guilty until proven innocent” can ban the placing of potentially dangerous products on the European market.

However, due to the complexity of trade and the obstacles involved, the negotiations became stigmatized by criticism towards lack of transparency. The rising opposition against TTIP negotiations showed how fragile the support of EU citizens was when it came to such a massive agreement like TTIP. For example, in Germany, the fear of lowering standards on consumer protection, food safety and genetically modified organisms and other sensitive issues, such as the Interstate Dispute settlement, was heightened by distrust of Germans towards the US (Chan, Crawford, 2017), although the negative attitude towards the TTIP negotiations was not only present in Germany. Garcia-Duran and Eliasson see the low knowledge of citizens about NTBs as a problem, but in the case of this FTA, the fact that it was the US as a partner played a significant role. (Garcia-Duran, Eliasson, 2017).

### **3. Problem Solution**

Despite low tariffs, regulatory barriers remain a challenge in the eventual further liberalization of bilateral trade. This in particular was the focus of trade talks on (Transatlantic Trade and Investment Partnership) TTIP, which started in 2013. However, the new approach toward trade policy that the new US administration has brought has shown that previous ambitions, such as joining TPP, are not priorities anymore. The “America First” commitment, which D. Trump promotes, has also affected trade talks with the EU. Griffith, Steinberg and Zysman (2017) argue that US position to TTIP means the loss of a key foreign policy tool in Europe. However, it's still unclear, what exactly will follow in terms of more concrete steps and measures that might be applied by the US towards the EU. The uncertainty and unpredictability of steps of the US administration therefore remain of the biggest threats.

For further deepening of the relations, also public support on the EU side is needed. The TTIP negotiations have shown, that lack of public support may be a critical for further progress in the trade talks and it may be a real risk for positive perception of the EU trade policy. On both sides of the Atlantic, the stakeholders need to continue on promoting their interests, so the economic and strategic incentives are understood by policy makers.

### **4. Conclusion**

The nature of transatlantic economic relations is very complex and can be characterized by deep roots that have evolved over decades. The transatlantic economy is, despite challenges particularly from emerging markets, the most integrated in the world. The relations are based on trade, but much more crucial are the FDI flowing in R&D and in general in the sectors with higher value added.

New US administration brought a new approach to the US trade policy. Protectionism and reformulating the US priorities in the global trade have resulted in abandoning the TPP, launching renegotiations the NAFTA and reconsiderations towards other regions and main trading partners too. In the EU-US relations, the trade talks on TTIP have been put on hold.

Despite the fact that the EU is one of the proponents of the free trade, the trade talks with the US has shown number of obstacles. Those can be identified in regulatory divergences, risk

management and other areas. Crucial issue is also opposition against the entire trade liberalization ambition in the EU. This illustrates that such a massive trade agreement needs a solid support not only among policy makers, but also in the society. From the US side, concerns can be seen about the eventual use of restrictive measures which may be implemented by the US administration towards other countries and could also eventually be imposed on the EU. The last statement of D. Trump proves that, the despite domestic criticism, imposing additional tariffs on steel and aluminium are not anymore only promises of the presidential campaign. (Reuters, 2017) This means that for the future, more realistic are trade conflicts rather than progress in complex trade liberalization in the transatlantic relations.

## Language Skills of EU Citizens and their Participation on Foreign Cultural Products

**Eva Ardielli**

VSB – Technical University of Ostrava  
Faculty of Economics, Department of Public Economics  
Sokolská 33, Ostrava, 702 00  
Czech Republic  
e-mail: eva.ardielli@vsb.cz

### **Abstract**

*Culture is an important aspect of European Union (EU) policy. It is a driving force for economic and social development, as well as innovation and cohesion. The main EU's cultural priorities are therefore to contribute to the development of the culture in the Member States, to encourage contemporary cultural production and to promote cultural cooperation and diffusion of culture across EU. Moreover, also the issue of cultural cohesion and multiculturalism is very topical in the contemporary, rapidly changing environment. Currently we are experiencing a number of manifestations of insufficient cultural integration in today's highly differentiated European societies. The paper deals with the issue of the participation of EU citizen on the foreign culture. The intention is to assess the attitude of EU citizens to foreign cultures. The expression of openness to foreign cultures can be demonstrated by the effort of citizens to learn foreign languages and to participate on foreign cultural products. The aim of the paper is therefore to evaluate the EU Member States in these areas, by usage of multi-criteria decision making methods. The results of the research are pointing out the differences among EU Member States, concerning the attitude of citizens to participate on foreign culture.*

**Keywords:** cultural participation, European member states, evaluation, language skills

**JEL Classification:** F68, H11, Z10, Z19

### **1. Introduction**

Culture is an important topic of the present time. As evidenced by UNESCO (2002) culture is at the heart of contemporary debates about identity, social cohesion, and the development of a knowledge-based economy. The international organizations (like UNESCO, OECD, Council of Europe) are affirming, that respect for the diversity of cultures, tolerance, dialogue and cooperation, in a climate of mutual trust and understanding, are among the best guarantees of international peace and security. Culture should be regarded as the set of distinctive spiritual, material, intellectual and emotional features of society or a social group, that encompasses, in addition to art and literature, also lifestyles, ways of living together, value systems, traditions and beliefs (UNESCO, 2002). Culture is becoming increasingly important also at EU level. In accordance with Article 167 of the Lisbon Treaty, “the EU shall contribute to the flowering of the cultures of the Member States, while respecting their national and regional diversity and at the same time bringing the common heritage to the fore”. Culture is an important element and determinant of many concepts and strategies, as evidenced by Ardielli (2016) in Good Governance concept evaluation in EU countries or Sustainable Development Assessment in Drastichová (2014).

As stated by Eurostat (2016a) culture is one of Europe's greatest strengths: "it is a source of values and identity and gives the continent a sense of belonging". It also contributes to people's well-being, to social cohesion and inclusion. The cultural and creative sectors are drivers of economic growth, job creation and external trade. In our increasingly diverse societies it is essential to ensure harmonious interaction among people and groups with plural, varied and dynamic cultural identities as well as their willingness to live together. Policies for the inclusion and participation of all citizens are therefore guarantees of social cohesion, the vitality of civil society and peace (UNESCO, 2002).

### ***1.1 Cultural Pluralism and Multiculturalism***

Cultural pluralism is a term used when smaller groups within a larger society maintain their unique cultural identities, and their values and practices are accepted by the wider culture. Cultural pluralism is distinct from multiculturalism (Nagle, 2009). Multiculturalism lacks the requirement of a dominant culture. If the dominant culture is weakened, societies can easily pass from cultural pluralism into multiculturalism without any intentional steps being taken by that society. If communities function separately from each other, or compete with one another, they are not considered culturally pluralistic (Pantoja, Perry and Blourock, 1976). Cultural pluralism seeks, on the one hand, the conditions and limits of peaceful coexistence of different cultures, but also examines the unexpected advantages of such cultural diversity. Historical and empirical studies show that culturally mixed society in the cities or in the border areas have been exceptionally productive (Kallen, 1997; Anghel, 1994). The task of cultural pluralism is therefore to explore and apply the conditions of fruitful communication among diverse cultural groups, to draw attention to the advantages and risks of culturally inhomogeneous societies and to promote cultural and intellectual exchanges between them. The basic conditions include knowledge of a common language, a fundamental recognition of the other, and finally the discovery of its potential importance and benefit to the majority society (Kallen, 1924). Multiculturalism is the school of thought and political stream, which is of the opinion that in a democratic state can live not only individuals but also groups with different cultures and highlights the benefits of cultural diversity for society and the state. It is applied in countries whose residents come from different cultural backgrounds and in some of them is also applied as a specific policy of the state. The aim is to unite politically all citizens, regardless of their origin, ethnicity or belief, so as to preserve their cultural differences if possible, as stated by Wayland (1997) or White (2001).

### ***1.2 Language Diversity in EU***

Language diversity across EU is great. In EU, there are 24 official languages. According to Council of Europe (2018) in their daily lives, Europeans increasingly come across foreign languages. There is therefore a need to generate a greater interest in languages among European citizens. Due to the influx of migrants and refugees, Europe has become largely multilingual. For example in London alone some 300 languages are spoken (Arabic, Turkish, Kurdish, Berber, Hindi, Punjabi, etc.). According to Eurostat (2018) that contains information on foreign language skills in EU, in many Member States, more than 9 out of 10 pupils in lower secondary education are studying two or more foreign languages. For example in Luxembourg it is 100 % of pupils, in Finland 98 %, in Greece 97 %, in Italy 96 %, in Estonia and Romania 95 %. The EU average is 59 %. In the Czech Republic 65 % of pupils are studying two or more foreign languages. The lowest share of pupils studying two or more foreign languages in EU Member States is in Ireland (13 %), Austria (9 %) and Hungary (6 %). Not surprisingly, English is by far the foreign language most studied in the EU. 97 % of

pupils studied English in lower secondary education in 2015, followed by French (34 %) and German (23 %). However, in some Member States English was not the main foreign language to be studied. This was the case in Belgium (French was the first foreign language), Ireland (French), Luxembourg (German).

### ***1.3 Cultural Participation in EU***

Cultural participation is an essential dimension of personal well-being and integration of individuals in society (Eurostat, 2016a). According to Council of Europe the right to take part in cultural life is - and shall be recognised as being - pivotal to the system of human rights (Compendium, 2017). Participation in cultural activities and on cultural products is a fundamental human behaviour and is promoting human well-being (Brook, 2011, Schuster, 2007). Wider participation in cultural life is a major concern of national cultural policies in different countries around the world (Compendium, 2017). Cultural practices can be defined according to three categories (Morrone, 2006): home-based (watching TV, listening to the radio, reading books and newspapers, watching and listening to recorded sound and images, reading and using computer and the Internet), going out (visits to cultural venues such as cinema, theatre, concerts, museums, monuments and heritage sites) and identity building (covers amateur cultural practices, membership of cultural associations, popular culture, ethnic culture, community practices and youth culture).

Nevertheless according to studies of European Commission from 2007 and 2013 (TNS Opinion & Social, 2013) the cultural participation is decreasing in the EU. For example the share of readers fell from 2007 to 2011 by 10 percentage points (the indicator Number of books read in the last 12 months), see Eurostat (2016b). Moreover the statistical data document the new trend on EU book market – increasing share of e-books and decreasing trend of printed books. Also going to the cinema and visiting live performances is significantly influenced by the entry of ICT. The main reasons to non-participation in cultural activities are according to Eurobarometr survey (TNS Opinion & Social, 2013) lack of interest, lack of time and expense. Also only small minorities of Europeans participate in cultural activities and on cultural products from another European country, and even fewer participate in activities in another EU country. The most commonly accessed activity is reading books by an author from another European country (31 % of Europeans have done so at least once in the last 12 months), followed by watching or listening to a cultural TV or radio programme from another European country (27 %). Fewer Europeans participate in cultural activities in another EU country: 19 % have visited a historical monument or site and 10 % have attended a live performance, exhibition or cultural activity.

## **2. Problem Formulation and Methodology**

The EU is diverse in cultural matters and Member States are different with diverse culture backgrounds. The paper is focused on the issue of participation of EU citizen on the foreign culture. The willingness of EU citizens to participate on foreign culture is evaluated based on the indicators describing the level of foreign languages knowledge and participation on foreign cultural products as the expression of openness to foreign culture.

As a cultural product, the art and cultural heritage and everything associated with it is referred to. For example, traditional arts (like writing, painting, sculpture and dance), theatre, museum, gallery, monument, exposition, individual exhibits and accompanying services, all of this, can be described as a cultural product (Johnová, 2009). Cultural product is also the output of

cultural-products industries (service outputs that focus on entertainment - motion pictures, recorded music and print media, etc.).

The aim of the paper is explicitly to evaluate the EU Member States citizens in the area of foreign language knowledge and participation on foreign cultural products by usage of multi-criteria decision making method MAPPAC.

## 2.1 Method

MAPPAC method is the example of MCDM methods based on the preference relation (Fiala, 2013; Brans, et al., 1984). The MAPPAC method was chosen because, apart from the information from the multi-criteria matrix and the vector of weights, does not need any additional information, such as threshold values or the choice of generalized criteria. The MAPPAC method is based on paired comparisons of variants, whereby each pair of individual criteria results in a decision on which of the two objects is the more important, or whether they are indistinguishable in terms of the selected criteria (Matarazzo, 1991). The MAPPAC method works with the criterion matrix and weights of the criteria. The method splits the variants into several preferential classes. MAPPAC method uses a normalized multi-criteria matrix  $C = (c_{ij})$ , where  $r$ -th row corresponds to variant  $a_r$  and  $s$ -th row corresponds to variant  $a_s$ . First the paired comparison of variants is processed (Martel and Matarazzo, 2005). On the basis of the results there are possible two relationships between variants. Either preference (variant  $a$  was rated better than variant  $b$ ) or indifference (variant  $a$  and variant  $b$  are assessed in the same way). In the last step preferences are aggregated, resulting in a final order. The row totals of the aggregated matrix  $\pi$  are calculated according to the equation (1):

$$\sigma^l(a_i) = \sum_{j=1}^p \pi(a_i, a_j), \quad i \in J^l \quad (1)$$

Variants with the highest  $\sigma^l$  values are placed on the first place in the ranking. The set of variants is reduced from these variants, new set of variants  $A^l$  is created, the set of indexes of variants from  $A^l$  are marked as  $J^l$ . The procedure is repeated for  $m$  steps where  $m$  is the number of preferential classes by the ranking from above. In a similar procedure is reached the value of  $\tau^1, \tau^2, \dots, \tau^n$ , where  $n$  is the number of preferential classes in the ranking from bottom, by usage of equation (2):

$$\tau^t(a_i) = \sum_{j \in J^t} \pi(a_j, a_i), \quad i \in J^t, \quad t = 1, 2, \dots, n. \quad (2)$$

The overall ranking of variants is reached by averaging of the serial numbers of variants by the ranking from above and bottom. As the best evaluated is the variant which has the lowest overall serial number.

## 2.2 Data

In this paper was performed the evaluation of language skills of EU citizens in individual Member States and evaluation of participation on foreign culture products. The evaluation of language skills was based on 7 indicators (criteria) available from the Eurostat database - Adult Education Survey (AES) (Eurostat, 2018). AES is a source of data on the knowledge of languages by the adult population (self-reported competencies). The survey focused on people aged 25–64 living in private households and the reference period was the 12-months prior to the respondent's interview. This unique dataset enabled the reliable analysis of foreign language knowledge, because it contains comparable data of all 28 EU Member States based on the results of questionnaire from the year 2016.

The evaluation of the cultural participation of EU citizens on foreign cultural products was carried out on the basis of 7 cultural indicators which were obtained in the framework of the Eurobarometr survey (TNS Opinion & Social 2013). The European Commission's Directorate-General for Education and Culture (DG EAC) commissioned this survey in an effort to measure the attitudes of the European public to individual cultural activities. The survey involved a total of 27,563 European citizens from all 28 EU countries. The last available data refer to the year 2013.

### 3. Problem Solution

Multi-criteria decision models show decision-making issues where the consequences of decisions are judged by multiple criteria. Multi-criteriality characterizes almost every decision-making situation. In these models of multi-criterial analysis of variants, a final set of variants is given, which is evaluated according to selected criteria. In the research, there was selected the final list of variants, which were 28 EU Member States and two sets of criteria. 7 criteria for evaluation of language skills (different weights for individual criteria – in total 0.5):

- Number of foreign languages known - no languages (weight 0.11842);
- number of foreign languages known – 1 language (weight 0.02632);
- number of foreign languages known - 2 languages (weight 0.06579);
- number of foreign languages known – 3 languages or more (weight 0.11842);
- level of the foreign language reported as best-known – proficient (weight 0.11842);
- level of the foreign language reported as best-known – good (weight 0.03948);
- level of the foreign language reported as best-known – basic (weight 0,01316);

and 7 criteria for evaluation of foreign cultural participation (the same weight 0,07142 for all criteria – in total 0,5):

- Visit of ballet, dance performance or opera from another EU country;
- visit of theatre performance from another EU country;
- visit of musical performance (concert, band, etc.) from another EU country;
- watching/listening to cultural programme on TV/radio from another EU country;
- reading a book by an author from another EU country;
- visit of historical monument/site (palaces, castles, etc.) in another EU country;
- attending live performance, festival or cultural activity in another EU country.

The input data were processed by MAPPAC method. The weights of selected criteria were established by usage of scoring method. These weighted values were used for the calculation by MAPPAC method.

The output of MAPPAC method is the arrangement of variants according to preferential classes. In Table 1, it is possible to see the variants in the order according to the rankings from the top (column Top) and from bottom (column Bot.) and the final ranking of EU Member States (column Range) according to the selected criteria. It is evident, that the first five places (Luxembourg, Sweden, Denmark, Netherlands, and Finland) are clearly given, because the countries are ranked in the same place as when ranking from top and also from bottom. It means that the citizens of these countries were evaluated as most skilled with knowledge of foreign languages and most interested in foreign cultures.

**Table 1: Ranking of EU Member States According to Participation on Foreign Culture**

Country	Top	Bot.	Range	Country	Top	Bot.	Range
Luxembourg	1	1	1.	Cyprus	15	16	15.
Sweden	2	2	2.	Czech Republic	17	17	16./17.
Denmark	3	3	3.	Ireland	19	15	16./17.
Netherlands	4	4	4.	Croatia	16	19	18.
Finland	5	6	5.	France	18	18	19.
Austria	6	7	6./7.	Hungary	21	20	20.
Malta	8	5	6./7.	United King.	22	21	21.
Slovakia	7	8	8.	Spain	20	24	22.
Belgium	9	9	9.	Portugal	24	22	23.
Estonia	11	12	10.	Greece	25	23	24./25.
Germany	10	14	11./12./13.	Italy	23	25	24./25.
Latvia	14	10	11./12./13.	Bulgaria	27	26	26./27.
Slovenia	13	11	11./12./13.	Poland	26	27	26./27.
Lithuania	12	13	14.	Romania	28	28	28.

Source: author's calculations, Eurostat (2018), TNS Opinion & Social (2013).

The next two variants (Austria and Malta) are placed in the same preferential class. Average serial numbers of these variants are the same. These two countries are placed on the 6. and 7. position together. For the 8.- 10. place the rank is clearly given – they are Slovakia, Belgium, Estonia. Germany, Latvia and Slovenia are placed in the same preferential class again. It means that these three countries are placed together on the 11., 12. and 13. position. The Czech Republic ranked on the 16. and 17. position together with Ireland. On the worst positions ranked Greece together with Italy (24./25.), Bulgaria and Poland (together on position 26./27.) and Romania (28. position). It means that the level of language skills and participation on foreign cultural products is in these countries the lowest across EU.

#### 4. Conclusion

Cultural, religious and linguistic diversity are, at first glance, obstacles to communication and clearly complicate social life. But closer study reveals that if these diverse segments of society learn to communicate, it brings unexpected benefits to the majority and minorities. Conversely, if the different cultures only live side by side, avoiding contacts and simply "tolerate" themselves, this represent a certain danger that in a crisis can erupt in violence.

The paper was focused on the evaluation of EU Member States according to the citizens' attitude to the knowledge of foreign languages and consumption of foreign culture products. The EU Member States were ranked based on 14 selected criteria by usage of MCDM method MAPPAC. It was confirmed the diversity across EU Member States in terms of willingness of citizens to participate on foreign culture. The most inclined to use foreign languages and to consume foreign culture products are the Luxembourgers, Swedes, Danish, Dutchmen and Finns. On the other hand the Greeks, Italians, Bulgarians, Poles and Romanians are less keen to get known foreign languages and cultures. The Europe is facing the process of globalization that involves mixing of different cultures. The trend of current time is also the rapid development of new Information and communication technologies. This all is representing a challenge for cultural diversity and creates the conditions for renewed dialogue among cultures and civilizations.

### **Abstract**

*The main goal of the article will be the analysis of relations between the European Union and three member states of the European Free Trade Association (EFTA): Iceland, Norway and Switzerland (in the context of their possible accession to the EU as well). The analysis will be performed in two areas: the contractual one (state of conventional relations) and economic one (values of economic indicators). The contractual part of the analysis will cover the period from year 1960 (establishment of EFTA) to year 2018 (present situation). The economic part of the analysis will utilize four variables: GDP, GDP per capita, value of trade in goods, and composition of trade in goods. In order to identify dynamic changes in variables, values for two years will be analyzed: 2005 and 2016.*

**Keywords:** *European Union's external relations, Iceland, Norway, Switzerland*

**JEL Classification:** *F15, F21, O19*

### **1. Introduction**

The main object of interest for scientists analyzing the phenomenon of European integration is, in most cases, the European Union. This comes from the fact, that the EU is the most important integrational grouping of the European continent and, at the same time, the most advanced one in the world. However, political and economic integration in Europe applies also to the countries that are not members of the EU. In this respect, the countries that – due to some reasons – decided not to become Member States of the European Union, even though the EU was interested in granting them full membership, are especially important. Three<sup>3</sup> highly-developed European countries: Iceland, Norway and Switzerland are not members of the European Union. These countries constitute three of four remaining members of the European Free Trade Association (EFTA), an integrational organization, which was in the past a sort of competitor to the European Economic Community. For European integration, the relevant issues are not so much the contractual and economic relations between these countries (limited in scope), but relations of these countries (in both mentioned aspects) with the European Union (which are highly-developed).

**The main goal** of this article is the analysis of relations between European Union and three members of EFTA (Iceland, Norway and Switzerland) in two aspects: contractual and economic. The outcomes of this analysis were used to formulate an opinion regarding

---

<sup>3</sup> Lichtenstein was omitted in the analysis – see below.

perspectives for future development of these relations (either their tightening or loosening), also taking into consideration the possibility of these countries' full accession into the EU.

**Subjective scope** of the article covers two aspects: current state of contractual relations between each EFTA country and the EU and present state of mutual economic relations, measured with values of selected empirical indicators. The list of indicators used in the analysis has been presented below.

**Objective scope** of the article covers three EFTA countries: Iceland, Norway and Switzerland. Lichtenstein has been omitted in the analysis due to: small size of its economy, small population (below 40.000 people), strong economic bonds with Switzerland (customs union, usage of Swiss currency) and also the lack of data regarding this country for the majority of indicators used in the analysis.

**Temporal scope** of the analysis covers years 1960-2017 in the contractual aspect and years 2005-2016 in the economic aspect. The "current" state of contractual relations was defined as the state from January 1<sup>st</sup>, 2018. The analysis of empirical indicators' values was performed for two separate years: 2005 and 2016, with the purpose of identifying dynamic changes. Year 2016 was chosen due to the fact that in case of the majority of indicators used in analysis, it was the last year, for which the values were available. In consequence, year 2005 was chosen as the base year of the analysis.

## 2. Relations Between EU and EFTA Countries – Contractual Aspect

The thing that all three analyzed countries: Iceland, Norway and Switzerland have in common, is not only the EFTA membership, but also the history of relations with European Communities (see: Flam, 1995; Haaland and Norman, 1995; EFTA Secretariat 2018). All these countries did not participate in the process of European Communities' creation in the 1950s, but instead, especially during the 1960s, focused on intergovernmental integration dealing exclusively with trade, within the framework of EFTA. The event of United Kingdom and Denmark leaving EFTA and joining the ECs in 1973 was an impulse for the remaining EFTA countries to tighten their relations with the Communities. It took the form of signing association agreements. In 1972, all EFTA members signed the so-called *Free Trade Agreements* (FTAs) with European Communities. Main component of these agreements provided an establishment of free trade area concerning industrial goods between the European Economic Community and each EFTA country. The subjective scope of these agreements had been later widened via so-called "evolutionary clauses". During the turn of 1980s and 1990s, all three analyzed countries engaged in talks with the ECs, concerning the possibility of their involvement in the creation of European Single Market (ESM). The outcome of these talks was establishment of the European Economic Area (EEA). The EEA Agreement has been signed in the 1992 by four EFTA countries: Iceland, Lichtenstein, Norway and Switzerland. In regard to the first three countries, the agreement came into force on January 1<sup>st</sup>, 1994, whereas Switzerland ultimately decided not to ratify the agreement (see below). The remaining three EFTA member countries: Austria, Finland and Sweden, left EFTA in 1995, joining European Union as regular members. The body of the EEA Agreement included a solution, disadvantageous from the perspective of the EEA-EFTA countries', establishing a mechanism of unidirectional implementation of EU's regulations into the legislative systems of these countries (they do not have the right to vote in the process of these regulations' creation). However, such solution ensures efficient functioning of the EEA: the decision about implementing new regulations into the Agreement is made by the EEA Joint Committee, while EEA-EFTA states only carry out technical implementation of these regulations (states cannot block or modify these regulations on their own). The lack of such mechanism has a negative

influence on relations between the EU and the only EFTA state, which decided not to join the EEA, that is Switzerland (see below).

Iceland became an EFTA member ten years after its establishment, that is in 1970. Since 1973, trade between this country and EEC (from 1993 – EU) has been regulated by the FTA (free trade area regulations apply only to industrial goods). Since 1994 Iceland is a member of EEA, and since 2001 member of the Schengen Area. In 2009, facing a serious financial and economic crisis, which hit the country at the time, Iceland for the first time in its history applied for a EU membership. Negotiations started in 2010, but after a negative result of a referendum, concerning the method of debt payment for a bankrupt Icelandic bank (“Icesave referendum”), accession process was put on hold (see: Mišik, 2008; Frankowski, 2011; EEAS, 2018; European Commission, 2018).

Norway is a founding member of EFTA (1960). Starting from 1973, Norway’s trade relations with EEC (from 1993 with EU) were controlled by the FTA (covering only industrial goods). Since 1994 Norway is a member of EEA and since 2001, member of Schengen Area. Norway is a country that unsuccessfully tried to join the ECs / EU four times, namely in years: 1962, 1967 (no approval for starting the negotiations on ECs’ side), 1970 and 1992 (negative results of accession referendums) (see: EEAS, 2018; European Commission, 2018).

Switzerland is another founding member of EFTA (1960). The FTA between this country and EEC came into force in 1973. Till the beginning of 1990s, contractual relations between both partners have been regulated by this agreement (plus “evolutionary clauses”). However, Switzerland was among the first external partners of ECs, who took the perspective of creating the European Single Market very seriously. In 1986, Swiss government introduced a special rule on federal level, stating that all legal acts introduced in the country should be checked beforehand in regard with their accordance to the law of ECs. At the beginning of the 1990s Switzerland, similarly to other EFTA countries, engaged in negotiations concerning the establishment of EEA, and in May 1992 officially applied for full EU membership (see: DEA, 2018; EEAS, 2018; European Commission, 2018). However, in December 1992, the country was forced to withdraw an application after a negative outcome of referendum regarding Swiss membership in the EEA (Christin and Trechsel, 2002). Thus, Switzerland became the only EFTA member not participating in the EEA, which compelled the country to look for other legal solutions, that would enable its participation in the ESM. These solutions took the form of special agreements with European Union, which have been negotiated since 1998. The first package of seven bilateral agreements (so-called Bilateral 1) came into force in 2002 and applied to (i. a.): free movement of persons, technical barriers to trade, public procurement and transport. In these areas Switzerland adopted de facto the EU’s regulations. In appliance to the whole package of agreements, a special “guillotine clause” has been introduced. This clause states, that even if only one agreement from the package has been denounced by any party, the whole package becomes terminated. Such solution was supposed to guarantee a comprehensive treatment of the agreements’ package, which regulates selected areas of European Single Market. On the other hand, it can negatively influence future relations between EU and Switzerland (see below). In 2005, the second package of agreements (Bilateral 2) came into force, which applied to (i. a.): Swiss association with the Schengen-Dublin system, taxation of savings and fight against fraud. The guillotine clause has been applied only to the first agreement (Schengen-Dublin), which is thus treated as the eighth agreement of the first package. Switzerland became a member of the Schengen Area in 2008. Between 2004 and 2014 Switzerland has negotiated another seven separate agreements with EU, which relate not only to the area of ESM, but also to the areas of Justice and Home Affairs or Foreign and Security Policy.

As opposed to the case of Iceland and Norway, in case of Swiss relations with the EU, there are already specific issues, which can possibly harm these relations in the future. The first one is the character of these relations itself, which is based on successively negotiated bilateral agreements, without a regular institutional and legal mechanism that would be responsible for transposition of EU's law into the Swiss legislation (such mechanism is present within the frame of EEA). In 2012, European Council has announced that no further agreements with Switzerland will be negotiated, until a "new legal framework" (similar to the one existing within EEA) is implemented in bilateral relations. Unfortunately, in following years some events put the future of EU-Switzerland relations at stake. In 2014 Swiss citizens approved via referendum a new law, which envisioned an implementation of yearly immigration quotas for EU citizens wanting to work in Switzerland, and special preferences for Swiss citizens in employment. European Commission regarded both measures as being in total conflict with base rules of the ESM (free movement of persons) and threatened to use the "guillotine clause" in case of such law coming into force. Later, the EU also decided to exclude Swiss entities from EU's Horizon and Erasmus programmes (Mitchell, 2017). In December 2016, the federal government of Switzerland introduced regulations, which were meant to carry out the outcomes of the 2014 referendum. These regulations however turned out to be much more liberal than the provisions introduced in the original bill (BBC, 2016). In February 2017, Swiss citizens rejected in a referendum the last bilateral agreement with the EU (concerning company taxation laws). The abovementioned facts, but also other factors, both internal (specific political system of Switzerland) and external (immigration crisis) can lead to a conclusion, that in case of Switzerland the probability of loosening relations with the EU seems higher than the probability of an opposite process.

### 3. Relations Between EU and EFTA Countries – Economic Aspect

The analysis of relations between the EU and the three EFTA countries in the economic aspect will be based on four indicators: value of GDP, value of GDP *per capita*, value of trade in goods and geographical pattern of trade in goods.

In Table 1 below, values of first two indicators have been presented, both in absolute and relative dimensions: GDP (USD millions & % of combined GDP of EU-28) and GDP *per capita* (USD thousands & % of mean GDP *per capita* of EU-28).

**Table 1: GDP and GDP per Capita of Iceland, Norway, Switzerland and EU-28**

Entity	2005				2015			
	GDP		GDP/Cap		GDP		GDP/Cap	
	bln USD	% EU	ths USD	% EU	bln USD	% EU	ths USD	% EU
Iceland	16.7	0.12	55.7	211.3	16.8	0.10	50.5	166.0
Norway	308.7	2.14	66.6	253.0	386.6	2.37	74.3	244.3
Switzerland	407.6	2.82	55.0	208.7	670.7	4.11	81.4	267.8
EU-28	14 431	100	26.3	100	16 326	100	30.4	100

Source: Author, based on (IMF, 2017a); current prices, 2016 data weren't available

The economy of Iceland was much smaller than economies of other two EFTA countries in both analyzed years. GDP of Iceland did not exceed 17 bln USD (less than 0,1% of EU's GDP). Norwegian economy was much bigger (over 300 bln USD), equaling more than 2% of

EU's GDP. Definitely the biggest (and also the fastest growing) was the economy of Switzerland. The value of Swiss GDP in 2005 equaled almost 3% of EU's GDP, while in 2015 it was over 4%. If Switzerland was a member of the EU, in 2015 its economy would have been the seventh biggest economy in the organization.

The analysis of countries' economic development levels leads to different conclusions. In 2005, the most developed country of the group was Norway, with level of GDP *per capita* exceeding 250% of EU's mean. For both remaining countries, these levels were lower and similar (~210% of EU's mean). However, in 2015, the most developed country of the analyzed group was Switzerland, whose level of GDP *per capita* was close to 270% of EU's mean. Value for Norway was lower, slightly exceeding 240% of EU's mean. In case of Iceland, a visible, negative impact of the 2008-2010 crisis on country's economy could have been identified. The value of GDP *per capita* for this country in 2015 equaled only around 170% of EU's mean. Iceland was thus the only analyzed country, whose level of GDP *per capita* decreased in both absolute and relative dimension in analyzed period.

Table 2 below presents values of trade in goods between three analyzed countries and the EU in two dimensions: absolute (USD billions) and relative (share of EU in trade).

**Table 2: Exports (FOB) and Imports (CIF) of Iceland, Norway, Switzerland and EU-28**

Entity	2005				2016

For all three analyzed EFTA countries, EU was the most important trade partner. However, trade between these countries and EU has undergone some serious changes during the analyzed period. In 2005, the EU's share in the trade of all these countries exceeded 60% (in both directions). However, in 2016, only in case of Norway these shares were at similar levels (over 80% of export and around 65% of import, with sizeable surplus on Norway's side). In case of Iceland, EU's share in export did not change significantly (it remained around 75%), while the share in import decreased from 62% to 52%. These changes led to a significant change in balance sheet of Icelandic trade with EU: from deficit in 2005 to surplus in 2016. Even bigger changes (both in absolute and relative dimensions) occurred for Switzerland. This country, during analyzed period, has significantly increased the value of its trade with EU. That however, coincided with a decrease of the EU's share in Swiss trade: from 63% to 48% in case of export, and from 80% to 56% in case of import. In both analyzed years, Switzerland has noted a surplus in trade with EU.

In Table 3 below, geographical pattern of trade in goods between the three analyzed EFTA countries and the EU has been presented.

**Table 3: Geographical Pattern of Trade in Goods Between Iceland, Norway, Switzerland And EU (SITC Groups\*), in %**

\* Explanation of SITC groups: 0 – food and live animals, 1 – beverages and tobacco, 2 – crude materials, inedible, except fuels, 3 – mineral fuels, lubricants and related materials, 4 – animal and vegetable oils, fats and waxes, 5 – chemicals and related products, 6 – manufactured goods classified chiefly by material, 7 – machinery and transport equipment, 8 – miscellaneous manufactured articles, 9 – commodities and transactions not classified elsewhere

Source: Author, based on (Eurostat, 2018)

The pattern of trade in goods between the three EFTA countries and the EU did not change significantly in the analyzed period. In Iceland's export to the EU two groups have had the biggest share: 0 (fishery is one of the most important branches of the economy) and 6 (the country is an important producer of aluminum, thanks to cheap electric energy from geothermal sources). A thing worth mentioning is a visible decrease in the share of articles from group 0 in Icelandic export to EU between analyzed years, combined with a considerable increase in the share of articles from group 6. In Icelandic import from the EU, one group has had constantly the biggest share: machinery and transport equipment (group 7). In case of Norway, export to the EU was dominated by so-called "energetic products" (mineral fuels and their derivatives), and import from the EU – similarly as in Iceland – by machinery and transport equipment (group 7). The trade in goods between Switzerland and the EU however has had quite different pattern than in case of other two countries. For both directions of trade, groups with the biggest share were: chemicals (group 5), machinery and transport equipment (7), and miscellaneous manufactured articles (8). This fact can be used as a proof of generally intra-industrial character of trade between Switzerland and European Union.

#### 4. Conclusion

The analysis performed above, allows to draw some conclusions about current state of relations between European Union and three analyzed EFTA countries, as well as formulating an opinion about the future of these relations.

In relations between EU and Iceland, the most important factor appears to be a modest demographic and economic potential of the latter partner. Iceland is a small country, with economy dependant on export of only a few goods (fish, aluminum) and tourism<sup>4</sup>. Iceland was the only EFTA country, which reported a decrease in GDP *per capita* in the analyzed period. Country's authorities declare the will of leaving behind the old model of development, based on an (excessive) expansion of financial sector, which was considered as the most important factor responsible for the outburst of the 2008-2011 economic crisis (Dvoroková, 2014). However, analyzed data indicate that economic relations between Iceland and EU countries are somehow atypical in analyzed group, as evidenced by the exceptionally high shares of two SITC groups in Iceland's export to the EU: 0 (food) and 6 (low-processed industrial goods). In the event of another serious economic crisis, Iceland may be (again) forced to reconsider full accession to the European Union (and especially the Euro Zone). At the moment, two main factors hampering such potential process can be mentioned: the unwillingness to part with some of country's sovereignty, which is being reinforced by influential local economic and political groups, opposing the accession (Frankowski, 2011).

The most crucial issue in Norway-EU relations seems to be the dominant role of energy raw materials in Norwegian export to the EU and Norwegian economy. In the event of depletion of these raw materials' deposits, Norway will most likely be forced to reorient its economy into production of advanced, complex and internationally competitive goods and services. If not, maintaining the current, very high level of economic development and quality of life, which in most cases is connected to high price levels for the majority of goods (especially food), most likely will not be possible. The retention of high prices in Norway is in some part caused by the lack of full freedom in movement of agricultural and fishery products between Norway and EU. The inevitable changes, forced upon the Norwegian economy and society by depletion of energy raw materials, can possibly be mitigated in the event of acquiring full membership in the European Union. Such scenario would be even more probable, if the majority of European funds were redirected from "traditional" areas (common agriculture policy, supporting of less-developed regions) to the "modern" ones (industrial policy, new technologies, knowledge-based economy). According to many authors, such changes in European funds are inevitable in the near future.

Relations between the EU and the last analyzed EFTA country – Switzerland – are not only the most complex and interesting ones, but also the ones with the most worrisome looking future. Economic connections between both partners are very strong, but huge size and high level of development characterizing Swiss economy can lead to a conclusion, that further tightening of contractual relations with the EU does not necessarily have to be the priority for Switzerland in the future. However, the most important issue in bilateral relations seems to be the specificity of Swiss form of government and legal system (direct democracy, broad competences of regions), which is probably the main reason for special model of contractual relations between EU and Switzerland. This model is based on packages of agreements, which can be renounced in the event of a crisis in bilateral relations. Functioning of this model is already in a crisis, mostly on account of issues, which negatively affect intra-EU relations as well (free movement of persons, immigration crisis).

---

<sup>4</sup> In 2015, Iceland had been visited by over 260 thousands of foreign tourists (having only around 330 thousands of citizens). The income from tourism amounted to about a third of the whole income from export of services (Icelandic Tourist Board, 2017).

## Support of CCI in Slovakia and EU

**Kristína Baculáková**

Dolnozemska cesta 1, Bratislava, 852 35

Slovakia

e-mail: kristina.baculakova@euba.sk

### **Abstract**

*The paper deals with the problematic of cultural and creative industries (CCI) in Slovakia and EU. It describes current decentralized support of CCI and compares current situation to the previous programs. It analyses the centralized support on EU level and evaluate the goals that have been (or should have been) reached on national level since the creation of first supportive policies. Paper also analyses the new decentralized form of the support for entrepreneurs and offers a critical view on the status comparing to other European countries. In the end, it tries to reveal basic weaknesses and possible solutions for improvement. Although there's no specific policy to support CCI on supranational level, we strongly believe EU could create a basic framework, which could be helpful mainly for the member states, which are "new" in the process of creating CCI supportive policies.*

**Keywords:** cultural and creative industries, EU, IROP, Slovakia

**JEL Classification:** Z10, Z11, Z18

### **1. Introduction**

The term creative industries firstly appeared in Europe in the 90's in United Kingdom. The Department of Culture, Media and Sport in the UK did the complex mapping and created the concept of creative industries. UK was the first European country that adopted the policy for supporting the development of creative industries. In the 2010, the importance of creative industries was finally recognized by the EU with adoption of Green paper on Unlocking the potential of cultural and creative industries.

The changes in the support of cultural and creative industries (CCI) in Slovakia started about ten years ago. With the creation of the first policy papers, there was a belief that CCI will be recognized and supported on the national level. Some documents and studies were written, however, they only represented basic theoretical knowledge of some other EU states. The most important one – Action plan, was adopted only in 2015. Action plan represented 4 selected priorities to develop CCI in Slovakia – Effective system for management development, Quality of human resources, Increasing the absorption capacity of the market and Supporting instruments for funding. Theory should be implemented in the practise via IROP axis 3. The first call for non-repayable funds was announced in 2016. The projects are in the phase of evaluation, however, it is now quite clear, that many of them will be rejected. It seems now, that the call was not set properly. However, second call is about to be announced. Besides decentralized support for the entrepreneurs, Ministry of Culture prepared the call for the self-governing regions to build up creative centres. The centralized support should go hand-in-hand with the decentralized call. But what will be achieved in reality?

The support of CCI in Slovakia is based on the policies of the EU. Year 2010 was an important milestone in the process of recognition of CCI in the EU policies. EU adopted Green paper on Unlocking the potential of CCI (EC, 2010). Document states *“In order to be able to fully unleash their dual cultural and economic potential, taking full advantage of the abovementioned drivers, CCIs need an increased capacity for experimenting and innovating, access to the right mix of skills and access to funding.”* (EC, 2010). The paper strictly defines both terms – cultural industries and creative industries. Cultural industries are *“those industries producing and distributing goods or services which at the time they are developed are considered to have a specific attribute, use or purpose which embodies or conveys cultural expressions, irrespective of the commercial value they may have. Besides the traditional arts sectors (performing arts, visual arts, cultural heritage – including the public sector), they include film, DVD and video, television and radio, video games, new media, music, books and press. This concept is defined in relation to cultural expressions in the context of the 2005 UNESCO Convention on the protection and promotion of the diversity of cultural expressions.”* (EC, 2010). Creative industries are *those industries which use culture as an input and have a cultural dimension, although their outputs are mainly functional. They include architecture and design, which integrate creative elements into wider processes, as well as subsectors such as graphic design, fashion design or advertising.* (EC, 2010).

Some authors believe that the term creative industry is only the new replacement for the term cultural industries (Fojtiková, 2011). However, today this approach was overcome. Cultural industry is nowadays the essential part of the creative industry; we can also talk about so called cultural sector or cultural core of the creative industries. (KEA, 2006).

Besides Green paper on CCI, in 2014, EU adopted the new program Creative Europe. The main aim of the program is to promote European cultural and linguistic diversity and cultural heritage and promoting the competitiveness of Europe's cultural and creative industries sectors, the audio-visual sector, with a view to promote intelligence inclusive and sustainable growth is therefore directly linked to the Europe 2020 objective. (EUR-LEX, 2013). Worse availability of cultural services can cause an outflow of population from rural areas across the EU. (Harakaľová, 2017). CCI also increase cultural capital, which compensates social inequalities (Galanská, Krkošková, 2015). Creative Europe linked two separately existing programs, namely Culture and MEDIA. Creating one program group should better reflect individual problems of supported industries that are largely the same.

However, there is no specific policy regarding CCI on the supranational EU level. The competences in supporting CCI are strictly in the hands of the member states. For this, structural funds can be used. Also, there is no single definition of CCI among EU member states. Of course, EU uses its definition in the documents, but there is nothing like single definition adopted by all member countries. Therefore, it is quite hard to create functioning supporting scheme, since CCI sector has many specifics.

The status of CCI among EU member states is also very different. The concept of creative industries was in Europe firstly defined by United Kingdom, a pioneer in the CCI politics in EU. UK, Germany and France also belong to the best countries regarding the cluster analysis done according to the Florida's 3T theory (Baculáková, Grešš, 2015). The countries with almost no support and favourable condition are Bulgaria, Czech Republic, Greece, Croatia, Cyprus, Latvia, Lithuania, Hungary, Malta, Portugal, Romania and, sadly, Slovakia. (Baculáková, Grešš, 2015). However, even within the cluster, we see differences. Czech Republic is doing much better in creative clusters and centres than Slovakia (e.g. Brno has much more functioning concept than Bratislava has). Slovakia also belong to the moderate innovating countries (Lipková, 2012).

UK very often plays the role of know-how holder. Specialist often share their knowledge in the seminars across EU, but we believe, even the EU itself could create the platform of knowledge for the states, which are “new” in the adopting the concept of CCI.

## **2. CCI Status and Support in Slovakia and EU Countries**

We will demonstrate the status of CCI and its support on Slovakia, which belongs to the weakest cluster among EU. As mentioned in the beginning, there are some documents on CCI, which represent only theoretical basis about the concept. The documents are very general; we are missing qualitative and quantitative analysis (*Scope of the Creative Industry Development Strategy in the Slovak Republic, Report on the Status and Potential of the Creative Industry in Slovakia, Creative Industry Development Possibilities in Slovakia, Action plan, Innovative Slovakia – Scope and Challenges*). Without having a proper analysis on the status of CCI in the country, it is quite hard and risky to create conditions for support. There are also many other indicators on CCI – such a creative index. However, this indicator is based again on the data, which are not applicable in the all EU countries. For the initial analysis of the CCI status, the most important indicators are of course the share of CCI on country’s GDP, total employment and employment in each subsector as well as number of subject in the business. Only after analysing these basic macro indicators we can focus on the micro-level analysis.

On the national level, there is no statistic on the share of CCI on GDP or employment, which represents the most important indicator. The basic problem is that there is missing methodology on how to measure CCI. There are data on the number of specific subject in the CCI, such as museums, galleries, number of tickets sold, but no macro data. This problem is discussed in the creative community and even within academics for a long time.

We can get some overview on the employment in CCI and public expenditures on culture in the EU countries from the research of Stumpo and Manchin (2015):

**Table 1: Employment and Share of Public Expenditures in Culture in CCI**

<b>EU country</b>	<b>Employment in CCI</b>	<b>Public expenditures on culture</b>
<b>Austria</b>	1.57	3.1
<b>Belgium</b>	1.48	2.4
<b>Bulgaria</b>	1.30	3.9
<b>Croatia</b>	1.50	5.1
<b>Cyprus</b>	1.29	3.7

Source: Stumpo, G., Manchin, R. (2015), The resilience of employment in the Culture and Creative Sectors (CCSs) during the crisis

According to the research, the employment in CCI in Slovakia is on a very low level, compared to other countries. Even the public expenditures on culture are among the lowest. In 2016, Ministry of Culture allocated money from the IROP axis 3 (Integrated regional operational program) for the support of development of CCI. This year, new call will be announced – not only for decentralized support for entrepreneurs, but for the self-governing regions as well.

### 3. Centralized and Decentralized Support of CCI in Slovakia

Ministry of Culture prepared two supporting schemes – centralized for the self-governing regions, and decentralized for the entrepreneurs. The following table summarize the main aspects and differences of both schemes.

**Table 2: Centralized Support of CCI in Slovakia**

<b>Authorized applicant</b>	Self – governing regions (8)
<b>Targets</b>	To build one creative centre in each region
<b>KPI indicators</b>	Sustainability of creative centre +10 years after beginning of the activity  Sustainability of the working force

Source: author's own

The aim of the centralized support is to create one creative centre in each of the self-governing region in Slovakia. Region can cooperate with the city, which usually provides a suitable building for the project. Creative centre is therefore physical location, but by the nature of its activities it is also the virtual providers of services for the distant subjects. Creative centre involves spaces for rents, co – working spaces, ateliers, presentation spaces. Besides infrastructure for creative workers, the valued added of the centre is the consulting service (legal, economic, experience sharing etc.) (British Council, 2016). Creative centre is not the employer; it is just a platform or a space that should attract creative workers and entrepreneurs. Creative activities itself are provided by the creative workers – therefore, centralized and decentralized support should be connected together. Creative centre should be commercial, meaning that it should make profit.

**Table 3: Decentralized Support of CCI in Slovakia**

<b>Authorized applicant</b>	Natural person, legal entity, non-profit organisation, free occupation
<b>Targets</b>	Support of S&M enterprises  Support of employment in CCI
<b>KPI indicators</b>	Sustainability of the FTE created +3 years after the end of the project

Source: author's own

Decentralized support is aimed to support individual project of creative workers. Allocation for the support represents 31 mil. euro. The use of money is conditional for these activities:

- procurement of tangible and intangible assets;
- renovation works in connection with the acquisition of new technology (interior);
- support of marketing activities;
- space and technology rent;
- support of creative production. (Ministry of Culture, 2016).

The activities are restricted with percentage of the money – only 20 % of the money can be allocated in the reconstruction of infrastructure (since the aim of the projects is not the reconstruction itself, but the creative activity). Ministry also earmarks authorized sectors by NACE codes according to the methodology ESS-net culture. The CCI sectors include performing arts, music, audio-visual media, advertising, art crafts, cultural heritage, archives, libraries, literature and printed media. There are several criteria for the assessment of the project – formal, criteria of number of FTE created, the location of the project as well as the size of the enterprise.

Besides the good idea behind the supporting schemes, we can we can highlight several potential threats.

- decentralized support is very byrocratic. Formal criterion is one of the exclusion criterions, meaning that if project is not formally prepared, it will be excluded. It is aimed to help people working in the CCI, who are mostly free occupations, for them, to prepare such a project means to hire a company and pay a lot of money;
- the assessment of these projects is often dubious and non-transparent;
- centralized support should be more flexible at adjusting to the needs of each self-governing regions;
- there are some irrelevant criteria (such as minimum floor area of the building for reconstruction etc.);
- the evaluation criteria does not fit the nature of functioning of CII (FTE is not relevant in this case);
- the new call was postponed;
- too little time for preparation of the project;
- there is also strong link between Ministry and private agency that is providing training and preparing of the projects.

#### **4. Conclusion**

The support of CCI is now part of the EU programs. However, each member country has its own competence to support CCI. Some of them do not have enough experience. Therefore, we believe EU could be the source of knowledge. The biggest challenge is the access to relevant statistical data. There are some data available in the EUROSTAT database. But there is no consolidated account on creative industries. Therefore, each country is doing its own statistic. In the case of Slovakia, statistics is only in the process of preparation. This causes lot of problems, since the policy making is already several years in process, but we still do not have relevant statistical data on national level. It is therefore very hard to create proper measures because they do not come from the economic analysis, just the mapping of single creative sectors. Action plan is mentioning the method of ESS-net Culture, which is based on the single NACE codes of relevant industries. We believe this is the best way how to coordinate also the statistics on the supranational level. If there is one account on CCI in EU consisting of the

same NACE codes, the comparison between EU countries would be not only easier, but transparent and most important statistically correct.

We believe this could help to improve the process of policy making in the countries, which are new in the CCI phenomenon. Adoption of Creative Europe program helped to stimulate the discussion about CCI in Slovakia. Now, it is clear the CCI is not a short-term trend and if the country wants to adopt in the fast-changing global environment, creative industries are the sources of innovation potential.

However, until now, the goals haven't been reached. It took almost 10 years to create action plan for the development of CCI, however, this action plan haven't resulted in the policy adoption. Without any serious policy framework, Slovakia started the direct project support via IROP. It is clear now, that this support fails. Delayed is not just the evaluation of last year's projects, but the new call as well (initially planned in January, but not active until now). The centralized regional support is currently in the same state.

Regarding the competences in the policy making, we see two possible scenarios – first one is that EU will adopt framework on consolidated CCI account. Due to exclusive competencies it is highly unlikely that EU will adopt more specific supportive program than Creative Europe. However, common statistical methodology would be desired. This scenario is conditional to the perception of importance of CCI for the EU economy. (last mapping done in 2015 by EY). Second one is the status quo – each country adopting own policy and methodology. In this case, the differences in the CCI sector in the EU members states will continue to grow. Due to the different methodology, the comparison of data will be very difficult

### Abstract

*In the context of the European Union's interest in promoting entrepreneurial education and learning, entrepreneurial universities aim to be strong and innovative organizations able to provide effective and sustainable solutions for social and economic development, but without giving up on their traditional task of ensuring a high scientific education for young people. Our paper uses survey data gathered from 194 students at a Romanian university included in the framework of the Entrepreneurship University program and the strategic instrument HEInnovate, on 7 pillars. The analysis reveals a very strong correlation between the pillars "Leadership and Governance" and "Organisational Capacity: Funding, People and Incentives", and between "Knowledge Exchange and Collaboration" and "The Internationalised Institution", respectively. However, data indicates a "below average" performance in terms of innovation in this university from a country which itself is considered a modest innovator by EU reports on entrepreneurship and innovation.*

**Keywords:** EU entrepreneurial education, HEInnovate survey, University of Oradea, Romania

## 1. Introduction

EU objectives in the timeframe of 2020 and beyond highlight that building a dynamic, innovative enterprise sector focused on sustainable development, which would provide more and better jobs, can only be achieved by incorporating creativity, innovation and entrepreneurship into education, and especially among the younger generations (European Commission, 2012, p. 21). Entrepreneurial education enhances individual capacities to turn ideas into actions, stimulates creativity and risk-taking, and the ability to plan and manage projects. Through adequate entrepreneurial education, EU member states aim to improve young people's entrepreneurial attitudes, increase employers' skills, encourage the creation of innovative businesses, and increase the role of young generations and entrepreneurs in society and economy. A way by which universities can combine traditional teaching and research objectives with those of stimulating entrepreneurship among younger generations remains a considerable challenge. The objective of our paper is to highlight how options, positive attitudes, and the openness of students to a potential entrepreneurial career can generate an optimistic rhetoric that overshadows the modest achievements and cumbersome accommodation of (some) higher education institutions (HEIs) to the realities of a changing economy and society.

## 2. Literature Review

The social importance of HEIs as generators of knowledge and education is unanimously recognized, as one of the major roles of higher education being clearly meeting the socio-economic needs of the state and of the economic environment. For Central and Eastern Europe (CEE) countries education is a way of recovering the differences in competitiveness which separate them from the developed EU countries and even to reduce regional disparities within their own countries (Staničková, 2014). HEIs are thus linked to organizational entrepreneurship as an outlook applicable to all conditions and aspects of life that create and implement new ideas and ways to do things, pro-active regarding the uncertainty and complexity of the environment, and consequently, promoting change and development through enhancing the capacity to recognize and act upon new opportunities (Jameson and O'Donnell, 2015, p. 73) and (OECD and European Commission, 2012). As a result, HEIs are also involved in the development of entrepreneurial intentions and behaviour (Hannon, et al., 2005; Lüthje and Franke, 2003), “since the education offered by a university mostly influences the career selection of students, universities can be seen as potential sources of future entrepreneurs” (Turker and Selcuk, 2009, p. 144).

There is considerable literature on the positive relationship between entrepreneurial education, entrepreneurial intentions and the stimulation of business initiatives (Kolvereid, 1996; Wiklund, 1999; Lüthje and Franke, 2003). HEIs become true academic, competitive and adaptable enterprises, responsive to the changing needs of economic actors and society, supporting and improving partnerships with other stakeholders in society (Gibb and Hannon, 2006). If the entrepreneurial university dealt at first with the spread of knowledge regarding entrepreneurship, it has gradually expanded to the adoption of entrepreneurial spirit among university graduates and culminates in the inclusion of entrepreneurship at organizational and conceptual level, useful to all participating parties – including academic management.

There are also reserved opinions that support an unconvincing or even negative impact of entrepreneurial education on young generations (Oosterbeek, et al., 2010; Graevenitz, et al., 2010) a mismatch or even waste of educational investment which would severely affect the core functions and the efficiency of HEIs. These errors are likely to generate “university risks and a schizophrenic entrepreneurial divide within their institution” (Philpott, et al., 2011, p. 169), and judging HEIs on the basis of externally imposed indicators “without taking into an account the mission of HEIs makes an appropriate oversimplification” (Sedláček, 2014, p. 608). EU studies regarding the effects and impact of entrepreneurship programs in higher education mention that some academics consider entrepreneurship (understood as learning how to start and lead a business) an “endeavour [which would] be at odds with the general objectives of higher education institutions and, therefore, they are reluctant to engage in entrepreneurship education” (European Commission, 2012, p. 23).

There are numerous initiatives attempting to unify national strategies regarding entrepreneurial education within a European platform, through which the impact of this education may be measured in a European context and in terms of policies, not only to the level of disparate projects (European Commission, 2012). A number of studies and programmes evaluates, through different instruments and techniques, the short-term impact of entrepreneurial education on student, estimating both entrepreneurial cognitive competences (financial and strategic aptitudes manifested in role-plays, or designing business plans), as well as non-cognitive (Danish Foundation for Entrepreneurship, 2017), entrepreneurial skills, abilities and perception about a future entrepreneurial career (Badulescu and Dodescu, 2010). Among these instruments, used both on a European and an international level, we can mention: OctoSkills, Global Entrepreneurship Monitor, Entrepreneurial Skills Pass (ESP), Entre Intention,

LoopMe, Measurement Tool for Enterprise Education (MTEE) (Danish Foundation for Entrepreneurship, 2017), GUESS (Bartha and Gubik, 2017), and, finally, the one on which we will rely in our research, HEInnovate, developed by the EU and OECD (Ruskovaara and Pihkala, 2016; HEInnovate, 2014).

### 3. Problem Formulation and Methodology

The information presented in this paper was obtained analysing the "Entrepreneurship University" project organized by Junior Achievement Romania (hereinafter JA Romania). Thus, in October 2016, JA Romania launched a project dedicated to higher education institutions in Romania, HEInnovate, as a self-assessment tool for Romanian universities that wish to explore their entrepreneurial and innovation potential, allowing each university to assess its current situation, but especially to identify the main areas with potential for development based on seven dimension (pillars), included in the self-evaluation process, namely: 1) Leadership and Governance, 2) Organizational capacity, people and incentives, 3) Entrepreneurship development through teaching and learning, 4) Pathways for Entrepreneurs, 5) External relations for exchange of expertise, 6) Entrepreneurial HEI as an international institution, 7) Impact assessment. Each self-assessment area comprises roughly five or six statements in total (see Annexe: HEI self-assessment: The seven dimensions (pillars) and detailed statements). All pillars refer to entrepreneurship (either as groundwork for students' future career or as an objective of an entrepreneurial university), especially the pillars *II Organizational Capacity* or *III Teaching and Learning*. The self-assessment of the Faculty of Economics of the University of Oradea, Romania was carried out using an online questionnaire filled in by 195 persons, out of which: nine professors, two researchers, one administrative leader, and four external stakeholders, while the remaining 179 are students enrolled in the Faculty of Economics of the University of Oradea. Each person has to evaluate on a scale ranging from 1 to the maximum of 5 to what extent certain objectives followed by HEInnovate are achieved by this university. The methodology followed the HEInnovate requirements, including on-line data collection. In this respect, our sample of respondents is self-selected.

In the first part of our analyses we present the distribution of our subjects' responses regarding the 7 pillars of the model.

**Table 1: Description of Variables**

Scale	Alpha Cronbach	Missing cases	Items	Mean	Mean/item	Median	Standard Deviation
<b>I</b>	0.818	2	5	17.35	3.47	17	3.93
<b>II</b>	0.826	5	5	16.74	3.35	17	4.13
<b>III</b>	0.834	11	5	17.2	3.44	17	3.94
<b>IV</b>	0.888	21	6	20.23	3.37	20	5.32
<b>V</b>	0.853	5	5	16.98	3.40	17	4.1
<b>VI</b>	0.863	17	5	17.46	3.49	18	4.09
<b>VII</b>	0.893	16	6	20.65	3.44	21	5.07

Source: authors' calculation based on data-set

In Table 1 the Alpha Cronbach indicator shows a good consistency, with a value of over 0.8, giving us the guarantee that the items of our instrument measure the same construct. The similar results of averages made on the 7 pillars of the analysis tool indicate that the subjects rated the described characteristics (mostly) equally. Both average and median on the 7 pillars

analysed indicate a high degree of similarity of responses. However, for a more in-depth analysis of the responses to this questionnaire, we have proposed an analysis of the correlations that are established between the 7 pillars of our model, which can provide us with a more detailed description of how the respondents appreciate entrepreneurship and innovation in their higher education institution.

**Table 2: Correlations Between the Pillars**

		Correlations						
		I	II	III	IV	V	VI	VII
<b>I Leadership and Governance</b>	Pearson Correlation	1	.849**	.712**	.757**	.807**	.748**	.799**

<b>VII Measuring Impact</b>	Pearson Correlation	.799**	.796**	.755**	.815**	.847**	.773**	1
	Sig. (2-tailed)	0	0	0	0	0	0	
	N	177	174	176	166	175	172	178
**. Correlation is significant at the 0.01 level (2-tailed).								

Source: authors' calculation based on data-set

The analysis shows a very strong correlation between items that represent the linear relationship between two variables (Table 2). Although we have several correlations with values above 0.8, the highest correlation values occur in two cases in this analysis model. There

is a strong correlation between *Leadership and Governance* and *Organizational Capacity: Funding, people and incentives*, where the Pearson coefficient is 0.849. The second strongest correlation is between *Exchange of Experience* and *Collaboration and the Internationalized Institution*, with a Pearson coefficient of 0.847. A reasonable correlation, but minor in comparison to those mentioned above, of 0.655 is between the pillar *Teaching and Learning of Entrepreneurship notions* and *Internationalized Institution*. Of course, this minor difference between correlations does not allow us to assert that there are significant links between some of the pillars of our model. This model of correlations suggests that our participants appreciate as equally important all the components described by pillars.

### 3. Discussion

Although the results of the analysis, based on the HEInnovate study, seem encouraging at a glance, we are asking ourselves to what extent do they correspond to reports and studies of European and international institutions regarding performance in entrepreneurship and innovation. In a national context, Romania's profile in the entrepreneurship - innovation – competitiveness relation, there are obvious disparities. Compared to the EU average or ECE countries, the rates of *entrepreneurial efficiency*, *entrepreneurial employees* and *young business entrepreneurs* (based on Global Entrepreneurship Monitor's methodologies) are encouraging (Dézsi-Benyovszki, et al., 2014; Badulescu and Cadar, 2016). However, Romania is a modest innovator, probably the weakest in the EU, according to most indicators used by official reports as *Innovation Union Scoreboard 2017* (European Commission, 2017).

In the particular context of the studied university (the University of Oradea, henceforth UO) as a promoter of entrepreneurship and innovation, we notice obvious mismatches between the results of the HEInnovate study and official data. On one hand, the HEInnovate research highlights an agreement of over 66% with statements like “*HEI demonstrate active involvement in partnerships and relationships with a wide range of stakeholders*”, or “*HEI has strong links with business incubators, technology parks and other external initiative*”. On the other hand, according to the Romanian State Office for Inventions and Trademarks (OSIM) during 2007-2016 a number of 37 HEIs in Romania filed 1837 patent applications (OSIM, 2017), with an average of approximately 50 applications per HEI during this timeframe, but the share of UO (only 15 patents filed) is below 1% of the total. Moreover, UO is not one of the 15 HEIs which have signed partnerships with the State Office for Inventions and Trademarks in the field of Intellectual Property (OSIM, 2017). To sum up, UO is not actively taking part in any business incubators opened in the last 5 years and is a part of only 2 research and learning HUBs (JA Romania, 2017). In other words, although the perceptions and receptiveness of HEI staff and students for entrepreneurship achieve high scores and obvious correlations between specific indicators, the actual extent of the involvement of HEIs in competitive and innovative entrepreneurship is rather modest.

### 4. Conclusion

Perseverance in developing a system of high-quality entrepreneurial education involves an even better insight in the impact of entrepreneurial education on the younger generations. Somewhat surprisingly, until now there has been an insufficient amount of studies on the effects of entrepreneurial education, and these few were often modest in their objectives. In other cases, the optimistic results of these studies regarding the eagerness and positive outlook of students and university staff on the involvement of HEI in stimulating innovation and collaboration paint a distorted picture on the actual role of these institutions in the fields of

entrepreneurship and innovation. Our research of one Romanian university involved in the HEInnovate study developed by the EU and OECD highlights the positive attitudes and perceptions of entrepreneurship, and a strong correlation between pillars such as *Leadership and Governance* and *Organisational Capacity: Funding, People and Incentives*, and between *Knowledge Exchange and Collaboration* and *The Internationalised Institution*, respectively, as well as an active involvement of this HEI in partnerships and relationships with a wide range of stakeholders, strong links with business incubators, technology parks and other external initiative. Nevertheless, it is our intention to continue our analysis through other statistical methods in order to determine the particularities of the assessments done by the participants in our study. The analysis of official data shows a significantly more limited performance of the institution, in a national framework which it is itself considered 'modest' in EU reports on innovation and entrepreneurial competitiveness. The lack, at the level of the investigated university, of relevant data series regarding the number and share of graduates who have succeeded in entrepreneurial careers, the relatively small scale of this research, and caution in extending the results to a significant number of Romanian or EU universities can be considerable limitations to the generalisation of the deductions of our research. Probably, the sample composition (i.e. primarily students, according to HEInnovate guidelines, who are unfamiliar with organizational, strategic and cooperation issues) contributes to this "too" optimistic vision. Additionally, we consider that the reduction of the discrepancies between factual realities, on one hand, and attitudes and perceptions of the performance of HEIs presented in these studies, on the other hand, are a major challenge in understanding the role of HEIs in entrepreneurial education. Only in this way these institutions can achieve these aims - relevant knowledge and abilities, and an increase in the number of innovative and dynamic firms, prepared for the challenges of the contemporary economy.

## **Appendix: HEI self-assessment: The seven dimensions (pillars) and detailed statements**

### **I Leadership and Governance**

*IQ1 Entrepreneurship is a major part of the HEI's strategy.*

*IQ2 There is commitment at a high level to implementing the entrepreneurial agenda.*

*IQ3 There is a model in place for coordinating and integrating entrepreneurial activities across the HEI.*

*IQ4 The HEI encourages and supports faculties and units to act entrepreneurially.*

*IQ5 The HEI is a driving force for entrepreneurship and innovation in regional, social and community development.*

### **II Organisational Capacity: Funding, People and Incentives**

*IIQ1 Entrepreneurial objectives are supported by a wide range of sustainable funding and investment*

*IIQ2 The HEI has the capacity and culture to build new relationships and synergies across the institution.*

*IIQ3 The HEI is open to engaging and recruiting individuals with entrepreneurial attitudes, behaviour and experience.*

*IIQ4 The HEI invests in staff development to support its entrepreneurial agenda.*

*IIQ5 Incentives and rewards are given to staff who actively support the entrepreneurial agenda.*

### **III Entrepreneurial Teaching and Learning**

*IIIQ1 The HEI provides diverse formal learning opportunities to develop entrepreneurial mind-sets and skills.*

*IIIQ2 The HEI provides diverse informal learning opportunities and experiences to stimulate the development of entrepreneurial mind-sets and skills.*

*IIIQ3 The HEI validates entrepreneurial learning outcomes which drives the design and execution of the entrepreneurial*

*IIIQ4 The HEI co-designs and delivers the curriculum with external stakeholders.*

*IIIQ5 Results of entrepreneurship research are integrated into the entrepreneurial education offer.*

#### **IV Preparing and Supporting Entrepreneurs**

*IVQ1 The HEI increases awareness of the value of entrepreneurship and stimulates the entrepreneurial intentions of students, graduates and staff to start-up a business or venture.*

*IVQ2 The HEI supports its students, graduates and staff to move from idea generation to business creation.*

*IVQ3 Training is offered to assist students, graduates and staff in starting, running and growing a business.*

*IVQ4 Mentoring and other forms of personal development are offered by experienced individuals from academia or industry.*

*IVQ5 The HEI facilitates access to financing for its entrepreneurs.*

*IVQ6 The HEI offers or facilitates access to business incubation.*

#### **V Knowledge Exchange and Collaboration**

*VQ1 The HEI is committed to collaboration and knowledge exchange with industry, the public sector and society.*

*VQ2 The HEI demonstrates active involvement in partnerships and relationships with a wide range of stakeholders.*

*VQ3 The HEI has strong links with incubators, science parks and other external initiatives.*

*VQ4 The HEI provides opportunities for staff and students to take part in innovative activities with business / the external environment.*

*VQ5 The HEI integrates research, education and industry (wider community) activities to exploit new knowledge.*

#### **VI The Internationalised Institution**

*VIQ1 Internationalisation is an integral part of the HEI's entrepreneurial agenda.*

*VIQ2 The HEI explicitly supports the international mobility of its staff and students.*

*VIQ3 The HEI seeks and attracts international and entrepreneurial staff.*

*VIQ4 International perspectives are reflected in the HEI's approach to teaching.*

*VIQ5 The international dimension is reflected in the HEI's approach to research.*

#### **VII Measuring Impact**

*VIIQ1 The HEI regularly assesses the impact of its entrepreneurial agenda.*

*VIIQ2 The HEI regularly assesses how its personnel and resources support its entrepreneurial agenda.*

*VIIQ3 The HEI regularly assesses entrepreneurial teaching and learning across the institution.*

*VIIQ4 The HEI regularly assesses the impact of start-up support.*

*VIIQ5 The HEI regularly assesses knowledge exchange and collaboration.*

*VIIQ6 The HEI regularly assesses the institution's international activities in relation to its entrepreneurial agenda.*

### **Abstract**

*The Eastern Expansion of the EU was linked with institutional problems, but among other benefits, it has also enriched the Union with the historical integration lessons of the new Member States, since their expertise is not less valuable than the old ones. Bulgaria is among the newest members of the EU, and is not large in terms of territory or population. Nevertheless, due to its geographical location, the country's historic fate is to be an external border of Europe, a country located at the crossroad between The East and the West. That's why it's no surprise that Bulgaria has centuries-old experience of coexistence of ethnic groups with different culture and religion. Based on these preconditions, this report aims to examine the successful and unsuccessful models of integration in the newest history of the Bulgarian state. The analysis focuses on Bulgarian state policies towards minorities and in times of refugee waves, and on the reactions and changes in attitude of ordinary people. The intention of the authors is to offer this paper as publicly available knowledge that together with similar analyses of other member states could be beneficial for the development of a common model, which could face the problems of future European integration.*

**Keywords:** European crisis, integration model, migration, minorities, social inequality

### **1. Introduction**

Europe is in crisis. Whether we call it a crisis of identity, of values or institutions, the perception of a critical moment in the development of European integration is a growing groundswell among public discussions in all EU Member States. Regardless of the different national peculiarities and interests, the common goal of a united and stable European future suggests that no single member of the EU could separately solve the problems that are disrupting the foundations of the Union. Growing social inequalities, demographic stagnation and minority integration, are all issues requiring efforts of the whole European Union. While some authors argue that the European Community has successfully overcome many critical moments in its history (Tendera-Wlaszczuk, 2016), others emphasize that even if crises are not something new to the EU, they still have begun to come very quickly one after another, with some of them affecting the heart of the European integration process. (Koprinarov, 2016). Indeed, while the continent was still recovering from the financial crisis and the following recession, it was hit by one of the largest refugee waves since the end of the Second World War. Both the financial and refugee crises have exposed the institutional inability of the European Union and have questioned the basic principle of solidarity between member states. The deepening of regional disparities since 2008 has led Europeans to doubt the success of the

cohesion policy and the potential of the European project to provide welfare to all its ends. Regardless of the adoption of the so called European Agenda on Migration by the European Commission, up till now the European leadership has failed to come up with a comprehensive approach to deal with the refugee crisis, which is supported by the national authorities of all member states. On the contrary, we have witnessed uncoordinated solitary actions such as Germany's "Refugees welcome" in 2015 on one hand, and the open disagreement on refugee relocation schemes from individual Member States on the other. We can judge on the importance of the migration problem by seeing it eventually turn into one of the major topics of the British referendum on leaving the EU- the so called Brexit. And so, in spite of the optimism of the European elite, in 2016 European integration was reversed for the first time in history. And here comes the legitimate question: are we able to stop turning disintegration into a permanent process?

## 1.1 Origins of the Crisis

The current European crisis has two main dimensions.

The first dimension is political and concerns the growing absence of democracy in the European political system. European institutions are increasingly moving away from their citizens, who are in their turn losing interest in participating in the political processes. An obvious manifestation of this apathy is the ever lower activity in European parliamentary elections and the rise of Euroscepticism throughout the continent. In 1979, the turnout in the European elections was 62% and in all subsequent elections the activity was reduced by 2 to 5% (Koprinarov, 2016). European citizens have an increased sense that their voice is not heard in Brussels. That instead of looking after the interests of taxpayers and voters, their representatives in the European Parliament serve lobbyists and large corporations.

The second dimension is economic and is rooted in the deepening social inequality in Europe. With the exception of the wars for the Yugoslavian heritage, the European Union has so far achieved its goal of preventing large-scale military conflicts on the European continent. It didn't do so well with another main goal, that of achieving prosperity for its citizens. There are large social disproportions even in the regions of individual countries, major differences between member states, but the real imbalances are between centre and periphery. For example, according to Eurostat figures of 2018, the difference between the lowest and the highest minimum wage in the EU is almost 8 times (Eurostat, 2018). Such differences cannot be ignored because they affect the overall competitiveness of the European economy (Kyjonková, 2014). In 2017 there was a widespread public debate in several European countries about the lower quality of a number of consumer products in the new Member States, compared to same products in their richer neighbour countries. These are just some of the reasons why some researchers claim that Multi-speed Europe is now a fact and the segmentation of the European Union is not temporary but a permanent state (Tendera-Wlaszczuk, 2016).

### 1.1.1 Main Challenges- Climate Change, Demographic Issues and Migration

Why is cohesion so important to the future of European integration? Well, on one hand cohesion is often related to the existence of harmonious relations between social groups. (Kyjonková, 2014). On the other, larger income gaps lead to deteriorations in social relations, human capital and health (Wilkinson, Pickett, 2009). In other words, in unequal societies we are lot less likely to help each other and trust those we consider alien. And as mentioned before, the challenges, that we Europeans are now facing, require the effort of all.

Despite living in Europe without major conflicts and in relative prosperity for more than half a century, we are not witnessing a golden age of ascent of the European civilization, but on the contrary we are observing times of unprecedented demographic decline, especially for the countries in Eastern Europe. Projections for the future are even more pessimistic, with the EU population expected to decline by more than 30 million by 2050, with an expected migration from the outside of almost the same figures (Manov, 2015). This means that according to estimates even the upcoming migratory pressure is not able to offset the demographic stagnation in the union. Demographic projections for the same period are showing that the African continent is expected to double its population, from 1186 million to 2 467 million. (Manov, 2015).

Climate change impact projections are even less reassuring. In Africa, there is already a serious shortage of resources for the growing population of the continent, especially for drinking water and irrigation. In fact, the civil war in Syria was preceded by a severe 5-year drought that led to serious problems with feeding the rural population and served as a catalyser for dissatisfaction with the Bashar Assad regime (Balabanov, 2017). The expected increase in the average annual temperatures in West Africa, as a result of climate change, accompanied by decrease of rainfall, will undoubtedly lead to even greater water shortages for its rapidly growing population, and also to more soil erosion and less arable land. As a result we will have a very strong pushing factor for new waves of migration from Africa and the Middle East to Europe (Koprinarov, 2016).

## **2. Problem Formulation and Methodology**

From our analysis until now, it is clear that in the near or far European future we are going to face more and more refugee waves. And the clear distinction between refugees, economic or climate migrants will become more and more difficult. How do we deal with the problems of current and forthcoming migration waves so that the pillars of EU- integration are not shaken and social peace on the continent is not threatened? In order to answer that question, we need to analyse the historical integration expertise of people with different culture and religion within individual member states, the fears and positive emotions that the European refugee crisis has caused among European citizens. This paper aims to analyse the integration lessons in the newest history of the Bulgarian state, focusing mainly on Muslim minorities, to display some of the good and bad practices and to produce reform suggestions. Because of what we have seen so far, it seems that we are not fit for the task. Otherwise how could we explain the widespread impression that instead of exposing and fighting the real causes for the ongoing migration tragedy, Europe is instead spending billions on the consequences of those processes? (Pachkova, 2015).

### ***2.1 Model and Data***

The authors have used data collected mainly by two empirical national representative researches: First by the Alfa research agency: "Attitudes of the Muslims in Bulgaria – 2016", and second by the Sova Harris agency: "Influence of the migrant's crisis to the Bulgarian society and Bulgarian policy: Fear, not hatred ". Both researches pointed out specific characteristics of the two large linguistic subgroups for the period of five years (2011-2016). The main conclusion is that considerable changes of attitudes and social status of the Muslim community in Bulgaria have not been made. Generally concerning the Bulgarian model of Muslim's integration, the authors identify that an attention is necessary to be paid to a certain

tendency of alienation to the Bulgarian state, which is more visible among the Muslims living in ghettos as well as among the Bulgarian Muslims (Pomaks).

### **3. Problem Solution**

#### ***3.1 Positive and Negative Trends of the Muslim Minorities' Integration from 1949 Till the Outbreak of the Refugee Crisis***

The data of the last census shows that the Muslim community in Bulgaria consists of different "sub-groups". The Muslim community in Bulgaria is the largest religious minority group in the country; it has remained within the boundaries of the Bulgarian state after the country's liberation from Ottoman rule in the second half of 19th century. Bulgarian Muslims are largely native-born and consist of different ethnicities such as Turks, Pomaks, Roma, Tatars, Cherkess, and Bulgarians. A small percentage of Muslims (about 15,000 people) are immigrants from other Muslim countries (Middle-East and Asia diasporas), who have settled mainly in the capital Sofia and the city of Plovdiv. The Turkish community is mainly the result of the Ottoman occupation of the country, lasting more than five centuries (from the end of the 14th century until 1878), and is concentrated in the South-West and the North-East of the country. Bulgarian Turks are in majority Sunnites and their mother language is the Turkish. The Pomak minority, also called Bulgarian Muslims, are considered to as Bulgarians who have been Islamized during the Ottoman occupation.

That is why on the one hand- Bulgaria has a large Bulgarian national majority, on the other a great mix of population- the two opposite characteristics describing the ethno cultural situation in the country. Many experts would say that it is the typical result of five centuries of coexistence between the Islamic and Christian civilization, which is present in the whole region.

Then, is it possible to have a particular model of integration only for Bulgaria? To answer this question is necessary to make a short historical research of the Bulgarian ethnic policies under and after socialist rule.

##### ***3.1.1 Historical Specifics of Integration Policy in Bulgaria***

During the five decades of socialist rule, there have been a multitude of policies towards the ethnic minorities. To simplify, they could be divided in three principal trends- recognition, integration and assimilation. (Nova, 2016). The first years of Socialism (1944-1955), were characterized by a common desire for emancipation, covering the whole civil society. It was the promise of the end of all dominations, including the one of the majority. In this particular context, the Bulgarian society opened to multiculturalism, and many initiatives, who encouraged recognition of cultural identities were settled. Theatres, media's, schools for minorities flourished everywhere, some even financed by the State. Measures of positive action have been also taken, and in the perspective of a future "Balkan federation", even the existence of a Macedonian identity was recognised. However, even if short, this period of "cultural recognition", was limited mainly to the ethnical recognition, not the religious' one. Though socialist rule changed its ethnic policies several times policies, religions – for the majority or the minorities- were all denied (Stancheva, 2002).

The second trend was the "integration period", which aimed to mobilize the society around a common identity, with no particular distinction of ethnic origins. The stress was put on the "society" and not the community, which had to be modernized through the Communist Party to ensure the development of the new "citizen". Illiteracy was almost totally eradicated and nomad communities settled down in towns to enjoy the benefits of modernity. This policy is

comparative to the French republican project, trying to unify the civil society around a political and social ideal (Krasteva, 2003).

The third policy was the “assimilation period”- the most radical one. Since 1958, the Communist Party hardened its attitude towards minorities, denying the Macedonian identity and closing all culturally connoted entities. There were still positive trends towards minorities in this period like quota for easy acceptance of Bulgarian Muslims at the universities, and accommodation in state owned apartment houses even for the gypsy minorities. The rapid and comprehensive industrialization of the country led to almost zero unemployment and eradicated extreme poverty. But in general this period was characterized by severe violation of the minorities’ rights, and also a general restriction of the civil rights of the majority. The most dramatic episode occurred from December 1984 to March 1985, when the Communist authorities launched an assimilation campaign against the Muslim minority in the country, aimed at the overt change of their identity and their ultimate “Bulgarisation”. This campaign, known as the “Revival process”, lasted until the autumn of 1989 and was admittedly considered among the main reasons for the fall of the communist government. It faced great and originally unexpected resistance of the Muslim communities, with many accidents and even deaths to deplore. Still today, the real reasons for this violent assimilation program, as well as the exact authors of the policy have not been cleared up.

But what doesn’t suffer any doubts, is that with the forced change of the Turkish names (even names of death people) the Communist party denied completely the notion of “private sphere”. Indeed, if something so personal and private as “names” could be easily changed by the government, nothing was left unattainable for the power. People were thus seen as “subjects” and not “citizens”, their identities and cultural belonging being shaped by the state (Krasteva, 2003, p. 160). This last wave of violence against the Turkish community caused in 1989 a massive exodus of more than 350 000 Bulgarian Muslims fleeing to Turkey, described as one of the largest migration since the end of the Second World War and strongly condemned by the international community. Though half of them returned to Bulgaria after the fall of the regime, this event provoked many tensions between the majority (suffering from a feeling of collective guiltiness), the government and the Turkish minority; accelerating the forming of the opposition (Barouh, 2001).

The 10th November 1989 signed the end of socialist rule. As consequence the country entered a long process of transition and democratisation, with major change in the political, economic and social spheres. First of all, it marked the beginning of a multi-plural political system, with the binary opposition between the “Reds” (former Communists) and the “Blues” (first a coalition of opposition, then the democratic party), as well as the appearance of a third actor- the MRF (Movement for Rights and Freedom), a party that set its main goal in defending the rights of the national minorities. Under the pressure of the public opinion and the international community, the new leadership of the socialist party was forced to “deny publicly” the “Revival process”. But there were also negative trends. Industrialization was replaced by deindustrialization. The lack of enterprises, the lack of jobs have driven big parts of the Bulgarian population in the group of so called “unnecessary people”. This was a result of educational degradation – educational decrease of the greatest part of the Bulgarian population, especially ethnic minority, returning to the eradicated illiteracy”. (Pachkova 2015)

Stigmatized as anti-Bulgarian for most of the transition period the MRF has played a major role in keeping the ethnic peace in Bulgaria. It gave Turkish and Muslim minorities its own political representation. Until now, the party has subtly managed to avoid political internal crises and always been well represented in the elections.

Globally, the strategy of the MRF aimed to ensure the loyalty of its voters on the communitarian base, trying on the same time to go beyond the unique “Turkish-identity” label. The ideological discourse justified mainly the pragmatic decisions of the party, which after 1992, supported the Socialist party (from 1993 to 1996), then the United Democratic Forces (from 1996 to 2001). On the same time, after 1996, the Party established a centrist position, in order to interfere in the binary logic of “communist-anti-Communist” parties, having the ability to form alliances with both sides (Ragaru, 2003).

The only real risk MRF can face is the disillusionment of its voters “who have reacted very positively until now” (Alfa research survey, 2016), becoming a more “traditional” party. It will not be able to hide behind the pretext of limited powers (because of its non-participation to the government) to justify his achievements.

### *3.1.2. Bulgaria as a Model for “Multi-cultural” State Policy Integration or Not?*

The main demands, expressed by the Muslim minorities have been dealt with in terms of political and not cultural rights, which avoided resentment on the part of the majority. But the positive effects the MRF has had over the consolidation of the Bulgarian democracy are counterbalanced by some less positive effects. The attitude towards other minorities is not the same, not all the minorities are treated as the Muslim have been, the process is extremely long, and needs mainly a change of mentality. The adoption of the National Framework for the Integration of the Roma in 1999 has led to a successful dialogue between the Roma and the Bulgarian government, and recently a Council on Ethnic and Demographic questions has been created. But this was just the beginning and the real implantation of the anti-discriminative measures will show what it is really worthy. In reality the situation is far from being perfect. Socio-economic distortions between majority and minority are flagrant, and even as a member of the European Union, Bulgaria remains one of the poorest countries in Europe. But furthermore, there are some really positive characteristics of the Bulgarian society acting for the country’s stability. First of all, the role of the “elites”. Having never had a strong civil society, the elites were the only ones to decide for the main direction of the transition. On the other hand, the still fresh memory of the Communist effort to assimilate the Turkish community at the end of the 80’s has contributed that the main political debate in 1989 turned around minority issues. Till this moment almost all parties in Bulgaria have shown evolution to more tolerance and real respect for minorities, the National Movement for Simeon II even invited representatives of the minority to enter the government (Kratseva, 2003). MRF’s role is becoming a model that other minority communities are trying to follow.

After considering the country’s view of ethnical groups, with mainly the Turkish community; and the policies towards them before and after Communism, we have to pronounce that the model isn’t simply in fact the Bulgarian “experience”. A model would need to deliver successful reconciliation, protect ethnicity and integrate all groups into the national community. Some good practises need to be observed in the political integration of the Muslim community, but social and economic differences still remain. And the exclusion of the Roma community, with growing racism all over Central and Eastern Europe is one of the big challenges for the respective authorities. If the problem is not dealt soon, the situation can become explosive, playing in favour of extremist parties. To counterbalance this phenomenon, an integrated approach, followed by appropriate legislation, strong implementation and clear information campaigns could help change the public mentality. The Bulgarian experience has shown that not every conflict in the Balkan irremediably leads to violence; moreover, there is no particular model to follow and every critical situation has to find its particular solution. Something very important in the Bulgarian “experience” of Muslim integration is the neighbourhood. Neighbourhood, as a universal social network of everyday practices, is able

to compensate for some of the tensions, but its influence remains confined within the framework of a contradiction in mass consciousness – the contradiction between a positive attitude to the neighbour who is of a certain religious confession and, at the same time, suspicion with regard to that religious community as a whole (Bosakov, 2010).

### ***3.1 Impact of the European Migration Crisis on the Bulgarian Society- Positive and Negative Lessons***

According to official Eurostat data from the third quarter of 2017, the number of first time asylum seekers from non-EU countries in the EU-28 sank back to the levels recorded in 2014, before the 2015 peak. Trends for destination countries remain the same, with Germany still remaining most preferred, with almost a third of all asylum applications, followed by Italy, France and Greece. At the other extreme, Bulgaria is one of the Member States with the largest drop in asylum applications compared to previous years. (Eurostat, 2017).

Drop rates for the Bulgarian state are high, but the base is generally low. Indeed, despite the fact that Bulgaria is an external border of the EU, the state as a whole was left aside from the main migratory flows and is mainly used a transit corridor for legal and illegal migration to Western Europe. Several factors contribute to this. First of all, Bulgaria and Romania are not Schengen members, so there is no possibility of moving from Greece to Western Europe without leaving the Schengen zone (Kyuchukov, 2016). Secondly, according to the so-called Dublin Regulation, all refugees, who are first registered in Bulgaria must remain in the country. If any of them manage to illegally reach another EU country, local authorities must send them back to Bulgaria, which is why many arrivals prefer to cross illegally Bulgaria in order not to be registered there (ClubZ, 2015). But perhaps the most important factor is, that in the information society era, even the fleeing from war have a vague idea that in the poorest country of Europe conditions for accommodation and nutrition, and especially for future integration are far from promising.

Despite the generally low levels of asylum seekers in the country during the peaks of the crisis, recent analyses show that Bulgarians have generally cultivated the attitude of seeing refugees as a threat, almost as a form of conquest, which could flood the depopulated from demographic problems territory at any time. This was partly accounted for by the mass media coverage of the incidents accompanying the main migratory flow and that of the frequent terrorist attacks in many European countries, carried out by young Muslims. Political and public speaking in the country also focused on the refugee crisis as a national security problem and a citizen's threat at the expense of the humanitarian side of the issue, thus also contributing to the formation of anti-refugee moods. Last but not least, public statements of the institutions over the period were divergent, often inadequately consistent, giving the impression of a lack of clear vision of the long-term solution to the problem (Kyuchukov, 2016).

Based on all these factors, several analyses and studies draw the following conclusions on the impact of the refugee crisis in Bulgaria:

- For the majority of Bulgarians (60%), refugees are a threat to national security (Kyuchukov, 2016: Sova Harris).
- 66% of the Bulgarians would not live in the same block entrance with a refugee and 59% don't want Gypsies as their neighbours (ClubZ, 2017: Trend).
- Nearly 5% of the people perceive refugees as a threat to themselves and say they hate foreigners (Kyuchukov, 2016: Sova Harris).

- 81% do not want to live next to a refugee camp (Capital, 2016: Alpha Research).
- 54% disagree, that Bulgaria should accept the respective quota of refugees, according to EU decisions (Kyuchukov, 2016: Sova Harris)
- 28% believe the EU should help refugees seeking asylum across Europe (Kyuchukov, 2016: Sova Harris).
- 76.3% are ready to help refugees with clothes or money (Capital, 2016: Alpha Research)
- 81% say yes to building of a system to select refugees outside the EU to obtain permission to enter its borders (Kyuchukov, 2016: Sova Harris)
- 49% of people believe that the most significant obstacle to the integration of refugees is the economic and social state of the Bulgarian state. (Kyuchukov, 2016: Sova Harris)
- 39% consider the integration of refugees to be impossible mainly because they have a different culture and religion and could not, in principle, integrate into our conditions. (Kyuchukov, 2016: Sova Harris)
- 57% share the view that the solution to the problem of refugees should be common to all countries within the EU (Kyuchukov, 2016: Sova Harris)

What can we learn from the Bulgarian experience? Although overall attitudes towards refugees are negative, some positive conclusions can still be drawn. First, despite the apparent inability of the European institutions to cope with the magnitude of the crisis, most Bulgarians are not in favour of a solution to the crisis, that would fit only Bulgarian national interests, but rather a common solution to the refugee problem, suitable for the whole Union. Regardless of the divergent and unclear signals from the state institutions and despite the repeated attempts to use the refugee crisis as an instrument for domestic policy purposes, in practice, Bulgaria adheres to a sufficiently consistent and pragmatic line of action on the refugee crisis. (Kyuchukov, 2016). Several consecutive Bulgarian governments after 2013 stand for a practically unified philosophy on one of the most complex and controversial elements of the crisis management measures - the construction of a protective wall along the Bulgarian-Turkish border. Bulgaria has been identified as one of the first countries to have built a similar facility at the EU's external borders without being a member of Schengen, at the same time refusing to do so at the internal EU border, between Bulgaria and Greece - despite strong domestic political and social pressure to do so (Kyuchukov, 2016). Which is again in line with the generally declared approach of the authorities to search for pan-European solutions, supported by the majority of Bulgarian citizens.

Secondly, a great number of Bulgarian citizens are willing to help refugees, and see obstacles to do so, not so much in the different ethnic and cultural identity, but in the inability of the Bulgarian state to provide suitable conditions for their accommodation and to solve the social and economic problems in their future integration into society. That is why we shouldn't be surprised that the Bulgarians are strongly opposed to the quota principle for the displacement of refugees, which the European Commission is trying to impose, but prefer the building of a system to select refugees outside the EU, "in strict control, new rules and clear conditions" (Kyuchukov, 2016).

#### **4. Conclusion**

As already mentioned, the current European crisis has two main dimensions: political and economic. Whether we take Spengler's pessimistic analysis of an ongoing decline of the

European civilization for granted or not, it is clear that external factors alone, such as the financial crisis brought by America or African migratory waves, cannot lead to a decline of the European Union if it is not previously shaken on the inside. United Europe is obliged to help those in distress who see it as their only hope for survival, not only due to of the humanitarian values on which it was constructed. But because through its consumerist way of existence, dating back to the colonial past and continuing to present, is to no lesser extent responsible for depriving the African continent of valuable resources without which the future of its growing population is doomed to conflict and misery. Last but not least, also because Europe took active participation, including by military, in the destabilization of migratory barrier states like Iraq, Libya, Syria, Tunisia, Egypt and others (Manov, 2015).

If we all Europeans should have a shared responsibility, so we should also exchange experiences on crisis management, positive or negative ones. From the latest Bulgarian history we can learn that the integration of minorities or migrants cannot be solved successfully when only economic issues are tackled without affecting political ones or vice versa. For example, in most of the socialist period a high quality of life was ensured for Bulgarian national minorities, through accessible and quality education, healthcare, recreation and professional development. But at the same time, they were deprived of political rights and representation, and subjected to violent and short-sighted assimilation, which ultimately led to building of enormous social tensions. During the so-called transition to democracy and market economy, Bulgarian Muslims and Roma received political rights and representation, but with the exception of a small elite, they fell into illiteracy, which led to unemployment and marginalization. The high social costs that the Bulgarian state is forced to spend on the day to day survival of minorities, especially the Roma, are a fruitful ground to fuel xenophobic moods and social conflicts. This can explain the negative attitude of the majority of Bulgarians towards refugees, seeing in them only new communities of which the state will have to take care of.

Interpreting the brilliant British historian Arnold Toynbee, we can conclude that crises are not necessarily something devastating (Bogomilova, 2016). On the contrary, according to Toynbee, finding successful responses to crises like the present ones is basic precondition for the continuous ascent of the European civilization. Similar to this, some authors state, that in response to crises, communities often decide to move to a higher level of integration. (Tendera-Wlaszczuk, 2016).

In order to deepen European integration, it is necessary to find an appropriate response to the political and economic challenges that we are facing. For crisis solving Toynbee calls upon creative personalities, similar to him Lev Gummiyov relies on "passionary" leaders (Manov, 2016). From the unsuccessful responses to the recent crises, it is clear that we can not only rely on the creativity of the Brussels government and administration. We need the passionate creativity of the whole European population, old and new member states alike, and future ones also. In order to involve as many European citizens as possible in the political processes, Europe needs further democratisation, drawing on the consensus of all its inhabitants, which at the same time would not threaten the autonomy of individual nation-states. (Nenička, 2016). After all, who knows, maybe some of the passionary creative people that we need, are among today's migrants and refugees.

### **Abstract**

*The development on the global commodity markets is influenced by the expansion of Chinese companies. On the import side, they have a decisive impact on the many input raw material prices, and on the export side, PRC applies its domestic comparative advantages and economic strategy supporting the export of domestic production. It concerns the labour cost, energy cost, transportation costs and many other forms of support. As the essential part of its growth strategy, the European Union supports own energy safety, focused especially on efficient use of renewable energy sources. This involves a significant increase of costs and more complex conditions of its use. For these reasons, the European industry is losing its competitiveness and is being pushed out of domestic as well as international markets. The aim of this paper is to study the above stated connections and based on an international comparison of production conditions in the steel industry identify the competitive (dis)advantages of the EU in this segment and formulate the authors' statements concerning the future of this sector in its industry.*

### **1. Introduction**

The world economy, which is under the pressure of globalisation, has been constantly showing large-scale changes in its functioning. This applies to all its territorial segments and commodity components as well as the intensity of international exchange. When only assessing the last decade of its development robustly affected by the international financial crisis and its consequences, it is evident that the rate of its interdependence on China's economic development had grown not only in terms of export-import flows of goods and services, but it also significantly affected the commodity markets themselves. It was not prepared for changes in demand for inputs required by the primary sector, and therefore, as a matter of course, the further development had a significant impact not only on the prices of such commodities and the conditions of their supply, but also on the direction and intensity of the territorial flows, which had a major impact on international markets. P. Krugman (6) in 1994 warned of the possible risks of a development in which the Asian economy would increasingly prevail, adding that: „*The extraordinary record of economic growth in East Asia has powerfully influenced the conventional wisdom about both economic policy and geopolitics. Its success demonstrate three prepositions: major diffusion of world technology in progress, the world's economic gravity is shifted to Asia and that the superiority of these economies works with fewer civil liberties and more planning than the west have been willing to accept.*“ It did not take the consequences of such direction of the Chinese economy a long time to manifest

themselves. In 2009, China became the world's largest exporter of goods, and in 2015, it also outstripped the United States in terms of the total volume of GDP generated (in terms of purchasing power parity).

The process of inversion in the international positions of the United States and China was accompanied by a similar trend in the inflow and outflow of foreign direct investments (FDIs), where China, together with its satellites Hong Kong, Singapore and Taiwan (the so-called Greater China) also became dominant. However, the territorial direction of FDIs was different from its major export-import flows. While their inflows chiefly from multinational corporations took advantage mainly of cheap labour, then after 2010, the production and export of products with higher value added began to predominate quickly. China's investment outflows were strategically different. Even in 2000, it was a net exporter, for example, of oil and coal and exported electricity. However, the rapidly growing production required increasingly greater supplies of these and other raw materials. Therefore, the expansion of Chinese state-owned companies to Angola, Tanzania, Sudan, Venezuela, Colombia and Brazil, etc., was aimed at acquiring and using new extraction capacities to effectively cover the growing domestic demand. In the last decade, the Chinese demand "sucked" half of the world's exports of coal and iron, but China quickly became the world's largest consumer of, for example, copper, aluminium, zinc, coltan, lithium, gold and silver (Baláz, 2012). Its rapidly growing imports of oil and energy commodities offset, to some extent, the declining supplies to the United States, which triggered a wave of euphoria on commodity exchanges and ultimately increased demand for mining and transport capacities, but in a relatively short period of time China began to produce them itself (Baláz, 2010).

The economic growth of China, which had exceeded 10% per year on average over the past three decades, was primarily the result of the huge development of capacities in the primary industry. In this context, Y. Wu (12) confirmed that primarily fixed investments served as a decisive factor in China's economic growth: *„There is no doubt that the high fixed investment over 50 % of GDP had made substantial contribution to China's GDP growth over the past three decades. In comparison with other major economies in the world, China's domestic consumption accounts for a relatively small share of GDP.”* It is clear that the domestic consumption in China is determined by the income level of its population and the low level of wages that did not allow it to grow (Wu, 2009). The supporting structure of the first stage of this unique economic growth was the Chinese steel industry. Its enormous capacity was used to implement grandiose programs in the field of the construction of new transport infrastructure, motorways, railroads, unique bridges, airports, flats or administrative buildings. In the last decade, the Chinese industry covered half of its global consumption. This was associated with the huge consumption of coal and coke, including electricity, the import of which accounted for almost half of their import on a global scale. As long as this production was only consumed to ensure its dynamic development. Disproportions in international markets predominantly related to fuel prices, notably oil, gas, precious metals, copper, or the deepening of trade deficits in the exchange of goods (Fojtíková, 2014).

After 2011, it seemed that both the U.S. and the EU had already adapted to the unfavourable consequences of the international financial crisis and restored their economic progress, due to which it was expected that the international equilibrium in the global commodity markets would be restored. The Chinese economy also contributed to this as its growth rate declined slightly and its foreign trade results and domestic consumption growth opened up new opportunities for both European and American exporters. At the end of 2014, it turned out that the whole recovery process was fragile and risky. First the US Federal reserves (FED) and later the unitary European Central Bank (ECB), resorted to quantitative easing and "pouring" billions of dollars into their economies in order to maintain a certain positive growth trend. In

2016, some economic stabilisation came about, but the cyclical risks in international financial and commodity markets remained. The crucial role was played by the Chinese economy, but a decline in its economic growth as a natural expression of the end of the stage of its own industrialisation and the resulting changes in the structure of internal consumption were reflected in lower demand in commodity markets. This resulted in a sharp fall in the prices of most raw materials and semi-fabrics. For instance, the price of coking coal dropped from about \$200 to less than \$50 per metric ton; and the same happened to iron scrap and metals. This was a disaster for their largest exporters. Just for that reason, Australia' GDP and that of Indonesia decreased by 2% and 1%, respectively, in 2015. In the first half of 2016, imports of coal from the US declined by 60% on a year-over-year basis, imports from Canada by 46%, and imports from Russia by 26% (WSA, 2017). This trend has had a far-reaching impact on the entire steel trade, and also "rolled out" into the other segments of the world economy. The increase of exports of steel products, by which Chinese companies responded to a decline in the domestic demand, taking advantage of the low costs of labour, energy and coal, triggered off panic on both sides of the Atlantic. The introduction of anti-dumping measures evoked by the European steel producers - Eurofer or the US State Administration proved to be ineffective. On the other hand, they induced the introduction of similar protective measures against the whole range of products imported to China from the EU or the United States. And although there is no doubt that it is a "vicious circle" of connections and dependencies, and its beginning and end are likely to be found in the Chinese economy, the situation confirms that it will be the EU who will "suffer" for not utilising the stabilisation period in the global economy to undergo a structural transformation towards the production of high technologies and a fundamental reform of its unitary economy. This way it could have contributed to the restoration of its international competitiveness (Vošta, 2010).

## **2. Problem Formulation and Methodology**

Developments in the global commodity markets show that due to the extent of demand and the territorial structure of imports, they are under the growing influence of the expansion of Chinese companies. These have a significant or almost decisive impact on the prices of most raw material inputs. In their subsequent consumption and production of finished products, the People's republic of China (PRC) applies its internal comparative advantages and economic strategy supporting the export of domestic products. This includes not only lower labour, energy and transport costs, but also various other forms of support for placing such goods on international markets. For the EU, industrial production has long been a crucial part of its growth strategy while seeking to exert its original comparative advantages when exporting it. Structural changes are mainly based on the increasing use of renewable energy sources, which entails a considerable increase in costs and more complex conditions for the industrial use of such energy sources. It is the energy prices that have a higher cost level in the overall algorithm forming the final price of steel which is the subject of investigation as a central manufacturing input for industry, compared to Chinese producers. Therefore, the EU is losing its competitiveness in those market segments where it is unable to apply any alternative comparative advantage, notably innovation, know-how or other commercially usable scientific and research outputs (Astrov, 2015 and Sturm, 2017). China's increased production as such was "dragged" primarily by the needs of its own growing economy as well as exports, which rose from 27 mil. (13% of world exports) in 2005 to 108 mil. tons - 36% of world exports)-in 2016, with EU exports falling from 41 mil. (19% of world exports) to 30 mil. tons (10% of world exports) in the reporting period. The decline in EU production was affected by a decrease in consumption per capita due to an increased standard of life and by high production costs. Developments in the international steel market have prompted, since 2015, the

introduction of a number of protective measures against Chinese imports of crude steel, on the account of it being accused of anti-dumping or using unfair methods in the pursuit of its commercial interests (Melecký, 2013). Developments in the international crude steel market show that there are several significant trends and changes in the territorial distribution of the centres of production and consumption of this material.

**Table 1: Production of the Steel (in mil. tons)**

	2000	2005	2008	2010	2012	2014	2015	2014 vs 2008	2015 vs 2000

Source: Author's calculations from WSA (26).

The aim of this paper is to examine the above-mentioned connections and to identify the competitive (dis)advantages of the EU in this segment on the basis of an international comparison of production conditions in the steel industry, and to subsequently formulate the authors' opinions on the future of this sector in the context of the further development of European industry as to its competitiveness and the possibility to defend its positions in the international steel market in the future. As there are no comprehensive indicators available to assess the competitiveness of the steel industry, we have focused on the assessment of energy costs through the RUEC (Real Unit Energy Costs) indicator and of the international competitiveness of the steel industry through the RCA (Revealed Comparative Advantage) indicator. RUEC is calculated as the ratio of energy costs to value added (both indicators in current prices). It expresses the amount of energy costs needed to achieve one unit of value added. The RCA index compares the ratio of the export share of the country's steel industry to the its total exports, and the share of total exports of the steel industry to the total world exports.

### 3. Problem Solution

The competitiveness of steel production in the PRC and the EU is based on a number of internal comparative advantages, with the overwhelming part of them being based on full-scale direct and indirect application of the benefits of cheap labour, consistent economic and foreign trade policy or long-term work experience or highly efficient organisation of work. The indicators used give us more precise information on how and in what the costs of production (focusing on energy prices) differ and how they affect the international competitiveness of steel and steel products. The RUEC indicator can be expressed as the product of the average real unit price of individual energies and the energy demands of the industry or of the whole industry (Sturm, 2017). The energy demands are calculated as the ratio of the amount of energy consumed to the value added expressed in constant prices (due to the need to have the value added net of inflation, exchange rate fluctuations, etc.). On the other hand, average unit energy costs are calculated on the basis of current prices in order to monitor changes in the quantity and price of energy inputs consumed as well as the ability of a particular industry to reflect them in the prices of its products or in the value added generated.

$$RUEC = \frac{EC}{VA_{current}} = \frac{EC}{VA_{const} * PVA} = \frac{EC}{QE * PVA} * \frac{QE}{VA_{const}} \quad (1)$$

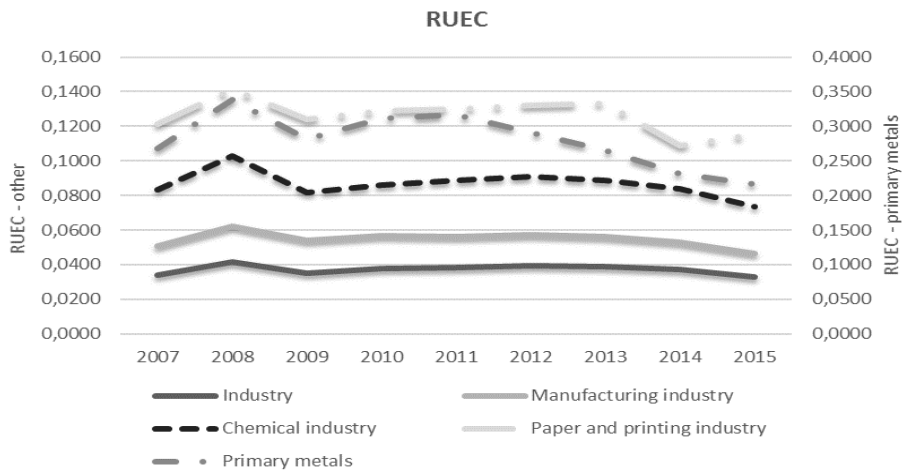

where:

*EC* – energy costs in current prices*QE* – quantity of energy consumed*PVA* – deflator of value added*VA<sub>current</sub>* – value added in current prices*VA<sub>const</sub>* – value added in constant prices.

During the period from 2007 to 2015, the RUEG (EG) indicator declined by 2.55% for the whole industry, but by as much as 19.17% for the processing industry (primarily metals - steel). Taking into account other energy costs, the RUEC indicator of the EU processing industry reached the second lowest value after the US. China and Russia had been reaching the highest values in the long term. Figure 3 shows a clear upward trend in this indicator, while in the EU and the US it was stable after 2008. The highest RUEC values were reached in the industry of primary metals, the chemical industry and the industry of non-metallic minerals. In these sectors, only Japan and China have higher values of this indicator. The US shows the lowest

RUEC values for all industries and, therefore, has the greatest competitive advantage. In terms of development in time between 2010 and 2014, only the EU and the US were able to maintain stable values. The EU achieved the stability of this indicator despite rising energy prices by restructuring its economy towards lower energy consumption. The US, where the commodity prices were higher due to more costly slate oil and natural gas extraction, increased labour productivity and benefited from various tax reliefs. China, the EU, Japan, the US, Russia, Brazil and India have all the share of export of the processing industry in the total exports of individual countries greater than that of the world's processing industry in the global exports, resulting in their competitive advantage vis-a-vis other countries.

**Figure 2: RUEC (EG)<sup>5</sup> of EU Industry and Selected Branches (2007 – 2015)**

**Figure 3: RUEC of Primary Industry in Selected Countries (1995 – 2013)**

Sources: Calculations from EEA (11), Eurostat (12), IEA (17), WSA (26) and EC (9)

<sup>5</sup> Real Unit Energy Costs for electricity and gas, only.

China had long been maintaining the greatest competitive advantage due to its low cost level, followed by Japan, which, on the other hand, primarily benefited from its advanced technologies. These countries even managed to increase their competitiveness slightly (Yongnian, 2017). The EU reached the third best RCA indicator, which, however, fell due to restructuring the EU economy towards industries and services consuming less energy, which consequently resulted in a decline in the production and export of the processing industry (Gespeicher, 2011). The RCA index used provides more information on the development of the competitiveness of a particular country and its comparison with other countries:

$$RCA_i = (X_{ij} / \sum X_j) / (X_{i world} / \sum X_{world}) \tag{2}$$

where:

$RCA_i$  means the revealed comparative advantage of product  $i$

$X_{ij}$  means the export of product  $i$  by country  $j$

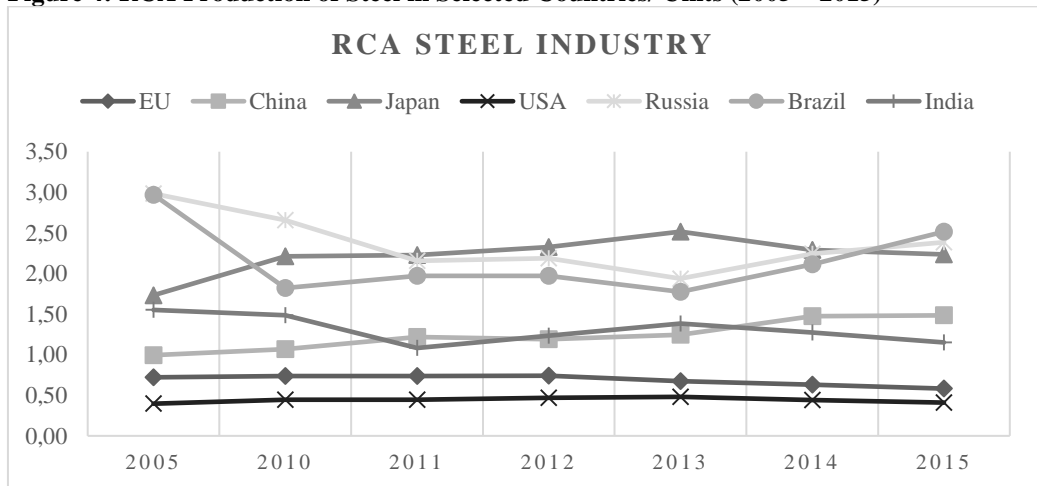

$\sum X_j$  means the sum of exports of country  $j$

$X_{i world}$  means the world export of product  $i$

$\sum X_{world}$  means the total world export

The results of the calculations in Figure 4 shows that the EU and the US do not have a competitive advantage in the RCA production of steel – the values are lower than 1.0 (3). During the reporting period, the EU RCA continued to fall slightly from 0.72 in 2005 to 0.58 in 2015, while the US at least managed to maintain its competitive advantage, expressed by the RCA indicator, at approximately 0.40. Other countries have a competitive advantage in steel production ( $RCA > 1$ ), with Japan, Brazil and Russia reaching high values; in the case of Russia, it was undoubtedly thanks to low domestic commodity prices.

**Figure 4: RCA Production of Steel in Selected Countries/ Units (2005 – 2015)**

Source: Author’s calculations from Eurostat, (13), Reuters (25) and WSA (26).

China sought to improve its competitive advantage through various forms of export support and various subsidies, and so the EC decided to impose anti-dumping duties ranging from 30.7% to 64.9%. This should reduce the negative value of the EU's trade balance with China,

when the volume of EU imports equals roughly four times its exports to China. Its amounted to 1.3 mil. tons of steel in 2017, with imports from China totalling 6.4 mil. tons of steel (WSA). The bilateral trade in steel and steel products between the PRC and the EU is therefore marginal in terms of the total bilateral trade volume and ranges between 2% and 4%. Therefore, the implemented measures are, in our opinion, rather a form of political "marketing" than an important element in the EU's adaptation to the development of the world commodity markets.

#### **4. Conclusion**

The results presented in this paper confirm that the process of globalisation has a major impact on the world economy. This is also evident in the developments in the international commodity markets. The volume of production in the primary and secondary sectors has been growing in the long term, accompanied by changes in the importance of individual countries in terms of exports and imports of individual commodities. China produces almost 50% of the world steel volume, with the EU reaching 10% and the US only 7%. This distribution shows the importance of this commodity to domestic economy, but on the other hand the efforts to export its surpluses are equally intense. A strong correlation between input prices and the growth of competitiveness in the primary sector, particularly in the production of steel, which was the subject of the analysis, was proved. This shows that steel prices are substantially influenced by the prices of the main inputs: iron, coke, coal and electricity, but in many countries they are influenced by the economic policy and the intensity of various support measures, in particular as for exports. The importance of steel industry in the world will increase in connection with the growing urbanisation and environmental protection. From this aspect, it is possible to expect that trade protectionism will continue in this way. The individual areas of the processing industry vary considerably in terms of cost structure, the consumption of individual types of energy, and the shares of individual countries in the total consumption or in exports. Steel industry is the industry with the highest consumption of energy, the cost of which has and will have the most significant impact on it (Blonigen, 2007 and Dohrn, 2013).

The EU and the USA recorded a revealed comparative disadvantage in the steel sector and were the most often the participants of trade disputes about protectionism. China recorded the most significant increase of its share in the global steel production and trade, although it also recorded a revealed comparative disadvantage in the steel sector. Then it is obvious that the main producers and exporters of steel and steel products, who did not have a revealed comparative advantage in steel export in the monitored period, carried out a bit unfair trade practices and became the most often the participants of trade disputes in the WTO (Fojtíková, 2016). Our forecasts suggest that if there is no significant increase in the prices of iron and steel products, including the price of the other inputs, in the world markets on the one hand, and the EU does not carry out an extensive sector-wide reform to minimise production costs, modernise the sector and implement significant innovations with a visible impact on the cost level on the other hand, the importance of this sector will decline rapidly and the production will be substituted by imports of steel from countries that have the necessary comparative prerequisites and are able to apply them effectively in the growth of the international competitiveness of this production (Bolotov, 2013).

## The Antitrust Compliance in Management Strategies of Enterprises – the European Perspective

**Agnieszka Barcik**

University of Bielsko-Biala

Faculty of Management and Transport, Department of Management

Willowa 2, Bielsko-Biala, 43-309

Poland

e-mail: abarcik@ath.bielsko.pl

### **Abstract**

*Due to the negative consequences of cartels for the economy, the priority for anti-trust bodies in the European Union has been the fight against cartels of enterprises. Current case law practice shows that the use of the system of "negative" repressive tools, mainly financial penalties, in relation to enterprises that committed cartel practices is not sufficiently effective. The need to use 'positive' tools is increasingly emphasized by promoting the building of business management strategies based on a culture of compliance with competition rules. This role can be played by the antitrust compliance program originating from the American practice. The article has a theoretical and cognitive character. In the theoretical part, the antitrust compliance scheme and tools that are necessary to build a management strategy based on it are characterized. In the practical part, the functioning of the antitrust program in selected European enterprises is discussed, this part is based on the case-study method.*

**Keywords:** cartels, compliance, European competition policy, risk management

**JEL Classification:** M10, M14, K21

### **1. Introduction**

Competition is the main determinant of economic development. It is not only a condition for the effective functioning of the market, but above all guarantees consumer welfare. For this reason, competition policy plays a special role among all European Union (EU) economic policies, mainly with regard to achieving the objectives of economic integration within the internal market. In the global economy, EU competition policy is primarily intended to strengthen the EU's industrial and commercial potential so that it can compete with the world's major trading partners (Mynarzová, Kaňa, 2014). It also serves European consumers through a guarantee of maintaining competitive prices offering a wide selection of high-quality goods and services and is to be an incentive and guarantor for enterprises not only European ones to operate and invest in the EU internal market (Blecharz, Štverková, 2017, Skowron-Grabowska, Mesjasz-Lech, 2016). It is extremely important in this respect to comply with the rules of competition policy both by the member states and entrepreneurs themselves and by creating an effective system of enforcing its provisions (Kordoš, 2016). Out of all competition policy violations, the most dangerous for the economy are business cartels because due to their secret and long-term nature they often distort competition through its complete elimination, limitation or violation. For this reason, cartel agreements are subject to special rigors of antimonopoly supervision, both of the European Commission and national antitrust authorities. In practice however, cooperating companies often unintentionally create cartel relations between themselves, thereby exposing themselves to the risk of violation of competition law and related financial sanctions as well as the risk of loss of reputation and

trust of business partners (the so-called antitrust risk). The antitrust compliance system defined as a system of ensuring compliance of the company's policy and strategy with the competition rules aimed at eliminating the risks associated with it is a relatively new tool on the basis of the European Union which aims to eliminate the antitrust risk in the enterprise.

## **2. Problem Formulation and Methodology**

The aim of the article is to define the mechanism of antitrust compliance and to define its place and importance in business management strategies, with particular emphasis on enterprises operating within the EU internal market. The research starts with the relevant literature, documents review to highlight the framework for implementation of antitrust compliance in management systems in the company. The study identifies also the areas in which the enterprises are particularly vulnerable to antitrust risk. For this research the author used the basic methods of the scientific research to obtain information necessary for the complex and systemic explanation of the issue. The research methods include mainly the analysis of literature, documents and legal acts applicable here. One of the qualitative research methods was used - the case-study method. This method enabled extensive analysis of the studied phenomenon and better understanding of the processes taking place in its course. The case study was based on observations and business reports. The criterion for selecting the examined enterprise was based on its long term experience in application of the anti - trust compliance mechanism, on a unit scale and on the scale of the entire capital group to which it belongs.

The article is a continuation of research conducted by the author in the area of cartel cooperation of enterprises and the related antitrust risk (Barcik, 2017, Barcik, 2016, Barcik, 2016).

### **2.1 Theoretical Background**

Antitrust compliance is one of the elements within the entire Compliance Management System (CMS). CMS is usually defined as the entirety of measures and processes in the company, which are aimed at detecting the risk of non-compliance and managing it in such a way as not to infringe the existing legal and internal regulations of the enterprise and act in accordance with them. In this context, CMS is also perceived as a value-based system aimed at creating and maintaining a long-term compliance culture, i.e. high awareness of employees at all levels in the company, so that they know what regulations may apply in a given area of their activity and how to behave in appropriate situations, to follow them (Kaptein, 2011). The basic task of CMS is to identify and properly manage the risk of non-compliance and on this basis, to make the selection of appropriate elements that will be part of the system. In the above sense, Compliance goes beyond the scope of only legal risk and includes the entire organizational culture of the company, the strategy of social responsibility and the ethical code of the company at the forefront. Increasingly CMS is perceived as a determinant of the company's competitiveness increase in relation to other entities on the market, mainly due to the fact that it positively affects the company's credibility as a safe business partner (Makowicz, 2015). The CMS concept derives from the practice of Anglo-Saxon countries, mainly the USA, where initially it was associated primarily with such regulated sectors as the banking sector and the insurance sector. Then, thanks to the activities of global corporations, which, while implementing CMS, simultaneously included all of their organizational structures of subsidiaries and branches, compliance policy began to become more and more popular among enterprises in the European Union. The CMS idea is also in line with the current trend of pro-quality management of the company, which is currently in force in the management strategies

of European enterprises, mainly in the area of effective risk management through its proper identification and elimination (Jakubiec, 2017, pp.11-24, Dziwiński, 2016). For this reason, in some countries, CMS audits are becoming more and more common in order to obtain certificates of compliance of a given system with the requirements of a given standard. Currently, there are two standards on the international arena that contain compliance quality standards: ISO 19600 Compliance Management Systems and ISO 37001 Anti-Bribery Management Systems (ISO 19600: 2014, ISO 37001: 2016).

Antitrust compliance by entering the company's CMS focuses on an internal business strategy aimed at preventing and eliminating risky anti-conceiting behaviors in the company. In EU, antitrust compliance has become part of a broader idea that the European Commission has identified as the European compliance culture. It assumes that market participants will be convinced of the need to act in accordance with legal regulations, ethical and industry standards. In order to implement the compliance mechanism in European competition policy, the Commission developed a document published in November 2011 *Compliance matter. What companies can do better to respect EU competition rules*: It defines compliance programs as a set of rules and procedural rules implemented by the company, defining requirements for employees to undertake activities compliant with competition law, especially on the basis of anti-cartel regulations, and creating a system to control its compliance, the Commission stressed that their creation leads to an increase in the level of competition law protection and facilitates the detection of its infringements (European Commission, 2011). The Commission's position in the above-mentioned matter was supported by the European Parliament, proposing the introduction of anti-competitive behavior of enterprises into the EU antitrust authorities' policies taking into account their antitrust compliance programs (European Parliament, 2011).

### **3. Problem Solution**

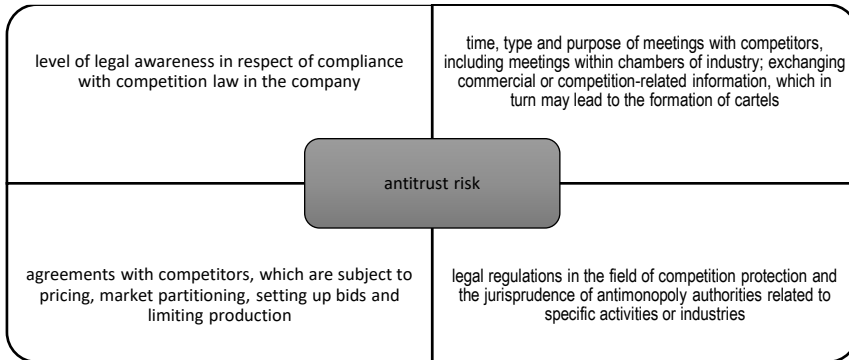

The doctrine emphasizes the fact that there is no single universal antitrust compliance system. Its effectiveness and efficiency depends on its ability to adapt it to the strategy and market position and the needs of a specific company. In other words, antitrust compliance, just like the entire CMS, should be created individually for a specific company (Gozman, Currie, 2014; Bethell, Valente, 2012). This approach is also due to the complex and latent character of business agreements that take on a diverse form of cartel cooperation that is usually based on informal coordination mechanisms. As a rule, cartels take the form of horizontal agreements between competitors and serve to coordinate market behavior mainly by dividing the market according to territorial, assortment and subjective criteria, and include types of agreements which are listed in Art. 101 paragraph 1 of Treaty on the Functioning of the European Union which are as follows: fixing directly or indirectly the purchase or sale prices of goods, determining other than the price transaction conditions, market partitioning, quotation agreements; limiting progress and investments, agreements with exclusion effect, information exchange (Treaty on the Functioning of the European Union, 2010).

#### ***3.1 Antitrust Risk Management and Implementation of Antitrust Compliance***

The antitrust compliance system should serve the effective management of anti-trust risk in the enterprise. Antitrust risk includes the probability of incurring material and intangible losses as a result of violation of one of the normative rules of the competitive order: freedom to compete, equality of enterprises competing on the markets and fairness of competition. The antitrust risk depends largely on external factors independent of the enterprise, which mainly

include the dynamic development of often complex antitrust regulations and the related instability of the applicable law, as well as the lack of uniform criteria and tools for antitrust supervision, mainly in the field of economic analysis. The antitrust risk may arise both from the obvious breach of competition rules related to the obvious violation of the prohibition of a specific action or from undertaking business activities that are not prohibited but may potentially have an anti-competitive effect. For this reason, it is necessary to analyze factors that increase the likelihood of anti-competitive behaviors (Figure 1).

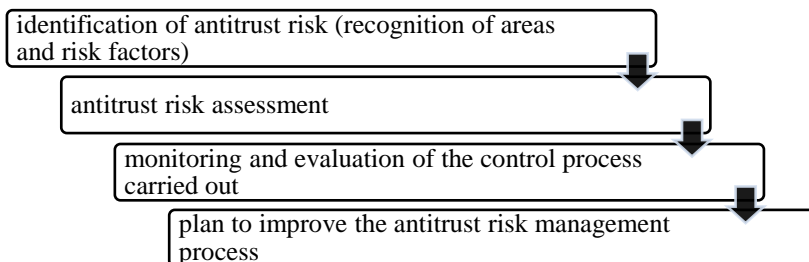

**Figure 1: Sources of Antitrust Risk in the Enterprise**

Source: Barcik (2016)

Thanks to the implementation of antitrust compliance, it is possible to achieve a reasonable level of risk reduction that is to minimize the probability of occurrence of problematic behaviors. An important role in this process should be played by the Compliance Department in the company, headed by the Compliance Officer, whose competences include, first of all, the implementation of the compliance program covering current tasks and control activities with risk identification and assessment. In addition, monitoring and evaluation of the undertaken activities together with an analysis of their effectiveness and development of recommendations on this basis aimed at improving the entire process, which is the elimination of identified deficiencies in the antitrust compliance program (Paha, 2017). The process also includes the urgent implementation of new solutions or the improvement of existing ones with the specification of the time frame and an indication of how to monitor them further. (Figure 2).

**Figure 2: Antitrust Compliance – The Antitrust Risk Management Process in the Enterprise**

Source: Barcik (2016)

Monitoring and evaluation of risk management procedures and controls should cover all areas of the company's activity and all levels of employees. Based on the recommendations of the Competition Commission of the International Chamber of Commerce, it is assumed that these activities should focus mainly on monitoring individual employee behavior in terms of compliance with antitrust rules, analyzing reports prepared by the Compliance Department on the knowledge, understanding and observance of procedures related to antitrust risk inside enterprises and monitoring of industry associations with which the company is related, as well as the activities of the company and employees in these associations. The effectiveness of the entire implementation process of antitrust compliance in the enterprise depends not only on the adoption of the control forms and actions taken but also on the effective communication strategy of the Compliance Department with the management and employees at various levels. In relation to employees it is important to raise awareness of antitrust risk along with propagating the antitrust compliance culture in the company (Competition Commission of the International Chamber of Commerce 2013).

### ***3.2 Antitrust Compliance in Strategy of ArcelorMittal***

#### ***3.2.1 Characteristics of the Enterprise***

ArcelorMittal Poland is part of the global steel LNM Holdings, which in 2004, under the privatization agreement concluded with the Ministry of Treasury took over the Polish steelworks that were failing at that time and restructured them and restored financial liquidity in the following years. Currently ArcelorMittal Poland is the largest steel producer in Poland employing over 11,000 employees in six branches in the Śląskie, Małopolskie and Opolskie voivodships. Thanks to investments, the value of which has been over PLN 6 billion since 2004, ArcelorMittal Poland is today one of the most modern steel producers in Europe. ArcelorMittal Poland gathers approx. 70 percent production potential of the Polish steel industry. It is also one of the largest Polish exporters and the largest coke producer in Europe and the entire ArcelorMittal group. The business strategy of the company is based on three values: sustainable development, quality and leadership. Thus the key place in the company's strategy is occupied by business responsibility based on the following assumptions: providing employees with a safe, healthy and friendly work environment, producing products that promote a more sustainable lifestyle and create sustainable infrastructures, efficient use of natural resources and high recycling rates, responsible use of environment and limiting the impact on water, soil and air quality, commitment and active participation in the life of local communities (ArcelorMittal Poland 2018).

#### ***3.2.2 Arcelormittal Antitrust Compliance Program***

The obligation to comply with competition rules, including in particular antitrust rules was adopted by ArcelorMittal Poland in the Code of Ethics. This applies to the activities carried out by all holding companies based on the laws of all the countries in which the company is present. Detailed guidelines in the scope of antitrust compliance also include a periodic amendment to the document of 2007 entitled ArcelorMittal antitrust compliance guidelines for Europe, which defines the various elements of the company's antitrust compliance program. The main goal of antitrust compliance in ArcelorMittal Poland is to help identify problems and obtain a state of full compliance with antitrust rules. The areas of ArcelorMittal's activities covered by the antitrust compliance program are: contacts with competitors, agreements with clients and suppliers, and the area entitled "precision of the written word". In particular, the area dedicated to contacts with competitors was regulated. The complexity of risk in this area

results from the fact that the usual economic pressure exerted on all competitors on a given market often results in parallel behavior on the global market. And although these parallel behaviors may be lawful, they attract the attention of antimonopoly authorities and may be the reason for the investigation, in particular when such behavior is accompanied by contacts with representatives of competitors. For this reason, the company's employees are obliged to avoid any contact with competitors that could justify the suspicion and presumption of collusion. This regime includes not only individual contacts with competitors, but also membership and participation in trade associations, market insights and benchmarking. Within the second area, particular caution should be maintained in activities related to, among other things, setting the customer's pricing policy, dividing the market into sales territories or customers, passive sales outside the sales territory assigned to a sales company or resale sales and prohibiting the sale of products competing with the imposed trading company or dealing with resale. The area of "precision of the written word" obliges the employees to be precise when preparing correspondence regarding matters being the object of competitive activity and competition of the company and to draw up internal notes and correspondence using a clear, concise and precise style without using hyperbole. The compliance program is responsible for the antitrust compliance program, which is managed by the Compliance Officer. Its activity is based on the strategy of transparent communication principles and reporting on identified irregularities to the management board. The promotion of the antitrust compliance culture mainly includes periodic antitrust compliance training and the whistleblower institution, mandatory for employees at all levels. (ArcelorMittal Poland 2018).

#### 4. Conclusion

To sum up the above considerations and analysis, all the companies irrespective of industry, size or market power are at risk of violating the EU competition policy rules. For this reason, it should be assumed that the antitrust compliance program should be an integral part of the management strategy of every enterprise in the EU internal market. It should be implemented in a comprehensive and adequate way for a specific company. Especially since the company itself is a source of antitrust risk, in addition to the environment and external events, as demonstrated in this study. According to the author, Antitrust compliance allows not only effective recognition, assessment and monitoring of antitrust risk, but also contributes to the increase of awareness and the need to consider competition rules when making any business decisions. Thanks to this, antitrust compliance has the potential to become an effective tool to promote behaviors in line with EU competition policy. The considerations regarding the implementation of antitrust compliance programs taken up in this article do not exhaust the topic, which is due to the insufficient recognition of this issue on the European ground. The direction of the author's further research will focus on the effectiveness and efficiency of antitrust compliance programs in European companies of all sizes and competing in different markets.

## **Industry 4.0 as the Determinant of Enterprises' Development in the European Union**

**Ryszard Barcik**

University of Bielsko-Biala

Faculty of Management and Transport, Department of Management

Willowa 2, Bielsko-Biala, 43-309

Poland

e-mail: rbarcik@ath.bielsko.pl

### **Abstract**

*The Industry 4.0 on the one hand opens up new opportunities for enterprises in the European Union, on the other hand, it entails threats related to the digitization of the economy and the security of functioning in cyberspace. Industry 4.0 means that companies need to change the business model to a fully digital one. Thus, joining in the process of digital transformation requires the company to have a comprehensive approach covering all its areas of activity. In the European Union, the concept of industry 4.0 has been a reality for several years, especially for companies in the automotive, steel and production industries, mainly in the field of production of electronic equipment or production of plastic products. The main objective of the study is to present the assumptions and determinants of the Fourth Industrial Revolution taking into account the European perspective. The research method used in the study is the case-study method, which are selected European enterprises.*

**Keywords:** digital transformation of enterprises, economy of European Union, Industry 4.0

**JEL Classification:** L60, O10, O52

### **1. Introduction**

Revolution means the process of rapid changes in a given field that causes a fundamental transformation of the state of affairs in which they function. In the common sense it is a "big change" moving from one stage of development to another. With regard to industry its evolution in the economies of individual European Union countries this process is called the "fourth revolution", and using the production language - Industry 4.0. Industry 4.0 is a combination of several technologies, mainly digitalization which are intended to significantly increase the efficiency in production processes. As the first, the term "industrial revolution" was used by historian Arnold Joseph Toynbee in his book "The Industrial Revolution" from 1884 while recognizing that the industrial revolution is a process of rapid technological, economic and social change (Toynbee, 1884/2017, Olender-Skorek, 2017). The various phases of the revolution were characterized by specific economic and technological changes. The first industrial revolution (1784-mid - 19th century) was characterized by mechanization i.e. steam engines and mechanical control, and initiated the mechanization of production. The second revolution (late 19th century-1970s) was connected with the introduction of electricity. Mass production was started with the use of electricity. The symbol of the third revolution (1970s - today) has become automation, which enabled the introduction of automated devices into production factories, as well as various types of software, such as SCADA, MES, ERP and programmable PLC controllers which enable not only diagnostics but control and simultaneous supervision over ongoing processes. The fourth revolution which has been developing more or less since the beginning of the XXI century is characterized by broadly

defined digitization that is, modernity based on Internet access, ICT networks and above all, the use of this to manage machines in the real process (Neugebauer, Hippmann, Leis, Landherr, 2016).

The EU industrial policy is currently one of the most strategic economic policies and the industrial sector remains the main driver of growth and employment in the EU Member States (Mynarzová, Kaňa, I 2014, Mesjasz-Lech, 2016). Although only about 1 out of 10 companies in the EU are classified as production enterprises the industry is one of the key elements of sustainable development for the EU economy and brings an added value to the economy mainly due to the process of converting materials to produce products. According to the European Commission's Digital Transformation of European Industry and Enterprises report from 2015, this sector covers 2 million companies and guarantees 33 million jobs. It is also responsible for over 80% of exports and 80% of private research and innovation (European Commission, 2015). For these reasons, Industry 4.0 is one of the biggest challenges and chances to maintain and increase the competitiveness of the European Union economy.

## **2. Problem Formulation and Methodology**

The main purpose of this study is to discuss the basic assumptions of the 4.0 revolution with particular emphasis on the implications that result from it for the economy of the European Union and its Member States and the indication of its practical implementation in selected European enterprises. Implementing the research goal, the thesis was formulated as follows: Implementation of Industry 4.0 is currently one of the strategic goals for economies and enterprises in the European Union. At the same time, the following research hypotheses were formulated:

Hypothesis 1: joining in the process of digital transformation requires the company to change the management strategy and to have a comprehensive approach covering all its areas of activity.

Hypothesis 2: the effectiveness of implementing Industry 4.0 solutions in EU enterprises, especially small and medium enterprises, requires institutional support and a comprehensive approach both at the level of the EU institutions and national programs.

The article has a theoretical and cognitive character. In the theoretical part the issue of the fourth industrial revolution with its basic concepts, elements and course was discussed. In the practical part, selected European enterprises were analyzed, which are an example of implementing solutions typical for the fourth revolution. The analysis of current literature and relevant documents as well as case studies was used to implement this target as research methods. The choice of the case study research method in the empirical part of the study allowed a detailed analysis of the practical implementation of Industry 4.0 solutions, including: objectives, assumptions, motives of actions taken. The research tool used in the case studies was the analysis and assessment of business reports.

## **3. Problem Solution**

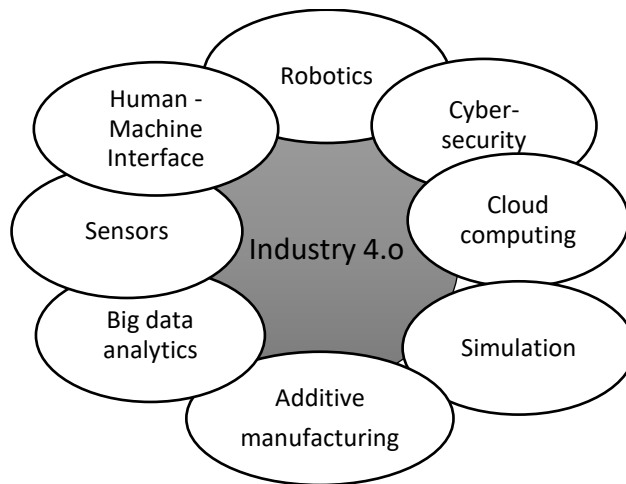

### ***3.1 The Main Assumptions of the Industrial Revolution 4.0***

The term "Industry 4.0" functions all over the world in the language of both business and technology, often alongside or interchangeably with the terms Internet of Things (IoT), or Industrial Internet of Things (IIoT) Smart Factories, Smart Industry, or Advanced Manufacturing. It was used for the first time in 2011 in the high-tech strategy project of the government of Germany promoting the computerization of manufacturing processes. Industry

4.0 should be defined through a whole range of new and innovative technological solutions that are related to it. According to the European Parliament these are as follows:

1. “The application of information and communication technology (ICT) to digitize information and integrate systems at all stages of product creation and use (including logistics and supply), both inside companies and across company boundaries”;
2. “Cyber-physical systems that use ICTs to monitor and control physical processes and systems. These may involve embedded sensors, intelligent robots that can configure themselves to suit the immediate product to be created, or additive manufacturing (3D printing) devices”;
3. “Network communications including wireless and internet technologies that serve to link machines, work products, systems and people, both within the manufacturing plant, and with suppliers and distributors”;
4. “Simulation, modelling and virtualization in the design of products and the establishment of manufacturing processes”;
5. “Collection of vast quantities of data, and their analysis and exploitation, either immediately on the factory floor, or through big data analysis and cloud computing”;
6. “Greater ICT-based support for human workers, including robots, augmented reality and intelligent tools” (European Parliament 2015).

**Figure 1: Key Technical Solutions and Technologies of Industry 4.0**

Source: own work based on Soldaty (2017)

The digitized production leads to many changes in production processes, results and business models. Intelligent factories allow for greater production flexibility. Automation of the production process, transfer of product data during its passage through the production chain and the use of configurable robots means that many different products can be produced in the same production unit. This mass customization allows the production of small batches due to the ability to quickly configure machines to adapt to the specifications provided by the customer and the production of additives. The speed at which the product can be produced will also improve. The integration of product development with digital and physical production was associated with a significant improvement in product quality and a significantly smaller number of errors (see box). Productivity may also increase due to various Industry 4.0 effects. Thanks to advanced analyzes in predictive maintenance programs, manufacturing companies can avoid machine failures in the production hall and reduce downtime (Westkämper, 2014).

Customers will be able to be more involved in the design process, even supplying their own modified designs, which can then be quickly and cheaply produced. Industry 4.0 will also cause changes in business models. Instead of only competing for costs, European enterprises can compete on the basis of innovation in the scope of the ability to produce customized projects or quality (European Parliament 2015).

Undoubtedly, the success of Industry 4.0 depends on a number of complex factors and the process of implementing solutions connected with it in practice encounters many barriers. First all changes in the area of cooperation and investment activity of enterprises should be mentioned. They are connected with the necessity to build a new, complex value network and to produce and distribute goods / services in a flexible way, including building new business partnerships. The cooperation should cover not only suppliers and distributors but also new partners such as technology companies, telecommunications and Internet infrastructure providers, including competitors (Bauer, Haemmerle, Schlund, et al., 2015). It is also important to implement appropriate legal regulations mainly related to intellectual property rights, employee supervision and product liability. Another challenge is the obligation to determine the ownership of the data held and guarantee their security as part of making it available to partners cooperating in the same network. In the discussed area, attention is also paid to the need to adopt uniform standards covering the process of data exchange between machines, systems and software within the value chain, as well as the challenges faced by employees. Industry 4.0 companies need specialists, especially programmers, data set analysts and cyber security experts. (Westkämper, 2014, European Parliament 2015).

### ***3.2 Fourth Industrial Revolution from the Perspective of the European Union***

Bearing in mind the strategic importance of Industry 4.0 for the economy, the EU undertakes numerous initiatives to support the development and implementation of this idea in Member States (Kollár Melková, 2016, Mynarzová, Kaňa, II 2014). In the first place, the European Parliament in its resolutions advocated the need to support small and medium-sized enterprises in the production of high added value and technologically advanced and underlined the need to reindustrialize the EU economy (European Parliament 2012, 2013). Similarly, the European Commission emphasizes in its documents many times that “*digital technologies (including cloud computing, big data, new industrial internet applications, smart factories, robotics and 3D printing) are essential to increase European productivity through redefining business models and creating new products and services*” (European Commission 2014). At the same time, the Commission recognized areas related to Industry 4.0, such as advanced production, key enabling technologies and intelligent networks and digital technologies as one of the six priority challenges for the EU economy. At the same time, the objective of increasing the share of total value added production in the EU to 20% by 2020 has been defined (European Commission 2012). In addition, the Commission has set up a strategic policy forum on digital entrepreneurship, the main objective of which is the digital transformation of European industry and enterprises. However, the Commission's strategy for the digital single market presupposes the need to guarantee at EU level the protection of data ownership and interoperability in communication between enterprises and machinery (European Commission 2105). Initiatives related to the Industry 4.0 sector are financial from various European Union programs. One of the main features here is the Horizon 2020 research program, in which EUR 80 billion is earmarked for the development of advanced, intelligent, digital production in the EU, as well as for research and innovation, primarily in relation to the development of key enabling technologies. However, Member States have the option of applying for funds from the European Structural and Investment Funds (ESIF) which are intended primarily to invest

in regions that support the development of industry 4.0, focusing on innovation in line with the concept of "smart specialization" (European Parliament 2015).

Among the EU Member States, Germany, France, Italy and Great Britain are most involved in the ideas of Industry 4.0. In the case of Germany, the creation of Platform Industrie 4.0 deserves special attention in this respect. Within which the private, public and academic sectors for the development of industrial technologies in Germany cooperate. The platform is one of the ten initiatives of the German government in the field of industry 4.0, which has already received over EUR 200 million (Platform Industrie 4.0). In France, as part of the Industrial Support Program, financial aid is directed in particular to small and medium-sized enterprises that initiate and implement projects in the field of digitization, robotics and energy efficiency. A factory of the Future was also opened, it is a kind of demonstration center. Similarly in Italy, support under the Fabbrica del Futuro project was directed mainly at initiatives related to the improvement of quality, flexibility and individualization of production. In the United Kingdom, among the government initiatives related to the promotion of Industry 4.0, it is worth to mention the "Catapult centers" manufacturing centers, which are designed to help enterprises access the research and expertise related to advanced innovative production and process technologies. Especially for enterprises from the SP sector, services in the field of industrial consulting are dedicated (European Parliament 2015). In the other Member States, especially Poland, characterized by weaker economic potential, the implementation of Industry 4.0 is quite a challenge. It started later and is based largely on the experience of the EU countries mentioned above. For example, in Poland this year, the Polish Platform Industry 4.0 will be launched. Its main priority is to be reindustrialization as one of the main elements in the Polish Government Strategy for Responsible Development and the main indicator of its effectiveness will be the level of digitization and robotization of Polish industry. (Ministerstwo Rozwoju 2017).

### **3.3 Examples of Practical Applications of Industry 4.0 In European Enterprises**

A model example of Industry 4.0 solutions, and thus a pioneer of its solutions in the EU, are the BHP Bosch factories, which produce automotive components. Located in German Blaichach and nearby Immenstadt, they employ a total of over 3,400 people, and it is also the

only German factory that increases employment. Already after the structure of employees you can see how advanced the facility is. As many as 23% of employees in Bhp are planners, constructors and managers with higher education, and 42% are highly qualified employees, technical managers and technicians. The branch of the Bhp factory in Immenstadt is involved in the production of, among others, ABS, ESP, iBooster systems and multi-purpose cameras used in the automotive industry, as well as in electric vehicles and using different levels of autonomy. He also deals with cross-sectional functions, specialized machines, and as a model plant development of production processes. There is also a showroom in its area. Located in nearby Blaichach, the factories produce sensors and ESP and ABS components as well as compressor components (Bosch Mahle Turbo Systems). In addition, there is a training center and hydroelectric power plant supplying energy to part of the plants. Bhp plants also produce production lines for their own organization, all production lines in the Blaichach and Immenstadt factories were produced on site. The breakthrough moment for the Bhp factory was 2006, when it became the model plant of Bosch Production Systems and 2013, in which the concept of Industry 4.0 was included in the strategy according to which Blaichach/Immenstadt is developed. This process has been gradually being implemented since then. It includes standardization of manufacturing processes, creation of network infrastructure that combines machine control systems and 100% acquisition of data from machines and production processes. These efforts have already resulted in the creation of production benchmarks concerning individual machines as well as entire production lines, not only on the spot but also in plants integrated around the world, which are integrated with Bhp. Data that is obtained in a non-site is used to analyze processes, and thus to optimize and develop production. ActiveCockpit solutions manufactured by Bosch Rexroth are used for this. The main place for gathering information and communication at the machine-man level are Bosch Rexroth ActiveCockpit solutions. They constitute a virtual platform for processing and visualization of production data, use the Internet and cloud computing, thanks to which everything happens in real time. Using various types of interfaces from traditional HMIs, through tablets, laptops, to large touch screens, it is possible to quickly display data, associate with each other and analyze it. Excellent insight into performance indicators and the ability to compare current and historical data is also possible. ActiveCockpit is connected to the ERP system, which allows for uniform production management and logistics. Industry 4.0 solutions are also visible in factory logistics. In this case, a system of tracking raw materials and products was used, including there is an automatic registration of trucks and containers with goods transported to the production area. Large RFID gates are used here that allow automatic recording of information related to transport between the warehouse and production (Bosch 2018).

The Polish example of the implementation of industry solutions 4.0 is the company POLMO S.A. providing elements of sheet metal and efficient teams for the automotive market for over 70 years. The company is located in Brodnica, approx. 150 km southeast of Gdańsk. In 2015. the company set out to expand the modernization activities of buildings and machines that were to shape its new face. Internal reorganization and new, effective production and work processes were to ensure long-term and positive competitiveness on the European market. The plants produce a wide range of high quality spare parts and accessories for the automotive industry. The basis of the assortment are steel fuel tanks and compressed air tanks for vehicles such as trucks, trailers, semi-trailers and buses. The company's management, in response to the growing quality requirements set by customers, decided to invest in comprehensive robotization and automation of the welding line for compressed air tanks, which are the basis of the company's assortment. From the business side, the goal of the investment was to increase the plant's production capacity. In the initial phase, it was assumed that the production capacity would reach 55,000 pieces of one type of tank per year on the line. Another goal was to raise

the prestige of the company and gain a competitive advantage. In turn, the challenge for the enterprise from the engineering side was to ensure the stability and repetitive quality of class B welding, which is the highest quality class in welding and comprehensive automation and robotization of one of two welding lines. The next challenges were the optimization of the cost of manufacturing the product and precise reporting of the process. Welding is a key process in the production of compressed air tanks, and its course is very demanding in terms of technology, as well as organizational due to the limited availability of qualified welders, which additionally have strict standards regarding qualifications and health protection. Tanks also have to meet the high quality requirements imposed by European Union regulations - they are overstated for security reasons. In addition, the recipients of these products are mainly international car concerns, which expect the supplier to adapt to their procedures and standards - not only qualitative, but also price and operational - including fast delivery time. The automated welding line is operated by 5 robots that perform the process of welding tanks and cleaning welds. The whole process of producing the tank is carried out in a mechanical way: from loading of components, to delivering them to the marking station of finished tanks. The task of line operators is to equip them with raw materials and to deliver finished products to the test zone. Welding robots at the POLMO plant allowed to obtain full control over the process and to optimize the production costs of the product. In addition, it enabled gradual improvement of product quality and production efficiency as well as increased prestige, thanks to which the plant became competitive on foreign markets (POLMO S.A. 2018).

#### 4. Conclusion

To sum up the above considerations, the new digital revolution 4.0 is an opportunity and a challenge for the economy of the European Union and its Member States. The basis for the implementation of "Industry 4.0" is investing in modern technologies that will optimize the production process and perfect management. This will lead to increased efficiency and lowering production costs. Thus, the thesis and hypotheses of the study were achieved. The author demonstrated the benefits are unquestionable for the European economy, enterprises and consumers. Enterprises, however, to achieve them must redefine their own strategic business goals. The business effects at the enterprise level may be: higher profitability, higher sales, additional revenues, more precise and much faster adaptation to market needs. Operational effects at the enterprise level can be: improvement of product quality, improvement of resource efficiency, avoiding downtimes and failures. However, this is not possible without a new definition of enterprise management strategy. On the other hand, the EU institutions and the governments of the Member States have an obligation to provide institutional and financial support to companies that participate in Industry 4.0. The research on the implementation of the Industry 4.0 in enterprises have only been launched and the near future will indicate the forthcoming trends and assessment of the actions undertaken.

### **Abstract**

*The paper deals with the European integration in the sphere of potential codification of the legal regulation regulating the administration and management of public property. The paper compares the current situation of legal regulation of public property of two EU member states - the Czech Republic and France. Thanks to this mutual comparison, the attention is paid to the shortcomings of Czech regulation of public property. On the basis of the existing situation, the author proposes some measures for the Czech legislator how to improve the current situation of the legal regulation of public property in the Czech Republic. The paper therefore necessarily includes the concept of French and Czech administrative law, which has been already affected in the past by the process of European integration, both in the legislative and political spheres. European integration of public property law also has primary impact on the economies of EU member states and secondarily on the EU as a whole.*

**Keywords:** codification, EU integration, France, public property

**JEL Classification:** K19, K23, K33

### **1. Introduction**

The European integration is a process that involves political, economic and legislative spheres of countries. These spheres are very often connected together. The presented paper is focused at the legislative sphere regulating administration and management of public property in two selected EU member states - the Czech Republic and France. It is necessary therefore to compare legal regulation of public property in these countries and to point out their advantages. Results and seminal differences could serve as an inspiration for the harmonization of the legal regulation of public property in the EU member states.

That is why the analytical, comparative and descriptive methods were used to write this paper. The aim of the paper is presented the French conception of legal regulation of public property and to point out its advantages. The hypothesis of the paper is defined as "the Czech legal regulation of public property is disintegrated".

Among a lot of writings dealing with French administration law, it is necessary to mention for example the writing by Prof. Jacqueline Morand-Deville (Morand-Deville, 2011). This writing comprehensively deals with the French administration law, including legal regulation of public property. The French and Czech legal regulation of public property was also used as another important source for this paper.

The public property is the opposite of the private property which constitutes the individual freedom and the right to private property (Feber, Petrucijová, 2016).

In the Czech law, there is impossible to find the full definition of public property. It is necessary to come out of the doctrine of Czech administrative law which understands public property most often as "*property belonging to public entity (state, territorial self-governing unit, other public law corporation, independent public institution, public fond...), i.e. typically the entity of public administration as a legal person of public law, respectively in general a "public subject" and its object being a public thing in a broad sense, or rather a thing intended for public purposes*" (Havlan, 2016, p. 11).

The significance of the legal definition of the public property is very important nowadays because it allows and warrants nondiscriminatory manner of access to the property by everyone (Nová, 2016).

In developed countries (for example France), there we can find a legal definition of the public property. This fact indicates a need of the protection both individual property rights and public property rights (Hon, Honová, 2016).

## 2. Legal Regulation of Public Property

In the Czech Republic the general legal regulation of State property is the Act No. 219/2000 Coll., on property of the Czech Republic and its engagement in legal relations. As can be seen from the title of the act, it explicitly governs the state property and not the property of other public entities. In any case, it is a general legal regulation governing the management of state property. However, in addition to this legislation, it is still necessary to reflect another legal acts such as the Civil Code, Public Procurement Act, etc. Regarding to the legal regulation of another public entities other than state, it is especially worth mentioning the Act on Municipalities, the Act on the Regions and the Act on the Capital City of Prague.

On the basis of the above mentioned, it is therefore possible to discuss the fragmentation of the Czech legislation, i.e. its incoherence and consequently the lack of clarity, and consequently, its heavier applicability.

If we focus on France, we could see the situation exactly opposite. France is the exemplary country typical of its codification across the legal regulation of the country. Concerning e.g. financial law, more precisely tax law, it can be stated that in France, there we can find both the substantive and the procedural tax law as codified. The French legislators' interest in codification can also be demonstrated through, for example, the Civil Aviation Code, the Sport Code, the Tourism Code and number of another codes.

Regarding to the French legal regulation of public property, it is absolutely necessary to mention the cardinal role of General Code on Public Property (i.e. in French *Code général de la propriété des personnes publiques*, hereinafter referred to as "GCPP"). It is a comprehensive code which contains legal regulation of property belonging to public entities under French law, which became effective in 2006.

In connection with the French legal regulation of public property, it is also necessary to mention another crucial codes - the General Code on Territorial Self-Governing Units (GCTSGU). This code is a *lex specialis* to the GCPP and it governs, besides other things, the treatment of public property of public entities (i.e. departments, overseas departments, regions, municipalities, associations of municipalities). The society is often forgetting the magnitude of the property of territorial self-governing units. But in fact, the property owned by self-governing units represents an important socioeconomic factor with the potential to affect a wide range of aspects of life, considering the scope of self-governing units (Havlan, P., Janeček, J., 2016).

The French legislation regulating the area of public property was rather complicated and fragmented until adoption of the GCPP. Although the State Property Code was adopted in 1957, the area of public property belonging to the territorial self-governing units and public institutions was still not fully covered. The legal regulation of the administration of public property of these public entities was rather fragmentary, or even empirical. It was therefore important to restore the unity of legal regulation of public property, with regard to an observance of the constitutional principle of access to law and the comprehensibility of legal norms. Since then, the primary objective has been to seek codification of rules regulating the public property and private property of French public entities.

GCPP effective from April 2006 includes all legal regulation regulating the administration and management of public property of public entities.

We can summarize that the biggest difference between the Czech and French legal regulation of public property consists in the codification (in France) and the fragmentation (in the Czech Republic) of the legislation concerning public property. It can be also concluded that the French form of legal regulation of public property looks and works more coherent than the Czech form of legal regulation. This fact, besides other things, results in better comprehensibility and also in better level of advancement of the French administrative law. According to the general opinion, the French codification of legal regulation of public property could be inspiring for both the Czech concept of legal regulation of public property and for the legal regulations of other EU member states.

### **3. Public Property in French Law**

In view of the fact that the French legal regulation was found as coherent, well arranged and inspiring, it is appropriate to occupy with the French legislation of public property.

The French legal regulation of public property (unlike the Czech legislative) includes a legal definition of public property. Under Article L. 2111-1 of GCPP, the property of public entities is, with the exception of special statutory provisions, the movable or immovable property belonging to such public entities and as well:

- is intended for direct use by the public;
- or is intended for a public service. In such a case, the public property has to be the subject of "the necessary planning for the performance of the public service tasks".

On the basis of the above-mentioned legal definition of public property in France, it can be concluded that it fulfils the main features listed in Chapter 1 *in fine* of this paper.

The foundation of conception of public property in France is a public interest, which is often transformed into a public utility in France, for example in the form of the phrase of "intended for direct use by the public" or "designated for public service". In France, the public property of public entities differs from private property of public entities by subjecting them to a highly protected legal regime which is based on the following aspects - the inalienability and the imprescriptibility.

However, in order for property to be included in this category, it must fulfil two principal criteria - the criterion of subject and the criterion of assignment. Regarding to the criterion of subject, a subject has to be a legal person of public law. Regarding to the criterion of assignment, i.e. within the meaning of the Article L. 2111-1 of GCPP.

### **3.1 Example of Public Property in France**

In the following subchapter I will focus on individual example (Hertz waves) of public property in France, which is completely different from the Czech concept of Hertz waves.

It should be noted at the outset that the status of property belonging to a public property group can also result from the act. In France, this is the case of Hertz waves.

While in the Czech Republic the frequency band, although considered by material possessions, is not eligible to be object of the proprietary right, in France the frequency band, respectively hertz waves belong to the state public property under the article L. 2111-17 of GCPP. Furthermore, the article L. 2124-26 of GCPP provides that "*the use of radio frequencies on the territory of the Republic constitutes a private use of the state's public property*".

It could be concluded that the French conception of legal regulation of Hertz waves reflects more precisely the reality and a social need of the legal regulation than the Czech legislation which is insufficient. This is another example why the French legislation should be the model of inspiration for EU member states.

### **3.2 Protection of Public Property in France**

The protection of public property or, more precisely, the legal regime for the protection of the public property of public entities in France is characterized by the following attributes:

- inalienability;
- non liable to confiscation;
- imprescriptibility.

The protection the public property of the French public entities also reflects the fact, that before such property can be transferred to a person of private law, it is necessary to exclude it from the public property as *a priori*. This operation involves the preliminary exemption of the property from the assignment for public use and the formal decision of the particular public entity.

However, a private person can use property in the public ownership in certain cases without the transfer of ownership. These are cases of so-called temporary use. The mentioned use is possible for a fee, it has to be approved in writing by the relevant public entity and it is always revocable. At the same time, such temporary use of public property by private entity has to be compulsory compatible with the original purpose of the property.

As regards the exclusion of property belonging to the public property of public entities, this process is governed by the second part of the GCPP, starting with Article L. 2141-1, which states that "*The property of public entity referred to in Article L. 1, which is no longer assigned to public service or direct use by the public is no longer part of the public property, from the time when the administrative act declaring its exclusion was put out.*"

The exclusion of property from the public property category of public entities can be characterized in the French law as a two-phase process. In the first phase (*la désaffectation*) it is necessary to separate the property from either direct use by the public or to separate the property from the assignment to the public service. After the successful completion of the first phase, it is possible to proceed to the second phase, i.e. the exclusion (*la déclassement*) of property from the category of the public property belonging to a public entity. While the first phase (i.e. the separation of property) could be characterized as a factual situation (i.e. factual

separation either from the direct use of the public or from the public service assignment), the second phase (i.e. exclusion of the property) involves the decision of the relevant public entity via a decree or an order (i.e. always an individual legal act) as a result of an administrative procedure which in some cases involves a public inquiry or the need to obtain the consent of a third public entity (the consent of a third entity is necessary, for example, when cultural buildings are removed from public property; in this case, a consent is required either by the Ministry of Culture or by the French State Monument Authority). The discharged public property becomes the private property of public entity. The public entity can give the property a new assignment, keep it as a land reserve, manage it as a private property or decide to transfer it under civil law conditions, while reflecting public law standards (primarily aimed at protecting the interest of the state and its public policies - for example the culture).

If there is a situation when the property of a public entity is straight excluded from the public property without its factual separation from the direct use of the public or the separation from the public service assignment, such property remains classified as public property. It follows from the above that both of the phases of the two-phase process of exempting property from public property of public entities are obligatory.

It can be summarized that the French legal protection of the public property is at a very high level which allows to protect a public interest. In my point of view the two-phase process is a comparatively uncomplicated, practical and well realizable. This process could be another inspiration for EU member countries how to unify and improve their legal regulation of the public property.

#### 4. Conclusion

The presented paper was aimed at the legal regulation, respectively the legal regime of public property in France and in the Czech Republic as two EU member states within the mutual comparison. From this comparison, it can undoubtedly be assumed that the Czech legal regulation is quite fragmented and therefore somewhat confusing. On the other hand the French legal regulation of public property is based on the comprehensive code that successfully solves the Czech problem of the fragmentation of legislation as well as its opacity. Apart from the General Code on Public Property, also the General Code on Territorial Self-Governing Units (governing the management of the public property belonging to relevant public entities) was mentioned.

In the paper there was presented legal definition of public property in France which is absenting completely in the Czech legal order. There were also mentioned crucial aspects on which the public property in France is built. As an interesting example of public property in France it has been mentioned the case of frequency waves which, unlike in the Czech Republic, are the object of public property.

Then the attention was paid to the legal regime of the protection of the public property in France which could be characterized as relatively strict. This fact substantiated by basic attributes on which the legal regime of the protection of the public property in France is built and then by the stating of an obligatory two-phase process which leads to a successful exclusion of the property from the public property category of public entities in France.

The hypothesis of the paper defined in the introduction as the "*the Czech legal regulation of public property is disintegrated*" was confirmed. It could be concluded that the French conception of codification of legal regulation of public property is considerably inspiring for

another EU member states and could be useful for a harmonization of the legislation in these countries.

### Abstract

*The population is aging. This indisputable fact is recognized and challenged by all developed countries in the world. In this paper, we demonstrate in the European context, based on data from the Eurostat and Czech Statistical Office, the situation of pensioner's consumption in the Czech Republic and EU. The analysis is concerned with expenditures of pensioners' households on their consumption. The transition from the economically active phase of life into the pensioner's state is often characterized by the decrease of the individual or household income. The financial instruments in the Czech Republic that would secure the individuals in retirement are still underdeveloped. It is undoubtedly the case for low-income individuals and households with income below average. Thus, the pensioners have to decrease their consumption. This phenomenon can be exaggerated by the growth of inequality of lower and high-income households.*

**Keywords:** Czech Republic, European Union, household's expenditures, inequality, pensioners

**JEL Classification:** D14, D31, D63

### 1. Introduction

For pensioners, the transition from the economically active phase of life to economically inactive (retirement) is a time of significant change. Often dramatically changes the content of the day, the motivation of activities, but also in most cases the household/individual income drops. If a pensioner household does not prepare for this situation in advance, it gets into a difficult life situation (Hrast et al., 2012; Sýkorová et al., 2014). Retirement is a time of life that has grown ever longer in the developed world, and the number of pensioners has increased accordingly. It puts the strength of social security systems and the social safety net in general into question. Therefore, there is a need for proper financial planning for retirement (Topa, Lunceford and Boyatzis, 2018). Most pensioner households are at risk of becoming entirely dependent on the country's social system. This problem arises from the fact that public old-age schemes were created under entirely different demographic and economic conditions (as the White Paper of the European Commission, 2012) points out. Pavolini and Seeleib-Kaiser (2018) have assessed what extent reforms of occupational pensions (OP) have fostered a risk shift or increased social protection dualism across countries in the EU. Thus, the changes should be prepared carefully, since it is evident that countries relying on voluntarism about

OPs coverage tend to witness processes of dualization. However, the general income inequality does not affect pensioners' subjective economic well-being (Palomaki, 2017). However, this paper does not have the ambition to address the issue of the income side of pensioner households, where the primary income of pensioner households is usually a retirement pension. It will focus on the limited manoeuvring space of pensioner households on the expenditure side. The underlying database is data from Eurostat and supplemented by data of the Czech Statistical Office, which will refine the situation of pensioners for the Czech Republic.

## **2. Analysis of Expenditures of Pensioners Households**

In this chapter, we analyse the expenditures structure of typical pensioner's households in the EU and the Czech Republic. It will lead to the investigation of the main issues that should be considered by the policymakers in the future. Household expenditures are one of the essential elements that are used for analysis of the efficiency of the social benefits systems (Beran, 2013; Beran and Franek, 2016).

### ***2.1 Demographic Development***

Over 10.5 million inhabitants lived in the Czech Republic in 2015 and of those, the people over 65, made up over 17.8%. In the absolute terms, it is a population of 1.9 million (Eurostat, 2017a). The Czech Statistical Office (2013) lists three alternative trends in the number of pensioners. According to the typical scenario in 2020, over 20,5% of the total population in the Czech Republic should be over 60+. In 2050, their number should increase to almost one-third of the population (about 32.2%) of the Czech Republic.

The trend mentioned above of population aging is not the reality of the Czech Republic alone. Over the past ten years, EU Member States have seen an increase in the old-age dependency ratio (% of the population aged 65 and over relative to the people aged 15–64 years) on average by more than 4 pp. It means from 25% in 2005 to 29% in 2015 (Eurostat, 2017a). In the Czech Republic, there is an increase of this indicator by 6.7 pp (the difference between 2005 and 2015), and thus, it is one of the three EU countries with the highest upsurge. The other two are Malta with an increase of 8.3 pp and Finland with an increase of 7.4 pp. However, it is also important to note that the old-age dependency ratio in the Czech Republic was 26.6% in 2015 and is therefore now below the EU average. According to Eurostat's forecasts (2017b), the Czech Republic will be in the 15th position in 2020 and even in the 11th position in 2050. We see a similar increase in other V4 countries, such as Poland moving 16th in 9th place in 2050, Slovakia shifting 14th place to 13th place. Public pension expenditure as a percentage of GDP has risen in the EU-15 from about 6% in 1960 to over 12% in 2000. Thus on the assumption that no action will be taken to address this situation, pension spending could reach unsustainable levels close to 20% of GDP in the coming decades (Gal, 2008). This situation creates further pressure on the welfare state and challenges the budgets of EU countries, some more than others (Baba, 2016).

An increasing number of pensioners is a challenge for economic policymakers. The old-age pension was designed to ensure a decent living standard in old age. As demographics change, it seems that this role cannot be fulfilled in the future.

## 2.2 Pensioner Citizens' Expenditure in the European Union

The first data group used in the article is Eurostat data. Two COICOP (Classification of individual consumption by purpose) consumer segments (in total it includes 12 parts) were selected in two tables for pensioner households across the European Union (28 countries). Two of these sections were chosen for their necessity: food, non-alcoholic beverages and housing, water, electricity, gas and other fuels. An also section including health. The other two sections represent the capability of the pensioner to interact with his or her surroundings, whether physically or using modern means of communication represented by transport and communications. The last section under review tells us about the capabilities or possibilities to spend money for leisure activities: recreation and culture. Here, it should be noted that this does not have to include the retirement pension for the given month only. The pensioner can use its savings too. Another option is to reduce spending in other sections, except for food and housing. As can be seen from Table 1, living standards in individual member states are crucial to the structure of money issuance. For economically weaker countries, it is typical that pensioner households spend more on the section "Food and non-alcoholic beverages." The theoretical limit could be 20% of the total budget. There are exceptions where pensioner households spend less in economically weaker countries, but they are not significantly lower.

Source: Authors based on data from Eurostat (2017c)

The average cash expenditure of pensioner households for Food and non-alcoholic beverages in the member countries that joined the EU after 2004 is 25.5%. Pensioner households in the Czech Republic in this comparison reach value of 22.3% (ranked 10th), which is relatively close to the average. The average amount for pensioner households in the original member states is 14.2%. It is, therefore, lower by more than 10 pp. In other words, the richer the country, the fewer pensioners spend their budget on the necessary survival items. The fact is that in the original member states there is a higher price level, which is also reflected in the conversion in the parity of the purchasing standard. An explanation of this phenomenon can, therefore, be found in the higher budget of pensioner households in the original member states. It is due to a higher income during the working age and consequently relatively lower spending of pensioner households in the comparison of this section across the member states of the European Union.

Source: Authors based on data from Eurostat (2017c)

Housing costs are an essential item in all EU member states. The average age of the pensioner households for this section in the original member states is 32.9% and 34.6% of the newcomers. Housing, water, energy, and fuel is the most significant spending for pensioner households throughout the European Union. Pensioner households in the Czech Republic in this comparison ranked up to 24th place with a value of 27.4%. Within the same methodology, pensioner households in the Czech Republic show a relatively low cost of spending on the

most expensive item. In the case of health expenditure, there is no difference between the European Union and the countries, which joined after 2004. The average for pensioner's households in the European Union in this section is 5.3%. The Table 2 captures the remaining three sections. For transport, we can suggest that the more advanced the country and the higher are expenditures of pensioner households. In the Czech Republic, we are struggling with the problem that when a pensioner's household loses one member, it abandons its means of transport (i.e., a vehicle). A pensioner household would renounce the car even if they became too old. At the same time, it should be noted that in the Czech Republic, the costs associated with transportation for elderly are subsidized from the public budget. For example, a reduced fare or it is free of charge. Nevertheless, living without a vehicle reduces the elderly's living space and thus increases the risk of social exclusion.

The opposite applies to communications. The more advanced the country (the original countries of the European Union), the lower is the spending on communications. The imaginary threshold (except for some exceptions) is 2.5%. The Czech Republic ranked second with 4.2%. It can also be influenced by the higher rate of communication services in comparison with the original EU member states. Again, restrictions on spending in this area would again increase the risk of social exclusion, as they would lose the ability to communicate with their family and their surroundings. The last section is "recreation and culture". Pensioner households in the original member states spend more than 10% of the total budget in this section. The cost of free time activities varies considerably. Again, however, it is higher than in the newly admitted countries. Except the Mediterranean countries (Greece, Portugal, Italy and Spain), where pensioner households issue so little money to this section that they are more like the new member states. Based on the result of the Eurostat survey, it can be argued that, in the EU comparison, pensioner households in the Czech Republic are similar to their counterparts in original member states. They spend 10.3% and ranked 6th. It is still necessary to point out that the absolute amount of money issued by pensioner households in the original member states is different. Pensioners in the Czech Republic would like to enjoy the same conditions of the original EU member states. However, the structure of expenditures is different. Pensioners' spending in the Czech Republic merely resembles the situation in countries that joined after 2004. If they achieve similar values in some items, it is at the expense of the reduction of other COICOPs. However, the expenditures are in relative measures, and without knowing the exact amount, it is not clear how much money the pensioners have at their disposal. Following Figure 1 shows median equalized net income in Euro and purchasing power standard. It shows the unevenness of pensioner's income in the EU.

**Figure 1: Median Equalized Net Income of EU pensioners**

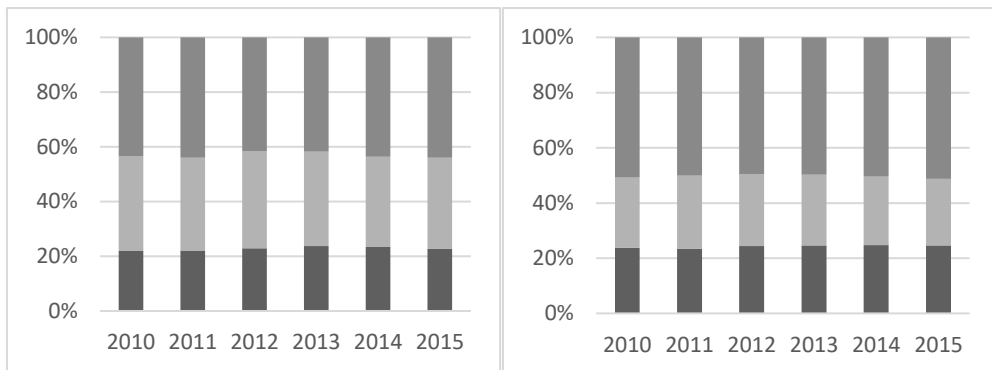

Source: Authors based on data from Eurostat (2017c)

### 2.3 Family Account Statistics of the Czech Statistical Office

The Czech Statistical Office provided further data through its “Household Budget Survey.” This investigation tracks the administration of private households and includes information on the amount of their spending and consumption patterns. The survey corresponds to the structure of households in the Czech Republic (contains a set of 3,000 households). The spending is calculated per head, even for a two-member household. The following charts in Figure 2 illustrate the distribution of pensioner household spending in 2010-2015. “Food and Non-Alcoholic Beverages and Housing, Water, Energy, Fuels are used individually. The remaining ten sections are aggregated. The first chart is for an average single-member pensioner household and the second for an average two-member pensioner household.

**Figure 2: Net Cash Expenditures Cumulated into Three Categories of Average Single-Member Pensioner Household (right) and Two-Member Pensioner Household (left) in 2010-2015 in the Czech Republic**

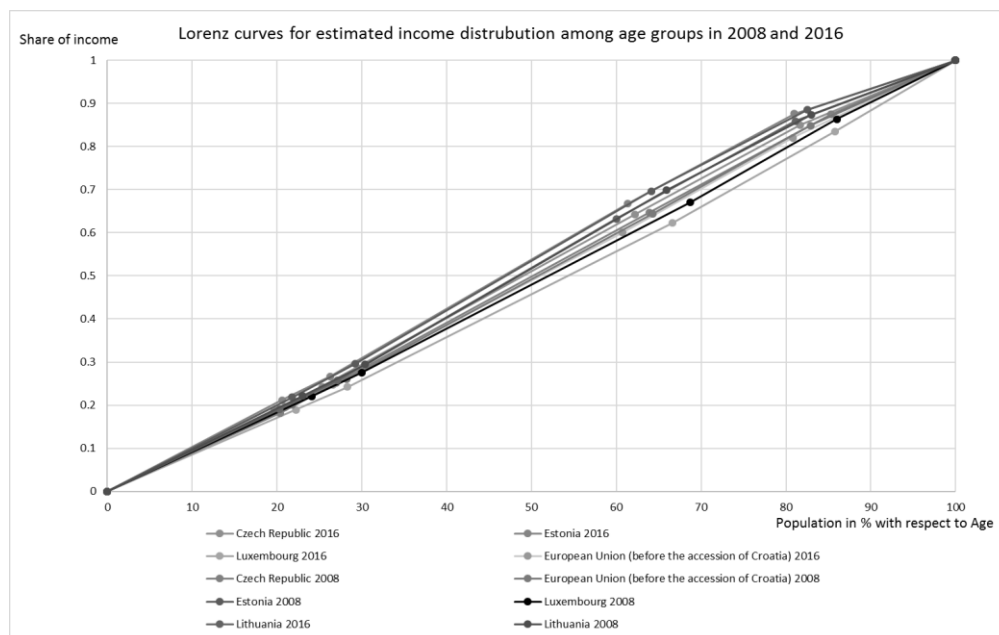

Source: Czech Statistical Office (2017a, 2017b, 2017c, 2017d, 2017e, 2017f), own elaboration

As can be seen from the chart, food (red column) represents over 22% of all spending (maximum 23.7%). Accommodation (yellow column) always exceeds 33% (maximum 35.5%). For the remaining ten sections (grey column), it is only under 45%. The largest share of the remaining ten divisions belongs to “Recreation and culture” (average in the monitored period is 8.6%) and “Other goods and services” (average in the monitored period 8.2%). In three of the six years surveyed, the Housing equipment and repairs are over 5%. The remaining seven sections of those twelve are below 5%. The two-member pensioner household, the situation is slightly different. It is because, in the case of a two-member household, the cost of living is higher, but economies of scale come into play. The spending on the food of a two-member pensioner household is almost identical. About 5 pp of savings were made from the amount spent on housing. For the remaining sections, it is about 5 pp. more than in single-member pensioner households. Over the entire monitored interval, four sections reached above the 5% limit: Other Goods and Services; Recreation and Culture; Transportation and Home Furnishings; Household Equipment and repairs. Transport expenditure for a two-member pensioner household has such a significant share because it owns a passenger car. The lowest expense share for pensioner households, according to the Czech Statistical Office and Eurostat, is Education. Here we can say that this is almost a zero item.

### 3. Discussion

There is no apparent problem in analysing expenditures of pensioner households. Only that the most prominent expenditure (over 50%) is for necessary goods. This deviation, however, has broader consequences, which are reflected in its cash balance. The single-member pensioner household in the monitored period has a negative overall cash balance. It means that a pensioner is not able to cover his expenses with his income. A two-member pensioner household acquires a bit better earnings. In all monitored years, it has ended with a surplus. For this surplus, it is necessary to add that it was sufficient to cover extraordinary expenses for only five of the six years surveyed. Extraordinary expenses in 2015 amounted to CZK 9,900. It is an expense to cover household-related unexpected expenditures, for example, when a washing machine, a refrigerator, etc. is broken. If we take another view of this problem using income distribution, we can see that in countries like Estonia or Lithuania, where the relative expenditures for necessities are among the highest in EU, also have income distribution skewed towards people under 65. It also corresponds to the income distribution among different age groups as shown in Figure 3.

**Figure 3: Lorenz Curve for Income Distribution Among Different Age Groups in 2008 and 2016**

Source: elaborated based on population structure and Mean and median income by age and sex - EU-SILC survey (Eurostat, 2018a; Eurostat, 2018b)

We can see that in countries like Lithuania and Estonia there is the higher difference in income distribution between age groups under 65 and over 65 (the Lorenz curve is concave). Furthermore, this situation has not changed since 2008. Interestingly, in Luxembourg, the situation is different (the curve is convex). We can see that the income distribution has shifted between 2008 and 2016 in favour of the elderly. The Czech Republic remains quite close to the European average. However, it finds itself on the side where the most post-communist countries lay. It also helps to explain the difference among the expenditures of the elderly in

EU member states. Failing to cover extraordinary expenses is in itself severe, especially from the social point of view. It decreases the maintaining the standard of living. However, failing to manage the positive balance at least in the short run is unsustainable and poses a big problem. Thus, the death of a partner in the Czech Republic represents almost automatically a fall into poverty. This fact supports two phenomena. There is the increase of pensioner households that face bankruptcy. Unfortunately, the time series is too short to get the idea of the depth of the problem, and there is no data available to provide additional information on why this phenomenon occurs. Secondly, the number of pensioners who are entitled to social benefits and tangible emergency benefits is growing. An advantage of the state budget is that pensioners who have the full right under the law for these benefits do not yet apply to them.

#### 4. Conclusion

Demographic developments in the Czech Republic predict a significant increase in the pensioners' population. These people will try to sustain their living standards from the productive stage of life. Nevertheless, it is going to be harder. Today, even shortly, pensioners will not be more secure in old age. On the one hand, some people do not have income in the productive phase of life, nor any financial instruments that could provide them with sufficient funds for later life. Therefore, the composition of the expenditure of Czech pensioners differs from the consumption of pensioners in developed countries of the European Union. It is also apparent from the difference in income distribution. The Czech pensioners failed to converge towards their counterparts from developed countries in the monitored period. The opportunities of pensioners are severely limited to pensioners from developed countries. It does not mean, however, that the Czech pensioner is unhappier or less active than a pensioner from a more developed country is. The pensioner from the more developed countries is not forced to turn five crowns before spending it or buying in discounts. Household expenditure in the Czech Republic is affected by the spending on two main sections: Food and non-alcoholic beverages and Housing, water, energy, and fuels. Expenditure on food and non-alcoholic beverages in both types of pensioner households was similar. The housing, water, energy and fuel share of the total expenditure in the two-member pensioner household was lower than that of the single-member pensioner household. For two-member pensioner households, the economies of scale influence each COICOP section.

The most important finding is the inability of Czech pensioner households to manage the positive balance for a single-member pensioner household and to cover extraordinary expenses for a two-member pensioner household. It poses a future problem when we predict the development of the demographic composition of the population in the Czech Republic in the future. There is a challenging question where these households will get the money to be able to sustain and not reduce their standard of living.

### Abstract

*The purpose of this paper is to compare usage results of the European Customer Satisfaction Index (ECSI) model for modelling customer satisfaction within supermarkets in Poland and Lithuania. Both countries became members of European Union and the common market relatively recently. This fact probably had an impact on changing consumer behaviour. Similarities and differences between these markets can be tested with ECSI model. This model was validated across a number of European countries and many industries. Its use can be interesting for newly joining European Union countries whose markets and consumer behaviours differ from the countries of the “old Union”. Lithuanian research was performed by Pilelienė and Grigaliūnaitė (2013). We adopted scales and variables used by them and ran parallel research in southern Poland. The research results showed considerable similarities. Both studies were not able to confirm the significant impact of customer expectations on perceived quality and perceived value. There was also no relationship between potential complaints and customer loyalty. In our study, we showed a greater impact of perceived quality on satisfaction and a smaller impact of perceived value. In the Lithuanian results, the perceived value had a greater impact on customer satisfaction.*

**Keywords:** *European customers' behaviour, European Customer Satisfaction Index (ECSI) model, European Union markets, structural equation modelling (SEM), supermarkets*

**JEL Classification:** *M30, L81, C30*

### 1. Introduction

Nowadays consumers have become more critical in their choices and show increased interest in many diverse attributes of products (Velčovská, Klapilová Krbová, 2016). Fulfilling their requirements and satisfaction is one of the most important issues of every company on the market. The competitiveness of a company on the market is connected with consumer satisfaction. Satisfied consumer repurchases, create positive word of mouth opinions about the company and its products, with which customers are emotionally involved with. Among a number of currently available approaches to studying customer satisfaction, satisfaction models are very useful.

In literature there are a lot of examples of customer satisfaction models. Some of them have become a classical concept i.e. ACSI (American Customer Satisfaction Index model) and ECSI (European Customer Satisfaction Index model) and they are often used by scholars all over the world.

These models are also often modified and supplemented. As an example of these models we can give TCSI – Taiwan Customer Satisfaction Index proposed by Chiu et al. (2011), H-CSI –

Hotel Customer Satisfaction Index (Deng et al. 2013) or the Swiss Index of Customer Satisfaction (SWICS) (Bruhn and Grund, 2000).

### 1.1 Model of European Customer Satisfaction Index

The Swedish Customer Satisfaction Barometer (SCSB) proposed by Fornell (1989) was the first customer satisfaction model broadly popularized within literature. The ECSI (European Consumer Satisfaction Index) has evolved from the American Customer Satisfaction Index model (ACSI). The ECSI is an indicator that measures customer satisfaction. It has been developed by the EOQ (European Organisation for Quality) and EFQM (European Foundation for Quality Management) (Grigoroudis and Siskos, 2004). It has been validated across a number of European countries and many industries (Ball et al. 2004).

Model of European Customer Satisfaction Index contains seven latent variables. The antecedents of satisfaction in this model are: perceived quality, value, image and customer expectation. While the consequences of satisfaction are: complaints and loyalty. The complaint behaviour and image in the model are used optionally. Figure 1 shows the relation between variables in this model.

Latent variables are equipped in proper manifest variables, which are measured in a consumer survey. Associations between manifest and latent variables are described using a set of equations with unknown coefficients. These coefficients are estimated using partial least squares (PLS) on maximum likelihood approach (ML). As a result, we get so called path coefficients, which determine the scale of the impact of variables on each other and its significance.

**Figure 1: Model of European Customer Satisfaction Index Used in the Study**

Source: Cassel and Eklöf (2001)

The ECSI model has many modifications e.g. additions of subsequent elements. They may have the character of exogenous and endogenous variables. For example, Kaveh et al. (2012) proposed a revised model where perceived value has an impact on satisfaction, which, in turn, is an antecedent to customer trust and repurchase intention. While perceived value is assumed to result from four factors i.e. the core service provided (technical dimensions), perceptions of

service processes (functional dimensions), the image and the price. Table 1 shows selected variables proposed by various authors as a modification of the ECSI model.

**Table 1: Variables Proposed as a Modification of ECSI Model**

<b>Authors</b>	<b>Variables</b>
Ball and Machas (2004)	communications and trust
Haq (2012)	trust and customer education
Magalhães (2009)	switching costs and attractiveness of alternatives
Ryglová and Vajčnerová (2005)	customer complains
Kaveh et al. (2012)	trust, repurchase intention, price, technical dimension, functional dimension
Ciavolino and Dahlgaard (2007)	hardware, software
Eurico et al. (2015)	employability

Source: authors' elaboration.

The ECSI model construction allows a calculation of the customer satisfaction index. Kristensen, Martensen and Grønholdt (2002) indicate several advantages of the concept. These are:

- to deliver useful information to the company's general measurement system,
- to provide useful information on customer satisfaction to the public authorities and organizations e.g. the dynamics and measurement of productivity, price and inflation,
- could lead to a sharper focus on quality and the customer,
- could increase the welfare of customer and the competitiveness of the country,
- helps to answer questions about European economy as a whole,
- using ECSI measures, customer satisfaction inside specific industries can be compared with each other and with the European average, and this could lead to increased competitiveness, further development, and the promotion of European quality,
- will benefit European customers by giving voice to their evaluations of the products and services they buy and use.

## 2. Problem Formulation and Methodology

The main goal of this article was to compare the results of the research carried out by the authors with the results of similar research performed in Lithuania. The comparison is interesting because both countries have common historical ties, both have experiences from the Eastern Bloc and their contemporary markets have shaped at the same time after 1989. However, we cannot forget about the differences between them: Polish market is larger than Lithuanian one and there are some differences in customer behaviours.

Lithuanian research results were announced by Pilelienė and Grigaliūnaitė (2013). They conducted their survey on February 2013. They carried out their survey in person and via the Internet. They gathered a sample of 250 supermarkets' clients and used the concept of ECSI model. Following their methodology, we ran a similar test in Poland. Due to this – the results of which are comparable. In the study the Lithuanian results will be marked as LT, and Polish – PL.

## 2.1 Model and Data

As a framework for our research we used the European Customer Satisfaction Index model shown in Figure 1.

In the measurement model we used a set of manifest variables adopted from Pilelienė and Grigaliūnaitė (2013). In contrast to our Lithuanian colleagues, we did not measure the variables on a 10 point scale but we used a 5-point Likert's scale, from 1 – „I do not agree at all” to 5 – „I extremely agree”. There were no reverse-scaled items.

Manifest variables were measured in a survey using a self-developed questionnaire. The questionnaire consisted of two parts, the first one described the profile of the customer, and the second, allowed to measure manifest variables. Every respondent had a possibility to assess 1-3 supermarkets.

The questionnaires were distributed in southern Poland (Silesian and Lesser Poland Voivodeships, Poland), using a snowballing method. In return, we received over 200 questionnaires, but because of missing data only 205 were used for modelling. Table 2 shows the structure of the sample in comparison with Lithuanian study.

**Table 2: Structure of the Sample in Comparison with Lithuanian Study**

PL	Percent	LT	Percent
Gender		Gender	
Female	74.0%	Female	52.0%
Male	26.0%	Male	48.0%
Age		Age	
no data	2.0%	no data	1.0%
less 18 y.o.	1.0%	less 18 y.o.	1.0%
18 – 25	36.0%	18 – 25	37.0%
26 – 40	31.0%	26 – 35	36.0%
40 – 65	27.0%	36 – 45	16.0%
more than 65	3.0%	46 – 55	8.0%
		more than 55	2.0 %

Source: Pilelienė and Grigaliūnaitė (2013) and authors' elaboration.

For constructing the model, we used software dedicated to structural equation modelling (SEM), using partial least square methods (PLS) with bootstrap methods.

## 3. Problem Solution

Firstly, we verified the internal consistency of the measurement model used in our research. For this verification Cronbach's alpha coefficient and Composite Reliability (CR) coefficient and Average Variance Extracted (AVE) were used. In this case Cronbach's alpha and CR significantly exceeded their threshold values (0.7) and AVE took values of over 0.5 which indicates, that the measurement model is internally consistent (cf. Biesok and Wyród-Wróbel, 2016). Table 3 shows the results of the verification and its comparison to the Lithuanian study.

The evaluation of the measurement model gave positive results so in the next step we were able to determine the internal structure of the model. Tables 4 and 5 present the results of the modelling. Using bold font, we marked path coefficient which have a significance level of  $p < 0.001$ .

**Table 3: Evaluation of the Measurement Model**

Variables	Items	Composite reliability		Cronbach's $\alpha$		AVE	
		LT	PL	LT	PL	LT	PL
Complaints	1	1.0000	1.0000	1.0000	1.0000	1.0000	1.0000
Customer Expectations	2	0.8996	0.8733	0.7769	0.7098	0.8175	0.7739
Customer Satisfaction	3	0.9284	0.9134	0.8843	0.8574	0.8122	0.7784
Image	5	0.8794	0.9008	0.7953	0.8618	0.7085	0.6456
Loyalty	2	0.9411	0.8687	0.8754	0.6978	0.8887	0.7673
Perceived Quality	6	0.9117	0.8813	0.8709	0.8377	0.7209	0.5525
Perceived Value	2	0.9487	0.9246	0.8919	0.837	0.9024	0.8592

Source: Pilelienė and Grigaliūnaitė (2013) and authors' calculations

Results of our research showed a considerable similarity to the Lithuanian results. Both studies have not confirmed the significant impact of customer expectations on perceived quality and perceived value. There was also no relationship between potential complaints and customer loyalty.

**Table 4: Modelling Results – Paths in the Inner Models**

Model path	LT		PL	
	Coeff.	p-value	Coeff.	p-value
Complaints > Loyalty	0.0641	0.457	0.0605	0.474
Customer Expectations > Customer Satisfaction	0.1191	0.013	-0.0850	0.065
Customer Expectations > Perceived Quality	<b>0.5273</b>	<b>0.000</b>	<b>0.4240</b>	<b>0.000</b>
Customer Expectations > Perceived Value	0.0096	0.847	-0.0811	0.232
Customer Satisfaction > Complaints	<b>0.6509</b>	<b>0.000</b>	<b>0.5507</b>	<b>0.000</b>
Customer Satisfaction > Loyalty	<b>0.5449</b>	<b>0.000</b>	<b>0.9338</b>	<b>0.000</b>
Image > Customer Expectations	<b>0.6333</b>	<b>0.000</b>	0.6804	0.004
Image > Customer Satisfaction	0.0215	0.644	<b>0.2617</b>	<b>0.000</b>
Image > Loyalty	0.1216	0.075	0.3635	0.006
Perceived Quality > Customer Satisfaction	<b>0.3081</b>	<b>0.000</b>	<b>0.7040</b>	<b>0.000</b>
Perceived Quality > Perceived Value	<b>0.7859</b>	<b>0.000</b>	<b>0.6641</b>	<b>0.000</b>
Perceived Value > Customer Satisfaction	<b>0.5354</b>	<b>0.000</b>	<b>0.2498</b>	<b>0.000</b>

Source: Pilelienė and Grigaliūnaitė (2013) and authors' calculations

On the other hand, in the Polish studies, a greater impact of perceived quality on satisfaction, and a smaller impact of perceived value are shown. In the Lithuanian results, the perceived value had a greater impact on customer satisfaction. You can also see a considerable difference in the impact of image on customer satisfaction. It is significant in our results, but insignificant in the Lithuanian study.

Customer satisfaction has a bigger determination in the Lithuanian model – over 77.5% of its variance is explained by the model. In the Polish research, the determination of satisfaction is lower, so it can be expected that there are still some factors outside the model, which can have an influence on customer satisfaction and must be considered in future research. Similarly, the perceived value in the Polish model is completely indeterminate.

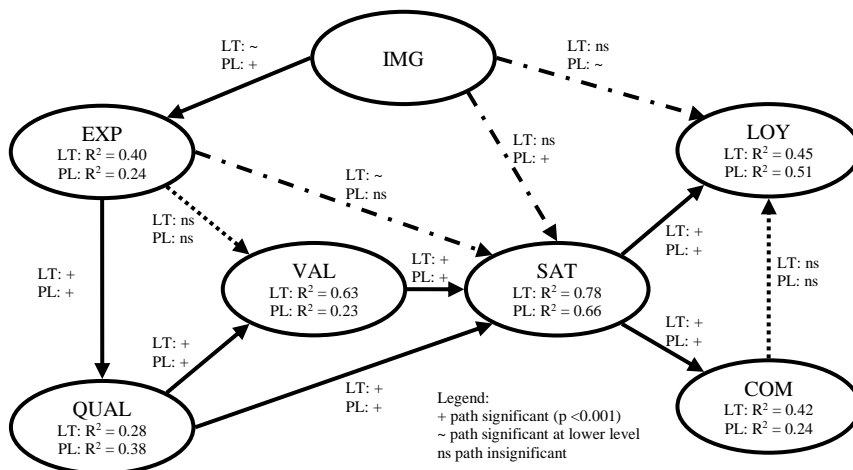

**Table 5: Comparison of Determinations and Latent Variables Indexes (LVI)**

Variables	R <sup>2</sup>		LV Index	
	LT	PL	LT	PL
Complaints	0.4236	0.2412	60.08	62.927
Customer Expectations	0.4010	0.2370	67.636	63.036
Customer Satisfaction	0.7753	0.6639	62.811	57.411
Image	–	–	65.878	58.974
Loyalty	0.4499	0.5147	72.207	65.468
Perceived Quality	0.2781	0.3764	63.923	62.778
Perceived Value	0.6258	0.2291	61.776	67.245

Source: Pilelienė and Grigaliūnaitė (2013) and authors’ calculations.

The analysis of Latent Variables indices shows that in both studies they obtained a similar value. The Lithuanian results show a higher level of customer loyalty. In both models customer satisfaction expressed with the LV index level is average (LT: 62.811, PL: 57.411). Comparison of determined models is shown in Figure 2.

**Figure 2: Comparison of Determined Models in the Polish and Lithuanian Study**

Source: authors’ elaboration. Significances at level 0.001.

### 4. Conclusion

Despite the fact that both studies were conducted in different geographical regions and they concerned different groups of clients, their results show significant similarities. The mechanism of satisfaction shaping is based on the common core: image affects the expectations of customers, expectations shape the perceived quality and value, and both these factors affect satisfaction. The difference is in the strength of these factors. The Lithuanian results show a greater impact of perceived value on customer satisfaction, and Polish – a greater importance of perceived quality.

Both studies did not confirm the direct impact of customer expectations on satisfaction. This is an interesting observation, because this dependence is one of the foundations of the ECSI

model. Perhaps the reason for this is the specificity of the countries of Central and Eastern Europe and differently shaped customer expectations.

In the Lithuanian research, customer satisfaction and perceived value are more determined by the model. The Polish results show that there are some factors outside the model that shape these constructs. Future research should find these factors and the model should be supplemented with them. Perhaps this will lead to the creation of a specific customer satisfaction model adequate to the Polish market.

Both studies also show the difference in the impact of image on customer satisfaction. This may be due to cultural differences, but this hypothesis would require further comparative research.

Two factors could have influenced the differences in results. First of which is different gender structure. Our respondents were dominated by women, which could have had an influence on the model, particularly on perceived quality and perceived value. In further studies, modelling should be carried out on both genders separately and the results should be compared with each other.

The second element influencing the results can be the scale. Based on our previous experience, we have used a five-point scale, which is more readable for respondents (cf. Biesok and Wyród-Wróbel, 2016), while Lithuanian colleagues used a 10-item scale following Coelho and Esteves (2006), who claim that this kind of scale is more accurate. Kristensen and Esklidsen (2010) showed, that 10-point scale gives smaller standard deviation, so we assume that changing the scale have not had an influence on statistical significant elements in the model. But the impact of this change on insignificant relationships is an open issue.

In future research, especially in Poland, the focus should be on extending the model with other variables that increase the determination of the perceived value. We also need to expand the measurement model, because the variable complaints and loyalty in the presented approach were poorly equipped with manifest variables.

### **Abstract**

*Social services play an irreplaceable role in supporting clients in their adverse social situation. The clients most commonly include persons with health and social problems that increase with their age, as a result they become more and more dependent on another person's expert support. Social services for the elderly are provided in various forms: in the ambulant, outreach and residential forms, as well as in the telecommunication form in justified cases. This work is dedicated to the analysis and subsequent comparison of the structure of social services facilities for the elderly in Trenčín and Žilina Self-Governing Regions in the Slovak Republic. It identifies key problems that social services facilities for the elderly in the above regions encounter and presents options through which the European social policy can be helpful in developing, modernizing and effectively adjusting these facilities from the standpoint of demand for the social services provided by them.*

**Keywords:** *European Union, regional policy of the European Union, social services, social services facilities, the elderly*

**JEL Classification:** *E62, I12, I31*

## **1. Introduction**

In the presented work we are focusing on social services facilities established under the authority of selected self-governing regions in Slovakia: Trenčín and Žilina Self-Governing Regions. Its contribution lies in timeliness, mapping the current situation and identifying trends that social service facilities in the regions will face in short and long term. It provides information about the structure of social service facilities in selected regions. By the way of introduction to discussing social services, it should be noted that they partially overlap with the wider category of public services.

## **2. Social Services in the Sphere of Public Administration**

*"Social services are defined as a significant part of the activities of the state, self-government and non-state actors that are provided to individuals, families and groups of people and contribute to solving social problems." (Halásková, Halásková, 2016). Matoušek (2011) writes that: "Unlike commercial services, they are financed from public budgets, are defined in more detail by legislation than other services, and as a result they depend more on the political decision-making of the state, regions and municipalities." Social services are specialized activities that are aimed at solving material or social need (Kostolanská, Baťová, 2003). In a*

publication written by Bočáková (2015) we learn that: *"Social services are usually understood to mean services of various social entities aimed at social needs of those people who would find themselves in a state of social need or at least at risk from it if they were not provided."* Social services play a protective role to the benefit of the citizen, by acting to their benefit. They are provided by public or private institutions – in this case the state acts as a guarantor of the observation of fundamental human rights and it must ensure, by periodic inspections of the activities of these entities and assigning licences, that these institutions will do what they undertook to do. Political parties were aware of the significance of the issue of social services to such a degree that it became a part of several election programmes of political parties running in the 2016 parliamentary election in Slovakia (Bočáková, Kubičková, Vavruš, 2016).

The legislative definition of social services in the Slovak Republic is elaborated on by Dávideková (2014) who states Act No 195/1998 Coll. on Social Support and then Act No 448/2008 Coll., which according to her: *"places emphasis on the specialization of individual expert activities by which it tries to solve and overcome an adverse social situation of the individual, family or group. Also the aims of social services are defined."*

*„Of course, the state has an interest in ensuring that those relationships are respected, because through these relations public funds are handled.“* (Koziel, 2016). *„The category of ‘senior citizens’ is one where biological, medical and sociological aspects intersect. The phenomena and processes of senescence are not just biological, but also psychological, cultural and social in character.“* (Smolík, Čeněk, 2017). Matoušek (2007) states a typology of social services according to target groups; in the context of this work the key ones are those that affect the elderly or whose output may be parallelly provided also by the elderly under certain circumstances: services for the elderly, services in response to poverty and homelessness, services for the disabled, services for the ill, services in response to crises and services for people suffering from mental illnesses, services for people with addictions, services related to the administration of justice. *"Formation of local self-governments in the Slovak Republic has begun to take place since its independence in 1993."* (Uramová, Šuplata, Kollár, 2015). Public establishers of social services facilities also include self-governing regions (higher territorial units) that provide social services; we state those that relate to the elderly: homes for the elderly, social care centres, rehabilitation centres, social care homes for adults providing week-long or year-long care, reception centre (Matoušek, 2007). Higher territorial units obtained powers in the field of social services during decentralization processes that were realized in accordance with the accepted principles stated by Bočáková, Kubičková (2016): *"effectiveness, economy, availability of social services, the provision in the interest of and according to the needs of the inhabitants of a region's self-governing area."* Higher territorial units represent administrative bodies in the following areas: reliance on the social service, end of reliance on the social service, parents' or children's obligation to pay for the social service, prohibiting the provision of the social service, deciding not to enter into the register of social service providers, deleting social service providers from the register, drawing up an assessment of reliance on the social service. (Bočáková, Kubičková, 2015).

### **3. Infrastructure of Social Services Facilities Established under the Authority of Žilina Self-Governing Region**

Žilina Self-Governing Region has established twenty-six social services facilities for the elderly. In Žilina district it has established six facilities in total, specifically homes for the elderly and social care homes, while some provide also other social services for various target groups. The capacity is 86 places in the homes for the elderly, and 438 places in the social care homes. In Kysucké Nové Mesto district the self-governing region has established two

facilities, while their common capacity reaches 31 places in a home for the elderly and 96 places in social care homes. A list of facilities with their specific capacities is presented in Table 1.

**Table 1: Social Services Facilities for the Elderly Established under the Authority of Žilina Self-Governing Region in Žilina District**

Name of the social services facility and its seat	Capacity of the home for the elderly	Capacity of the social care home	Other provided social services

Source: Žilina Self-Governing Region

In Bytča district Social Services Centre LÚČ provides its services – it is the only public provider in the district established under the authority of the higher territorial unit. Its capacity is 8 places in a social care home. In Turčianske Teplice, Social Services Centre Horný Turiec is located – its capacity is 40 places in a home for the elderly and 83 places in a social care home. In Čadca district the self-governing region has established four facilities, while their total capacity is 87 places in homes for the elderly and 335 places in social care homes. Tvrdošín district has one facility with a capacity of 44 places in a social care home and one

place in a home for the elderly. An overview of social services facilities and their capacities in Bytča, Turčianske Teplice, Čadca and Tvrdošín districts is shown in Table 2.

**Table 2: Social Services Facilities for the Elderly Established under the Authority of Žilina Self-Governing Region in Bytča, Turčianske Teplice, Čadca a Tvrdošín Districts**

Žilina Self-Governing Region has established two social services facilities in each of Námestovo, Dolný Kubín, Ružomberok and Martin districts and three social services facilities in Liptovský Mikuláš district. In Námestovo the homes for the elderly have the capacity of 27 places and social care homes 129 places. There are 40 places in homes for the elderly and 62 places in social care homes in Dolný Kubín. Homes for the elderly have the capacity of 52 places in Ružomberok district, 43 places in Liptovský Mikuláš district and 40 places in Martin district. Social care homes have the capacity of 181 places in Ružomberok district, 142 places in Liptovský Mikuláš district and 129 places in Martin district.

#### 4. The Infrastructure of Social Services Facilities Established under the Authority of Trenčín Self-Governing Region

Trenčín Self-Governing Region has established five social services facilities in Trenčín district, while the capacity of social care homes is 299 places. In 2017, the self-governing region allocated 20.9 mil. EUR. Of which 19.7 mil. EUR for contributory organizations and 1.2 mil. EUR for public and non-public providers of social services (TSK, 2017). There are 272 places in two facilities in Ilava district. In Púchov district four social care homes have the capacity of 158 places. The northernmost district of Trenčín region – Považská Bystrica district – has two facilities with the capacity of 159 places. An overview of social services facilities in Trenčín, Ilava, Púchov and Považská Bystrica districts and their capacities is shown in Table 4.

The self-governing region has established one social services facility in Myjava, Bánovce nad Bebravou and Partizánske districts. In Prievidza district Trenčín Self-Governing Region has established three facilities with the total capacity of 249 places. In Nové Mesto nad Váhom district four social services facilities with the total capacity of 157 places have been established. An overview of the facilities and their capacities in Bánovce nad Bebravou, Myjava, Nové Mesto nad Váhom, Partizánske and Prievidza districts is shown in Table 5.

## 5. Conclusion

As of 1<sup>st</sup> of July 1998 self-governing regions have had significant powers in terms of social support – social services. The role of social services is indispensable for the recipient since they saturate both health and social support. It follows from the analysis of social services infrastructure in Trenčín and Žilina Self-Governing Regions that these authorities exercise their powers and establish social services facilities – they are present in every district of both regions. Trenčín Self-Governing Region has established 23 social services facilities in total, while the capacity of social care homes is 1,447 places. Žilina Self-Governing Region has established 24 social services facilities – the capacity of social care homes is 1,677 places in

total, and there are further 447 places in homes for the elderly. The key problem of social service facilities not only in Žilina and Trenčín self-governing regions, but throughout Slovakia is insufficient capacity for accepting applicants for social service facilities. It is also desirable to increase funding for reconstruction of buildings, to revitalize the near vicinity of these facilities, to purchase new equipment, to increase the salaries of professional staff, but also to improve and expand leisure activities they offer to their clients. Capacity of social service facilities is currently insufficient in both self-governing regions, as waiting times arises when clients are accepted in individual facilities. The longest waiting times are for public service facilities because their services are more affordable for applicants for social services, such as those receiving old-age or early retirement pensions which are low. To satisfy larger number of applications in the shortest possible time, it is desirable to extend current capacity of public providers or to establish entirely new social service facilities. The adverse development of natality and ageing of the population will result in rising pressure on increasing the capacity of social services facilities. The European Union can be helpful to member states by taking part in making financial investments in social services. The way how to integrate social policies of member states, interconnect social states and unite them continues to be the problem as well as challenge for the whole of the European Union.

### **Abstract**

*Innovations in the medicine, increasing average age of life expectancy, increasing economic demands of an individual, change in the life style of the majority of society, change in social values and other factors cause that on average a human being reaches a higher age and requires not only health care, but also social and nursing care, which in combination with stagnation of reproduction processes causes increasing pressure of social services facilities and subsequently also on public finances. In our paper we pay attention to the possibilities of participation in other financial sources in functioning of the social services facilities in the Czech and in the Slovak Republic. Experience shows that funds earmarked for functioning and development of social services facilities are insufficient and inadequate in both member states. The presented paper deals with the possibilities of participation of other than state finances not only in the operation of social services facilities, but also in their development and flexible introduction of innovations into practice.*

### **1. Introduction**

From methodological point of view, in this article we apply method of description when describing the current state of social services in the Slovak Republic and the Czech Republic. At the same time, we use the method of studying the documents, by which we support our own statements given in presented article. We analyze the sources that are mentioned in the text as well as valid legislation that affects the legal framework of social services. Through the analysis method, we explore the broader context of funding of social services.

*"Social policy is one of the key areas of public policy interests." (Mandys, Mojžišová, 2015). Social policy is based on the system of values (solidarity, equality, humanism, freedom, responsibility, social justice, etc.), it requires intensive flow of funds from the state budget and from the budgets of regions and municipalities and from the sources of civil society.*

*"The role of the state is to balance internal pressures and to act in a cohesive manner in order to make social reconciliation in society." (Horváth, 2013). „The main objective of European Union is to ensure the harmonious development of the territory and all of its parts.“ (Rentková, Roštárová, Mazanovský, 2016).*

Social services help a human being to secure basic conditions of life, to acquire social stability and help them to restore their social independence and sovereignty (Cibáková and col., 2012).

*„Adequate allocation and development of social infrastructure in rural areas has been recognized at the level of the European Union as the factors of better opportunities for integration of the elderly into society.“ (Kiaušienė, Vaznonienė, 2016).*

## **2. Financing of Social Services in the Slovak Republic**

In 1989 transformation processes started changes in the area of social services, which were emphasised by decentralisation processes of public administration. These changes brought space for multi-source financing. According to collective of authors Oláh, Iglarová and Bujdová (2013): multi-source financing is to lead to quality increase of provided services, but also to financial co-participation of social services recipients. Professor Malíková (2007) in expressing herself in this context that in social services new conditions led to appearance of alternative forms of providers of services. *“New forms of providers were formed, such as e.g. church providers, non-profit organisations etc. In the same period the law made it possible also for self-governments to provide social services, but only on voluntary basis. Later upon decentralisation all self-governments took over responsibility for provision of social services (July 2004) and existing (state) facilities were transferred into their competence.”* In financing of social services an important role is played by the factor of the public - i.e. whether it is a public or a non-public provider. In case of public providers social services provided by them can be financed from the following sources:

- from the budget of public provider of public service;
- from the payments for social services from the recipient of social service, on the basis of a contract regarding providing social service;
- from the funds received on the basis of written donation contract;
- from the funds of association of municipalities, association of higher territorial units and association of persons;
- from the result of business from non-core activity, which are carried out by the facilities in the founder's competence of the municipality or of a higher territorial unit with its consent;
- from revenues from social enterprise (according to Section 50b Act No. 5/2004 Coll. on Employment Services);
- by a natural person or by a legal person, which employs handicapped job-seekers in the min. number of 30% of the total number of employees, provides support and assistance in finding an employment in the open labour market, at least 30% from the funds acquired from the income of the object of business, which will remain, after all expenses for the subject matter of activity for the respective tax period according to the tax return has been used every year for creating of new work positions or for improving of social conditions, it is registered in the register of social enterprises, it can provide social services and it can be a public or non-public provider;
- from the subsidy of the Ministry of labour, social affairs and family of the Slovak Republic;
- from other sources (Oláh, Iglarová, Bujdová, 2013).

The possibilities of obtaining financial means for setting up, operation and development of social services in case of non-public providers are different from the possibilities, which are available to the public providers (Lukáč, Hájek, 2016). The author Dávideková (2014) is stating the sources for financing of social services facilities in the founders competence of non-public providers:

- from the financial contribution in case a natural person is dependent on the assistance of another natural person in acts of self-service and from financial contribution for operation under conditions provided by Act. No. 448/2008 Coll.;
- from the payments for social services from the recipient of social service, on the basis of a contract regarding providing social service;
- from own sources of non-public provider of social service;
- from the funds received on the basis of written donation contract;
- from the result of business, from business activity after having been taxed by the income tax, which is performed by a non-public provider of social service according to specific legislation (e.g. Section 23 Act No. 455/1991 Coll. Trade Act);
- from the profits from social enterprise;
- or from other sources.

In the context of the fact that each social service has to be paid in a certain way the authors Bočáková and Kubičková (2015) are saying: *“By legislative amendment No. 448/2008 Coll. the public and non-public providers of facilities of social services have been made equal in the issue of providing of state contribution in the amount of €320 for one client and for one month for facilities for seniors.”* In the practice it happens that a client becomes insolvent and is not capable to pay all charges connected with their placement in the facilities of social services or with use of social service. Most often they old age pensioners, whose amount of pension is low - subsequently they become non-payers and debtors and the financial burden has to be solved by their relatives otherwise they get into more unfavourable situation with financial debts against the social services facility. Social services can be provided by the general or third, i.e. by non-government sector. Dohnalová (2012) is saying that the third sector is often connected with economics and is adding that civil sector and social economy represent mostly overlapping areas. As Cibáková (2012) is stating we distinguish four legal forms of organisations providing social services, namely:

- associations - their purpose is to associate person in order to satisfy their own interests. These are various clubs, societies, unions, movements, clubs etc.
- foundations - they are special purpose associations of assets. Their substance is assets created by a set of things, monetary means, securities and other monetary values, which are intended for performance of generally beneficial purpose;
- non-profit organisations providing generally beneficial services - these are in particular activities focused on providing health care, development and protection of spiritual and cultural values, additional education of children and youth, development of sports and physical education and they are accessible to all users in the same scope in the same area;
- non-investment funds - they associate funds intended for financing of generally beneficial targets, these funds can be provided not only to non-profit organisations, but also for individual specified humanitarian assistance (e.g. financing of concrete operation, purchase of health facility, etc.) (Cibáková and col., 2012).

### 3. Financing of Social Services in the Czech Republic

*“In the system of social services in the Czech Republic are gradually implemented changes in the responsibility for social services from the state to regions, municipalities and individuals.”* (Halásková, Halásková, 2016). A great number of criteria and factors have impact on the characteristics of appearing system of financing and providing of long term social and health care and the following criteria may be ranked as the most important:

- criteria for setting the rate of dependence;
- structure of users of individual types of social services from the point of view of their dependence;
- criteria for awarding subsidies by the state - Ministry of labour and social matters of the Czech Republic and the founder;
- access of health insurance companies to financing of provided nursing and rehabilitation health care in the facilities with accommodation;
- criteria for setting the amount of payments from the user of a service for accommodation and food in facilities of social services with accommodation, for individual acts for ambulatory field services and for provided social and health services in the health facilities with accommodation (Matoušek, 2011).

The author Průša (2010) is reminding that when assessing efficiency, it is not possible to forget the influence of different standard of facilities with social and health services in the individual regions, which significantly determines the possibilities of optimum satisfaction of the client needs in dependence on their overall social situation. Furthermore, he reminds that the amount of operational costs of individual facilities is in a significant way determined by the age of the buildings and by personal equipment of individual facilities. Attention has to be paid also to the size of individual settlements and main development tendencies, which are applied in development of social services in the European states. Expenses for social services have been for a long time on the rise since 1990s of the twentieth century and this tendency has been caused by several factors. The point was a significant increase of the amount for accommodation and food in the social care institute in the second half of the 1990s, when the increase took place, which was higher than valorisation of pensions. Payments for providing of individual acts of carer service were on the rise. The stable level of state subsidies for a bed in institutional facilities in the course of the whole second half of the 1990s and at the beginning of the 21st century had also its influence. It is also important to mention passing of Act No. 108/2006 Coll. on social services, which principally changed the system of financing social services. Subsidies from state budget are provided to the providers of social services, which are registered in the register of providers, by the Ministry of labour and social matters through the budgets of regions within their transferred competency.

The most important change, which has been brought by the new act on social services is enshrining of a new social benefit through the contribution for care (Šramel, 2016). This contribution represents a new tool of financing of social services, yet it is expected that it will lead to positive and expected changes. Contribution for care is provided only to the persons, who due to the reason of their long time bad health condition need assistance from another natural person, when looking after their own person and with their own self-sufficiency secured. Matoušek (2011) is mentioning the targets of this contribution:

- providing free selection of the manner of providing services and reversibility transition from “passive dependant patient” to the “active patient”;
- unification of conditions for obtaining public funds for all entities providing care under the condition of registration;
- Increase of the element of co-operation of the citizen in solving their social situation;
- cancellation of generalisation of the view to the disabled citizens and old age pensioners;
- to start the process of deinstitutionalization and individualisation of care.

#### 4. Conclusion

Social policy is a system that contains several subsystems - one of which are social services. From legislative point of view, the key framework of the legal form of social services in the Slovak Republic is the Act No. 448/2008 Coll. on social services. In the case of the Czech Republic, such a key legislative amendment is Act No. 108/2006 Coll. on social services.

The advantage of a non-public provider, who draws funds from other sources than the public budget of a city or municipality, or self-governing regions, is that he can also provide the client with extraordinary services. If a client is well-financially situated, it is a non-public provider who can provide him with extraordinary care or otherwise meet his specific requirements. The advantage of public service providers is the ability to provide social services without the goal of generating profits. They primarily focus on satisfying the basic and necessary requirements of clients. The fundamental difference between providers is also their affordability. Generally, a public service provider is able to provide a social service with the involvement of a client, thus overall financial burden of accepting social services is more accessible to the client.

*"Social policy is one of the key areas of public policy interests."* (Mandys, Mojžišová, 2015). Social services represent a sphere, which is going to face big pressures in the context of negative demographic trends in the Slovak and in the Czech Republic. The pressure will go up with increasing demand for social services and with stagnating supply of social services. This challenge will represent a financial burden for public budgets, but at the same time it can represent a space for development of business in social services. Importance and scope on issues will also be reflected upon the fact that it will force attention of persons in charge and shall be an integrated part not only of professional, but also of lay discussion. The success rate depends on the fact, how central governments will be able to react to increasing demand and how their budgets cope with the connected costs. We assume that in the course of increasing demand for social services the significance and scope of participation of the third sector will grow. For further research, it would be advisable to focus attention on Member States of the European Union with a similar demographic trend as in the Czech Republic and Slovak Republic and to find out how these countries cope with demographic crisis in the context of social services and what proposals for systemic changes and preparations in the social assistance system could the Slovak Republic and the Czech Republic apply in practice.

### **Abstract**

*The aim of the contribution is to analyse the amount of funds earmarked by local and regional self-government from the EU Structural Funds for cohesion policy in 2011-2016. An analysis of the allocation of the funds received covered the two programming periods 2007-2013 and 2014-2020. The analysis is based on official local government documents, individual documents of VÚC, state budgets and state final accounts in the monitored period. The contribution of the presented article analyses the use of euro-funds in Slovakia in the framework of cohesion policy through its important subject - territorial self-government. In addition, we can determine the development tendencies of drawing funds from the structural funds of both local, regional and local self-government in Slovakia in 2011-2016. The less important task of the article is to graphically capture changes in the absolute and relative rate of EU funds absorption by Slovak territorial self-government.*

**Keywords:** EU funds, Slovak republic, territorial self-government

**JEL Classification:** H72, H73, H81

### **1. Introduction**

One of the most widespread ways to analyze cohesion policy and European integration is to analyze the use of funding from individual operational programs (Bachtler and Mendez, 2007). This makes it possible to compare the "success rate" of using EU funds among countries. The second but more demanding approach is to analyze the use of "European money" within individual entities in a specific country. We have leaned on this research approach and decided not to look at basic indicators (eg the amount of EU funds for individual entities). Instead, we have paid attention to one sub-level of public administration – the territorial self-government and its involvement in drawdown of EU funds. This process builds on a general overview of EU funds absorption and contains a detailed analysis of local and regional self-government. European Union funds are a tool for job creation and the creation of a sustainable economy and a good environment. From the point of view of cohesion policy and economic impacts on individual Member States, the role of these financial mechanisms is to mitigate inter-regional disparities. These differences should be wiped out both within countries as well as across the EU (Hájek, Novosák and Horváth, 2017).

Municipalities, cities and regions are the ones most affected by the geographically uneven economic development of the states. Therefore, it is very important to monitor the level of local government participation in drawdown of the Structural Funds. In a more detailed analysis of the EU funds' spending, we can identify, from this point of view, the most important expenditure areas of local government. The specific focus of individual EU funds and national

priorities create a framework that determines the degree of involvement by local government in the use of the Structural Funds (Ezcurra and Pascual, 2008).

The degree of participation of municipalities, cities and regions in the use of EU funds expresses the intensity of involvement of local authorities in the use of these funds. This enables us to identify the priority areas of the individual local government entities as well as the entire local and regional self-governmental level. Representatives of municipalities, cities and regions are better informed about the needs and preferences of local residents (Jilek, 2008), therefore individual financial flows reflect local conditions. Drawdown of EU funds at the level of municipalities, cities or regions tells us, among other things, about the areas that are the most important for the units or levels of local government. Grisorio and Prot (2016) came to a similar conclusion, adding that the amount of funds targeted on different areas by municipalities and regions, is linked to several variables, including European and national priorities, bureaucratic difficulty, the stage of the policy cycle and the programming period phase (beginning-middle-end). These conclusions can be applied to both local and regional self-government (Dąbrowski, 2013).

## **2. Problem Formulation and Methodology**

In 2004, the Slovak Republic joined the EU and started to participate in EU Structural Funds. The eligible entities to which these funds are allocated are Slovak municipalities, towns and higher territorial units (HTUs). HTUs represent a regional self-governing level and from the point of view of the EU funds, are classified as NUTS III. They have a specific status as they are both subjects and objects of EU cohesion policy. Slovak territorial self-government has been able to finance its own projects through EU funds. This way, the flow of EU funds reflects the priorities and needs of individual municipalities, cities and HTUs.

In addition, in the case of Slovak territorial self-government, another determinant is its competency framework and the phase of the programming period. Determining the target area where EU funding is being spent within the individual Slovak cities and the HTUs depends on the division of powers, responsibility and control (Sramel, 2017). In principle, the powers of municipalities, cities and HTUs are generally regulated by law. The individual groups of competencies - the spending areas that municipalities, cities or HTUs finance through their budgets are determined by Act No. 416/2001. According to the Act, municipalities spend on roads, general internal administration, social assistance, spatial planning, nature protection, education, physical culture, theatre, health, regional development and tourism. The HTUs finance from their budgets roads, railways, road transport, civil protection, social assistance, spatial planning, education, physical culture, theatrical and educational activities, libraries, health, human pharmacy, regional development and tourism (Machyniak and Sebik, 2013). By combining the delegated spending power and possibility to finance own projects from EU funds, Slovak municipalities as well as HTUs have been given the opportunity to obtain these financial resources and their utilization according to their own needs and preferences.

### **2.1 Data**

By setting the limits in our research, we have moved to obtain the necessary data. Information and precise data from the local and regional levels are not precisely mentioned, so we have to separately quantify the amount and area of EU funds spent. Documents from 2011-2016 served as sources of data. Specifically, we used the Final Accounts of Higher Territorial Units and Materials from the Ministry of Finance of the Slovak Republic (Implementation Status, List of Beneficiaries). We also drew data from the State Final Accounts of the Slovak Republic

from 2011-2016. Our contribution has been working with data since 2011, because these data were not processed in detail in the State Final Accounts before.

To determine the amount of EU funds for the local and regional levels during 2011-2016, two variables had to be identified. The total amount of current and capital grants that were provided to municipalities and HTUs from all state institutions and bodies and the amount of funding that was provided to municipalities and HTUs directly from the state budget and associated extra-budgetary funds.

The total amount of income of municipalities from all state administration bodies in Slovakia is shown in the respective section of the state final account. This category of revenue includes all funds allocated to municipal budgets from the state budget, extra-budgetary funds, EU funds and others. The total amount of state support for both levels of territorial self-government includes EU funds. They are directed to the budgets of individual ministries and are secondly distributed to cover the projects of individual municipalities, cities or HTUs. If we deduct the amount of all grants and subsidies only from the state budget and extra-budgetary funds from the total amount of revenues of municipalities and HTUs, the difference will be the amount that the municipalities and HTUs received from EU funds in the calendar year. This workflow will allocate municipalities' and HTUs' revenue from EU funds for individual years, from other subsidies and grants from the state budget.

Our research focuses on drawdown of funds for projects of municipalities, cities and HTUs in Slovakia during 2011-2016. An analysis of the allocation of the funds received covers two programming periods 2007-2013 and 2014-2020. However, it should be added that, the Slovak Republic was among the countries with the lowest possible use of European funds in the 2007-13 programming period, so the European Parliament's Committee on Regional Development approved the exception for longer-term spending. The Slovak Republic could use funds from this programming period until 2016, when the new programming period was already running.

### **3. Problem Solution**

Based on the work with budgetary and economic documents of the territorial self-government and the annual reports of the Slovak Republic, we have determined the amount of funds for local and regional self-government from EU funds during 2011-2016. The subsequent total of both amounts represents the amount of funds that the entire Slovak territorial self-government drew down of EU funds for the given year. In addition to absolute values, we have also expressed this amount as a relative quantity. Thanks to the basic statistical procedures and calculations, we have found the relative rate of drawdown of EU funds of local, regional as well as all territorial self-government in Slovakia during 2011-2016 compared to the total amount of EU funds throughout the Slovak Republic. The values given in absolute value as well as the relative rate (the share of EU funds drawn down by the local government and all funds drawn down for the Slovak Republic) from 2011 is captured by Table 1.

Cohesion policy is based on the mitigation of differences among regions in Member States. (Gutan, 2017) In the process of reducing regional disparities, the territorial self-governments are therefore primarily involved. That is the reason why they should be major beneficiaries of the EU Structural Funds.

Slovak local government has received the most EU funding for its projects in 2011. Since then, the total amount of EU funding for municipalities and cities has been decreasing. An exception is the year 2015, when compared with the previous year, the amount of EU funding, which was drawn down by the local government, increased. A similar situation exists in the case of

regional self-government, when the highest absolute value of EU funding was in 2012, and thereafter we recorded a decline. In 2015, it rose slightly (+ € 8 million.), but the following year 2016 we recorded a drop of over 55%.

**Table 1: Drawdown of EU Funds by Self-Government in 2011-2016**

Self-government	2011		2012		2013		2014		2015		2016		Average per year

<b>Slovakia TOTAL</b>	2041	100	2137	100	2185	100	1265	100	4288	100	1947	100	<b>2310</b>	<b>100</b>

Source: author's elaboration

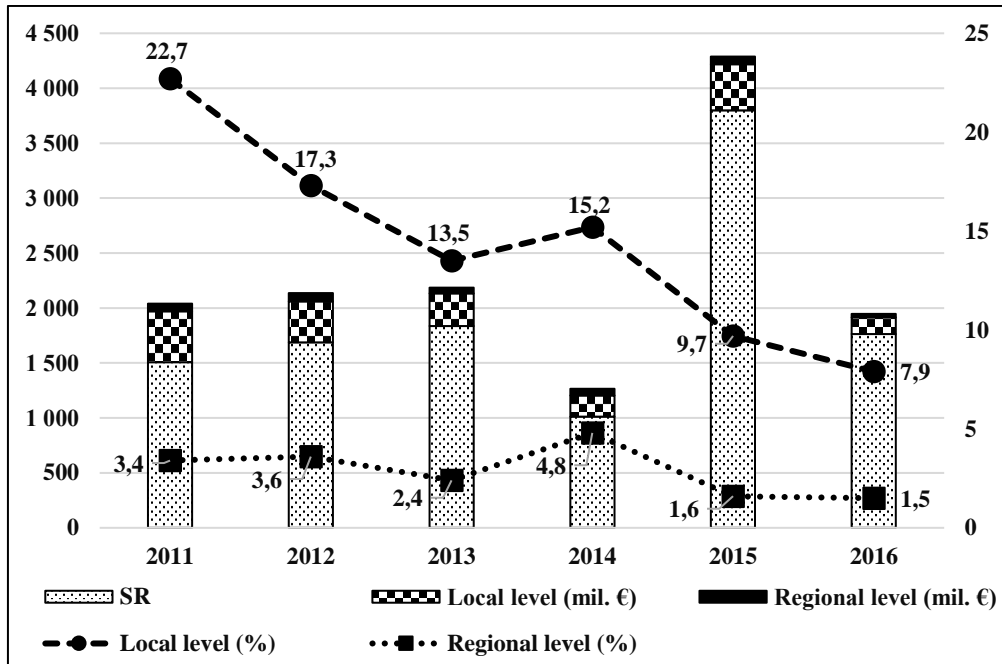

A very interesting finding is that the development tendencies of the territorial self-government when drawing down of EU funds do not reflect the development of drawdown of EU funds for the SR in individual years. If the absolute value of EU funds at the central level was dynamically changing (increasing and decreasing) during 2011-2016, in the case of the Slovak territorial self-government, the amount of EU funding was basically decreasing.

Territorial self-government in Slovakia has been involved in drawing down of EU funds to an increasingly lesser extent. Since 2011, its share in the nationwide drawdown of EU funds has fallen from 26,1% to 9,4%. This fall is quite significant and represents a decrease of almost 2/3 compared to 2011, when the amount of funding used by municipalities, cities and the HTUs was decreased by € 369 mil.

Thus, municipalities, cities and HTUs are still less involved in EU funds from 2011 onwards, and this fact is captured by figure 1. Figure 1 shows the development of the share of local and regional self-government in drawdown of EU funds in comparison with national values. At the same time, it demonstrates what part in € million consists of EU funds drawn down by local and regional self-government.

The share of EU funds has drastically decreased in the case of local self-government. In 2011-2016, the share of cities and municipalities in the nationwide drawdown of EU funds has been reduced by almost two-thirds. In addition, this negative trend is not due to the resulting amount of national drawdown of EU funds, as it was at approximately the same level in 2011 and 2016. At the same time, there was a marked difference in local level participation in drawdown of the Structural Funds, as compared to 2011, the share of local government decreased by 14,8%. In the same period, we have seen a decline in the level of regional self-government involvement in spending more than half of EU funds. The decline in the level of HTUs participation in drawing down of EU funds was not as dramatic as in the case of local self-government.

**Figure 1: The Share of Local and Regional Self-Government in Drawdown of EU Funds in 2011-2016 (€ million and %)**

Source: author’s elaboration

Our analysis of drawdown of EU funds by territorial self-government in Slovakia in 2011-2016 shows that the difference in the participation rate of local and regional levels is diminishing. At the beginning of the 2011 measurement, the difference between the local and regional government spending rate was more than 19%. This inequality has gradually been mitigated, in particular by a sharp drop in the rate of EU funding for local self-government. In the last year of measurement, we noticed that the difference in drawdown was only 6,4%.

#### 4. Conclusion

The aim of the contribution is to analyze the amount of funds earmarked by local and regional authorities from the EU Structural Funds for cohesion policy in 2011-2016. Based on data from available HTUs' materials, aggregate local government data, state budgets and final accounts, we calculated how much municipalities, cities, and HTUs have used in funding from the EU. Subsequently, the basic statistical calculations opened up a window to compare the evolution of absolute and relative values of EU funds used by local government in Slovakia in 2011-2016.

As a result of our work, we find that the local government absorption rate of EU funds has significantly decreased since 2011. At the same time, on the basis of available data, we note that throughout the period the territorial self-government has received much more EU funding than the regional self-government. However, the difference in the share of national drawdown of the EU Structural Funds between local and regional levels is gradually decreasing. The wiping of disproportions is primarily due to a decline in the use of EU funds in the case of local self-government.

### **Abstract**

*Comprehensive Strategic Partnership means not only an equivalent and mutually beneficial cooperation between partners, but also a joint solution to challenging strategic tasks which arise from due to changing conditions of global, regional and national dimensions. The objective of this paper is neither a deeper characterization of these changes, nor of the new challenges that changes bring for the relationships between the two strategic partners. The aim of this paper is to briefly characterize EU-China Comprehensive Strategic Partnership as a concept reflecting the challenges of a changing world and to show – an example of untapped space for the development of EU-China investment relations and both sides' approach to the problem – the possibility of adapting mutual relations to new conditions in the world.*

**Keywords:** *bilateral relations, China, Comprehensive Strategic Partnership, European Union, foreign investment, International relations*

**JEL Classification:** *F13, F21, F50, F60, F63*

### **1. Introduction**

The tradition of European-Chinese relations had emerged in the 19<sup>th</sup> century, when European countries represented the influence of industrialized countries in China by their presence in local concessions and open ports, and China retained its culture and social essence but did not refuse the material and technical elements of Western modernity, which it regarded as a means of achieving the goal of economic and political strengthening of the country both internally and externally. Since then, the interrelationships and sequences of the different stages of cooperation between European countries and China have gone through a long and challenging way of adapting to the changing conditions of the global, regional and national dimensions.

The European Union (EU) and the People's Republic of China (China) have become key actors around the world in the light of changes in world politics and economy, the emergence and development of the European integration process and the ongoing reforms in China, as well as many other factors. Their traditional contacts have developed since 1975 into bilateral relations that have evolved over time from one-dimensional (trade) to all-dimensional (trade, economic, political, scientific and technical areas), from more-limited (covering a few areas) to wide-ranging (covering an extensive range of areas) and from one-level (interstate) to multi-tiered (local, interstate, supranational) cooperation. Cooperation in new areas, based on the 1985 Agreement on Trade and Economic Cooperation (TECA), has been accompanied by the establishment of joint committees, working groups, expert and sectoral dialogues and meetings, joint institutions and programs, the organization of joint short- and long-term

activities, etc. New instruments of mutual cooperation, especially sectoral agreements, have emerged and the interaction of both parties has been directed towards the Comprehensive Strategic Partnership from the initial fewer or more branched relationships. Analysis of the qualitative changes in the development of EU-China relations was dealt with the first phase of our research (Cihelková and Nguyen, 2016).

The aim of this paper is to briefly characterize EU-China Comprehensive Strategic Partnership as a concept that reflects the challenges of a changing world and to present the EU and Chinese approaches to creating an open, transparent and safer environment for foreign direct investment inflows from one party into the territory of the other party as a case study.

## **2. Comprehensive Strategic Partnership – a Concept that Reflects the Challenges of the Changing World**

Approximately in the mid-1990s, as a result of the massive economic rise of Asia and the growing interest of the EU in Asia (and particularly in China) in the spirit of the “New Asia Strategy” (European Commission, 1994), the relationship between the EU and China changed. Their bilateral dimension was complemented by the Asia-Europe Meeting (ASEM) multilateral approach to the Asian continent. It has also been stressed by the EU on the long-term relationship between China and the usability of European experience of the EU’s rise in the world. Jing Men (2007) said in a context that “China’s changes are attack the EU, and EU’s experience fascinates China. Since 1990s, the mutual attraction of the two sides has brought their bilateral relationship to a new high”. On the basis of the EU’s strategic approach to China and China’s pragmatic approach to the EU, as well as the transformation of the EU and China itself, and deepening and expanding mutual co-operation, the foundations for the development of the EU-China Comprehensive Strategic Partnership have been established.

The emergence of the EU-China Comprehensive Strategic Partnership has made it possible by adopting two Policy Papers: “A Maturing Partnership – Shared Interests and Challenges in EU-China Relations”, which was adopted by the Commission on 10 September 2003, and “China’s EU Policy Paper”, adopted by the Chinese Government on 13 October 2003. The EU and China defined relations as “maturing” and “more strategic”. While the EU’s Policy Paper is based on the Common Foreign and Security Policy of the EU (and is predominantly of an inter-state type), the China’s Policy Paper reflects China’s foreign policy, common interests with the EU but, on the other hand, insists on the application of principles that arise from different historical and cultural backgrounds, the socio-economic system and the level of economic development (“One China”, “One Country, Two Systems”, “respecting China’s sovereignty, interdependence and territorial integrity and non-interference in China’s internal affairs” and alike). While the EU’s Paper has included an evaluation of a new maturity in EU-China relations and updated the EU’s approach to China in helping to drive policy and take EU action over the coming years, China’s Paper is a set of procedures clearly defined by individual areas of mutual cooperation, even though less developed. Based on both Policy Papers, the EU-China Comprehensive Strategic Partnership was endorsed at the 6<sup>th</sup> EU-China Summit held in late October 2003 (Cihelková and Nguyen, 2016).

From the definition that we provided earlier (Cihelková, Nguyen, Woźniaková and Straková, 2017), suggests that Comprehensive Strategic Partnership includes two parallel processes – all-dimensional, wide-ranging and multi-layered cooperation (Comprehensive Partnership) and synergy and sharing of responsibility in strategic issues and issues that rise from bilateral relations in both economic and non-economic areas, but also within their framework (Strategic Partnership). The Strategic Partnership also includes cooperation in third regions (countries,

regions, etc.), where the EU and China share common interests (Central Asia, Africa, Arctic, etc.), and acting in coalitions and alliances (mainly in international organizations) varies according to the nature of the problems under consideration and the interests and benefits that the solution brings to partner countries. In addition, EU-China relations do not only involve conflict-free cooperation but also include areas of cooperation that show disagreements and problems between the two sides, such as human rights, the arms embargo, the fulfillment of WTO conditions and procedures, etc., which have led to controversial views on the formulation of the Strategic Partnership itself.

Just as the scale and scope and quality of bilateral relations between the EU (formerly the European Communities) and China changed, the EU-China Comprehensive Strategic Partnership began to develop and change at the same time. In 2003–2013, it underwent the initial phase of the consolidation of European integration, linked to the EU's preparations for eastern enlargement (2004), and China's shift from a traditional, centrally planned developing country to a reforming, socialist economy of a market type. Its second (current) stage was started ten years later (November 2013) after the adoption of the "EU-China 2020 Strategic Agenda for Cooperation" and continues to date. It was linked to the EU's drive to revitalize the European economy (2008–2009) and the global financial and economic crisis and China's efforts to strengthen its internal and international position, but also to help the economic recovery in Europe through which it wants to build a "partnership for peace, growth, reform and civilisation" and further strengthen the global influence of China-EU relations (Government of China, 2014). Strategic Agenda as a basic document for strengthening mutual relations providing a list of key initiatives which should be achieved by 2020 and beyond. It covers every possible aspect of cooperation in the area of prosperity, sustainable development, people-to-people exchanges and peace and security (EEAS, 2013). The Comprehensive Strategic Partnership between the EU and China has thus gradually included foreign affairs, security issues and international challenges such as global governance.

If the Comprehensive Strategic Partnership is to become a concept for reflecting the challenges of a changing world, it must take into account the very world itself, which has become, through globalization as a dominant tendency, a more interconnected, more dangerous and more complex world. Its considerable degree of interconnection is manifested not only in the economic sphere, i.e. in the interconnection of production; markets for goods, services and investment; increasing transport connectivity; Internet and digital interconnection; the existence of a "democratization paradox", but also in social, political, cultural areas, etc. "While a more connected world", as states Antonio Missiroli (2015), "is full of opportunities, it is also putting the nation state under unprecedented strain. By generating vulnerabilities and fragmented identities, this is giving rise to tensions and, at times, leading to more conflict. It is becoming a more dangerous world". However, the more interconnected world is also the more complex world. On a global scale, new powers are emerging that do not create coherent blocks. While global power is targeted, besides the nation state, on a network of state, non-state, interstate and transnational actors, individual regions represent different configurations of power. Global shift and scattering of power are challenges for traditional world multilateralism.

Developing the conditions in a more interconnected, more dangerous and more complex world, including the changing policy and approach of the United States as a world leader in a range of global issues and uncertainties stemming from Brexit, implies the need to further expand and deepen EU-China Comprehensive Strategic Partnership with greater emphasis on strategic issues. There are many challenges that by grasping and proper usage could bring mutual benefits in terms of driving economic growth, creating jobs and improving levels of social welfare. This is mainly about adapting the bilateral and multilateral framework for the

development of the EU-China trade; taking advantage of the Belt and Road Initiative (BRI) and Investment Plan for Europe (the Juncker's Plan) to develop connectivity in trading, investing, financing, policy and interpersonal relationships among more than 100 countries; coping with the financialisation of the world economy; the creation of innovative links and industrial cooperation to take advantage of the opportunities offered by breakthrough trends in science, technology and innovation; finding a broad agreement on climate change and energy security; strengthening people-to-people transcontinental ties and exchanges, especially in the fields of tourism, education, culture and health. The challenges outlined above represent areas in which the EU and China have the opportunity to deepen their Comprehensive Strategic Partnership, thereby assisting in stable, balanced and sustainable global development.

### **3. Creating an Open, Transparent and Safer Environment for the Flow of Investment Between the EU and China (Case Study)**

One of the primary challenges of the current world, not mentioned in the above list, is the reform of the environment for the inflow of foreign direct investment (FDI) of one party into the territory of the other. If this challenge is reflected through EU-China Comprehensive Strategic Partnership, it will lead to the use of space for a substantial increase in bi-directional investment flows. For the time being, they do not match the economic potential of the EU and China, and are incomparable with the flow of investment between the two major investors in the world – the EU and the US.

#### ***3.1 Unexploited Space to Move FDI and its Causes***

According to Eurostat data (2017), the share of China (including Hong Kong) in total EU FDI stocks in third countries was 4.2% at the end of 2015, i.e. EUR 288 billion, while the same share of the USA amounted to 37.2%, i.e. EUR 2 561 billion. Conversely, China's share (including Hong Kong) in total EU FDI stocks amounted to 2% (EUR 117 billion), while the same share of the USA amounted to 41.7% (EUR 2 436 billion). If we take as a base only the share of mainland China in total EU FDI stocks abroad, we will receive EUR 168 billion, and the share of continental China in total FDI stocks from third countries in the EU, even EUR 35 billion (European Commission, 2017). The United States is therefore a much larger place for the EU FDI, but also an FDI exporter to the EU. However, there is a need to take the development of the FDI share of China to EU FDI and the proportion of EU FDI to EU's aggregate outward FDI. If we compare these relative shares, we will find that China has been around 1.75% of EU FDI in recent years, while the EU has an average of 6% of total Chinese FDI. In the case of the EU, this share has stagnated despite the fact that the stimulus factors have changed – before 2005, the benefits of FDI's move to China have been associated with low local labor costs, low soil and less stringent environmental regulations; after 2005 with the growth of the domestic market; after 2012 with expanding service sectors.

The main reasons preventing proper use of this space is the regulation of accession to the capital market of the other party and also the nature of the main Chinese investors in the EU Member States, which are state-owned enterprises.

European investors are convinced that they are restricted in their approach to the Chinese market. If they are established in this market, they are explicitly or implicitly discriminated against, mainly because of the domestic development strategy and the existing protectionism in some sectors. Also, Chinese companies perceive certain constraints on the European market, especially if they want to invest in high technology. They believe that this is because of unfair competition, but also because of national security concerns. The level of restraint of the

Chinese market and the EU market is demonstrated not only by investors but also by FDI Regulatory Restrictiveness Index (FDI Index), which is compiled and published by the OECD. In 2016, the ten countries with the lowest FDI Index, indicating the openness of the countries, were: Luxembourg, Portugal, Slovenia, Romania, the Czech Republic, the Netherlands, Estonia, Finland, Spain, Germany, whose index was between 0.004 (Luxembourg) and 0.023 (Germany); the United States is above the OECD average of 0.089. On the other hand, ten countries with the highest FDI Index, indicating country closure, were: Tunisia, Malaysia, India, New Zealand, Jordan, Indonesia, China, Myanmar, Saudi Arabia, Philippines (ranging from 0.206 in Tunisia and 0.398 from Philippines). China was 0.327 with the fourth most sophisticated of the monitored countries (OECD, 2017).

Although the FDI Index speaks in favor of considerable restrictions, and hence the closure of the Chinese market, García-Herrero, Kwok, Xiangdong, Summers and Yansheng (2017) argue that “China today is much more open than Japan and South Korea were when they were at similar stages of development.” In other words, the European partners appreciate the shift in the liberalization of important parts of the Chinese economy, especially after the country entered the WTO in 2001 (see, for example, Fojtková, 2012). In the investment area, however, there is a lack of transparency in the environment, industrial policy and non-tariff measures that discriminate against foreign companies; strong government interventions into the economy lead to the dominant position of state-owned enterprises, unequal access to subsidies and financing; there is poor protection and enforcement of intellectual property rights. The Chinese government, on the other hand, wishes to improve the business environment for foreign investors, in line with policies to promote further openness of the Chinese economy. It was proclaimed at the last 19<sup>th</sup> Congress of the China Communist Party held in Beijing on October 18–24, 2017. It is mainly about the timetables for achieving openness in individual sectors, enhancing the protection of intellectual property, creating a national system of work permits for foreign workers in China, improvement of the procedure for obtaining visas, etc.

The main Chinese investors on the territory of the EU Member States are state-owned enterprises (SOEs). In the years 2000–2014 SOEs came from more than two thirds of Chinese FDI (31 out of 46 billion EUR) (García-Herrero, Kwok, Xiangdong, Summers and Yansheng, 2017). These FDIs are linked to the possibility of government subsidies for companies entering the EU markets. This leads the EU countries to fear of unfair competition, but also the possibility of Chinese investment in its territory, not just for economic but also for non-economic reasons, which may be linked to political or security risks. Although since 2016 SOEs are no longer the main players in the Chinese economy, they maintain their decisive position in the financial sector (90.7%), healthcare (89.9%) and culture (86.6%). More than 50% of them participate in education, research, commercial leasing, wholesale and retail, accommodation and construction. The main subject of the Chinese economy today is market-oriented private-owned enterprises (POEs). POEs today dominate in such sectors as real estate (67.8%), manufacturing (61.2%) and hospitality/restaurant (56%). Sectors with the highest shares of wholly foreign-owned enterprises (WFOEs) are: manufacturing (11%), hospitality/restaurant (9%) and commercial leasing (8.4%). Since joining the WTO, China has been supporting reforms of SOEs, along with opening up the country. Thanks to them, it has succeeded in significantly reducing the size of Chinese industrial enterprises since the late 1990s. In 2015, SOEs accounted for 38.8% of the total assets of above-average industrial enterprises whose annual incomes exceeded RMB 20 million. According to estimations of China’s National Bureau of Statistics (cited according to García-Herrero, Kwok, Xiangdong, Summers and Yansheng, 2017) this share is likely to be higher because there are 2/3 SOEs among Chinese listed companies.

### **3.2 The Main Tool to Build a Better Investment Environment for FDI flows**

Fulfilling this challenge in EU-China relations will mean not only reforming the business and investment environment, i.e. creating a more open, transparent and safer environment, but also negotiating an institutional platform to address the differences between the Chinese and EU environments and facilitating further investment in the form of “EU-China Comprehensive Investment Agreement”.

In the area of EU-China investment relations can be assumed (Fojtíková, 2016), in the next decade, FDI flows will increase, although the characteristics of these flows will differ in every direction. The reasons for China’s growth in China’s investments will be the following factors: excessive national savings, insufficient domestic opportunities, increasing availability of investments, relatively lower costs. And then gaining access to markets, brands and technologies, often related to the drive to develop the domestic market. The European investments in China are then motivated mainly by efforts to gain access to expanding local consumption and services. From a systemic point of view, the increase in investment flows will be made possible by reducing the gap between the business environment in China and the EU, including the opening up of the service sector. Reducing differences will be conditional on reconciling the interests of both parties in promoting and protecting FDI while maintaining competition between European and Chinese companies. Motivating factors will also be job creation, support for innovation and global competitiveness. Retarding factors that will limit the possibilities of Chinese companies exporting or investing in the EU will continue to be EU standards in the areas of human rights, intellectual property, environmental protection, welfare, etc.

The EU-China Comprehensive Investment Agreement should become the basic tool for better access to the Chinese and European markets for investors from the other side and to remove the concerns of European investors from Chinese investments in its territory. The negotiation of this agreement considers the EU-China 2020 Strategic Agenda for Cooperation to be the focal point of long-term bilateral relations between China and the EU. The negotiations aim to facilitate investment by both European and Chinese investors by creating investment rights and guaranteeing non-discrimination; improve transparency, licensing and authorization procedures; ensure a high and balanced level of investors and investment protection and guarantee the rules on environmental and labor aspects of FDI (European Commission, 2017). The main objective of this agreement should therefore be to create a fair, stable, transparent and predictable business climate in both China and the EU so that businesses of both sides enjoy equal treatment regardless of their country of origin. This will require both China and the EU to update their development strategies and institutional frameworks, including the adoption of new legislation.

China declares that it will improve foreign investors’ access to the domestic market and create a non-discriminatory competitive environment for SOEs, POEs and WFOEs. As far as restrictions on sectors to which EU and non-EU companies can enter, China has already reduced its number “special” restrictions from 93 (2015) down to 63 (2017) and adopted a “negative list” for foreign investors, according to which foreign investment in China is allowed unless the industry to which it is directed is listed as forbidden or limited. (Previously, the industry has been categorized as banned, limited or permitted.) This list includes not only industries such as the mass media or national shipping but also finance and telecommunications in which the market dominates the SOEs. So SOEs will probably remain a significant feature of Chinese business by 2025. In unrestricted sectors, the government is considering simplifying the investor’s entry procedure – it is likely that the submission or registration of foreign investment projects will be sufficient. The Chinese government intends

to offer so-called pre-investment national treatment to foreign investors, as well as domestic firms, for example to move “from a system of controlling market access beforehand to one in which supervision is exercised after entry”. At the moment, the market-oriented reform of the land and credit management system and the energy resource management system is accelerating so that the market mechanism can play a decisive role in the allocation of resources. By 2020, he intends to complete the reform of the SOEs where he wants to apply modern standards of corporate governance and ensure that they act together with other businesses in line with market rules. From the EU China expects to recognize the changing Chinese companies that have already adopted and continue to adopt the international principles of corporate governance (García-Herrero, Kwok, Xiangdong, Summers and Yansheng, 2017).

The European Union strives for the shortest possible “negative list” of the industry and also for the unification of laws for Chinese and foreign companies. Given the changing conditions of the international environment, it is crucial for the EU to open the service sector and protect intellectual property rights. The policy of the Chinese Government to promote innovation and research, the strengthening of equal treatment of domestic and foreign firms, legal certainty and the protection of intellectual property should be unified. The EU is interested in Chinese initiative “Made in China 2025”, which has become a target for ten high-tech sectors and could lead to more restrictive access to this market and, in the future, to the transfer of intellectual property. The Chinese government, on the other hand, declares that foreign companies have access to the benefits of the initiative, and that the initiative can foster cooperation within the innovation and industrial partnerships of both parties. The EU will also have to examine its own restrictions for Chinese investors, including depoliticization and greater transparency in the review of national security measures. Beyond its two key instruments – competition policy and dispute resolution frameworks – the EU should develop other instruments that would better cope with inward FDI and regulate unfair operations of Chinese SOEs in the EU. On the other hand, such an instrument can raise China’s fears of rising European protectionism (García-Herrero, Kwok, Xiangdong, Summers and Yansheng, 2017).

The effort of both parties should be that EU-China Investment Agreement started to work as soon as possible and created a unified problem-solving platform. A successful negotiation of the agreement will bring benefits not only for regional but global economic growth. Negotiations have already reached agreement on a number of areas (e.g. on non-discrimination, improved regulatory environment for investor protection, labor and environmental rules) but have also opened up a number of issues that need to be addressed – improving market access to the other party or merging Chinese companies on the basis of political decisions. The necessary convergence between EU and China investment treatment and institutional cooperation frameworks leads the EU to promote clauses that guarantee “competitive neutrality”. This means that no business entity will be favored by the nature of its ownership. The Chinese side acknowledges this requirement in principle, however considering that “when enterprises are not just making decisions for commercial objectives, but taking on public service functions, provisions on competitive neutrality should not apply”. Both sides call for an anchor mechanism for resolving investment disputes. It could be either the Investor-State Dispute Settlement according to the pattern of existing Bilateral Investment Treaties (BITs) between EU Member States and China, or the use of a public judicial system to resolve investment disputes according to the pattern of the EU-Canada Comprehensive Economic and Trade Agreement (García-Herrero, Kwok, Xiangdong, Summers and Yansheng, 2017).

#### 4. Conclusion

In Chapter 2, we highlighted the EU-China Comprehensive Strategic Partnership and its core contexts, which are an opportunity to reflect the challenges of the changing world, and in the decade and beyond will be reflected in the European Union and China relations. The EU-China 2020 Strategic Agenda for Cooperation has set the agenda for the development of the Euro-China Partnership. The basic elements of the strategic agenda are both shared and differentiated approaches of both sides in the context of mutual ties, as well as their shared interests and responsibility in global and regional affairs.

One of the key areas in which mutual cooperation should continue to grow and deepen is investment relations and the liberalization of business environments in the EU and China. The basis for this liberalization should be the comprehensive EU-China Investment Agreement, where the negotiations of which began in January 2014. Its objective is “elimination of restrictions for investors to each other’s market. It will provide a simpler and more secure legal framework to investors of both sides by securing predictable long-term access to the EU and Chinese markets respectively and providing for strong protection to investors and their investments” (European Union, 2016). This agreement should replace the 26 existing BITs between the 27 EU Member States and China. The only EU country that does not have a signed BIT is Ireland; Belgium and Luxembourg signed a joint BIT with China.

European Union and China should, in the future, take advantage of all the opportunities in the investment area to bring together the two strategic partners, including cooperation on investment in infrastructure investments in the countries that will host initiative “The Silk Road Economic Belt” and “The 21<sup>st</sup> Century Maritime Silk Road”. There are two BRI initiatives, also as “New Silk Road” or “One Belt, One Road” (OBOR). Investment relations have thus become an element of Chinese vision, seeking national revival and building a prosperous society in a wide range of economic, social, cultural and political areas. These visions also include a plan for China to become a fully-developed country by 2049. The EU supports this vision and is helping to make the Chinese economy a sustainable way. At the same time, it will strive to bring the EU and China’s interests closer so that it will form the basis for the economic and geopolitical aspirations not only of China but also of the European Union.

### **Abstract**

*One of the key factors of competitiveness of enterprises is innovation. In response to quickly changing customer preferences, companies modify their market offer and deliver new or improved products or services. The importance of innovation has also increased in the public sector recently. On the one hand, this is caused by introduction of management methods characteristic for enterprises into the public sphere and, on the other hand, from the growing demands of citizens. This results in the implementation of various types of new solutions, in the field of administration, customer service, transport and waste management. As a consequence, the public sector assessment can be made according to criteria known from business management such as efficiency, rationality and cost-effectiveness.*

*The objective of this article is to systematize the definitions and types of public sector innovation and to outline their meaning in social life. It also reviews the research conducted on innovation in the public sector at the level of the European Union countries.*

**Keywords:** European Union, innovation, public sector

**JEL Classification:** H41, H75, O31, O38

### **1. Introduction**

The growing importance of innovation in the public sector is related to the change in the bureaucratic administration paradigm towards the 'New Public Management' model. The new approach is based on the use of market mechanisms in public management. These mechanisms include performance evaluation instruments, customer focus and innovation. This means that techniques and methods known from business operations are increasingly used in public management. Another novelty is the openness to stakeholders. An open government is characterized by transparency of its activities, accessibility of services and participation of citizens in making public decisions (Jäppinen, 2011, p. 158). This reorientation of the public sector is aimed at increasing the efficiency of operations and optimizing costs.

In recent years, the role of innovation in the public sector has been on the increase. This is connected with a number of challenges, out of which the most serious one is the aging process of societies, which, on the one hand, causes a decrease in the group of taxpayers, and, on the other hand, an increase in pressure on the quality and scope of medical services provided. In addition, there is still a growing demand for public services, especially in large cities. As a result of the increase in city congestion, solutions are needed that will enable sustainable economic growth and social well-being. Municipal authorities face the necessity of guaranteeing an adequate level of living conditions for their citizens. One of the possibilities is to implement various types of new solutions, for instance, in the fields of administration,

stakeholder services, transport and waste management. An additional reason for introducing improvements in public activities is the possibility of limiting current budget expenditures and reducing the negative impact on the natural environment. The smart city concept and the use of information and communication technologies (ICT) are gaining in popularity. These technologies are becoming more and more ubiquitous and integrated with urban spaces (Gath-Morad et al., 2017, p. 190). Nevertheless, a smart city should not resist the dominance of ICT (Husár et al., 2017). Many urban problems are not related to technological aspects only. Therefore, it is important to take into account social initiative and human potential, too.

The objective of the article is to present the idea of innovation in the public sector, its meaning and typology. In addition, an analysis of available research in the field of public innovation at the level of the European Union countries was carried out. The reports and analyses prepared by the European Commission, OECD, and some research teams from various parts of Europe were used for this purpose.

The first section of the article includes the introduction, an overview of definitions of public innovations, a description of their significance for the functioning of the public sector and citizens, and the functional division of innovations. The second section contains an overview of research carried out in the field of public sector innovation in the European Union. The most important findings are discussed in the final section.

## **2. Public Sector Innovation – Meaning, Definition and Typology**

Innovations are naturally associated with economic activity and with J. Schumpeter who incorporated them into economic sciences (Schumpeter, 1961). He claimed that creative destruction through innovation causes the collapse of some economic structures and the emergence of new ones. Innovations have the shape of a wave that appears from time to time and sets trends in the development of specific industries. Innovations are usually associated with the introduction of a new product, service, or process, finding new markets or modifications to which particular elements of the business are subjected. They can also be associated with the introduction of a new or significantly improved product (a good or service) or process, a new marketing or organizational method to be applied throughout a company, workplace organization or external relations (OECD, 2005, p. 46).

Over time, innovations have begun to be analysed in a wider context that goes well beyond business. It was noticed that in order to gain a higher effectiveness of the innovation process, it is necessary to network cooperation of private and public entities within a given territory (Moulaert, Sekia, 2003; Simmie, 1997; Maillat, 1995). The next trend was the transfer of competences to the regional level. Spatial proximity allows regions to create a competitive advantage based on tacit knowledge sharing, mutual formal and informal linkage of players and networking (Klímová, Žítek, 2012, p. 118). An institutional system involved in the initiation and diffusion of innovation should seek new ideas and inventions and commercialize them to obtain added value for the region and the country. In this way regional and national innovation systems are created. Regular cooperation that is coordinated by public authorities may positively influence economic and social development (Cooke, 2004; Edquist, 1997; Howells, 1999).

Today, innovations are widely used also in the public sector. This is connected with a new orientation of management directed at social effects - security, social responsibility, and creation of society (Raipa, 2012, p. 718-719). Therefore, the determinants of the innovation process, apart from economic values such as, for instance, efficiency and finance, should also contain social goals.

Innovation in the public sector means a new or significant modified process or approach that is innovative in nature and is aimed at better public performance, i.e. higher efficiency, effectiveness and greater satisfaction of citizens and public employees (OECD [online], 2018). When analysing public innovations at a greater degree of generality, they can be considered as a new activity undertaken in the social sphere. In this sense 'Innovation is a social entity's implementation and performance of a new specific form or repertoire of social action that is implemented deliberately by the entity in the context of the objectives and functionalities of the entity's activities' (Koch, Hauknes, 2005, p. 9). The novelty in this definition refers to a specific position in public administration. This means that if a public official uses a new method in his work that improves the provision of services, then we can speak of an innovation. It does not matter that such an improvement is applied outside the public sphere. What is most significant here is its being new in this particular activity.

Several types of innovations can be distinguished in the public sector. These are as follows (De Vries et al., 2016, p. 153):

1. Process innovation – improving the quality and efficiency of internal and external processes,
2. Administrative process innovation – creation of new organizational forms, implementation of new management methods and techniques, new working methods. An example of this is the establishment of a customer service office, where in the same place one is offered a complex public service,
3. Technological process innovation – technological process innovation - creation or use of new technologies introduced in the organization to improve the efficiency of service provision, e.g. computer calculation of taxes,
4. Product or service innovation – creating new products or services, e.g., introducing an allowance for young unemployed who are unable to work,
5. Governance innovation – development of new forms and processes related to specific social problems,
6. Conceptual innovation – implementation of new concepts, reference frames or new paradigms that will enable solving specific problems.

Among the many divisions described in the literature, one can also come across the following innovation classifications (Halvorsen et al., 2005, p. 5-6):

1. Incremental innovations - radical innovations - referring to the degree of novelty,
2. Top-down innovations - bottom-up innovations - refer to the entity that initiated the innovation, 'the top' - means organizations, positions at the top of the hierarchy, 'the bottom' refers to lower-level employees in the public sector, public officials, mid-level politicians and users of innovation,
3. Needs-led innovations and efficiency-led innovation - denoting whether the innovation process has been initiated to solve a specific problem or in order to make already existing products, services or procedures more efficient.

One of the examples of the bottom-up approach are the so-called collaborative innovations. They consist in involving users of innovation and citizens in the process of creating new solutions (Langergaard, 2015, p. 47). This is a reflection of the demand-driven approach to innovation based on social inclusion. Innovation users complement the three remaining spheres that cooperate with each other, i.e. public, academic, and industrial, thus creating the

so-called quadruple helix (Arnkil et al., 2010; Lew et al., 2018). The role of innovation users in the whole process may vary depending on the type of innovation and the stage of involvement. Nevertheless, the contribution of citizens to the development of new ideas and solutions is essential for a comprehensive understanding of needs and better matching to users. It is related to the fact that innovation is a multidimensional, complex and potentially chaotic process. Therefore, it requires a broad inclusion of actors who combine certain problems and solutions in the following successive stages (Torfing, 2016, p. 32-34):

1. Defining problems and challenges,
2. Generating new and creative ideas,
3. Selecting the most promising ideas,
4. Implementing new solutions in practice,
5. Diffusing new ideas and practices.

Innovations are usually related to a specific invention. Thus, if this invention can be converted into a value for the user, then it becomes an innovation. However, this is not always the case. There are certain innovations that do not require an original invention. This is the case when innovations within processes and services employ well-known techniques and technologies (Matei, Bujac, 2016, p. 763). The explanation for this can be that an innovation is not closely related to a new invention but to the already existing one. However, this does not change the fact that an innovation comes into being and that it has signs of novelty but only on the scale of the organization. However, to create an innovation it is indispensable to understand creativity as a mental process that leads to the development of ideas and concepts that become useful.

### **3. Review of Research on Public Sector Innovation**

Innovation in enterprises is the subject of frequent analyses and comparative research. However, in the public sphere there is a large deficit in this area. Although there is research based on surveys and data derived from statistical offices, it is not cyclical and does not allow comparisons between countries over a longer period of time. This part of the article contains an overview of the most significant research in the field of public sector innovation at the level of the European Union countries.

One of the key planning documents of the European Union is the Europe 2020 strategy. It is based on an initiative coordinated by the European Commission under the name of Innovation Union. It contains a number of postulates aimed at improving national innovation systems, including the need to include the public sector in the innovation cycle (Europe 2020, 2010, p. 9). The intention of the European Commission is to involve citizens on a large scale at the public level and stimulate social innovation (Kordoš, 2014, p. 339). A pilot study on innovation in the public sector initiated in 2012 by the European Public Sector Innovation Scoreboard (EPSIS) was intended to function as an auxiliary tool in this initiative. The intention of these activities was to create an instrument that would allow cyclical comparisons of the innovation performance of the public sphere between EU countries. The point of reference was to be the research which had already been carried out on innovation in countries (the Innovation Union Scoreboard) and regions (the Regional Innovation Scoreboard). Public sector analysis includes seven dimensions of innovation described by 22 indicators derived from the Eurostat, OECD, World Bank, World Economic Forum databases as well as from the results of Innobarometer surveys carried out in 2010 and 2011. In 2010, surveys were carried out among over 4,000

organizations operating in public administration. It turned out that about 90 % of them had implemented at least one innovation in the period of three years preceding the survey. The most important barriers with regard to innovation were the lack of human and financial resources, the existing legal requirements and the deficit of support and incentive systems for employees. Public innovations had a positive impact on improving users' access to information, their satisfaction and faster delivery of services. In turn, the 2011 survey concerned the opinion of over 10,000 entrepreneurs on the perception of the impact of improved services and public innovation on the results of the private sector. In those countries where innovative public services were offered together with a business-friendly environment, enterprises were more inclined to implement new business solutions. Thus, public innovation also translated into the innovation of the economic sphere. Unfortunately, the EPSIS study failed to obtain all necessary data and organize countries according to the degree of innovation. Nevertheless, we should look upon it as an important step forward, which sheds new light on the unrecognized aspect of public administration.

Another example of research done on public sector innovation is the analysis of the Nordic countries, i.e. Denmark, Finland, Iceland, Norway and Sweden carried out in 2008-2011 (The MEPIN project). The survey covered 2012 institutions at central (ministries and governmental agencies), regional, and local (municipalities, schools, hospitals) levels. The high level of innovativeness of the Nordic countries in the Innovation Union Scoreboard was also confirmed in their public sectors. The ranking also included two non-EU countries - Iceland and Norway. In 2008-2009, at least one product innovation was introduced by the institutions surveyed – the percentage ranged from 38.2 % (in Sweden) up to 72 % (in Iceland and Denmark) (see Table 1). Even higher rates were achieved in the field of process innovation (from 50 % in Iceland up to 72.3 % in Norway) and organizational innovation (from 50 % in Sweden up to 91.2 % in Iceland). An interesting case was communication innovation understood as ‘the implementation of a new method of promoting the organization or its services and goods, or new methods to influence the behavior of individuals or others (Bloch, 2011, p. 14). This rarely described type of innovation was implemented in the range from 30.9 % of institutions in Finland up to 88 % in Iceland.

**Table 1: Selected Results of the Research Carried Out on Public Sector Innovation in the Nordic Countries, in %**

	Denmark		Finland		Iceland		Norway		Sweden	
	Central government	Other	Central government	Other	Central government	Other	Central government	Other	Central government	Other
<b>Innovations</b>										
Product innovation	71.6	72.0	51.9	56.7	72.0	70.6	61.4	50.9	38.2	45.8
Process innovation	71.6	72.0	57.7	66.0	60.0	50.0	72.3	59.4	65.5	58.0
Organisational innovation	61.4	69.0	57.7	63.9	80.0	91.2	60.8	62.4	50.0	59.3
Communication innovation	60.2	66.1	40.4	30.9	88.0	85.3	52.5	35.2	40.7	49.6

Source: Bloch, Bugge, 2013, p. 140

It is worth noting that the surveyed institutions most frequently pointed to the business sector as their partners in implementing innovation. This concerned mainly the central government. It was related to the fact that in most cases public institutions purchased results of R&D works

or consultancy services from enterprises. However, it was not a passive purchase but an effective cooperation resulting in a useful innovation. The goal of implemented innovations was usually to increase efficiency and improve the quality of services and user satisfaction. Interesting is the fact that social challenges obtained relatively few indications. It is worth emphasising that legal regulations may also be the premise for introducing changes. In the examined countries, with the exception of Finland, about 40 % of the institutions confirmed that they implemented innovations due to the need to adapt to legal requirements.

The NESTA pilot survey is another example of research carried out on public sector innovation (Hughes et al., 2011). The survey covered 64 health organizations and 111 local governments in the UK. The study was carried out in 2010. The results confirmed the high innovativeness of British institutions - around 90 % of respondents indicated that in the previous 3 years they had implemented a novel service or a greatly improved service.

Another report on European public sector innovation is 'Trends and Challenges in Public Sector Innovation in Europe' prepared by Technopolis Group (León et al., 2012). The report is based on country reports produced by the Trend Chart country correspondents performing selected interviews with public officials and academics from 25 Member States (i.e. EU27 with the exception of Cyprus and Luxembourg). It contains the outcome of the research done on the perception of innovation in the public sector, factors and barriers, potential for future innovations and a catalogue of good practices. However, it does not contain quantitative analysis and is not a basis for comparing the results of the level of innovation in the EU. It is rather a compendium of knowledge about understanding of and approach to innovation.

An interesting study on the role of innovation in improving the efficiency and effectiveness of local/regional policy development was carried out by the Fund for Applied and Communication Research based in Sofia (Bulgaria) as part of the Complex Challenges - Innovative Cities (CCIC) project, financed under the EU INTERREG IVC programme (Innovation in the Public Sector, 2013). This study was based on an online survey (859 respondents) and direct in-depth interviews (90 respondents). It was performed in 2010 among representatives of local and regional authorities and, to a lesser extent, ministries, universities and other public and non-governmental institutions. Respondents came from 10 EU countries: Poland, Romania, Spain, Sweden, UK, Bulgaria, Estonia, Finland, Italy, and the Netherlands. The outcome of the research was presented collectively without breaking it down by the organization's country of origin. It turned out that the basic factor in the creation of innovation was the increase in the cost effectiveness of the services provided and the improvement of their coverage and availability. The benefits of innovation included improving relations between citizens and the public sector. It was also important to strengthen the communication channels by means of which the authorities received feedback on the needs and expectations of citizens. Among the causative forces of innovative activity, respondents most often indicated organizational culture, leadership, political will, and political support for change.

#### **4. Conclusion**

For several decades the public sector has been implementing operational methods and techniques taken from business practice. The changes include not only management methods, but also a greater focus on the client (citizen), cost effectiveness and the quality of services provided. This resulted in the increased interest in innovation in most areas of public activity. They may concern more advanced forms such as, for example, implementing ICT in e-government, but they can also involve minor organizational improvements, such as setting up a customer service office where many official matters can be dealt with in one place. The range of innovation is therefore very large. There are many new opportunities, especially in the area

of smart city management, where innovations are necessary to counteract the negative effects of urban population growth.

One of the basic problems for theoreticians and practitioners involved in public management is the deficit of extensive research and analysis that would allow monitoring the progress of individual European Union countries made with regard to increasing the level of public innovation. Although the available research on the Nordic countries, the UK or selected EU countries confirms the high level of innovation in the public sphere and provides abundant information about its stimulants and barriers, these analyses are losing their relevance as most of the data used comes from the 2008-2012 time period. Moreover, there are no studies that would rank EU countries according to the synthetic indicators (the Innovation Union Scoreboard and the Regional Innovation Scoreboard). Although a pilot study was initiated by the European Commission in 2010, it contains a number of statistical data gaps, which makes it impossible to create a reliable ranking of countries. In addition, it was intended to be cyclical, but no further analyses have been published so far.

Therefore, the postulate regarding the necessity to continue research on public sector innovation in the European Union remains valid. The lack of an instrument to monitor changes significantly hinders the debate on the implementation of the Europe 2020 strategy. The strategy postulates an increase in the involvement of the public sphere in initiating and implementing new solutions aimed at improving the quality of life of citizens.

### Abstract

*The paper analyzes the initiatives of European Union to support the development of scale-ups. Nowadays, a scale-ups are considered to be one of the most dynamic economic development tools and therefore the main goal of the article is to analyze how scale-ups are supported by EU. A secondary goal of the paper is to identify most successful European scale-ups and define their impact on the economic development processes and competitiveness of the European Union. The authors of the paper are based on the assumption that scale-ups and innovations associated with them are also an important tool for regional development. At the same time, their scalability and transnational character represent an opportunity for the economic development of European countries that cooperate within their platforms. The dominant research method is an analytical method. In research was also used a questionnaire filled in by selected scale-ups, to map their perception of the EU's mechanisms and tools to support their growth.*

**Keywords:** competitiveness, economic development, European Union, innovations, scale-ups

**JEL Classification:** O31, O38, O44, Z00

### 1. Introduction

*"Innovations are considered to be the main driver of economic development of states and regions. Innovation policy is evolving in all developed countries and it is clear that this policy is going to play a crucial role in the future efforts for European integration and joint development of European states"* (Fránková, 2016, p. 244). Probably the most important subjects, producing innovations are High Growth Firms, or so-called scaleups. There are many definitions of scaleups, but we have chosen the following one by OECD: "A 'scale-up company' is one that is growing its sales or employee numbers by 20% per annum over a three-year period, and which started that period of growth with at least ten employees" (Gaskel, 2016, p. 4). Scaleup can also be described as a "grown" startup. The main difference between startup and scaleup is that startup represents the earlier stage of business development. A startup company valued at over \$1 billion is named unicorn. Scaleups have a great potential to deliver hundreds of thousands additional jobs and billions of dollars towards European Union's (EU) GDP. It also has a potential for higher growth in European productivity through competition, to knock-on opportunities for firms in the EU's supply-chain and make an impact across all sectors of the EU's economy (Deloitte, 2014). In this paper, we decided to analyse EU's tools and activities for supporting scaleup companies in development and growth and also to provide a short insight into few chosen scaleups with a great potential to become new

European startup unicorns. In the final part of the work, we tried to compare EU and US startup ecosystems in numbers and perception of scaleup companies.

## 2. Initiatives of European Union to Support Scaleups

EU officials and economic experts do realise that scaleups can be one of the most important tools for economic growth. Strengthening and developing a favourable ecosystem for startups and scaleups was also one of the main priorities of the Maltese Presidency to the Council of the EU (Mintoff, 2017). EU's initiatives aiming to support scaleups can be divided into two main groups. The first group consists of strategies trying to boost economy and competitiveness of EU via building an effective and functioning single market. We decided to mention mainly initiatives to strengthen The Single Market of the European Union (SM EU) and also The Digital Single Market of the European Union (DSM EU). The second initiative group is trying to directly create a better environment for scaleups and also startups. We decided to include in this group Startup Europe Partnership (SEP), Scaleup Manifesto and Europe's next leaders: the Start-up and Scale-up Initiative.

Functioning SM EU can be nowadays considered to be one of the most significant trading powers. Free movement of goods, persons, capital, and services without any regulatory obstacles can enhance the competitiveness of the EU's economy. Therefore European Commission (EC) created in October 2015 "The Single Market Strategy" (SMS). In the context of our research we decided to point out only selected points, we consider to be the most important in creation of a fertile ground for scale-ups to grow, which are: enabling the balanced development of the collaborative economy; helping SMEs and start-ups to grow; making the market without borders for services a practical reality; encouraging modernisation and innovation; modernising our standards system; consolidating Europe's intellectual property framework and creating a culture of compliance and smart enforcement (European Commission, 2015a).

Simultaneously, all sectors of society, economic sphere included, are vastly influenced by new digital technologies and innovations, which leads to the emergence of new business models such as startups and scaleups and even pushes traditional companies to innovate their way of thinking and working. EU reflects these new technological challenges and therefore focuses on the building of the DSM EU. *"A connected digital Single Market will improve access for consumers and businesses to online goods and services while creating the right conditions for networks to flourish and maximising the growth potential of Europe's digital economy."* (European Commission, 2015b, p.2). We consider this step to be very important, as most of the scaleups are digitally based platforms. As J. Janošec et al. accurately described in their article published in MM Science Journal in November 2017, *"it is crucial to follow new industry challenges as the upcoming digital revolution enables connectivity, automation, robotization etc. with the potential to change the productive structure and reorganise the value creation increasingly around digital platform ecosystems"* (Janošec, J. et al, 2017, p.1).

A huge step towards scaleup Europe happened at the World Economic Forum, which took place in Davos in January 2014, where EC established SEP. SEP is *"the first pan-European open innovation platform dedicated to transforming European startups into scaleups by linking them with global corporations"* (Startup Europe Partnership [online], 2018). SEP is led by Europe and the United States based global organisation Mind the Bridge, which is institutionally supported by the European Investment Fund, London Stock Exchange, European Business Angel Network, Cambridge University, IE Business School and Alexander von Humboldt Institute for Internet and Society and its business partners are for example Telefónica, Orange, Unipol Group, Microsoft and Nesta (Mind the Bridge, 2017). The main

and the most important goal of SEP is to map European scaleups and support the ones that are aspirants to become global businesses offering new jobs. European Scaleup process can be also eased by other companies taking part in SEP initiative by offering their investments, technologies and further help (Startup Europe Partnership, 2018).

Another initiative supporting the development of EU's startup and scaleup ecosystem is called "Startup Manifesto". It is important to note, that this document was created by European startups and other successful entrepreneurs as a reaction to the speech of Commissioner Günther Oettinger regarding the formation of better environment for scaleups. The Manifesto is a roadmap, which is divided into the following categories and their objectives (A Scaleup Manifesto, 2016):

- 1) **complete the single market** (simplify VAT system, test SMEs and add scaleup component to the test, edit copyright, data protection, support of e-Identity creation, make patent creation easier and cheaper, digital and better administration, invest in digital infrastructure, harmonise consumer law);
- 2) **mobilise capital** (complete the capital markets union, make effective tax system, crowd in capital);
- 3) **activate talent** (mobilise and attract talented workers, hire or train at least one additional employee);
- 4) **power innovation** (open government data, use sandboxes to test new models, fund research and innovation, flourish new business models, collaboration of startups and corporations);
- 5) **broaden education** (educate entrepreneurship, ICT and business skills);
- 6) **monitor, measure and evaluate** (observe and evaluate at local, national and European level, set up annual meetings of the community representatives).

The last document we will mention is called "Europe's next leaders: the Start-up and Scale-up Initiative" and it was created by EC in November 2016. European representatives are aware of the fact that fast-growing companies and innovative businesses can create new working opportunities and therefore increase innovation and competitiveness of the EU. This document also addresses a big problem for SMEs, startups, and scaleups - different tax regimes causing high tax-related costs which are even higher, if the company operates in more than one European country (European Commission, 2016b).

In abovementioned part, we defined the main European initiatives aimed to support the growth of scaleups. Now it is important to ask a question: How can functioning scaleups within EU's territory influence competitiveness of the EU? It is important to note, that according to EC's report "*it has been estimated that there could be up to 1 million new jobs created and up to €2 000 billion added to GDP in the EU over the next 20 years if the share of scale-ups would match that of the US*" (European Commission, 2016b, p. 2). One of the main elements influencing competition in the economy is also dynamism and innovation capabilities, which are nowadays closely connected to the digital development, information, and communication technologies and even population's skills and abilities in mentioned spheres. High significance has also triple helix thesis, based on the fact that economic and innovation development is positively influenced by the cooperation among universities, industries, and governments (Kreusel and Roth, 2018). However it is important to point out a fact that considering European region as a whole, it is not as competitive and innovative due to the high disparities in EU member states. So besides promoting European single market, EU should focus on mitigating these differences and promoting digital knowledge and skills of its population.

Professor Daniel Isenberg and Associate Professor Vincent Onyemah from Babson College presented on the World Economic Forum in Latin America paper about the importance of

scaleups in economic growth, because they are able to create more jobs, wealth and taxes. This is also one of the reasons, why EU member states should focus on building ground for scaleups to grow and not prioritize creation of new enterprises (Isenberg – Onyemah, 2017). Isenberg also points out, that *“the best scale-up environment has a modicum of start-ups. Just like doctors, teachers or scientists, start-ups are essential – but there is such a thing as having too many of them. It’s a law of physics. If you have lots of people starting companies, you can’t have lots of growing companies, partly because they compete for talent”* (Rock [online], 2017).

There are also other reasons, how can scaleups positively influence economic development and competitiveness. First of all, scaleups create more job opportunities than other businesses. By creating a friendly environment for scaleups and by helping them to grow, a dynamical job growth could be ensured. Another reason is that scaleups are able to offer more diverse business opportunities than high-tech startups, for example such as engineering firms, financial services, biomedical research or even electronics recyclers (Belk, 2017).

### 3. Analysis of Selected Scaleups

In the EU there are circa 3,950 scaleups with the capital raised \$55.6B. UK's share is approximately 36%, what is regarding current post-Brexit situation huge challenge for the EU. As it is obvious Britain is the biggest and the best startup ecosystem in the EU. It is followed by Germany with 442 scaleups and 10.1B, France, Spain, the Netherlands, Denmark, Ireland, Finland, Italy, Luxembourg, Belgium, Portugal, Poland, Austria, Estonia, and Lithuania. UK's share is approximately 36%, what is regarding current post-Brexit situation huge challenge for the EU (Mind the Bridge, 2017).

We decided to pick up the most successful European tech-scaleups and analyse their business. When identifying the best scaleups we have been inspired by a selection of best European Tech Scaleups from the project Startup Europe Comes to Silicon Valley (SEC2SV), organized by Mind the Bridge and EIT Digital with the support of the EC and European Parliament in 2017. Companies selection was based on following criteria: the significant growth of revenue and/or a number of employees during the last 3 years (the project was conducted during the August 2017) and they, scaleup companies, needed to be prepared for expansion into US market (Startup Europe Partnership, 2017). Due to a limited range of the paper, we will describe in detail only one scaleup from respective country.

We'll start our analysis with Austria's best scaleup called **App-Ray**. App-Ray is fully automated application security scanning solution, which provides automated security analysis of mobile applications to find security issues and mitigate risks. They claim that approx. 48% of organizations believe that their apps will likely be hacked and approx. 69% of mobile apps use encrypted plaintext communication. The company was founded in 2015 and is headquartered in Vienna (App-Ray Mobile Security, 2018).

Italy's best scaleup regarding above mention project is a mobile data company providing behavioural analysis and data-driven campaign based on geo-location information, called **Beintoo**. In their words: *“We collect and analyse geo-behavioral data in order to generate specific audiences to deliver innovative and highly engaging mobile campaigns”* (Beintoo, 2018, p.1). Beintoo claims that in Italy there are 45.2 million mobile phone owners of which 73,1% are smartphone owners on mobile audience. Moreover, 65% of the time is spent their time on the internet via mobile devices of which 88% time spent is on the mobile app. The company was founded in 2011 and is headquartered in Milan (Beintoo, 2018). There is another

team from Italy on the list of the most successful scaleups from EU. They are called **Buzzoole** (Startup Europe Partnership, 2017).

**BitBar** a solution from Finland that automates mobile testing, building, monitoring and deployment processes for enterprises in general is another current top scaleup from EU. BitBar offers Testdroid Recorder, an eclipse plugin for recording user actions and generating reusable test cases. The company was founded in 2009 and is based in Helsinki. (BitBar, 2018) There are another two successful scaleups from Finland. The first is **Swap** and the second **Wirepas Oy** (Startup Europe Partnership, 2017).

**Five Degrees** from Netherlands represents banking technology with online digital banking platform, that automate banking processes. In other words, Five Degrees and its Matrix-five platform comprises CRM, workflow, document archiving, business validation and communication modules. Five Degrees was founded in 2009 and is based in Loenen aan de Vecht (Fivedegrees, 2018).

**Ignilife** from France creates digital platform to empower people to be active in managing their own health. Methods as gamification and social interaction are used to encourage positive behavior. Ignilife was founded in 2015 and is headquartered in a European technology park in Sophia Antipolis. (Ignilife, 2018) Another France's scaleup from the list is called **Semarchy** (Startup Europe Partnership, 2017).

**OnePulse** from UK is self-service platform that allows businesses to ask targeted groups of people questions in the form of micro-surveys and receive answers within few seconds. For better illustration of the company's clients we would like to demonstrate just a few of them. Coca-Cola, Barclays, Google, Tesco, Virgin Media and many others worlds big players are getting their answers on OnePulse. The company was founded in 2011 and is based in London. Another UK's scaleups that are part of this list are **Primo** and **Sunamp** (Startup Europe Partnership, 2017).

Germany's **ProGlove** enhances hands of professionals, enabling manufacturing and logistics staff to works safer, faster and easier. ProGlove provides a suite of connected capabilities to every user with their wearable smart glove. The company Workaround GmbH, which develops ProGlove was founded in 2014 and is based in Munich (ProGlove, 2018).

Another scaleup called **Redborder**: ENEO Technologia S.L. is an all in one cybersecurity open source platform for businesses and enterprises. Redborder is a Spanish cybersecurity solution created to improve device data losses efficiency and streamline operations on operational efficiency in multi-vendor network monitoring. The company was founded in 2003 and is based in Sevilla (Redborder, 2018).

The last scaleup in the list is **Sentiance** from Belgium. Sentiance is turning IoT sensor data into insights about user's behavior in real time context. The company operates in following sectors: Insurance, Health, Commerce, Mobility, Connected Car – Automotive, Smart Home and Smart City (Crunchbase, 2018).

All the above mentioned companies have a great chance to become European new unicorns and become the integral part of the exclusive group of companies as Adyen, Asos, Zoopla, Yandex, Avito, Criteo, VKontakte, Markit and many others. Nowadays, there are more than 47 European unicorns, companies that can compete with the very best, anywhere in the world. From the wider perspective, it's very interesting to compare the EU's and the US values when talking about unicorns and innovations. When in the EU tech valuations are, on average 18 times the revenue produced by the company, in the US this number is considerable higher, at 48 times. In 2016 there was 30 new unicorns in the US, what is over three times the number

in Europe. Moreover, the average revenue of the European unicorns is approximately \$315 million compared to \$129 million as a revenue of US unicorns. The cumulative value of European unicorns is now more than \$130 billion (Madhvani et al., 2016). Due to our own research on scaleups perception of the quality of startup ecosystems in the EU and the USA, conducted in February and March 2018 we've found out, that the EU has a worse perception of the quality of incubators and accelerators, platforming platforms, investors, funding mechanisms and media and lower level of cooperation of corporations and universities with scaleups than the US. The quality of events and startups itself was on the same high level on both sides and the perception of the level of administrative barriers connected with Intellectual Property Rights was on the same medium level. As a main need of the European startup ecosystem was stated the improvement of venture funding opportunities.

#### **4. Conclusion**

Not only the EU member states realize that scaleups are important for economic growth and competitiveness (we can mention Brazil, Canada or Singapore). Based on our research and questionnaire we can conclude that nowadays is the best environment for scaleups in the USA, however the EU also takes new steps to improve economic conditions for scaleups to grow in order to enhance its competitiveness within global economy. In achieving mentioned goals, the EU should focus mainly on few aspects. First one is financing. Only small percentage (2%) of scaleups in the EU decide to go public and the rest is still funded by venture capital. In this context it is also important to note, that the UK is still a leading European country, whose scaleups raised the highest capital on the stock markets. On the other hand, American initial public offering scaleups are able to raise six-times more capital than European ones, because the US market offers higher valuations (Pisoni and Onetti, 2015).

It is important to note, that the highest number of effective functioning scaleups are located in UK, so Brexit will not only have negative influence on the Scaleup European ecosystem, but also on the EU's economy as whole. The EU should therefore support more scaleups in the EU member states. Another important step is to remove existing regulatory and administrative barriers in SM EU and in DSM EU and to create more business opportunities for cooperation with global corporations, investors and other potential partners.

Furthermore, the EU states should also focus on promoting scaleups and their growth and not on creating more new businesses because it causes so-called "scaleup-gap" – there is not enough firms to displace older businesses which can result into a reduction of economic growth and productivity. To ensure a higher quality of businesses, governments should also focus on targeted investments in specific scaleups (Aernoudt, 2017).

We can conclude, that scaleups are sources of innovations and they play important role in growth of economy because they can create more job opportunities than regular companies and thus increase the EU's GDP. This is also a reason, why researchers should pay more attention to scaleups and also unicorns and not just in the context of their research, but they should also try to enhance their cooperation.

### **Abstract**

*The main objective of the present paper is to highlight the most significant milestones in the common history of Slovakia and Austria as neighboring countries located in Central Europe. We will predominantly focus on the 20<sup>th</sup> century, which may be characterized by intensification of European integration. However, several events and developments from older periods will be included, as well. Next, we will examine the influence of selected historical circumstances on the cultural profiles of both countries. For this purpose, a brief comparative analysis of the respective national cultures is required. Hereby, respected authors and scholars involved in the topic of cultural differences and cultural categorization will be referred to. The aim of the article is thus to demonstrate how important role history plays in relation to the development of a culture. Throughout the whole research, the aspect of European civilization will be underlined.*

**Keywords:** Austria, culture, European civilization, history, Slovakia, 20<sup>th</sup> century

**JEL Classification:** N00, N30, Z13

### **1. Introduction**

Slovakia and Austria are countries characterized not only by their being neighbouring countries and important business partners, but as well by their for centuries interlinked history.

In the present paper we attempt to identify the most significant milestones in the mutual Austrian-Slovak history, whereby the focus is put on the 20<sup>th</sup> century. The selected historical events are consequently examined in connection to the cultural profiles of the both countries. The objective is to point out the influence of historical circumstances on development of the countries' cultural profiles. However, in our opinion, the geographical proximity and co-existence in central Europe has caused significantly less differences in cultures than could be observable, for instance, between a European and an East Asian culture. According to Delgadova and Gullerova „similarities between cultures draw people closer to one another and facilitate interaction,” (2015, p. 190). As Baculáková (2014) points out, Slovak culture is an important component of European culture. We believe, this statement can identically be applied to Austrian culture as well.

Without doubts, the historical development has impacted not only cultural profiles of the countries, but also their socio-economic position, not only within the European Union. For instance, both countries are characterized by ageing populations (Šotkovský, 2012; Čiefová and Raneta, 2017). Austria also belongs to successful countries on the field of innovations

(Lipková, 2012). Slovakia's economic situation has improved considerably since its accession to the European Union in 2004 (except for the year 2008), whereby foreign direct investments have played a significant role in this development (Krajčo, 2014). A large proportion of foreign companies in Slovakia, more specifically in Bratislava and surrounding areas, are of Austrian origin (Čiefová and Seresová, 2017). In general, Slovak economy has changed in recent years, as far as its structure is concerned (Kubičková, Benešová and Breveníková, 2016).

## 2. Problem Formulation and Methodology

As already stated above, the main intention of this contribution is to prove the linkage between a country's history and its cultural characteristics. In order to prove this statement, we will analyse mutual Austrian-Slovak recent history and its impact on both national cultures.

Our research is divided into several partial analyses. Firstly, we will examine the mutual history of both countries and select the most important milestones, primarily in the 20<sup>th</sup> century. For this purpose, relevant scientific literature sources will be applied.

One of the works we find especially useful for our research is the one by Zuzana Poláčková. In her monography *Za oponou slovensko-rakúskych vzťahov v 20. storočí* she discusses topics such as Slovak (as well as Czech) minority in Vienna, relations between Vienna and Bratislava after 1918, political situation in Austria after 1945, or the relations of the countries after 1968.

Another noteworthy book is the proceedings edited by Emilia Hrabovec and Beata Katrebova-Blehnova, *Slowakei und Österreich im 20. Jahrhundert: Eine Nachbarschaft in historisch-literarischer Perspektive*, including contributions concerning for instance history of Slovaks in Austria, or Slovak political exile in Austria between 1945-1955.

Investments and trade relations, history, European integration, as well as cross-border cooperation are all topics included in the publication *Dve dekády slovensko-rakúskych vzťahov* (Benč, Bilčík, Duleba, Gruber and Strážay, 2013). The issues of cross-border cooperation, for instance concerning the Twin City project, are also discussed by Mattoš (2014).

The second part of our work is engaged in cultural characteristics of Austria and Slovakia. As several approaches of classification of cultures exist, we have selected two respected authors, whose research will represent the basis of our analysis. The first of them is Geert Hofstede (et al., 2010) and his concept of cultural dimension; the latter is Richard D. Lewis (2006) and his categorization of cultures.

Based on the two partial analyses, i. e. the examination of the mutual history and identification of the most important milestones, and the culture-related comparative analysis, the connection between the historical and cultural aspect will be demonstrated.

## 3. Brief Outline of Mutual Austrian-Slovak History

History is an important element in Austrian-Slovak relations. Universally, history is not only a component of culture, but it itself influences the mentality and culture. Therefore, we attempt to point out the linkage between mutual history of both nations and their cultural profiles, whereby our focus is predominantly on the 20<sup>th</sup> century. This may, in fact, partially influence our findings, as culture is in constant development, with much older periods impacting it.

In spite of rich mutual connections and geographical proximity, the history of complex mutual relations needs to be detected and written. Moreover, there is a deficiency of knowledge on the population's side (Hrabovec, 2008).

Slovak history can generally be characterized by migration tendencies. In this regard, Austria was frequently the target destination of Slovaks. One of the periods of Slovaks' relocation to Austria was the time of inner migration within the Austro-Hungarian state, the 20<sup>th</sup> century as seasonal migration, and then the period after the World War II due to political reasons (political emigration) (Rydlo, 2008). The area of contemporary Austria has thus been a meeting point of Germanic and Slavic world. Regarding the numerical data, the highest number of Slovaks living in Austria was registered around 1900. A decrease started prior to the World War I (Rydlo, 2008).

The period between 1938-1945 represents an atypical chapter in history of the Slovak Republic, as well as of Austria (*Ostmark*) as a part of the Third Reich. In this era characterised by totalism, the mutual relations discontinued (Poláčková, 2013). An important milestone is the year 1948, in which the communists came to power in Czecho-Slovakia. By this situation, the migration was triggered (Rydlo, 2008). In 1955, Austria achieved independence, after it had been occupied by the four powers between 1945-1955. In this regard, the issue of national identity is rather crucial, as the *Anschluss* hindered creation of Austrian identity and national consciousness, which was, on the other hand, empowered at the time of the occupation by the four powers (Poláčková, 2013). In the context of the Cold War, new importance was attached to the proximity of Austria from Slovak perspective (Gruber, 2013). Another noteworthy historical circumstance occurred in August 1968, when occupation of Czecho-Slovakia by the Warsaw Pact commenced. Similarly, the migration from Slovakia was intensified by this development. When migrating through Austria, legal protection as well as economic and social aid was provided to Slovaks. In November 1989, as the iron curtain fell, Slovaks from Austria could have crossed the border again (Rydlo, 2008). According to Poláčková (2013), the year 1989 is a fundamental milestone in the mutual history of the two states after the World War II, as up to this point both countries had belonged to two different parts of the bipolar Europe.

The division of the world after the World War II was crucial in relation to economic development of European countries. Suppan (2008), for instance, points out the rejection of the Marshall Plan, which resulted in considerable divergence between the two blocks regarding their economic situation; therefore, logically, between Czecho-Slovakia and Austria, too. Similarly, Kirschbaum (2008) emphasises the fact of Austria's not having been part of the Soviet bloc but an integral part of the Western European economy, which he calls „*good fortune*” (Kirschbaum, 2008, pp. 225). Even today we can witness a gap in economic indicators, for example is the value of indexes measuring national competitiveness (such as the Global Competitiveness Index by the World Economic Forum).

When the separation of Czecho-Slovakia was being conducted, Austria had less doubts about Slovakia's viability than many other countries, and thus due to information and contacts (Gruber, 2013). Slovakia became an independent state in 1993, which was followed by acceptance from Austrian side, since Slovakia was considered to be a relatively important partner and player in the region (Kirschbaum, 2008) and future cooperation was found to have high potential (Gruber, 2013). Since then, bilateral political relations have been maintained. These relations, however, were based on a long common history. In the 90s, Austria was supporting the idea of Slovakia's integration into European structures and was an advocate of Slovakia's political and economic stability (Gruber, 2013).

#### **4. Comparison of Austrian and Slovak National Culture**

The following part of the article aims to summarize the most significant attributes of Slovak and Austrian national culture. Since a variety of models characterising and describing cultures

exist, only two models are applied in the present paper, namely the model of Richard D. Lewis and the model of Geert Hofstede.

#### **4.1 Austrian and Slovak Culture Based on the Model of Richard D. Lewis**

Currently, there is an enormous variety of cultures in the world. „*The several hundred national and regional cultures of the world can be roughly classified into three groups: task-oriented, highly organized planners (linear-active); people-oriented, loquacious interrelators (multi-active); and introverted, respect-oriented listeners (reactive)*,” (Lewis, 2006, p. 27). Both Austrians and Slovaks are situated on the linear-active – multi-active scale, with Austrians being located closer to the ideal linear-active state, and Slovaks demonstrating more features of multi-active cultures (Table 1). As we can see, the majority of cultures on this line are European cultures (or descendants of Europeans). Only a few cultures from the European area are situated on the linear-active – reactive scale. This enhances the presumption of cultural similarities being more frequent than differences in the European context, and the idea of common European civilization.

In general, Latin Americans or Arabic cultures are considered to be the most multi-active ones. These may be characterised as extrovert, impatient, talkative, not punctual. Besides, doing several things at once is rather common. On the other hand, German and Swiss culture represent typical examples of linear-active cultures. According to Lewis (2006), individuals from linear-active cultures tend to be introvert, patient, quiet, and punctual. Planning ahead methodologically and focusing on one thing at a time only are examples of typical behaviour of representatives of linear-active cultures. Based on this model, Slovaks are supposed to be more extrovert and less punctual than Austrians. Austrians, in contrast to Slovaks, are more likely to be planners, sticking to plans and facts, and confronting with logic rather than with emotions. Apart from that, Austrians are more likely to separate the professional and social sphere, whereas Slovaks tend to interweave them (Lewis, 2006).

However, it needs to be emphasised that we talk about tendencies and presumptions, since exceptions might exist. One can surely encounter an introverted representative of Slovak culture who always focuses exclusively on a single task at a time (Čiefová, 2017).

**Table 1: Scale of Linear-Active and Multi-Active Cultures**

1. Germans, Swiss
2. Americans (WASPs)*
3. Scandinavians, Austrians
4. British, Canadians, New Zealanders
5. Australians, South Africans
6. Japanese
7. Dutch, Belgians
8. American subcultures (e.g., Jewish, Italian, Polish)
9. French, Belgians (Walloons)
10. Czechs, Slovenians, Croats, Hungarians
11. Northern Italians (Milan, Turin, Genoa)
12. Chileans
13. Russians, other Slavs
14. Portuguese
15. Polynesians
16. Spanish, Southern Italians, Mediterranean peoples
17. Indians, Pakistanis, etc.
18. Latin Americans, Arabs, Africans
*White Anglo-Saxon Protestants

Source: Lewis, 2006, p. 33.

Lewis further describes individual national cultures in more detail. He summarizes Austrian and Slovak values as shown in Table 2.

**Table 2: Austrian and Slovak Cultural Values**

Austrian values	Slovak values
Hospitable, traditional, old-fashioned, nostalgic, sentimental, romantic, love nature, clean, Catholic, pessimistic, respect education, self-deprecatory humor, hypersensitive to criticism, lack self-assurance, chivalrous, charming, class conscious, stylish	extended families, closeness to nature, respect for education, attachment to folklore, folk art, love of music and sport, epicureanism, defense of their Slovak nation and culture, attachment to popular traditions, rather religious (marriage, baptism, funerals), sense of historical victimization, lack of self-confidence

Source: Lewis, 2006, p. 234 and 298

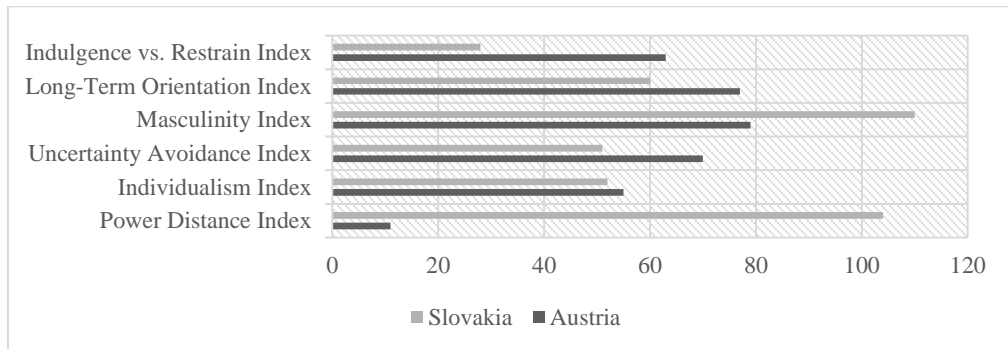

According to Lewis (2006), Austrians generally lack self-confidence. Private networks and family connections are rather influential. The important thing to mention is the regional aspect, i.e. the differences for instance between the Viennese and the Tyrolese. In this place we would like to add that regional differences with no doubt exist also in Slovakia. In our research, however, these are not considered. On the hand, both Austrian and Slovak cultures are regarded from the general perspective.

Slovaks demonstrate a historically developed victim mentality. Moreover, some Slovaks are anxious of responsibility, although, on the other hand, they are usually more punctual than the rest of the Slavs. Taking the European context into account, Slovakia is a relatively new nation state, inhabited by polite people willing to learn (Lewis, 2006, p. 297-300). However, historical circumstances have resulted in Slovaks not being fully confident as far as their national consciousness is concerned. As Rydlo (2008) states: „*Hinzu kamen – historisch bedingt – das geschwächte Nationalbewusstsein und größere Assimilationsbereitschaft der Slowaken* (Rydlo, 2008, p. 53).

#### ***4.2 Austrian and Slovak Culture in the Context of Hofstede's Dimensions***

Another approach we would like to apply within the present paper is the concept of cultural dimensions, as introduced by Geert Hofstede. He is not the only author dealing with cultural dimension, nevertheless, his work surely belongs to the most cited and respected ones.

Originally, there used to be four dimensions of national cultures, namely power distance, individualism vs. collectivism, masculinity vs. femininity, and uncertainty avoidance. However, two more were added later, in concrete long-term orientation and indulgence vs. restraint.

**Figure 1: Dimensions of National Culture of Slovakia and Austria**

Source: Hofstede, Hofstede and Minkov, 2010 (own elaboration)

The comparison of cultural dimensions of both countries shows interesting results. On the one hand, the index of some dimensions differs only slightly. On the other hand, in some cases the difference is considerable, for instance within the power distance dimension. Slovakia, based on its high score, can be defined as a large-power-distance country, which means the unequal distribution of power is accepted and expected. This may as well be applied to the work sphere.

Another visible difference demonstrates the indulgence vs. restraint index. Due to the fact that this dimension is relatively new, and as the authors themselves emphasise, it deserves more study, we include the whole definition: „*Indulgence stands for a tendency to allow relatively free gratification of basic and natural human desires related to enjoying life and having fun. Its opposite pole, restraint, reflects a conviction that such gratification needs to be curbed and regulated by strict social norms,*” (Hofstede, Hofstede and Minkov, 2010, p. 281). A country’s score within this dimension is influenced by several factors. For instance, national wealth plays an important role. According to the authors, national wealth is liable for approximately 10 per cent of differences regarding indulgence among countries (Hofstede, Hofstede and Minkov, 2010). We believe, Austria’s strong economic position may thus be interconnected with its score within this dimension. Besides, more indulgent cultures tend to have more optimistic population (Hofstede, Hofstede and Minkov, 2010).

Noteworthy is also the difference in masculinity. In a masculine society, there is a distinction between emotional gender roles, i.e. men are supposed to be focused on material success and show assertiveness. To women, modesty and quality of life are the principal values. In a feminine society, there is no clear distinction between emotional gender roles. This means, men as well as women tend to be modes and tender (Hofstede, Hofstede and Minkov, 2010). Applying this model to the analysed countries, Slovakia with its high score within the index is supposed to clearly mirror both masculine and feminine tendencies. Austria’s score, although still relatively high, results as well in a certain amount of femininity.

We can further conclude that common history in central Europe does not necessarily guarantee identical cultural values and cultural characteristics, as certain differences within the dimensions occur.

## 5. Conclusion

In the present paper we attempted to discuss the connection between Austrian-Slovak historical development in the 20<sup>th</sup> century and their cultural profiles.

Having conducted the analysis of historical events and the comparison of the national cultures, several results can be drawn. For instance, based on the Lewis's model, Austria demonstrates rather linear-active tendencies, in contrast to predominantly multi-active Slovakia. This might have been intensified during the Cold War by maintaining contacts to other Slavic cultures, that are usually also located on a very similar place on the scale. Regarding Hofstede's dimensions, Austria is more indulgent than Slovakia. Since Austria's economy was not part of the Soviet bloc, it flourished, and it still belongs to the most innovative and competitive countries.

It needs to be emphasised that the present research may be limited by the analysed timeframe, as well as by solely two models of cultural comparison having been applied. Therefore, further debate on the topic is highly welcome. On the other hand, we are convinced our research is relevant in today's globalized world.

### **Abstract**

*Eastern European countries (CEECs) started to be popular destinations for foreign direct investment (FDI) inflows not until 1990s and over time became successful FDI recipients. Currently, an ongoing investment of Jaguar Land Rover into Slovakia is a highly discussed topic. As the inflows of FDI to CEECs gained importance over time, helped by becoming the European Union (EU) member or candidate countries, it is necessary to understand the main factors attracting FDI into this region. As FDI decisions are mainly sector oriented, it is also necessary to focus on sector level. Nevertheless, such studies are very rare especially owing to issues related to data collection. Therefore, this paper is devoted to the topic of determinants of FDI in CEECs with focus on Slovakia and manufacturing sector. The aim of the paper is to identify the main factors affecting the FDI flows in CEECs focused on Slovakia and manufacturing sector.*

**Keywords:** European union, foreign direct investment, sector analysis, Slovakia

**JEL Classification:** F21, F23, N64

### **1. Introduction**

Nowadays, foreign direct investment (FDI) is seen as a tool and as a driving force of companies to expand their power across new territories. Companies which decide to go international often invest into production i.e. the international production which is usually perceived as production financed by FDI. Dunning (1988, p. 1) defined the international production as: “*a value-adding activity which is owned or produced by a firm (or group of firms) outside its (or their) national boundaries.*” This definition has been later widened to: “*all value adding activities in one country, which either includes intermediate products supplied by a firm from another, over which it continues to exercise some organizational governance for a specified or indefinite time period.*”

For a host country, FDI inflows are often seen not only as a significant non/debt source of financing which helps long-term economic growth and development more than other forms of capital inflows but also e.g. as a source of knowledge, technology transfer, job creation, increased work productivity, development of human capital etc. The European Union (EU) shares a similar approach and tries to attract FDI flows especially from external investors, see Assuncao etc. (2011).

Central and Eastern European countries (CEEC) experienced a massive increase of FDI inflows and became successful recipients of FDI compared to the period before launching transition processes towards democracy and market economy, before becoming member countries of various international organizations and finally before integrating themselves into the European integration. All previously mentioned activities massively helped them to attract

FDI, see Resmini (2000) or Tintin (2013). For illustration, table 1 shows Slovakian FDI inflows in 1998-2015 and proves that Slovakia, as a CEEC, has become a significant FDI recipient.

**Table 1: Slovakian FDI Inflows in 1998-2015 (Thousands EUR)**

Source: National Bank of Slovakia (2017a, 2017b), own calculation

Resmini (2000) mentions that it has already been published much about FDI trends in CEEC but it is also very important to understand the determinants stimulating foreign investors to engage in this region. Therefore, the aim of this paper is to identify the main factors affecting the FDI flows in CEECs again with a focus on Slovakia and manufacturing sector. After all, the FDI decision is not only country oriented but mainly sector oriented. Slovakia, as a representative of CEECs, was chosen for this reason: since 2015, when Slovakian government and British company Jaguar Land Rover signed an investment agreement about building a factory production line in Nitra region, see Vlada (2015), Slovakia as a FDI recipient has been a highly discussed topic. The manufacturing sector, a traditional sector of Slovakian economy, was identified as the most invested Slovakia economic sector from 1998-2015, see table 2, and therefore chosen as another interest of this paper. Sabol and Hoskova (2004) confirm the attractiveness of the chosen sector in Slovakia.

**Table 2: The First Five FDI Recipients: Slovakian Sectors in 1998-2015 (the Sum of Annual Values)**

Sector	Position	FDI inflows (thousands EUR)
Manufacturing	1.	9,342,093
Financial and insurance activities	2.	6,123,953
Electricity, gas, steam, air conditioning and water supply, sewerage, waste management and remediation activities	3.	3,563,074
Real estate activities, professional, scientific, technical, administrative and support service activities	4.	3,116,762
Transportation and storage, information and communication	5.	2,568,359
All sectors	X	28,379,393

## 2. Theoretical Approach to FDI Determinants

In professional literature, it is possible to find several explanations why companies decide to internationalize and to engage in FDI. Dunning (1988) states that some authors follow and respect only few of the following statements, while some authors rather have a mixed approach and accept all of them:

- a. There is the existence of some market imperfections.
- b. Enterprises try to reduce their transactional costs.
- c. Enterprises tend to enhance their value-adding skills.
- d. Enterprises tend to gain the dominant or monopolistic position on the market.

Dunning (1988) adds that all of them are preceded by two main assumptions. The first assumption is that company is able to supply the foreign market, independently on whether the production itself is produced within a domestic or foreign country. The second assumption is as follows: the turning point when enterprises start to consider the FDI is the moment, when some change of foreign variable occurs. Such turning point or trigger may be e.g. when a foreign country impose a tariff on an imported product. Thus, for a domestic enterprise it is not profitable to export to the foreign country anymore. In such case, a foreign enterprise faces three possible options: it can leave the market, license a foreign company to produce together or delegate it (to the foreign company) in order to produce the part of production which is not profitable to be produced anymore. As the third option, it can establish a subsidiary abroad including the possibility to come into possession of the production equipment and produce there itself, see Rasciute and Downward (2017).

Furthermore, for some countries and industries it is more common to be more engaged globally than for the others. Dunning (2002) asserts that it exists two different attitudes to explain why some countries and enterprises are more dominated by foreign enterprise's affiliates than the others. The two individual attitudes are namely: approach of locational economists and approach of industrial international economist. In terms of their attitude, locational economists focus on a place/location of company's production and they try to answer the question why they choose these places. The idea standing behind is that it must exist some certain reason why enterprises decide to acquire the foreign ownership of enterprises and they assume that such foreign ownership gives them some competitive advantage on the domestic market. The industrial economists do not deal with the same questions and rather focus on the reasons standing behind the choice of a particular invested industry. The typical questions they try to answer are which factors determine some enterprise to supply its output. To conclude, while the first attitude is more country oriented the second approach is rather industry oriented.

The factors according to which a company decides where it locates its production were the best described by Dunning (1988, 1993, 2002) and Dunning and Lundan (2008). These factors are partly external and partly internal which is the best described by Dunning's eclectic paradigm also known as OLI paradigm. This paradigm supposes that FDI will be located abroad only if three sets of factors exist simultaneously:

Ownership specific advantages (O) in a transnational company - specific advantages are synonym for competitive advantages of companies which are to make FDI. The bigger competitive advantage they possess, the more likely they are going to engage in FDI to foreign production. These specific advantages are e.g. possession of patents, technology or management skills.

Locational advantages (L) in home and host countries - refer to alternative countries or regions where the international production may be transferred as the economic system offers

convenient tax systems, low transport or production costs or is perceived as a legislatively well-protected market.

Internalisation advantages (I) - refer to net benefits of internalisation as cutting transaction costs, lowering risk of technology copying etc.

Franco et al. (2008) add that the OLI paradigm explains why (O) and how (I) a company makes its decision to go international and where (L) to invest.

Although, Dunning's OLI paradigm is probably the most respected and referred one it is not the only theoretical approach towards FDI determinants. Accuncao et al. (2011) summarized the theories explaining FDI determinants which can be found in table 3.

**Table 3: Other Theoretical Approaches Towards FDI Determinants**

Theoretical Approach	Determinants
Heckscher-Ohlin Model / MacDougall-Kemp Model	Higher return on investment, lower labour costs, exchange risk
Market imperfection	Ownership benefits (product differentiation), economies of scale, government incentives
Product differentiation	Imperfect competition
Oligopoly markets	Following rivals, responding to competition in domestic market
Product life cycle	Production function characteristics
Behaviour theory	Fear of loss of competitive edge, following rivals and increased competition at home
Internalisation	Market failures/inefficiencies
New theory of trade	Economic variables e.g. market size, transport costs or barriers to entry
Institutional approach	Political variables e.g. financial and economic incentives, tariffs and tax rate

Source: Accuncao et al. (2011), author's own adjustment

### 3. FDI Determinants in CEECs with Focus on Slovakia and Manufacturing Sector

Franco et al. (2008) state that, in general, host country or region FDI determinants can be divided into three categories according to motives of transnational corporations (TNC). These FDI determinants are as follows: policy framework for FDI, business facilitation and economic determinants. Policy framework for FDI basically involves variables as economic, political or social stability, rules influencing the market entry and market operations, standards for foreign affiliates, FDI policies i.e. especially M&A, *international agreements on FDI, privatization policy, trade and tax policy*. *Business facilitation includes investment incentives, hassle costs which are connected for instance with a level of corruption or administrative effectiveness, social facilities e.g. schools, investment and after investment services etc.* Economic determinants are divided into three individual categories by motives of transnational corporations:

- a. *Market-seeking: the main determinants of market-seeking TNCs are income per capita, market size, growth of the market and potential growth of the market, access to regional and global markets, preferences of a particular country consumers, market's structure etc.*
- b. *Resource/asset seeking: the main determinants of resource/asset seeking TNCs are accessibility and equipment of raw materials, workforce costs (preferably low) and skills, quality of physical infrastructure including telecommunication, other created assets as for instance clusters etc.*
- c. *Efficiency-seeking: the main determinants of efficiency-seeking TNCs are costs in general (including costs of all assets stated under resource/asset seeking) and membership in regional integration agreements (beneficial to the creation and establishment of regional corporate networks).*

In order to identify FDI determinants in CEECs with a focus on Slovakia and manufacturing sector, the literature devoted to the topic was researched. These were especially studies by: Ciurila (2007), Gausemann et al. (2011), Janicki and Wunnava (2004), Michalíková and Galeotti (2010), Resmini (2000), Rutkowski (2006), Srholec (2004) and Zamrazilova (2007).

Zamrazilova (2007) states that the most important FDI motives in general are geographical closeness, labour costs as well as the quality and availability of labour force, the level of regional integration maturity, the level of foreign trade liberalization, size of the host economy, the level of taxation, transport costs and governmental incentives. On the other hand, Srholec (2004) holds an opinion that an effort to decrease free trade barriers and an attempt to lower transport costs are not seen as main FDI localization factors.

Ciurila (2007) focused on determinant factors of FDI inflows in six CEECs and particularly gave an attention to four determinants namely productivity, unemployment rate, real exchange rate and the taxation environment. She estimated a Vector Error Correction Model (VECM) using quarterly data for the period 1997-2007 and concluded that the determinants of FDI inflows are different in each CEE country. She stated that it was proved that there was no relationship between the real exchange rate and FDI inflows in case of Hungary, Romania and Slovakia. On the other hand, in case of Bulgaria and the Czech Republic the exchange rate was proved as an important FDI determinant. In general, the unemployment rate was identified as a significant determinant of FDI inflows for all CEECs. The relationships between FDI inflows and other determinants were less clear than expected. Janicki and Wunnava (2004) dealt with FDI determinants for 8 CEECs (Bulgaria, Czech Republic, Estonia, Hungary, Poland, Romania, Slovak Republic and Slovenia) in 1997. They conducted regression analysis of several variables and revealed that the most important FDI determinants are namely: size of the host economy, host country risk, labour costs in the host country and openness to trade.

Gausemann et al. (2011) investigated five CEEC (Czech Republic, Hungary, Poland, Romania and Slovakia) in 1989-2009 with a focus on the following determinants: market access, costs advantages, scale economies, product diversification, access to technology as well as access to natural resources. Their analysis revealed that these countries are interesting for investors mainly due to their low costs of labours with a combination of highly-trained and skilled labour force as well as because of quick economic growth related to growing purchasing power of potential buyers. They assume that the investor's motives are mainly market and resource seeking. On the other hand, they suggest that technology seeking investors are not satisfied with the level of technology availability in these countries. Rutkowski (2006) estimated several regression models for thirteen CEEC and verified that investors were interested in these countries mainly because of their risen demand for skilled labour available for relatively low costs.

Resmini (2000) investigated the FDI determinants in CEECs at a sector level. Her research was particularly focused on the manufacturing sector divided into four groups according to the Pavitt taxonomy: supplier-dominated firms, scale-intensive firms, specialized suppliers and finally science-based firms. The similar classification but in different context was used e.g by Klapilová Krbová and Velčovská (2016). Resmini (2000) concluded that the FDI motives into classified manufacturing groups/industries significantly differed. She also stated that her work was the first attempt to analyse the determinants of FDI to manufacturing sector of CEECs. A similar study focused on a sector analysis, for one chosen country, was made for the Czech manufacturing industries in 2000-2007 by see Michalíková and Geleotti (2010). They used panel data of twenty-three sectors and applied an Ordinary Least Squares (OLS), Generalized Method of Moments (GMM) and Least Trimmed Squares Estimator (LTS) to reveal that in the Czech Republic, an amount of qualified labours with technical skills is still a comparative advantage as investors prefer industries with a high quality of labours. The profit per labour is another very important aspect which is monitored by foreign investors. To conclude they empirically proved that the higher number of qualified labours with technical skills, the higher FDI inflows into these sectors and the higher the profit per labour is, the higher FDI inflows are into individual industries.

Seemingly, the literature review revealed that the similar study about FDI determinants into Slovakian manufacturing sector has not been done yet, or at least has not been found in top journals, which is likely connected with the problem of data availability. As Slovakia and its FDI are currently highly discussed topic, the relevance of such study is very high.

#### **4. Conclusion**

The aim of the paper was to conduct a descriptive analysis of FDI determinants in CEECs with a focus on Slovakia and manufacturing sector. According to the professional literature devoted to the topic it was revealed that FDI determinants differ across CEECs. It seems that most authors share the opinion that CEECs attract foreign investors mainly due to labour costs and highly-trained and skilled labour force. So, it makes sense that unemployment rate was identified as an important FDI determinant. It seems that exchange rate is not an important FDI determinant in Hungary, Romania and Slovakia unlike in case of the Bulgaria and the Czech Republic. In general, it seems that foreign investor's motives are mainly market and resource seeking oriented therefore market size, economic growth connected with growing purchasing power of potential buyers are also taken into consideration when investors make their FDI decisions into CEECs. In terms of manufacturing sector in CEECs, it was revealed that not much work was done in this area although FDI motives into classified manufacturing industries significantly differed in CEECs. In the Czech Republic, in 2000-2007, quality of labours with technical skills as well as a profit per hour generated by a worker, were significant determinants of FDI inflows into manufacturing industries. Albeit, FDI decision is mainly sector oriented, a study dealing with determinants of FDI inflows into Slovakian sectors has not been done yet or at least was not found in top journals which indicated a literature gap.

### **Abstract**

*The selected indicators of the EU Sustainable Development Goal (SDG) indicator set were chosen for the Hierarchical Cluster Analysis (HCA) to classify the 28 EU countries, Norway and Switzerland according to their sustainability levels. Four clusters were created according to the indicator values in the initial period (primarily 2007) and the recent period (predominantly 2016). The changes in the assignment to the clusters also point out to the Sustainable Development (SD) path of countries. This can especially be seen in Slovenia. Cluster 1 is evaluated as the most sustainable cluster and cluster 2 as the least sustainable one. In the combination of the most important representative indicators in the social dimension, which are the People at risk of poverty or social exclusion (SDG1) and the Life expectancy at birth (SDG3), the poor results were shown by Bulgaria, Romania, Latvia and Lithuania (cluster 2 countries in the initial period) while the non-EU countries – Switzerland and Norway, included in cluster 1, are evaluated as the best performing countries.*

**Keywords:** European Union, hierarchical cluster analysis, sustainable development, sustainable development goals, people at risk of poverty or social exclusion

**JEL Classification:** C38, I32, F56

### **1. Introduction**

Sustainable development (SD) is a global challenge, which requires a progressive transformation of economies (Hediger, 2006). According to the most quoted definition of the World Commission on Environment and Development (WCED, 1987), SD is development that meets the needs of the present without compromising the ability of future generations to meet their own needs. SD is a fundamental objective of the EU enshrined in its primary law (Treaty of Lisbon, 2007), governing all the EU's policies and activities. The EU formulated its Sustainable Development Strategy (SDS), i.e. long-term strategy dovetailing the policies for economically, socially and environmentally SD in 2001 (Adelle and Pallemarts, 2010). The external dimension was added to the EU SDS in 2002. The strategy was renewed in 2006 (see more in Drastichová (2014)). Although in this paper the focus is on the SD of countries, the SD must also be studied at the lower analytical levels. For example, the SD of Moravian-Silesian enterprises was investigated by Sucháček et al. (2018).

The 2030 Agenda for Sustainable Development and its 17 Sustainable Development Goals (SDGs), adopted by the United Nations (UN) in September 2015, have given a new impetus to global efforts for achieving SD. The SDGs provide a recent policy framework worldwide for the issues that are crucial for the SD path, such as the framework towards ending all forms of poverty, fighting inequalities and tackling climate change. The EU, in coordination with its

Member States, is committed to support the implementation of the 2030 Agenda. The EU's answer to this Agenda is outlined in the 2016 European Commission's Communication (European Commission, 2016). Accordingly, the EU SDG indicator set replaced the EU SDS in 2017 (Eurostat, 2018). Allievi et al. (2011) used the HCA to group the EU-27 countries based on their performance measured by the EU Sustainable Development Indicators (SDIs). In comparison to that, the innovation of this paper lies in using the new EU SDG indicator set to compare the sustainability of the EU-28 countries together with other two developed countries, i.e. Norway and Switzerland.

The aim of the Paper is to cluster the EU countries, Norway and Switzerland according to their sustainability levels measured by the selected indicators included in the EU SDG indicator set. The indicators monitoring all three dimensions of the SD are included, but the special focus is on the crucial indicators in the social pillar of the SD. The level of sustainability is compared in the sample of 30 countries, i.e. the 28 EU countries, Norway and Switzerland, according to their assignment to particular clusters. The changes in the composition of clusters and the values of the indicators also reflect the SD path.

## **2. Data and Methodology**

In this section, the cluster analysis is introduced as the main methodology for the analysis (subsection 2.1). Subsequently, the EU SDIs and the EU SDG indicator set are described and the process of indicators selection is explained (subsection 2.2).

### **2.1 Cluster Analysis**

The cluster analysis is an exploratory data analysis tool which aims at sorting different objects (or cases, observations) into groups in a way that the degree of association between two objects is maximal if they are part of the same group and minimal otherwise (Mooi and Sarstedt, 2011). Hierarchical Cluster Analysis (HCA) is a method for the cluster analysis, which attempts to identify relatively homogeneous groups of cases, or variables, based on selected characteristics, using an algorithm that starts with each case (or variable) in a separate cluster and combines clusters until only one is left. HCA was applied to create clusters of analysed countries based on the indicator values of two periods: the most recent year, which is basically 2016, and the initial year 2007. Because not for all countries and indicators the data were available in this year, some modifications were adopted (described in Table 2). In the analysis, groups of countries are created while the Ward's method is used as the cluster method. The squared Euclidean distance was chosen from the measures for interval to specify distance. This is because the quantitative variables are used. From the available standardization methods, the Z scores were chosen because the variables included are measured in different units (Aldenderfer a Blashfield, 1984; Meloun a Militký, 2002; Řezánková, Húsek, Snášel, 2007).

### **2.2 Indicators Sets used for the Cluster Analysis**

As regards the previously used set of the indicators to measure the progress toward the EU SDS, i.e. the EU SDIs, ten indicators represent the headline indicators in the set of more than 130 SDIs. They provide an overall view of the EU's progress towards the SD in terms of the objectives and targets defined in the strategy. Because the EU SDS and its SDIs set were replaced with the EU SDG indicator set, related to the themes of the SDGs, the indicators from the latter were chosen for the cluster analysis. The EU SDG indicator set comprises 100 indicators that are structured along the 17 SDGs (see Table 1). Each goal contains 6 indicators primarily attributed to it, except for goals 14 and 17 which only have 5 indicators. There are also multipurpose indicators, i.e. 41 of the 100 indicators are used to monitor more than one

SDG. All indicators are grouped in sub-themes to underline interlinkages and emphasise different aspects of each SDG. Although the EU adjusted its framework for the SD measurement to the global agenda and the indicators are recently classified according to the 17 SDGs framework, a number of the particular indicators are the same or similar to those used under the framework of the EU SDIs. It means that the priority areas for the SD in the EU remained the same, but the global aspects of pursuing the SD path have been emphasised.

**Table 1: The UN 17 Sustainable Development Goals**

**Goal 1.** End poverty in all its forms everywhere; **Goal 2.** End hunger, achieve food security and improved nutrition and promote sustainable agriculture; **Goal 3.** Ensure healthy lives and promote well-being for all at all ages; **Goal 4.** Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all; **Goal 5.** Achieve gender equality and empower all women and girls; **Goal 6.** Ensure availability and sustainable management of water and sanitation for all; **Goal 7.** Ensure access to affordable, reliable, sustainable and modern energy for all; **Goal 8.** Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all; **Goal 9.** Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation; **Goal 10.** Reduce inequality within and among countries; **Goal 11.** Make cities and human settlements inclusive, safe, resilient and sustainable; **Goal 12.** Ensure sustainable consumption and production patterns; **Goal 13.** Take urgent action to combat climate change and its impacts; **Goal 14.** Conserve and sustainably use the oceans, seas and marine resources for SD; **Goal 15.** Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss; **Goal 16.** Promote peaceful and inclusive societies for SD, provide access to justice for all and build effective, accountable and inclusive institutions at all levels; **Goal 17.** Strengthen means of implementation and revitalise the Global Partnership for.

Source: Eurostat (2018)

Efforts were made to include the most important representative indicator of each SDG, except for the SDG14 and SDG15, while the SDG14 is not relevant for all the countries and for the SDG15 the data were not available in all the countries. However, subsequently nine indicators were chosen for which the data were available and simultaneously these indicators met the conditions required for the cluster analysis. This procedure is described more in detail at the beginning of section 3 but the indicators omitted due to noncompliance with the conditions necessary for the cluster analysis are also summarized in the last row of Table 2. The selection of the indicators was guided by their importance as representatives of the relevant SD pillars. The indicators serving as the headline indicators of the EU SDIs (the SDG1, 3, 8, and 12) and Europe 2020 strategy (the SDG1, SDG4, 9) were favoured. As regards the SDG8, the indicator chosen for the analysis, i.e. Real GDP per capita growth, is further considered. Efforts were also made to include all three basic pillars of the SD, together with the aspects of decoupling, represented by the SDG12 (analysis of decoupling and its relations to the SD can be found in Drastichová (2016, 2017)), and the institutional pillar, where the relevant SDG16 indicator was omitted due to noncompliance (see section 3). The SDG13 plays the crucial role in all three indicator sets, however, it was omitted due to the insignificance. Climate change is the crucial topic for the SD and requires special analysis (see more in Drastichová (2016b, 2017)). The priority was also given to the indicators reflecting the crucial aspects of the social pillar even if the topic in which these are included is not primarily social (the SDG7 indicator). Applying the criteria indicated above, the nine indicators included in Table 2 were chosen.

**Table 2: Indicators Chosen for the Cluster Analysis and Data Modifications**

SDG / Indicators used	Initial year	Recent year
SDG1: People at risk of poverty or social exclusion; Percentage	HR – 2010	-
SDG3: Life expectancy at birth total (Years)	-	All countries – 2015
SDG4: Early leavers from education and training total (% of population aged 18 to 24)	-	-
SDG5: Gender employment gap (percentage points (p.p.))	FR – 2014; CH – 2010	-
SDG7: Population unable to keep home adequately warm (% of population)	HR – 2010	
SDG8G: Real GDP per capita, Chain linked volumes (percent. change on previous period)		
SDG9: Gross domestic expenditure on R&D, All sectors (% of GDP)	CH – 2008	CH – 2012; FR – 2015
SDG11: Recycling rate of municipal waste (% of total waste generated)	-	IR – 2012; PT – 2014; GR, AT, RO, FI, UK – 2015;
SDG12: Resource productivity; PPS per kilogram		NO - 2015
SDG2: Area under organic farming; % of utilised agricultural area; SDG8U: Long-term unemployment rate; SDG10: Gini coefficient of equivalised disposable income; SDG13: Greenhouse gas emissions - tonnes per capita; SDG16: Corruption Perceptions Index; SDG17: Shares of environmental taxes in total tax revenues.		

Source: Eurostat (2018); author's elaboration

Note: PPS - Purchasing power standard

The first four indicators that are representatives of the SDG1, 3, 4, 5 reflect the social dimension of the SD together with the indicator representing the SDG7 although it is primarily related to the energy sustainability (see Table 1). The SDG8 and 9 represent the economic and the SDG11 and 12 the environmental dimension while Resource productivity is also the crucial decoupling indicator reflecting the efficiency of the resource use.

### 3. Results of the Analysis

At the beginning, all the 15 indicators described in Table 2 were considered to be included in the analysis. Before the analysis is carried out, the mutual dependence of the variables is examined. Particularly, the correlation and multicollinearity of the used indicators were tested. Due to the multicollinearity problem, the SDG16 and SDG10 indicators were omitted from the analysis. Meloun and Militký (2002) indicate that if the Variance Inflation Factor (VIF) is higher than 10, strong multicollinearity is present in data. The VIF statistics were below 10 in all the examined cases after omitting the above-indicated two indicators. Based on the One-Way ANOVA, not all the indicators included were significant by the creation of the clusters at the 0.05 significance level. Accordingly, the SDG2, SDG8U, SDG13 and SDG17 indicators (all insignificant at the 0.05 significance level in the initial period) are left out from the analysis (the SDG2 and the SDG13 indicators are insignificant in the recent period at the same significance level as well). All the nine remaining indicators were significant by the creation of clusters. The SDG3 had the highest influence in the initial period because the calculated F-statistic showed the highest level (32.808). The SDG9 showed the highest influence in the recent period (F-statistic = 19.483). In this set of nine indicators, the highest level of the

Pearson Correlation was shown between the SDG1 and the SDG7 in both periods (2007: 0.829; 2016: 0.819). The only other level of the Pearson Correlation exceeding 0.8, particularly 0.801, was reached between the SDG9 and the SDG11 in 2007. Accordingly, all the coefficients are below 0.9 while those and higher values indicate strong dependence (Sambandam, 2003). The classification of countries into four clusters in two years, which seems to be the optimal solution according to the created Dendrograms, is shown in Table 3.

**Table 3: The Composition of the Created Clusters**

	Cluster 1	Cluster 2	Cluster 3	Cluster 4
<b>Initial period</b>	BE, DK, DE, FR, LU, NL, AT, FI, SE, UK, NO, CH	BG, LT, LV, RO	CZ, EE, HR, CY, HU, PL, SL, SK	IR, GR, ES, IT, MT, PT
<b>Recent period</b>	BE, DK, DE, FR, LU, NL, AT, SL, FI, SE, UK, NO, CH	BG, LV	CZ, EE, IR, HR, LT, HU, PL, SK	GR, ES, IT, CY, MT, PT, RO

Source: author's elaboration

The results for the four clusters can be summarized as follows. The cluster 1 contains 12 countries in the initial period and 13 countries in the recent one. Slovenia was shifted from cluster 3, which mainly consists of the transitive economies, i.e. the new member countries, to cluster 1. Some of the new member countries are also included in cluster 2, especially those less developed. Latvia and Romania were shifted to cluster 3 and cluster 4 respectively in the recent period. Cluster 4 contains all four Southern economies and Malta in both years together with Ireland in the initial year and Cyprus and Romania in the recent year. Ireland was shifted from cluster 4 to cluster 3 in the recent year and conversely, Cyprus was shifted from cluster 3 to cluster 4 in the recent year.

Ireland showed significant increase in the Real GDP per capita growth rate (SDG8), Resource Productivity (SDG12) as well as in the share of Population unable to keep home adequately warm (SDG7). On the other hand, the representative indicators of the SDG4 and the SDG5, reflecting the crucial social aspect, where the poorest performance is shown by cluster 4, decreased significantly, which indicates the improvements. This should also be the reason why Ireland was shifted from cluster 4. In Cyprus, almost all the social indicators showed the improvement, i.e. the SDG3, 4, 5 and 7, the SDG11 and 12 indicators increased as well, the SDG9 indicator increased only very slightly. The GDP growth rate remained the same (SDG8). However, the SDG1 indicator increased and the SDG11, 9 and 7 indicators still show the poor performance. Slovenia showed the relatively high increases in almost all the indicators, slight increase in the SDG7 indicator (0.6 p.p.) and the relatively high drop in the growth rate of the real GDP (SDG8) but also Gender employment gap (SDG5). The increase in the SDG1 and SDG4 indicators also indicates deterioration of social conditions. Both Latvia and Romania achieved the relatively high drop in the share of People at risk of poverty or social exclusion (SDG1), the share of Population unable to keep home adequately warm (SDG7), Gross domestic expenditure on R&D (SDG9) and Real GDP per capita growth (the SDG8) slowed down as well. Both increased Life expectancy at birth (SDG3), especially Latvia. The SDG4 and 5 indicators significantly decreased in Latvia, but showed one of the highest increases in Romania. Accordingly, the poor performance of the cluster 4 countries in these indicators is also likely to be the reason why Romania was shifted to cluster 4. Recycling rate of municipal waste (SDG11) also increased significantly and Resource productivity (SDG12) slightly in both countries.

In Table 4, the Descriptive Statistics of clusters are included. Cluster 1 showed highest means for the SDG3, 9, 11 and 12 in both years and the lowest means for the SDG1, 7 in both years and the SDG8 in the recent year. This indicates the highest average Life expectancy at birth, Gross domestic expenditure on R&D, Recycling rate of municipal waste together with the highest Resource productivity. On the other hand, the share of People at risk of poverty or social exclusion, Population unable to keep home adequately warm together with Real GDP per capita growth showed the lowest average levels (the latter only in the recent year). Cluster 2 showed the lowest means for the SDG3, 5, 9, 12 and 11 (the latter in the initial period) and the highest mean for the SDG1, 7 and 8. It means that it has the lowest average Life expectancy at birth, Gender employment gap, Gross domestic expenditure on R&D, Resource productivity together with the lowest Recycling rate of municipal waste in the initial year. Cluster 3 showed the lowest mean for the SDG4, i.e. the lowest average share of Early leavers from education and training in both years. Cluster 4 showed the highest means for the SDG4 and 5 indicators and the lowest mean for the SDG8 (in the initial period) and the SDG11 (in the recent period).

**Table 4: Descriptive Statistics for the Four Clusters in the Initial and Recent Period**

Ind (Cl)	Mean (Rec)	St. D. (Rec)	Mean (In)	St. D. (In)	Ind (Cl)	Mean (Rec)	St. D. (Rec)	Mean (In)	St. D. (In)

Source: author's elaboration

Notes: Ind – Indicator, Cl – cluster; In – initial period, Rec – recent period; St. D. - Standard Deviation.

The following two Boxplots displayed by Figure 1 and 2 show the distribution of data for nine indicators in the four clusters based on the five number summary: minimum, first quartile, median, third quartile, and maximum. By means of them, the results included in Table 4 are extended. In both periods, cluster 1 showed the lowest medians and means for the SDG1, represented by the People at risk of poverty or social exclusion indicator, while the cluster 2 showed their highest levels. For the SDG3 - Life expectancy at birth indicator, the opposite is true. Cluster 1 achieved the highest means and medians in both periods (except for the slightly higher median in cluster 4 in the recent year, but Romania represents the extreme outlier showing the lowest indicator value) and cluster 2 showed the lowest levels. These results,

shown more in detail in Figure 3 and 4, indicate the highest sustainability in the crucial social indicators in cluster 1 and the lowest sustainability in cluster 2.

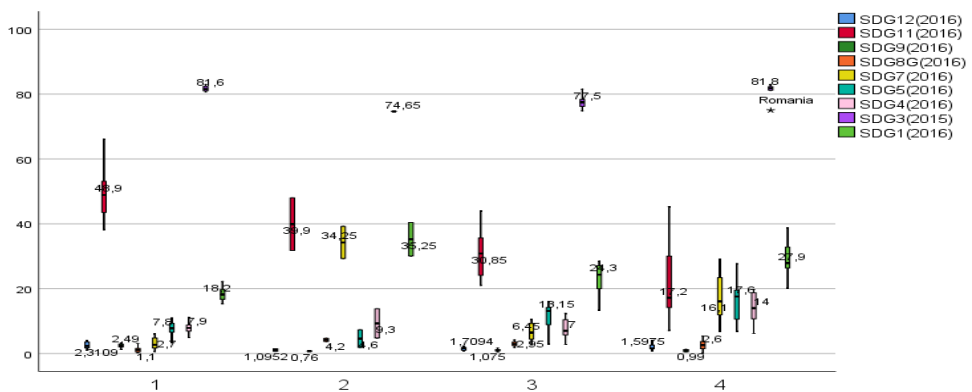

**Figure 1: Boxplot for the Initial Period**

Source: author’s elaboration

There are additional two crucial social indicators, representing the SDG4 and 5. For the SDG4, represented by Early leavers from education and training indicator, the highest medians and means are typical of cluster 4 and the lowest ones of cluster 3 in both years. The second lowest levels are shown by cluster 1 again. Accordingly, the cluster 3 can be regarded as the second best performing in the crucial social aspects. For the SDG5 representative indicator, i.e. Gender employment gap, the lowest means and medians were achieved by cluster 2, the second lowest by cluster 1, and the highest levels by cluster 4 in both periods. So, in this social aspects the cluster 4 showed the poorest performance again, but the good performance was achieved by cluster 2 and 1.

**Figure 2: Boxplot for the Recent Period**

Source: author’s elaboration

Cluster 2 showed the highest medians and means for the SDG7 represented by Population unable to keep home adequately warm in both periods while the lowest ones were achieved by cluster 1. This indicator representing the socio-energy aspects indicates the best average performance of cluster 1, followed by cluster 3. Real GDP per capita growth as the

representative of the SDG8 showed the highest means and medians in cluster 2 in both periods and their lowest levels in cluster 4 in the initial and in cluster 1 in the recent period. The second highest means and medians are typical of cluster 3 in both periods. This indicator representing the economic pillar of the SD shows that the majority of less developed new member countries grow faster, while the developed economies of cluster 1 and the Southern economies included in cluster 4 (except for Spain in 2016) often show slower growth rates. Gross domestic expenditure on R&D represents the SDG9 while the best results, i.e. the highest medians and means, are clearly achieved by cluster 1 in both periods. The lowest levels are typical of cluster 2 in both periods. In the initial year, the second best performance is shown by cluster 4, but in recent year in cluster 3. Recycling rate of municipal waste, reflecting the SDG11 and the environmental pillar of the SD, shows the highest medians and means in cluster 1. The lowest levels were shown in cluster 4 in the recent period and in cluster 2 in the initial period. As the composition of cluster 2 changed, the medians and means increased significantly from the lowest to the second highest level. On the one hand, the rates increased in the all initial cluster 2 countries, on the other hand, they are still relatively lower in Latvia and Romania, which were shifted to cluster 3 and 4 respectively. The last indicator - Resource productivity is the representative of the SDG12. The highest means and medians are also achieved in cluster 1 and the lowest ones in cluster 2 for both periods. The second highest means and the median in the initial period are typical of cluster 4. Recently the median for cluster 3 is higher.

Due to the special focus of the analysis on the social dimension of the SD, Figure 3 and 4 show the relations between the crucial representatives, i.e. of the SDG1 and of the SDG3 for the clusters in the initial year (Figure 3) and in the recent year (Figure 4).

**Figure 3: People at Risk of Poverty or Social Exclusion (SDG1) and Life Expectancy at Birth (SDG3) in the Four Clusters, 2007**

Source: author’s elaboration

In both years, the best results were achieved by cluster 1 showing the relatively lowest People at risk of poverty or social exclusion shares together with the relatively highest Life expectancy at birth. Cluster 2 is unambiguously the worst performing group in these indicators showing the relatively lowest Life expectancy at birth levels and the relatively highest People at risk of poverty or social exclusion shares. For the majority of the cluster 4 countries the Life expectancy at birth is also relatively high. It showed the second highest means in both periods, the second highest median in the initial and the highest median in the recent period while

Romania represents the extreme outlier. This is also connected with the highest standard deviation for this indicator in cluster 4 in the recent period (see also Figure 2). As regards the People at risk of poverty or social exclusion shares of cluster 4, these are often similar to those of cluster 3 (the mean is higher in cluster 4 in the recent period but slightly lower in the initial period, the medians are higher in cluster 4). However, the medians and means of Life expectancy at birth of cluster 3 are lower than those of cluster 4. As regards the particular countries, the poor results were shown by Bulgaria, Romania, Latvia and Lithuania (the initial cluster 2 countries) while the non-EU countries – Switzerland and Norway, included in cluster 1, can be evaluated as the best performing countries.

**Figure 4: People at Risk of Poverty or Social Exclusion (SDG1) 2016 and Life Expectancy at Birth (SDG3) 2015 in the Four Clusters**

Source: author's elaboration

To sum up, the analysis showed that the average best performance in the selected sustainability indicators was shown by cluster 1, consisting predominantly of the more developed EU economies together with Switzerland and Norway. The two latter, especially Switzerland, together with Sweden, can be regarded as the best performing countries at all. The poorest performance is shown by cluster 2 where the less developed new EU member countries are included. They also showed highest growth rates of the real GDP (the SDG8). Nevertheless, the initial four cluster 2 countries still show poor performance in a number of indicators. Cluster 4, consisting of the all Southern countries, several new member countries and Ireland in the initial period, can be regarded as the second worst performing cluster.

#### 4. Conclusion

The aim of the Paper was to cluster the EU countries, Norway and Switzerland according to their sustainability levels measured by the selected indicators included in the EU SDG indicator set. Overall, cluster 1 containing the majority of the most developed EU countries, Switzerland and Norway, can be evaluated as the most sustainable cluster in both periods while cluster 2, consisting of the selected less developed EU countries, showed the poorest performance. Between 2007 and 2016, the composition of cluster changed due to the changes in the indicators values. Slovenia was shifted from cluster 3, which consists of the transitive economies (the new member countries), to cluster 1. Latvia and Romania were shifted from cluster 2 to cluster 3 and cluster 4 respectively. Cluster 4 contains all four Southern economies

and Malta in both years together with Ireland in the initial year and Cyprus and Romania in the recent year. Ireland was shifted to cluster 3 in the recent year and conversely, Cyprus was shifted from cluster 3 to cluster 4 in the recent year. It is difficult to assess the changes in the composition of the clusters in relation to the SD path of countries. From the above indicated changes, the shift of Slovenia to cluster 1 is most likely to be the positive change towards the SD path.

In the crucial indicators representing the social dimension of the SD, the best results were achieved by cluster 1 showing the relatively lowest People at risk of poverty or social exclusion (representing the SDG1) shares together with the relatively highest Life expectancy at birth (representing the SDG3). Cluster 2 is unambiguously the worst performing group in these indicators showing the relatively lowest Life expectancy at birth levels and the relatively highest People at risk of poverty or social exclusion shares. The indicator representing the socio-energy aspects, i.e. the share of Population unable to keep home adequately warm (SDG7), indicates the best average performance of cluster 1, followed by cluster 3 and cluster 2 showed the lowest performance. There are additional two crucial indicators reflecting the social dimension of the SD. For the SDG4, represented by Early leavers from education and training indicator, on average, the best results were achieved in cluster 3, followed by cluster 1 and worst results in cluster 4. The poorest average performance in cluster 4 is also typical of Gender employment gap (representing the SDG 5) while the best performance was achieved by cluster 2, followed by cluster 1. For the economic dimension of the SD, two crucial aspects were chosen. The SDG8 representative, i.e. Real GDP per capita growth, showed the highest average rates in cluster 2, followed by cluster 3, while the relatively lower rates are typical of cluster 1 and cluster 4. It means that the majority of less developed new member countries grow faster, while the developed economies of cluster 1 and the Southern economies included in cluster 4 often show slower growth rates. On the other hand, average Gross domestic expenditure on R&D representing the SDG9 are unambiguously highest in cluster 1 and lowest in cluster 2. The latter two indicators, reflecting the environmental pillar of the SD and decoupling aspects, represent the SDG11 and the SDG12 respectively. The best performance in both of them, i.e. in Recycling rate of municipal waste (the SDG11) and Resource productivity (SDG12) is achieved in cluster 1. Resource productivity is lowest in cluster 2 but the Recycling rate increased significantly in all the initial cluster 2 countries and also due to the change in composition of cluster 2, the lower average rate is recently shown by cluster 4.

Overall, cluster 1 can be evaluated as the most sustainable cluster in both periods while cluster 2 showed the poorest performance. However, in some important aspects of the SD, cluster 3 also achieved high performance while cluster 4 often showed poor performance. Between 2007 and 2016 the composition of cluster changed. Norway, Switzerland and Sweden can be evaluated as the best performing countries while the four cluster 2 countries from the initial period can be evaluated as the countries with the poorest performance in relation to sustainability. The positive development in the indicators indicates the shift towards the SD path. To achieve the SD path, the important challenge is to change the quality of the economic growth. Particularly, the fast growing (often cluster 2 and cluster 3) countries should achieve decoupling, i.e. decrease their environmental burden while increasing their economic product. The significant attention should also be paid to the social aspects of development.

### **Abstract**

*Since the collapse of the Bretton Woods system, the international monetary systems have undergone significant dynamic changes. This period was characterized not only by gold demonetization, currency crises, but the globalization of financial markets. The aim of the article is to evaluate the position of the Eurozone in the international monetary systems as it gradually evolved over time. The results of the analysis revealed, on the one hand, the growing share of the EMU's common currency euro in the international monetary systems. On the other hand, the share of US dollar does not detract from only the euro but also the currencies of emerging markets. In particular, the Chinese renminbi can play a more important role in the future than it has played so far.*

**Keywords:** *currency crisis, EMU, foreign exchange reserves, government debt to GDP, monetary system*

**JEL Classification:** *E42, F31, F36*

### **1. Introduction**

The collapse of Bretton Woods system in 1973 changed the international monetary system much more than a modification of the gold standard in the 20s of the 20th century or restoration of currencies convertibility in 1958 (Eichengreen, 2008). Reasons for reforms of the international monetary system were paradoxically caused by a growth of world economies and development of international trade where US dollar played the role of an acceptable mean of payment. And therefore around 1964 foreign debts in dollars exceeded its golden cover guaranteed by the Federal Reserve System of the United States of America (Sedláček, 2008). Internal and external problems of the USA contributed to the reform of the post-war international monetary system. The external problems were caused mainly by the outflow of dollars from the USA. This *export of dollars* was caused mainly by investments of American companies in Europe. It was a major factor causing deficit of US payment balance (excluding official foreign exchange reserves account). Another factor negatively affecting the deficit of current account of the USA was the inflation growth caused by increased pressure on the US public spending. Roots of these internal problems of the USA can be linked to high cost of the war in Vietnam, but also to generous social programs as well.

At the beginning of 1971 the central banks were trying to ward off the end of the Bretton Woods system by exchange rate interventions. From January to March of the same year they bought US dollars in a total value of up to 5 billion USD. The aim was to prevent the weakening of the US dollar. In August 1971 the USA officially responded by series of measures. As mentioned above, American president Richard Nixon announced the cancellation of convertibility of foreign dollars reserves for gold. Most imported goods were

additionally imposed by a 10% import tax and a principle of *buying American goods* started to enforce. There was also a wage freeze for a period of 90 days. The external imbalance was solved primarily by pressure towards revaluation of other currencies parity against the US dollar. At the same time there was an effort to reduce military spending which should be transferred to a large extent on other states of military agreements (Germany, Japan). A significant effort of the USA was also general effort to reduce the role of gold in the international monetary system.

Except the war period and post-war reconstruction the aim of the monetary politics was also to maintain a fixed exchange rate. However, until March 1973 the attempts of recovery of the fixed exchange rates, for example in a form of Smithsonian Agreement, were not successful and the main world currencies started to float.

This transition from the fixed to the floating exchange was a result of increasing international capital mobility. During the period of functioning of Bretton Woods system capital controls provided isolation from pressures in the payment balance for governments that have felt need to perform a direct monetary policy for achieving other goals. Actually the capital controls offered a space for a regular adjustment of fixed, however, adjustable exchange rates. Policymakers therefore could consider adjusting of parities without causing destabilizing tidal wave of international capital. However the effectiveness of controls has been disrupted for years. Renewal of the international financial market following the Great Depression in 30s and after the war was gradual. With the restoration of currency convertibility it has become more and more difficult to distinguish between purchases and sales of foreign currencies binding to common or capital accounts. The market participants have managed to find new and more sophisticated ways of circumventing barriers imposed by the international capital flows.

The situation has become more and more problematic for governments and central banks. The mere suggestion that a country is considering a parity change, for example, could cause a massive outflow of capital which in its conclusion of monetary authority discouraged such change to be ever done. In the world of high capital mobility the maintenance of parity requires unprecedented amount of interventions on the international foreign exchange markets and also considerable international support. The transition to floating exchange rates which followed the collapse of Bretton Woods's monetary system was a leap into the void. Particularly the IMF, which functioning was vitally linked to the post-war monetary system, did not report to this transition voluntarily.

## **2. Period after Collapse of Bretton Woods System**

In the period after the collapse of the Bretton Woods system, which persists to nowadays, the exchange rate regime is dependent on the choice of central authority of a given state. It is therefore on the shoulders of individual governments or monetary authorities which exchange rate to choose and be able to resist potential risk of currency crisis. Nowadays it is possible to meet several exchange rate systems that can be divided into two main groups, namely a fixed exchange rate regime and a floating exchange rate regime.

The fixed exchange rate regime may also take a form of a fixed exchange rate without oscillating band (PEG), a fixed exchange rate with oscillating band of at least  $\pm 1\%$  around the central parity (horizontal band), a fixed exchange rate with a regular shift (crawling peg), a fixed exchange rate with a regular shift with oscillating band of at least  $\pm 1\%$  around the central parity (crawling band) and Monetary Affairs (currency board). In the case of the floating exchange rate the system can be divided into so-called clean and managed floating.

## 2.1 Demonetization of Gold

Reform efforts of the international monetary system after the World War II consisted mainly in the rescue of the Bretton Woods monetary system. Ex post, these efforts can be evaluated as unsuccessful if their primary aim was to prevent the collapse of the Bretton Wood system. However the contemporary view of many experts and economists see the collapse of the Bretton Woods system via different optics. Thus there is not general agreement about the usefulness or negative impact of the end of the post-war monetary system that was made via the transition of a significant part of the global economy from a modified gold standard for demonetization of gold.

New York University Professor Nouriel Roubini considers the gold standard as one of the causes of the Great Depression of the 30s of the last century (Němec and Pravec, 2013). He pointed to the inability of the central banks in the position of lender of last resort. From the Czech economists an opinion of Professor Revenda (2010) can be mentioned who points to a fundamental lack of golden metal: *If we took all the gold reserves in all central banks – it is over 31, 000 tons – and appreciate them by dollar price, the overall amount would not cover the total amount of money in the USA. Americans would need another 42,000 tons to achieve full coverage of its cash reserves.* It is also necessary to realize that the gold standard is dependent on the market price of gold which is highly volatile.

**Figure 1: % of Dollar Backed by Gold (Market Value of Federal Reserve's Gold)/ (Balance of the Federal Reserve)**

Source: The Market Oracle (2018)

Contrary the proponents of the gold standard demand stabilization of the amount of money in circulation. Opponents counterbalance here (Revenda, 2010) by pointing to a fact that with the economy growth the requirements for additional liquidity are increasing which are ultimately decided by an offer of cashless bank loans, see Figure 1. This situation caused a steady amount of money in the economy would cause deflationary pressures, which would in turn lead to a reduction in economic output (typical example is Japan). Indeed, the European Union is in a similar situation at the moment. Economic policy mix is represented by a strong fiscal restrictions, coupled with an extremely loose monetary policy. Return to the gold standard in this situation would not be certainly an adequate solution for starting an economic growth in the EU environment.

## 2.2 Currency Crisis

The post-Bretton Woods period is also characterized for its high frequency of currency crisis, especially in countries of developing world. These crisis struck mainly in South Africa and Zimbabwe (8 crisis), Argentina (7 crisis), Pakistan and Peru (in both countries 6 crisis). Indonesia, Nigeria, Mexico and Turkey have faced five crises totally. A smaller number of crises were recorded in industrialized countries. These were mainly in New Zealand which underwent five crises and Spain that was exposed to four crises. The most serious currency crises include mainly the crisis of the European monetary system which took place in 1992-1993, the crisis in Mexico (1994-1995) and the crisis in Southeast Asia which affected mainly Thailand, Philippines, Malaysia, Indonesia and South Korea (year 1997). Australian dollar experienced a currency crisis in 1998, as well as Russian ruble. A year later a crisis in Brazil broke out (1999) and then on the same continent in Argentina in 2002, for details see Sedláček (2008) and Krugman (2009).

The IMF in individual countries and regions reacted on the above mentioned crises in different ways. In the case of the Mexican crisis it solved the situation co-ordinately in cooperation with the US Ministry of Finance and the Bank for International Settlements (BIS). Financial assistance program was provided in a total value of 50 billion USD, where the IMF contributed with 20 billion USD. Despite this high financial help the fund was not able to solve the crisis on the capital account of the payment balance of Mexico which was triggered by liberalization of international capital movements. The fund was also not able to react to fundamental imbalance in the Mexican economy which did not provide it with sufficient information about its economic development. After the announcement of statistics on international foreign exchange reserves and foreign debt there was a strong reaction from investors and overspill of financial costs of the crisis to other countries of Latin America, *the tequila effect*. The lessons of the crisis lied thus in a proposal for a greater information transparency about economic development in individual economies, stronger supervision and creation of sufficient financial programs.

The role of the IMF in solving the Asian crisis has also been very significant. The Fund provided financial assistance to Indonesia, the Republic of Korea and Thailand in a total value of 35 billion USD. Many recommendations by the IMF for the area of macroeconomic policies flowed to the affected economies. It was particularly tightening of currency and fiscal policy, in a sphere of financial and business sector the Fund then proposed to implement structural reforms. The lesson of the crisis was the Fund self-reflection which stated that it is necessary to strengthen the supervision, mainly in the sphere of exchange rate policy and the financial sector. Even in this case the Fund failed to response immediately due to the lack of data transparency from the affected economies. The IMF response to the crisis situation in the Asian region was the creation of two new credit lines. In 1997 Supplemental Reserve Facility (*Supplemental Reserve Facility*, SRF) for countries affected by a sudden loss of market confidence was introduced. In 1999 Contingent Credit Line (*Contingent Credit Line*, CCL) was established. It was not primarily designed for countries affected by the crisis, but those which could be affected by panic among investors as well. Sedláček (2008) points to an important moment which happened in the context with the Asian crisis. In January 1998 it was agreed to increase the membership quotas (11th general review of quotas) by 45% and in December of the same year an agreement, New Arrangements to borrow (*New Arrangements to Borrow*, NAB) increasing the fund sources by 34 billion SDR, was concluded. As the Asian countries felt offended, in relation to lower decision-making powers arising from their voting share in the IMF, a discussion on membership interest change the IMF corporate governance.

Common symptoms of a new generation of financial crises of the 90s of the 20<sup>th</sup> century can be traced in a comparable maturity of affected economies, strength and crises speed, their economic and social costs, moreover, but also in external manifestations in relation to foreign countries, for details see (Sedláček, 2008). The financial crises affected mainly new emerging market economies that were recruited from the developing part of global economy. High economic and social costs resulted in the loss of retirement, decline in production and increased unemployment. In relation to foreign countries, which is expressed by financial flows and transfers in the payment balance, there were movements of crisis manifestations from a current account to a capital account.

When comparing the frequency of crises across individual international monetary systems it is obvious that in time there is an increasing frequency of currency crises. The smallest number of crises and their smallest frequency was recorded in the period of the gold standard, while the most crises as to their frequency, can be seen in the post-Bretton Woods period.

Helísek (2004) as the most common causes of the growing number and frequency of crises states decreasing capital regulation, high capital mobility, decline of exchange regulation, reducing of transaction costs and the impact of bank crises on the currency markets.

The dependence of increased frequency of currency crises to declining capital and exchange regulations is however not so clear. The period of the gold standard was for example typical for the absence of capital regulation and capital movements took on considerable dimensions despite of it the crises frequency was much lower. An important determinant of the increasing frequency of the currency crises is a technological progress which enabled a smoother functioning of exchange markets or decreasing transactional costs of currency speculation. A frequent cause of the crises can be also disorders in a banking system which will lead to the bank crisis itself. It can then simultaneously coexist alongside the currency crisis (*so called twin crisis*).

### **2.3 Financial Globalization**

Not only the current global financial crisis, which will be discussed below, but also currency crises are denoted as the globalization crises. There are contrary views on positive or negative benefits of globalization in general. Proponents of this global process highlight mainly its positive effect on a growth of freedom and economic prosperity, technological boom, but also increase in opportunities for innovation, for details see (Stuchlíková, 2009). The controversial moment is then the influence of globalization on the convergence of developing and developed countries of the world economy to each other.

Undoubtedly the strongest impacts of globalization are observed in the area of financial system. The so called financial globalization has undergone the greatest expansion after the Asian financial crisis. It is reflected in a global deployment of large amounts of capital in other countries. For comparison Krugman (2009) states that in 1996 the amount of US assets located abroad was 52% of the GDP, while the amount of liabilities was 57% of the GDP. In 2007 it was already 128% in favour of foreign assets of the USA and 145% were foreign liabilities. Two moments are therefore important. The first one is associated with the increase of debtor position of the USA towards abroad. The second one signalizes the unprecedented increase in the volume of mutual debts. This strong link of the strong capital can be considered as an origin of all currency and financial crisis. When efforts to reduce risks in the domestic economy represented by moving a large part of capital abroad causes mutual interdependence of the world economies within the international currency and financial system against each other.

### 3. Monetary Stability of the Eurozone in the Current World Economy

Monetary stability of the Eurozone mainly depends on its internal macroeconomic stability. During the first decade of the Eurozone functioning there was a strong economic and financial integration between the individual Member States. In the spirit of the endogeneity hypothesis of the optimum currency area criteria (Frankel and Rose, 1998) there also occurred a process of convergence between poorer states on the periphery of Europe and economically developed countries of northern Europe, for details see Melecký and Skokan (2011). Research of monetary stability is currently an important topic of discussion at specialized universities where students are analysing the Eurozone position in international monetary systems. About this and other relevant topics that are subject of student activities, Staničková writes in her article (Staničková et. al, 2013).

However, nowadays financial and debt crisis is spread in the Eurozone. Despite the fulfilment of fiscal and monetary Maastricht criteria which the countries had to follow before joining the Eurozone, they are now in a situation of debt traps and outflow of foreign capital. Elimination of exchange rate risk in the application of common currency has led primarily to a decrease in the costs on lending in these countries, which then reflected in a positive economic growth in the Eurozone peripheries and capital inflows. Paradoxically, this low interest rate led to excessive lending and inflating bubbles in peripheral countries (Ireland, Portugal, and Spain), see Ruá, M.J. et al. (2010). Unfortunately borrowed funds were not directed productive capacity building, but they were invested to real estates, consumed by households and the government. The resulted increased domestic aggregate demand caused a pressure for higher wages and price which finally resulted in decreasing competitiveness of these economies on the world markets. These countries have lost a share on the global market due to the integration of China and other emerging markets into global production chains.

Internal problems represented by inadequate coordination of economic policies in the Eurozone contributed to the expansion of macroeconomic imbalances. Some of the Eurozone countries had bloated government spending (Greece and Portugal) which led to an increase in their domestic demand due to its debt financing. In contrast economies, which enjoyed high rates of economic growth, did not dampen increasing private demand and did not create building up of budget surpluses for a less favourable economic period. Temporary increase of output in the economy was caused by rampant real estate sector. The intense growth of tax revenues led to tax cuts and growth of expenses, which in the long run mainly in times of global economic crisis, proved to be unsustainable.

Another factor, which destabilized the Eurozone economy, was a structure of goods market and labour markets which helped to the excessive wage growth and price increases. Mainly in the peripheries of the Eurozone were increased wages due to a limited competition in the labour market; these were ultimately passed on the consumers through higher prices.

An important factor was also indiscipline on the financial markets. Despite the economic growth, unsustainable due to its character, and growing foreign debt of the states on the periphery of the Eurozone, financial markets did not reveal, as well as market regulators, too much interest in this situation. This behaviour could be caused by a global decline in aversion to risk, because great financial crises were considered to be unlikely and as a result this led to riskier investment behaviour.

As the above mentioned states the Eurozone faces its own macroeconomic problems which destabilize it outwardly. Its geopolitical position may gradually become weaker if it does not solve its internal difficulties in the nearest future, see Sucháček (2016). The time in this case

is an important parameter, because in nowadays globalized world other important countries from the emerging markets enter the geopolitical scene.

**Figure 2: Composition of International Foreign Exchange Reserves (Allocated Reserves by Currency for 2017Q2)**

Source: IMF (2018)

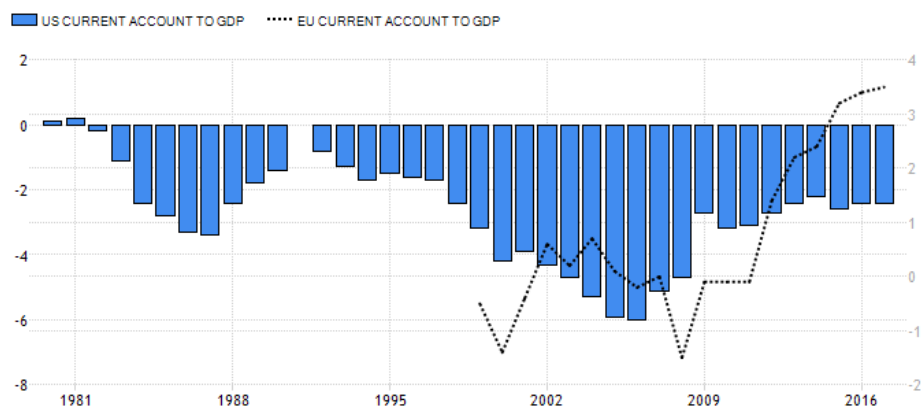

When assessing external stability of the Eurozone, i.e. the position of euro in the current conditions of the world economy, the euro share is a significant determinant in the international foreign exchange reserves. During its existence euro has become, after the US dollar, the second most important reserve currency in the international monetary system. While the share of USD was decreasing the percentage share of euro was increasing from 17.90 % in 1999 to 26.14 % in 2007, see Table 1. Figure 2 shows the shares of the most important world currencies on the international foreign exchange reserves for 2017Q2. It reflects the above mentioned fact that the US dollar still holds its dominant position with its 62.70 % share. Euro in 2017 comprised 20.15 % of the international foreign exchange reserves in the world. Other currencies like the British pound, and Japanese yen in comparison with the USD and euro play only a partial role in the international monetary system.

**Table 1: World Currency Composition of Official Foreign Exchange Reserves (in %)**

	1971	1973	1999	2007	2017
<b>Shares of Allocated Reserves</b>	76.21	70.93	77.43	61.48	87.69
<b>Shares of U.S. dollars</b>	84.63	82.61	71.01	63.87	62.70
<b>Shares of euros</b>			17.90	26.14	20.15
<b>Shares of Chinese renminbi</b>					1.23
<b>Shares of Japanese yen</b>	0.05	0.07	6.37	3.18	4.89
<b>Shares of pounds sterling</b>	9.67	5.63	2.89	4.82	4.54
<b>Shares of Swiss francs</b>	1.16	1.47	0.23	0.16	0.18
<b>Shares of other currencies</b>	0.54	1.21	1.60	1.83	2.50
<b>Shares of Unallocated Reserves</b>	23.79	29.07	22.57	38.52	12.31

Source: IMF (2018)

The international monetary system is therefore nowadays strongly oriented to American dollar as a dominant international reserve currency. The subject for discussion is a proposal of a new arrangement of the international monetary system with respect to economic and political problems which the USA faces. In comparison with the Eurozone the United States deal with the so called *double deficit*. They show a budget deficit in the public sector, but also deficit on the current account of the payment balance, see Table 6.

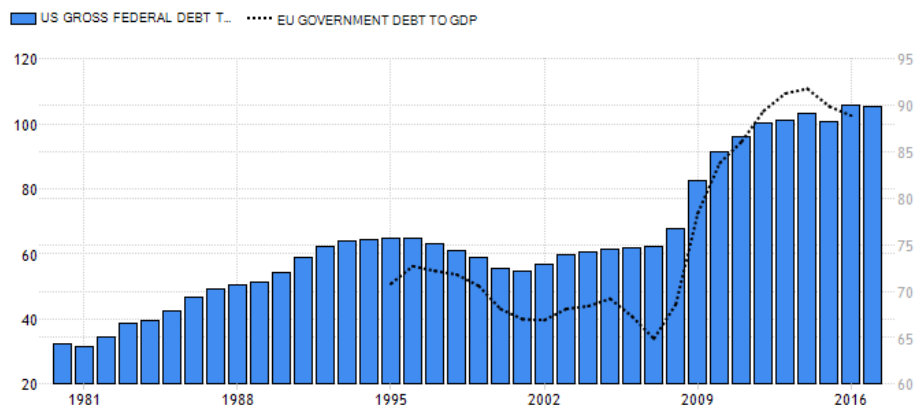

**Figure 3: US and Eurozone Current Account to GDP (in %)**

Source: Trading Economics (2018)

The Eurozone is in comparison with the USA able to achieve positive balance on a current account, the USA is permanently located in negative values. Eurozone recorded a Current Account surplus of 3.50 percent of the country's Gross Domestic Product in 2017. Current Account to GDP in the Eurozone averaged 0.71 percent from 1999 until 2017, reaching an all-time high of 3.50 percent in 2017 and a record low of -1.50 percent in 2008. The United States recorded a Current Account deficit of 2.40 percent of the country's Gross Domestic Product in

2017. Current Account to GDP in the United States averaged -2.64 percent from 1980 until 2017, reaching an all-time high of 0.20 percent in 1981 and a record low of -6 percent in 2006 (Trading Economics, 2018).

**Figure 4: US and Eurozone Government Debt to GDP (in %)**

Source: Trading Economics (2018)

Euro Area recorded a government debt equivalent to 88.90 percent of the country's Gross Domestic Product in 2016. Government Debt to GDP in the Euro Area averaged 75.74 percent from 1995 until 2016, reaching an all-time high of 91.80 percent in 2014 and a record low of 64.90 percent in 2007. The United States recorded a government debt equivalent to 105.40 percent of the country's Gross Domestic Product in 2017. Government Debt to GDP in the United States averaged 61.70 percent from 1940 until 2017, reaching an all-time high of 118.90 percent in 1946 and a record low of 31.70 percent in 1981 (Trading Economics, 2018).

#### 4. Conclusion

A question therefore arises whether euro could take a baton after the US dollar and become a world currency number one. Lim (2006) states five important criteria that currency with the status of an international currency reserve must comply. They are as follows: a) great economic power, b) well-developed financial system, c) confidence in the value of the currency, d) political stability, e) network externalities. The US dollar was gaining its position by a gradual extrusion of British pound in its leadership position in the period between the two world wars. However the British pound has maintained its status of a reserve currency until today. The reason still remains high and frequent usage of the British pound all over the world which led to reduction of transaction costs and subsequent increase in the usage of this currency in the international trade, see Vahalík and Fojtíková (2016). The same network effect can be seen with the US dollar, since the moment when it has become the world reserve currency. In the future it does not seem very likely to happen that the British pound would threaten the US dollar in its leading position. Much more significant shares of the global foreign exchange reserves may reach euro, Japanese yen and other currencies of the *emerging market*. This development will probably dependent on the robustness of the domestic institutional environment in the financial sector. If the above mentioned economies want to absorb the influx of capital flows, then it is necessary for this to have correct size and institutional background of the financial markets.

### **Abstract**

*The EU promotes economic, social and territorial cohesion in its international grouping. Social cohesion, in particular, should be considered, which was emphasised in the Europe 2020 strategy, in the face of problems that emerged in EU member states, especially after the financial and economic crisis. This is reflected in the amount of financial resources directed to promoting social cohesion under the European cohesion policy and mobilised from the European Social Fund and other European initiatives. Social cohesion is a multidimensional concept, related to the improvement to the well-being of the citizens as well. Being a member of the European Union should have positive effects on the socio-economic situation of Poland and its regions. The main aim of the paper is to present social cohesion in Poland after accession to the EU. Along with the membership in the EU, there has been an improvement to the economic situation of Poland. The question is: is the improvement to the economic situation also reflected in the increase in social cohesion?*

**Keywords:** *European Union, regional disparities in the EU, regions, social cohesion, social innovations*

**JEL Classification:** *035, R11, R12*

### **1. Introduction**

Promoting cohesion not only in the economic, but also in the social and territorial dimension is one of the objectives of the European cohesion policy. Social cohesion, in particular, should be considered, which was emphasised in the Europe 2020 strategy (Europe 2020), in the face of problems that emerged in EU countries, especially after the financial and economic crisis. This is reflected in the amount of financial resources directed to promoting social cohesion under the European cohesion policy and mobilised from the European Social Fund and other European initiatives. Their beneficiaries primarily involve new member states, including Poland and its regions, which experience diverse social problems. Along with the membership in the EU, there has been an improvement to the economic situation of Poland reflected in the increase in GDP per capita. The question is: is the improvement to the economic situation accompanied by an increase in social cohesion? Have interregional disparities in social terms become worse within the last couple of years of Poland's membership in the EU and what is the situation of individual regions of our country like?

### **2. Problem Formulation and Methodology**

The main aim of the paper is to present social cohesion in Poland after accession to the EU. It is stated that social cohesion between Polish regions decreased and the projects co-financed

from the EU funds, including social innovations projects, should make a contribution to the achievement of a higher degree of social cohesion in Poland. These kinds of projects are supported within the EU cohesion policy, also in Poland, in the new financial perspective 2014-2020. The critical analysis of the scientific literature, the statistical analysis, and the Ward's method were performed.

### **3. Problem Solution**

Being the objective to be pursued, ensuring social cohesion in the EU is at the heart of the cohesion policy, which is indicated in the documents and strategies of the grouping (European Union, 2017). The financial and economic crisis contributed to the deterioration of social problems, thus more attention began to be paid to the social dimension of cohesion. Simultaneously, it has been increasingly emphasised that it is important not only to focus activities on the stimulation of strong economic growth, but also to pay attention to its consequences as they may not be beneficial to all social groups in all instances. Therefore, economic growth should also be inclusive, which means that its benefits should be enjoyed to a greater extent by various social groups (OECD, 2014).

#### ***3.1. Social Cohesion - Concept and Its Measurement***

It is emphasised that social cohesion may be perceived as a condition conducive to the political stability and safety, constitutes a source of well-being and economic growth, while relationships between social cohesion within a country and economic results are also indicated. Gaps in terms of this cohesion, which manifest themselves in the form of, for example, social exclusion, result in higher public spending (Berger-Schmitt, R., 2002, p. 404-405). When raising the issues of reducing social cohesion, attention is drawn to its causes, which include: globalisation and economic changes associated with it, global migration and increasing ethno-cultural diversity, development of IT and communication technologies affecting social relations, while referring to the integrating group being the EU, accession of new member states also constitutes a challenge to cohesion (Schiefer, D., van der Noll, J., 2017, p. 580).

The concept of social cohesion is widely considered in the subject literature, whereas a considerable number of its definitions indicate a difficulty in conveying the gist of the concept, which is multidimensional. One of the presented approaches refers to social cohesion in the framework of the following dimensions given in Table 1.

The referenced definitions in the subject literature emphasise cohesion as community bonds, sharing values, a sense of belonging, and an ability to work together (Council of Europe, 2005, p. 24-25). In view of the complexity and ambiguity of the approach itself, there are attempts to identify it. The necessity of separating key cohesion elements and determinants is considered. Schiefer and van der Noll identify three key dimensions of social cohesion: social relations (including social networks, trust, acceptance of diversity, participation), identification with the geographical unit, and orientation towards the common good, while there are individual subdimensions within these dimensions. However, the elements such as: shared values, inequalities, quality of life are more associated with determinants or social cohesion consequences than with key social cohesion elements (Schiefer, D., van der Noll, J., 2017, p. 579-603).

**Table 1: Characteristics of Dimensions of Social Cohesion**

Dimensions	General description
Common values and civic culture	Sharing common values that make it possible to reach common goals, a certain and mutually respected code of conduct and moral principles. On the basis of these values, there are mutual interactions between members of society. Support for political institutions, engaging citizens in, for example, the political system and supporting it; inhabitants' tendency to participate in local/national policies, trust in and acceptance of the government, observing mutually agreed rights, respecting principles of responsibility. Joint debating in a democratic manner, engaging in public issues and matters common to society.
Social order and social control	No major conflicts, no social unrest or disorder, acceptance of the existing order, system, or respecting existing differences/tolerance related to social groups. Social order means that there is a certain network of connections, obligations etc. regarding people, thus every person has/feels that they have their own place in this order and bears some benefits.
Social solidarity and fewer disparities in terms of well-being	Within society, social cohesion is connected with a harmonious development of society or its groups. Making decisions in favour of cohesion by redistributing resources in the name of solidarity as well as creating opportunities for regions and social groups. Cohesion is linked to the level of inequality in terms of access to employment, income, or access to other resources. Cohesion is linked to equality in society. Cohesion is related to inclusion because access to various resources is provided by solidarity along with redistribution activities performed with the use of public policies. On the other hand, reduction of existing economic and social disparities has a positive effect on existing personal relations or on safety. Social exclusion is associated with cohesion. It involves being unable to be supported or participate in social life etc.
Social networks and social capital	Cohesion is associated with social interactions within society. It establishes social connectedness. Strong connections are significant in terms of mental health or counteracting marginalisation. They also provide emotional support. Social involvement networks contribute to/provide social capital.
Attachment to a place and territorial integrity	Social cohesion is associated with the concept of belonging, attachment to a place, and mobility. Close attachment to a place, building identity in relation to the place favours network building, creating identity, or providing social capital.

Source: this is a modified table presented in: Dziembała, M., 2013, p. 59-60 and developed based on Kearns, A., Forrest, R., 2000, p. 996-1002; Turok., I. et al., 2004, p. 21-24; Turok, I., Bailey, N., 2004, pp 175-186; McCormick, J., 1995, p. 1-32; Vranken, J., 2008, p. 23-24; Home Office, 2001, p. 13, Table 1

It is indicated that policies and adopted strategies, e.g. multiculturalism, may affect this type of cohesion (Levräu, F., Loobuyck, P., 2013, p. 101-109). Simultaneously, it is emphasised that the concept of social cohesion involves the following two dimensions of social goals, which should be considered as one, i.e. inequality. Therefore, promoting equal opportunities and limiting divisions in society are taken into account. Another dimension includes social capital, which emphasises the necessity of focusing on the reinforcement of social bonds and relations, including aspects associated with social capital (Berger-Schmitt, R., 2002, p. 406).

At the same time, there are attempts to operationalise this concept, which would enable cohesion to be measured; however, the fact that the concept is qualitative in nature is an issue (Dragolov, G. et al., 2013, p. 17). Cohesion is analysed in the framework of individual factors that may affect this cohesion considerably, such as diversity (Ariley, G., 2014, Wiceks, R., et al., 2014). One of the approaches perceives cohesion through how members of society live together in a given area (Dragolov, G. et al., 2013, p. 13). The following three domains of social cohesion were indicated: resilient social relations, i.e. networks horizontal in character and connecting society group individuals, connectedness in relation to members, countries, institutions linked together with positive bonds, and focus on common goods. Three dimensions were identified for each of these three domains (Dragolov, G., et al., 2013, p. 13-14).

Another approach considers social cohesion as an ability of society to ensure long-term well-being of its members. It is expressed in equal access to resources and respect for human dignity (Council of Europe, 2005, p. 23). The Council of Europe, on the other hand, perceives social cohesion as a (perfect) objective, a process (of creating this cohesion), and as acquisition (Council of Europe, 2005, p. 47-48).

### **3.2. Social Cohesion in Polish Regions after Accession to the European Union**

The issue of social cohesion is widely analysed in the subject literature. What is studied include not only cohesion between countries, but also between regions within one country (European Commission, 2017), or between selected regions (Bočáková, O., 2016). The analysis includes cohesion of cities as well (Cortese, C. et al., 2014).

For the purposes of the studies in this paper, it was assumed that “social cohesion is supposed to prevail when disparities on a number of social indicators are politically sustainable” (Molle, W., 2007, p. 61), which meant that a decreasing number of disparities reflect an improvement to social cohesion (Molle, W., 2007, p. 1). The assumption was that the indicators concerning demographic changes, public health, poverty and living conditions, education, access to the labour market, or public security will describe social cohesion in Polish regions well. Data selection was also dictated by their availability (CSO [online], 2018).

The process of Poland's integration with the EU contributed to the acceleration of economic growth and the improvement to the level of economic development, which is reflected by GDP per capita. While GDP per capita in Poland was 50% of the GDP per capita in the EU in 2004, it increased to 60% in 2008, and it further increased to 68% in 2016 (in the PPS) (Eurostat [online], 2018). Therefore, the question is as follows: were these positive changes accompanied by the improvement to social cohesion in Polish regions? As already mentioned, cohesion is associated with a decreasing number of disparities between regions. The evaluation involved current disparities in relation to selected indicators that describe social cohesion between Polish voivodships, i.e. NUTS 2 regions, which was also dictated by data availability.

The social cohesion situation may be evaluated with the use of unemployment rate. Between 2004-2016, the unemployment rate in Poland (according to the BAEL- Labour Force Survey in Poland) was gradually decreasing (Figure 1). The range, i.e. the difference between the highest and lowest unemployment rate, decreased from 10.3 p.p. to 4.9 p.p. during the analysed period. At the same time, the coefficient of variation increased, which indicates an increase in the number of disparities between voivodships, thus deterioration of interregional disparities and, consequently, cohesion (Figure 2). While the relationship between unemployment rate in the region with its highest value and unemployment rate in the region with its lowest value was 1.7 in 2004, it increased to 2 in 2016.

**Figure 1: Mean Unemployment Rate (acc. to the BAEL) for Polish Voivodships in 2004-2016 (expressed in %)**

Source: author's own elaboration based on CSO [online] (2018)

**Figure 2: Coefficient of Variation of the Unemployment Rate (acc. to the BAEL) for Polish Voivodships in 2004-2016**

Source: author's own elaboration based on CSO [online] (2018)

However, the analysis of the unemployment rate in Polish voivodships reveals that while 8 voivodships had a lower unemployment rate compared to the mean rate for Poland in 2004, the number of such voivodships increased to 9 in 2016. There are voivodships in which the unemployment rate was higher compared to the mean rate in Poland during the analysed period. These voivodships included: Świętokrzyskie, Kujawsko-Pomorskie and Warmia-Mazury (Table 2).

**Table 2: Differences in the Unemployment Rate Values in Individual Voivodships and Unemployment Rates in Poland in 2004-2016 acc. to the BAEL (expressed in p.p.)**

	<0;2)
	> 2

Source: author's own elaboration based on CSO [online] (2018)

Another indicator that may be used to present social cohesion is household's monthly available income per 1 person. Between 2004-2016, the income situation of the citizens of Poland improved since household's monthly available income per 1 person was PLN 708.355 in 2004 to increase to PLN 1433.31 in 2016 (Figure 3). However, the improvement to this indicator did not accompany deterioration of interregional disparities, which is indicated by the analysis of the coefficient of variation over the following years (Figure 4).

**Figure 3: Average Household's Monthly Available Income per 1 Person in Polish Voivodships in 2004-2016 (expressed in PLN)**

Source: author's own elaboration based on CSO [online] (2018)

**Figure 4: Coefficient of Variation of Average Household's Monthly Available Income per 1 Person in Polish Voivodships in 2004-2016**

Source: author's own elaboration based on CSO [online] (2018)

Between 2004-2016, household's monthly available income per 1 person in 3 voivodships was lower than the mean value for Poland; these voivodships included: Lubelskie, Podkarpackie, and Świętokrzyskie - which are also the poorest regions in terms of the volume of GDP per capita (Table 3).

In view of the selected indicators, a definite statement whether social cohesion in Polish regions improved or deteriorated is difficult. Therefore, it was assumed that a synthetic measure will constitute a comprehensive reflection of various dimensions of social cohesion.

**Table 3: Indicator of Average Household's Monthly Available Income per 1 Person in Relation to the National Average (Poland = 100) in 2004-2016**

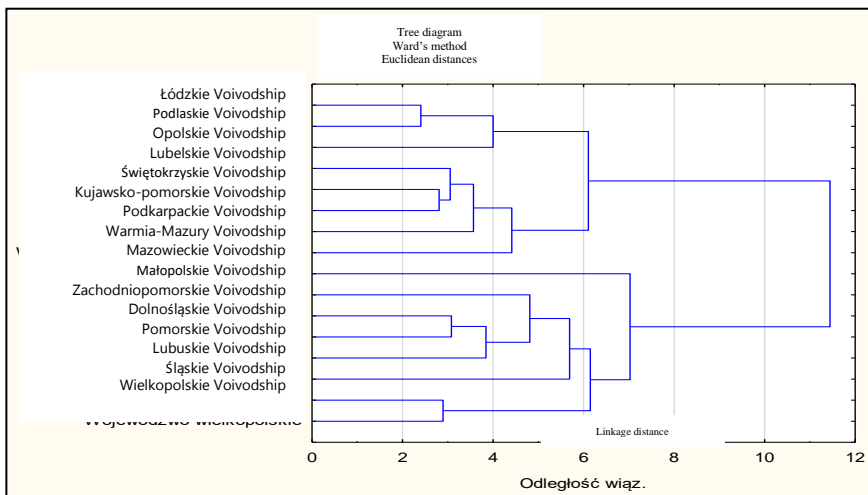

Voivodship	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016

Source: author's own elaboration based on CSO [online] (2018)

It was considered that a synthetic variable, which includes variables representing various social cohesion aspects: public health, poverty and living conditions, education, access to the labour market, factors determining poverty and delinquency, should be used to examine social cohesion in Polish voivodships. As a result of applying the variable selection procedure, including the literature review, statistical analysis and data availability, the following 12 variables were finally included in the analysis:  $X_1$  – infant deaths per 1 000 live births,  $X_2$  – suicide rate per 10 thous. population,  $X_3$  – average number of people in a household receiving social benefits in relation to the average number of persons per household,  $X_4$  – average monthly available income per capita in private households (expressed in PLN),  $X_5$  – children covered by pre-school education in percentage of the total number of children at the age 3-5,  $X_6$  – life-long learning of persons aged 25-64 (expressed in %),  $X_7$  – unemployment rate acc. to the BAEL (expressed in %),  $X_8$  – employment rate of disable people (expressed in %),  $X_9$  – entitled to practise doctors per 10 thous. population,  $X_{10}$  – persons injured in accidents at work per 1,000 employed persons,  $X_{11}$  – ascertained by Police crimes in completed preparatory proceedings per 1,000 population,  $X_{12}$  – victims of road accidents per 100 thous. registered motors. The analysis covers the years 2005 and 2015. As a result of applying one of the hierarchical cluster analysis methods - the Ward's method, which is one of the agglomeration methods (see: Balicki, 2009, p. 276-279), voivodships were classified, and a dendrogram with clusters was developed (Figure 5).

**Figure 5: Classification of Polish Voivodships with the Use of the Ward's Method, 2015**

Source: author's own elaboration based on CSO [online] (2018)

In the light of these studies involving the 2015 data and the adopted set of variables, three clusters of regions similar to each other were found. The 1<sup>st</sup> group includes 8 voivodships: Łódzkie, Podlaskie, Opolskie, Lubelskie, Świętokrzyskie, Kujawsko-Pomorskie, Podkarpackie, and Warmia-Mazury. The 2<sup>nd</sup> group constitutes only the Mazowieckie voivodship. The last 3<sup>rd</sup> group includes: Małopolskie, Zachodniopomorskie, Dolnośląskie,

Pomorskie, Lubuskie, Śląskie, and Wielkopolskie. As a result, „cohesion groups”, including regions similar to each other on the basis of the adopted set of variables, may be distinguished. According to the voivodships classification made with the use of the Ward’s method and including the 2005 data, three clusters of voivodships were determined as well; the first cluster involves the following voivodships: Łódzkie, Podlaskie, Małopolskie, Wielkopolskie, Opolskie, and Mazowieckie. The second cluster comprises: Lubelskie, Podkarpackie, Świętokrzyskie, Lubuskie, Kujawsko-Pomorskie, and Warmia-Mazury. The third and last cluster includes: Śląskie, Pomorskie, Zachodniopomorskie, and Dolnośląskie. In view of the 2005 and 2015 data, the comparative analysis of the composition of the clusters determined using the Ward’s method reveals that the following regions: Lubelskie, Podkarpackie, Świętokrzyskie, and Kujawsko-Pomorskie were included in the same voivodship cluster in the years 2005 and 2015 under consideration.

### ***3.3 EU Funding Support to Improve Social Cohesion in Poland in 2014-2020***

In Poland, activities focused on social cohesion are supported by European Union funds, which - either directly or indirectly - have a positive impact on the well-being of citizens or, thus, contribute to achieving social cohesion. In the 2007-2013 and 2014-2020 financial perspectives, financial resources were transferred from the European Regional Development Fund and the European Social Fund (ESF). However, it is and was from the ESF that resources directly targeted at supporting solutions concerning social issues were transferred, which were mobilised under the Operational Programme Human Capital 2007-2013 and, in the current perspective of financing, under the Operational Programme Knowledge Education Development 2014-2020. EUR 4,436.8 million were budgeted to implement the latter, including EUR 268.8 million under Youth Employment Initiative. 6 priority axes were formulated: axis I: young people on the labour market; axis II: effective public policies for the labour market, economy and education; axis III: higher education for economy and development; axis IV: social innovation and transnational cooperation; axis V: support for healthcare; and axis VI: technical assistance. To implement axis IV, EUR 621,916,101 were allocated from the ESF (Operational Programme..., p. 38-50, 256). One of the axes is supporting social innovations that constitute innovative solutions in terms of achieving social goals in specific areas, e.g. on the labour or healthcare markets. As emphasised, social innovations mean "such solutions that both respond to social needs and cause a permanent change within certain social groups" (Social Innovation Programme, NCBR, p. 1).

The intervention will include the use of social innovations for effective problem-solving in the areas of: employment, social inclusion, lifelong learning, health, modernisation of public administration functioning if they require a new approach to be developed. The following types of projects are supported: micro-innovations concerning incubation of new initial ideas, aimed at enabling to tackle the problems which have been the subject of the ESF intervention. The assumption is that social innovators will be supported in developing and advancing new initial ideas, which will be tested and disseminated, and then integrated into policy and practice. On the other hand, macro-innovations will involve developing, testing, and integrating the new solutions into policy and practice. Innovation scaling is also indicated, which involves the increase in the use of new solutions, the scope of which was limited territorially, or sectorally before (Operational Programme..., p. 204-210). It appears that these types of projects are an important complement to "traditional" instruments in terms of solving diverse social problems, while their implementation should contribute to increasing quality of life, well-being of citizens and, as a result, improving cohesion in Polish regions.

#### 4. Conclusion

To conclude, social cohesion is a multidimensional concept and involves diverse approaches not only with respect to its essence, but also how to measure it because social cohesion is difficult to perceive through only one indicator. In view of the selected indicators, a definite statement whether social cohesion in Polish regions improved or deteriorated is difficult because it is dependent on the adopted indicator. The results of the analysis show that we observed deterioration of interregional disparities in terms of unemployment rate, which is indicated by the analysis of the coefficient of variation over the following years. However, between 2004-2016, the unemployment rate for the entire country - Poland was gradually decreasing. Between 2004-2016, the income situation of the citizens of Poland improved; however, the improvement to this indicator did not accompany deterioration of interregional disparities. Therefore, the Ward's method was used to identify the clusters of voivodships in terms of the adopted variables. Three clusters of voivodships were identified, revealing that there are groups of „cohesive” regions in relation to the adopted set of variables. Further research should involve an in-depth analysis of how the values of individual indicators for voivodships in these three clusters for the years 2005 and 2015 develop.

This analysis is a contribution to the performance of further and detailed research concerning social cohesion in Polish regions. The proposed set of variables only concerns the ones of a quantitative nature. Further research on social cohesion should also consider data of a qualitative nature; what is more, the analysis should concern individual voivodships in Poland regarding their social cohesion situation in the light of the adopted, or perhaps expanded, set of variables, including ones of a qualitative or of a quantitative nature. It is also essential to identify conditions affecting the situation of social cohesion in Polish voivodships.

## **The Startups' Environment in European Union – Current Trends in Supporting New Business Initiatives**

**Piotr Dziwiński**

University of Bielsko-Biala

Faculty of Management and Transport, Department of Management

Willowa 2, Bielsko-Biala, 43-309

Poland

e-mail : pdziwinski@ath.bielsko.pl

### **Abstract**

*Startups seem to play increasing role in the economic policy of the European Union. Policymakers encourage young entrepreneurs to start their own business through introducing several startup support measures in order to enable young jobseekers to enter into the labour market. Various undertakings have been developed in different European states. As the European Union seemed to be relatively slow to undertake more decisive steps in this regard, the new initiatives have been launched in order to strengthen the startup environment. These are among others: Entrepreneurship 2020 Action Plan, Horizon 2020 or Startup Europe which are supervised by the European Commission. The main objective of the paper is to discuss and evaluate the business environment for startups in European Union. The paper also presents today's trends in understanding and supporting this phenomenon both in individual states as well as at European level.*

**Keywords:** entrepreneurship, European Union, startups, young entrepreneurs

**JEL Classification:** M13, L26, O52

### **1. Introduction**

The phenomenon of startups has been gaining importance in recent years. The culture of startups has rapidly widespread across the world including Europe. Although startups have been increasingly becoming the object of interest for the economy, there is no unified definition or concept of a startup. For some authors it is an enterprise at the initial stage of development while for other authors it is a small company relating to the industry of new technologies. The term does not mean anything but simply the business. To put it more precisely - the person who runs the startup starts building the business, takes the first steps towards financial independence. Startup is nothing but a young company created by usually young people (Robehmed, 2013). The most widespread definition was created by Blank and Dorf, who are the authors of the "The Startup Owner's Manual". According to them a startup is "a temporary organization that is looking for a profitable, scalable and repeatable business model" (Blank, Dorf, 2012). Ries in turn, in his work "Lean Startup", claims that "a startup is an organization that creates products and services in conditions of extreme uncertainty" (Ries, 2011). Considering above mentioned definitions not every small company is a startup but only those which start their business with the risk that the product or service may not be accepted by the client. The uncertainty connected with the activity is intensified by the fact that a given business model does not have a direct representation in another, similar organization because no one previously has had such a business. It is not possible to predict the demand response, conditions and the success of the entire undertaking in the initial phase of operation. An additional element that has not been included in the definition is that this activity has a short

history of existence on the market, however, there is no predetermined time limit for operation. The moment when a startup turns into a company depends on the industry in which it operates, how long it takes to assess the risk and recognize the conditions of activity on the market. If a given product or service is not complicated and easy to put on the market, verification of the business model can take only a few weeks. However, in the case of complex projects, such as those in which long-lasting research is necessary the verification of the model may take up to several years. Startup is looking for a business model and its good definition is provided by Osterwalder and Pigneur. According to them the business model describes how the organization creates value and provides profits from this value (Osterwalder, Pigneur, 2010). The definitions of a startup do not express it clearly but as a rule one startup focuses on the development of one product. The most known startups from around the world are Uber, Airbnb, Dropbox, Snapchat, Pinterest, Spotify, LinkedIn.

The dynamic appearance of startups in the market and their importance for the economy created the need to build up a friendly environment for them by the policymakers and the system providing efficient support (Mynarzová, Štverková, 2015). The issue seems to be important for the European Union as well. The intention of the European Union is to prevent young and innovative European companies from escaping abroad mainly to the United States. Therefore various programs supporting startups have been launched under the auspices of the European Union. In 2016 the Initiative for Startups by the European Commission was announced (European Commission (a) [online], 2018). The main goal of this initiative are: the removal of barriers for startups in the Single Market; creation of better opportunities for partnership, commercial opportunities and skills; improving the access to finance (European Commission (a) [online], 2018).

The paper intends to increase the theoretical knowledge of the European Union policy for startups as well as the knowledge of the key programs which support the growth of the environment for startups in European Union. The paper ends with conclusion including brief assessment of the current situation referring to European startups. The research method used in the paper is the case-study method, which are examples from selected European states as well as selected European programs.

## **2. The Outline of Business Environment for Startups in European Union**

Promotion and support for European startups is the essential element of the broader European Union's concept for creation of the Digital Single Market as an element of the Common Market under which entrepreneurs receive tools to apply for different types of support (Mynarzová, Kaňa, Okręglicka, 2016). According to European Commission, the Digital Single Market strategy aims to ensure access to online activities for businesses under conditions of fair competition, consumer and data protection, protection of copyrights, elimination of geoblocking etc. (European Commission (a) [online], 2018). The startups are the integral part of this market as they are mostly based on digital solutions and innovation (European Startup Monitor [online], 2016). Startups play significant role in creation of wealth by providing new products or services to the market and creating large number of jobs (Dziwiński, 2016). Europe however has been lagging behind with the global trends in this regard. Part of European startups decided to move the business abroad where the conditions were much better. Currently the race for technological innovations and talents all over the world can be observed. More and more countries offer preferential conditions encouraging startups to operate in their territory. The European Union has taken up the challenge as well. The Digital Single Market strategy covers many measures which have been taken to encourage startups for running business in Europe. All these undertakings contribute to creation of a friendly business

environment for new ventures. At this moment it is essential to make a distinction to the business environment in individual member states and business environment at European Union level. Each member state offers different conditions for establishing, running as well as funding the startups. Therefore at current stage it is not possible to determine one, unified business environment for Europe as a whole. At European Union level meanwhile, the European Commission undertakes the actions which are intended to build a common framework for European startups' environment within the Common Market policy which includes primarily free flow of services, finances as well as fair competition (Barcik, 2016). It is however dependent on the implementation of those measures by all member states as well as promoting them among home entrepreneurs. For these reasons the startups' landscape within European Union seems to be diversified. Furthermore the phenomenon of creation of the local ecosystems for startups can be observed which then contribute to building so called startup hubs (Startup Hubs Europe [online], 2018). These are in most of cases vibrant and dynamically developing European cities offering preferential conditions for running startup businesses. The examples are among others: Berlin, Amsterdam, Helsinki or London. However if we analyze this situation more precisely it turns out that serious differences appear which mostly refer to the governmental involvement (Startus Magazine [online], 2016). Some member states spend no efforts to finance the startups' brands which were established in those states while the others offer very low financial support. There are numerous places in Europe that try to foster up the startups' initiatives which are Ireland, Czech Republic, Finland, Denmark or Poland but not everywhere at the same level (Krajcik, 2015). That is the reason why the European Union guided by the need to create the Digital Single Market and thus the more coherent Common Market desires to speed things up in order to remain the important trend setter of technology and innovation instead of becoming a trend taker (Startus Magazine [online], 2016). The following section of this paper focuses on the key initiatives which have been launched by the European Union recently.

### 3. European Union Initiatives for Startups

One of the most significant measures initiated by the European Commission is the Startup Europe project (Startup Europe [online], 2018). The project works as an umbrella organization and focuses on resolving specific problems of European startups' ecosystems. Its goal is to increase the innovation rate of Europe and to improve the growth of the economy through creating new job opportunities. According to the Startup Europe's mission, the main goals to be achieved are (Startup Europe [online], 2018):

7. Connecting startups, investors, accelerators, female entrepreneurs, universities, corporate networks through among others the specially designed Startup Europe Map connecting startup players in the ecosystems of Europe;
8. Connecting local startup ecosystems through support of regional initiatives which are for example the Startup Europe Regions Network or Startup Europe Week;
9. Supporting startups to enter into other market such as the Silicon Valley;
10. Appreciation of the startups' success through for example the Startup Europe Awards.

Another undertaking which is worth mentioning is the Startup Europe Partnership (SEP) which was established by the European Commission too. It is a part of Startup Europe. SEP aims to tackle the problem that as stated the continental Europe currently does not create new businesses intended for growth as it is done for example in Silicon Valley. SEP offers in this regard a pan-European platform in order to support startups in the scale-up process. This goal is expected to achieve through connecting European startups with corporates (Startus Magazine [online], 2016).

The cooperation between the European Commission and Startup Europe gave originated the Accelerator Assembly. Its aim is to facilitate connections among entrepreneurs, policy makers and accelerators. The program was launched as a response to the fact that entrepreneurs still do not get adequate support or resources for their startups. The Accelerator Assembly expects to achieve this by managing an online community where entrepreneurs may share their experience, enabling accelerators to form a community and come together to workshops and events, ongoing research to improve available data on European web startups and accelerators and by bringing accelerators and policy makers at the same table to create connections (Startup Magazine [online], 2016).

Another program which is worth mentioning is the Entrepreneurship 2020 Action Plan. It is the Commission's response to challenges brought by the recent economic crisis. As it is underlined by the European Commission "it is a blueprint for action to unleash Europe's entrepreneurial potential, remove existing obstacles and revolutionize the culture of entrepreneurship in the EU. It aims to ease the creation of new businesses and to create a much more supportive environment for existing entrepreneurs to thrive and grow" (European Commission (b) [online], 2018).

The Entrepreneurship 2020 Action Plan comprises three major areas in which the immediate intervention is desirable (European Commission (b) [online], 2018):

1. Entrepreneurial education and training in order to enforce growth and business creation;
2. Removal of existing barriers and supporting entrepreneurs in crucial phases of a lifecycle;
3. Rebuilding the culture of entrepreneurship in Europe and raising up a new generation of entrepreneurs.

The next European Union program which is dedicated to small and medium sized enterprises as well as to startups is Horizon 2020. It is the biggest EU research and innovation programme with nearly €80 billion available from 2014 till 2020. According to the European Commission "it promises more breakthroughs, discoveries and world-firsts by taking great ideas from the lab to the market" (European Commission (c) [online], 2018). This is the financial instrument which implements the strategies of the European Union such as: Innovation Europe and Europe 2020.

#### **4. Startups' Ecosystem in Poland in Comparison to Selected European States**

The idea of startup initiatives in Poland is only few years old. During that time many grassroots undertakings have been created such as cyclical conferences aimed at the startup environment, acceleration trainings, education and networking meetings or programming marathons. Brands such as Startup Weekend, Aula Poland, Tech Camp, Geek Girls Carrots, Netcamp, East Camp or Lub Camp are just a few examples of regional ecosystem leaders who contribute to the development of the startup community. This also includes nationwide projects such as the e-Business Academy organized by the Polish Agency for Enterprise Development. Today's image of startups' ecosystem in Poland indicates that it is still developing and it has been making much progress although still differentiated (Rostek, Skala, 2017). The need to create efficient ecosystem is powerful which is illustrated by a number of initiatives aimed at enabling the free flow of knowledge, ideas and creating a back-up in the form of a network of contacts and investments in order to create an efficient digital market in Poland (Skala, 2016). A number of large startup centers have been established in Poland for example in Warsaw, Gdańsk,

Poznań and Kraków, where such initiatives as meetings, conferences, competitions, incubation and acceleration programs develop. Lack of capital is a kind of glass ceiling for the Polish ecosystem. This does not mean, however, that Poland is doomed to failure. Optimism lies in the concentration of technology produced on the Polish market, because it is an element without which capital itself will not succeed. The Polish market needs to understand what the financing process is and learn that the current market practice which is spending almost exclusively public money does not have much in common with investing, which is characterized by increased risk. The Polish investment ecosystem is constantly growing. Thanks to EU programs, a network of over 70 seed funds and 16 venture funds was created. As part of the ecosystem, there are also more than 40 funds associated in the Polish Association of Capital Investors. In the entire European Union Poland belongs to the countries with the highest number of enterprises. According to the Central Statistical Office (GUS) data, the number of small and medium-sized enterprises increases by a dozen or so percent year on year. It is in the small and medium-sized sector that start-ups are being created for inventiveness, innovation and self-denial of mostly young people. Over the last years a business culture has developed with which people interested in combining technology and business are particularly identifiable. Dynamic development, especially in the IT and new technologies industry resulted in the crystallization of a specific start-up ecosystem. It consists of many factors, none of which, analogically to the natural environment can be effectively developed in isolation from others. It includes: enterprises in the initial stage of development, universities providing specialists, venture capital institutions and private investors (venture capitals, seed capitals, business angels, accelerators), government and local government institutions (education and financing initiatives), human capital (educational institutions, universities, incubators), media, events, co-working spaces and all initiatives that affect the dynamics of this environment.

According to the European Startup Monitor European (ESM) startups are distinguished by the pace of development and are key players in building a globally competitive European digital economy. A survey of European startups which was carried out in 2016 showed that after 2.5 years technology companies employ on average 13 employees and within a year are ready to accept 7 more (European Startup Monitor [online], 2018). The ESM details the situation of European startups, identifies challenges specific to each country and Europe. The document emphasizes the growing influence of young enterprises on the entire European economy and indicates that through the development of innovation and the growth of startups, they ensure the competitiveness of the European economy, while creating thousands of jobs. The survey shows that the majority (almost 65%) of the founders of Polish startups are people between 25 and 34 years old. This is a high score compared to other EU countries where young entrepreneurs make up less than half (European Startup Monitor [online], 2018). The average age of Polish startups does not exceed 2 years. This gives Poland the third place in Europe among the youngest enterprises right after Romania (1.3 years) and Italy (1.7 years). However, startups assess their situation not well against similar EU companies. Answering the question on current business situation, half of Polish startups are negative. Only 13.2% of Poles declare that their situation is "good", compared to 36.3% Europeans according to the European Startup Monitor (European Startup Monitor [online], 2018). The report also shows that in Poland 95.4 percent employees and 94.9 percent startup founders are native citizens. This is a high result compared to other EU countries where already 12 percent of founders and successively 32 percent of employees come from countries other than the founding country. Looking at the results one can conclude that cultural pluralism generates a much greater potential for innovation and productivity. The startup capitals of Europe like London and Berlin have the most international employees. Over one third of companies claim that the capital that will accumulate during the next year will amount to a maximum of 1 million euros and nearly a quarter plan revenues between 1 and 5 million euros. The highest level of turnover which is

more than EUR 500,000 was achieved only by 7.4% of Polish companies. This is three times lower compared to startups from other EU countries. Revenues of 74% of Polish startups do not exceed EUR 50,000 annually (European Startup Monitor [online], 2018).

The European Startup Monitor was developed on the basis of a survey carried out among 15 different EU Member States (EU) and Israel. Over 2,300 companies took part in the survey, representing over 31,000 employees in total. In the future the report will be published by the European Startup Network an umbrella organization founded by 15 different startup associations from all over Europe including Startup Poland.

## **5. Conclusion**

For the European Union it is essential to create an entrepreneurial framework in which big ideas can grow. Whilst much is happening at the national level there is a need for more coherent action at European level. The above presented solutions introduced by the European Union are the steps taken in the right direction toward creation of the Digital Single Market. Below there are some recommendations which may be taken into deeper consideration during the process of building the coherent European business environment for startups as it is also emphasized by the European Young Innovators Forum (EYIF, 2018). These are as follows:

1. Ensuring the availability of financing for entrepreneurs. In order to encourage financial support for entrepreneurs the European Union should simplify the regulations in the area of alternative financing and expand European programs which are funding entrepreneurs as well as encourage venture capital investments in Europe.
2. Simplification of startups building. There is nowadays a great deal of incompatibility in terms of company types and registration procedures in Europe. This makes the creation of startups difficult and may also create long-term difficulties in attracting investment. As a remedy to this the European Union should accelerate the process of harmonization in the field of company law with the aim of creating a single European private company which would act as the main tool for the incorporation of startups. This includes the harmonization and digitalization of registration procedures as well as harmonization of minimum capital requirements and simplification of the existing VAT regulations.
3. Improvement of the entrepreneurial exchange. The large number of efforts have been taken on the national level to attract foreign entrepreneurs and provide national entrepreneurs with experience from abroad. However the European action on this regard should be reinforced in order to support national measures and make them more efficient. As an example the extension of the European Union Blue Card to entrepreneurs should be offered. Policies should continue to encourage foreign entrepreneurs to relocate to Europe and encourage European entrepreneurs to gain experience outside of Europe to improve their European businesses and boost the innovation process.
4. Ensuring the e-skills. The European Union suffers from a deficit in digital skills to support in particular developing digital startups. This creates gaps in the job market which could be filled by the growing number of unemployed remaining in many Member States. The European Union thus needs to enhance the campaign to equip the labour market with the necessary digital skills.
5. Elimination of the geo-blocking. Services continue to be confined to national borders and far too often consumers are not able to access content when they move from member state to another member state. This is particularly true in the case of the audio-visual sector. To ensure these services are available as uniformly as possible the Digital Single Market strategy should be continued with regard to improvement

of the copyright law and implementation of the European standard in this respect. This should be supplemented by the competition policy ensuring the prohibition of agreements for licenses which prohibit sales of services outside licensed territories.

The future research on startups in the European Union should focus on the dynamics of their development in European conditions and their impact on the economy of European Union as well as individual member states.

### **Abstract**

*This article attempts to determine the importance of institutions (institutional environment) for the international competitiveness of EU and non-EU CEE economies. The key research problem is to answer the question of whether the existing advancement of institutional transition processes, as exemplified by the quality and efficiency of institutions in these countries, determines the international competitive position of their economies. The main thesis is that there are significant differences between EU and non-EU CEE countries in the quality and efficiency of their economic institutions, which is directly attributable to the advancement of institutional transition processes in these countries, as determined by socio-economic and political factors (including their ambitions to become an EU member state or their actual EU membership itself). However, the institutional environment in these countries, which sets the conditions for doing business in them, determines their competitiveness on the international arena.*

**Keywords:** CEE countries, institutions, institutional competitiveness, institutional transformation

**JEL Classification:** D02, O17, O43

### **1. Introduction**

The progressing globalisation, the ICT revolution and the internationalisation of economic activity in the modern world economy, which is accompanied by intensified cooperation (competition + cooperation) of business entities on an international scale, necessitate major changes in the way and extent of economies' competing on the international arena (Hämäläinen, Elgar, 2003). These changes concern not only the general nature of contemporary international competitiveness, but also the role and importance of factors determining this competitiveness (Staničková, 2014). Nowadays, factors of lesser or underestimated significance, such as the quality of human capital, the level of development and quality of infrastructure, especially the soft infrastructure responsible for creation and diffusion of knowledge, the innovativeness of the economy, as well as the efficiency and effectiveness of broadly understood institutions, which are especially important from the point of view of the subject of this article, play a much greater role than it was only a few decades ago (Miozzo, Walsh, 2010; Fagerberg, 1996). Moreover, the institutional quality is also of considerable importance for the level of socio-economic development of individual countries, and to a large extent determines differences in this respect between them (Acemoglu, Johnson, 2005).

Amidst the growing interest of economists in the influence of institutions on the international competitiveness of economies, it is worth looking at this issue in relation to the countries of Central and Eastern Europe (hereinafter: the EU and non-EU CEE countries). The countries of this region, all without exception painfully experienced by communism and the system of a centrally planned economy, and then forced to undergo a systemic transition at the turn of the 1980s and 1990s, are nowadays widely diverse. They fall into two main groups: 1) the countries that are EU members, which have successfully managed to transform their economies into market economies and their political systems towards pluralistic democracy, i.e. Poland, Hungary, the Czech Republic, Slovakia, the Baltic States (hereinafter: EU CEE countries) and 2) those that for various reasons (mainly political) are outside the EU, i.e. Belarus, Moldova, Russia, and Ukraine (hereinafter: non-EU CEE countries), in which these transition processes have never been successfully completed. The fundamental differences also concern the broadly understood institutions, and it is precisely the analysis of these differences (which are the differences in the advancement of the so-called institutional transition in these countries) with regard to their potential impact on the competitiveness of their economies that will be analysed in this article.

This article sets forth the thesis that the quality and efficiency of economic institutions varied greatly between the EU and non-EU CEE countries, which is a direct consequence of the advancement of institutional transition processes in these countries, dependent on socio-economic and political factors (including their aspiration to become EU members or their actual EU membership). The institutional environment present in these countries, which sets the conditions for doing business in them, in turn determines their international competitiveness in a significant way.

## **2. The Role of Institutions (Institutional Transition) in Shaping the International Competitiveness of Economies - Theoretical Approach**

For the purposes of this article, when defining the notion of international competitiveness of an economy, it is worth recalling the relevant OECD (2005) definition, according to which it should be understood as the ability of an economy to compete fairly and effectively in international markets for goods and services, which consequently leads to an improved standard of living of its citizens in the long term. The European Commission, on the other hand, defines it as a nation's capacity to ensure consistent improvement in living standards for its citizens, providing jobs to those willing to work (European Commission, 2010). In this article, the notion of international competitiveness of an economy is defined as the ability of a given country, understood as the whole socio-political and economic system, to obtain certain competitive advantages in terms of international input markets and outlets for goods and services, as well as their permanent improvement amid the dynamically changing international environment.

The actual competitive position of a given economy in the realities of a modern, strongly globalised and internationalized world economy is increasingly dependent not so much on the quantity of the production factors possessed, but rather on the efficiency of their utilization. Therefore, in this respect the key role is played by the qualitative features of the entire socio-political and economic system, determined by the quality of human capital, innovativeness of a given economy and, above all, the efficiency of institutions (the efficiency of the so-called institutional environment within which all business entities operate in a given country) (World Economic Forum, 2017).

As in the case of the notion of international competitiveness, it is not easy to define unambiguously the notion of institutions, which has been pointed out by i.a. Nelson (2008). Thus, in accordance with the so-called New Institutional Economics (NIE), institutions are understood as all permanent, legal, organisational and customary conditions for repetitive patterns of human behaviour and interpersonal interactions (Pejovich, 1995). In turn, the World Bank (2002) defines institutions as standards, rules of conduct, contract enforcement mechanisms and organisations for doing market transactions that assist in the flow of information, in the enforcement of property rights and contracts and regulate competition in the market. Also, North's (1990) definition of an institution should be referred to in here, according to whom institutions should be understood as rules of the game in society, and more formally, humanly created constraints that structure human interactions. For the purposes of this article, institutions (institutional environment) will be understood to mean a certain set of rules of the game, principles, procedures, as well as moral and ethical standards regulating the behaviour of economic units, while at the same time ensuring the maximisation of certain benefits (e. g. wealth or increased competitiveness) from functioning within a given community (a given system).

In the case of post-communist countries, the above mentioned efficiency of institutions is a direct consequence of the advancement of the so-called institutional transition processes, i.e. the progress made in transition from the communist system of a centrally managed economy towards the system of a democratic market economy in terms of key principles and values, which are the basis for functioning of broadly understood institutions, regulating formal or informal social, economic and political relations in a given country (Falkowski, 2016). In turn, the well-known Polish economist and creator of the success of the Polish transition, L. Balcerowicz (2009) defines the process of institutional transition as fundamental changes in both formal and informal institutions necessary to achieve the so-called "critical mass" of systemic transition in post-communist countries. It is therefore an inherent element of this transition, which consists of both economic and political transition, in a fundamental way determining its final result.

There is no doubt that institutions, which determine the principles of and conditions for doing business in a given country, both public and private, as well as formal and informal ones, are of fundamental importance for the competitiveness of its economy and, consequently, for its socio-economic development.

First of all, institutions (the institutional environment existing in a given country) have a fundamental influence on the level of transaction costs and systemic business risk. The higher the quality and efficiency of the institutions, the lower the transaction costs and systemic risk, and the greater the country's ability to compete internationally (Rodrik, Subramanian, Trebbi, 2004).

The exceptional importance of institutions (institutional environment) for the competitiveness, as well as for the development of a given economy, is also emphasized by the widely understood New Institutional Economics (NIE), according to which institutions are treated as crucial economic resources of non-economic nature (Oppen, 2008). North (1990), in turn, believes that institutions in general, and in particular their quality (stability, transparency, efficiency), are a factor which in the long run has influence on the – prioritised in this approach – accumulation of human and physical capital, stimulating the necessary technological progress and the innovativeness of a given economy, and thus also its international competitiveness.

To sum up, undoubtedly the importance of institutions (institutional environment) for the international competitiveness of individual countries is vital. Their impact on the said

competitiveness can be *de facto* twofold (because it is hard to imagine in practice the neutral impact of institutions on competitiveness), i.e. they can:

- a) improve international competitiveness by increasing the efficiency of the operations of the entire political, and socio-economic system in a given country, primarily by reducing transaction costs of doing business in that country and increasing the productivity of input factors, which will necessarily increase its competitive capacity and, consequently, also its competitive position on the international arena;
- b) deteriorate international competitiveness by reducing the afore-mentioned efficiency of the operations of the entire political, and socio-economic system in a given country, which, as a result, will generate an undesirable phenomenon of wasting the resources possessed and, consequently, lower its competitive capacity position on the international arena.

### 3. Progress in the Institutional Transition in EU and Non-EU CEE Countries and Their International Competitiveness

The present quality of institutions (institutional environment) in EU and non-EU CEE countries is a direct consequence of the advancement of institutional transition processes initiated in them after the fall of communism at the turn of the 1980s and 1990s. The scope and effectiveness of reforms in the area of institutional changes in the so-called transition countries is assessed by experts of the European Bank for Reconstruction and Development (EBRD). Until 2014 inclusive, they evaluated, using a uniform methodology, the advancement of institutional changes towards liberal principles specific to the market economy in terms of changes in the ownership structure (so-called small and large privatisation), management and restructuring of enterprises, price liberalisation, trade and financial markets, as well as competition policy.

**Figure 1: Advancement of Institutional Transition in EU CEE Countries and Non-EU CEE Countries in 1989-2014\* (Overall Score, Max. 4.3)**

\* The latest data are available for 2014.

Source: Author's own calculations based on the EBRD data.

If, using the relevant EBRD data, we look at the general level of institutional transition processes (including institutional changes in all the five institutional environment areas indicated above) among the analysed EU and non-EU CEE countries, we immediately notice significant differences in this respect (Figure 1).

The EU CEE countries (i. e. the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland and Slovakia), despite some minor differences between them, have made much greater progress in transforming their institutions towards liberal market economy than the non-EU CEE countries (i. e. Belarus, Moldova, Russia, and Ukraine). Moreover, institutional changes in the EU CEE countries were faster and deeper than in the non-EU CEE countries. A very important accelerator of these changes were, of course, the efforts of these countries to become EU members, with the basic conditions of their EU membership, as laid down in the 1993 Copenhagen criteria, being to have market economies, as well as to adapt their legal system to the *acquis communautaire* of the EU. The year 2004, the date of accession of all the analysed countries from Central Europe to the EU, therefore represents a pivotal point in the course and advancement of institutional changes in these countries.

**Figure 2: Advancement of Institutional Transition in EU and Non-EU CEE Countries vs. their International Competitiveness**

Source: Author's own calculations based on (World Economic Forum, 2017), (EBRD database)

Now, if we relate the advancement of institutional transition processes in the EU and non-EU CEE countries (as measured by the value of the Transition Index, according to EBRD data) to their international competitiveness (as determined by the Global Competitiveness Index, compiled by the World Economic Forum), it will turn out that, in principle, countries with more advanced institutional transition are also much more competitive in the international arena and *vice versa* (Figure 2). The exception is Russia, which – despite being at the level as low as Ukraine and Moldova in terms of institutional changes – still possesses much higher international competitiveness not only as compared to these two countries, but even to some EU CEE countries with more advanced transition. This should be explained by the size of the country's economy, its socio-economic potential, but, first and foremost, by the resources-

based character of its economy and the resulting revealed comparative advantages in international trade (Falkowski, 2017). Due to the lack of data on Belarus' international competitiveness, this country has regrettably been omitted from this and subsequent analyses. Next, when we look more broadly than before at the institutions (institutional environment) present in the EU and non-EU CEE countries, resulting from the institutional transition analysed above (as evaluated according to the methodology of the World Economic Forum (World Economic Forum, 2017)) and relate them to the international competitiveness of their economies, this operation will confirm the hypothesis of a strong correlation between these two variables, that is of a strong impact of institutions on the competitiveness (Figure 3). Additionally, a high  $R^2$  factor is also noticeable in this case.

**Figure 3: Quality of Institutions in the EU and Non-EU CEE Countries vs. their International Competitiveness**

Source: Author's own calculations based on (World Economic Forum, 2017)

**Figure 4: Scope of Economic Freedom in EU and Non-EU CEE Countries vs. their International Competitiveness**

Source: Author's own calculations based on (World Economic Forum, 2017), (Heritage Foundation, 2017)

An important testimony to the quality of institutions (institutional environment) in EU and non-EU CEE countries is the scope of economic freedom. A relevant assessment of this scope is carried out annually by Heritage Foundation by compiling the so-called Index of Economic Freedom, in which 12 main areas are evaluated: property rights, government integrity, judicial effectiveness, government spending, tax burden, fiscal health, business freedom, labour freedom, monetary freedom, trade freedom, investment freedom and financial freedom (Heritage Foundation, 2017).

If we relate the scope of the said economic freedom to the international competitiveness of individual EU and non-EU CEE countries (Figure 4), then once again it will turn out that countries with solid, strong, transparent and effective institutions are characterized by much greater international competitiveness and *vice versa* (with the exception of Russia, for the reasons explained earlier).

#### 4. Conclusion

The analysis carried out in this article clearly shows that the EU and non-EU CEE countries differ strongly in terms of the quality and efficiency of economic institutions, which is directly attributable to the advancement of institutional transition processes in these countries. The development of these processes, and thus the present institutional quality, was influenced by both socio-economic as well as political factors. Adaptation processes in the area of institutions in several CEE countries connected with their accession to the EU structures also played an important role in this respect. Moreover, their international competitiveness is highly dependent on the institutional environment present in all CEE countries, which sets the conditions for doing business in them.

Completing the institutional changes in non-EU CEE countries seems to be a prerequisite for improving their international competitiveness. Only then will it be possible to expect a real improvement in the quality of the human and physical capital possessed by them, stimulating the required technological progress and innovativeness necessary to improve their international competitive position. Unfortunately, this process, if at all possible, will be extremely difficult and socially costly. It cannot reasonably be expected that – in completely different geopolitical conditions than those pertaining to institutional changes in the EU CEE countries – the non-EU CEE countries will quickly and effectively repeat the transitional success of the former.

## **Brexit – An Opportunity for the United Kingdom to Escape from EU Law and Related Challenges**

**Iva Fellerová Palkovská**

Masaryk University

Faculty of Law, Department of International and European Law

Veveří 70, Brno, 611 80

Czech Republic

e-mail: 370609@mail.muni.cz

### **Abstract**

*Brexit has been presented in the United Kingdom as an opportunity to escape the Court of Justice of the European Union and EU law in general. However, the principle of legal certainty precludes EU law from losing all legal effect in the territory of UK in the very moment of withdrawal from EU. EU law will continue to bind individuals and confer rights on them at least for some time, albeit on different legal basis. Determining the scope of application of EU law after Brexit in the UK, is not only a matter for UK and EU negotiators to agree on a sensible arrangement of future relations, it is also a challenge for lawyers. The paper also briefly outlines possible scenarios of future involvement of the UK in economic structures on the European continent, and more specifically deals with the question of applicability of EU law in case United Kingdom becomes a member of the European Economic Area.*

**Keywords:** *Brexit, European Union, Court of Justice of the European Union, European Economic Area*

**JEL Classification:** *K33, K40, K15*

### **1. Introduction**

Before the Brexit referendum, in the United Kingdom we might have heard in media that leaving the European Union is a possibility to escape the constraints of EU law and regain full sovereignty, which essentially means taking back control of the rules which apply on the UK territory. Now, almost two years after, the rhetoric remains. Brexit has also been presented as an opportunity to escape the bulky case law of the activist EU Court of Justice (“CJEU”). Special attention to court’s case law is paid because United Kingdom is the home of judicial law-making and court decisions are openly acknowledged as formal source of law. On the continent we rather blame the legislator for bad rules, not judges. In the UK court cases traditionally matter more than in continental Europe.

Currently it seems highly probable that United Kingdom will indeed withdraw from the European Union, that UK will not retract its announcement of exit made according to Art. 50 Treaty on European Union (“TEU”). It is unclear what will be the terms of the exit. It is clear that leaving the EU poses a threat to UK, its economy and citizens and their rights on the one hand and opportunities for change in many areas on the other (Ševčíková, 2016).

There are two elements that will be of major importance – Great Repeal Bill, an act which will end the direct effect of EU law on the UK territory by repealing European Communities Act from 1972, and the withdrawal agreement between UK and EU which shall terminate the membership of the UK in the EU and provide for settlement of mutual rights and obligations

and establish future relations between UK and EU. Naturally, conclusion of other international treaties between UK and EU concerning future relations may and probably will follow.

The content of both the Great Repeal Bill and the withdrawal agreement is significant from the legal, economic and political perspective. The aim of this paper is to deal with the question what impact will the EU law have on the UK territory after the Brexit.

Instantaneous abandonment of all law that is somehow related to EU law would lead to immense gaps in law since some areas of law are formed purely by EU law, others are strongly Europeanized. Depriving Treaty provisions and regulations from having binding effect on the UK territory would theoretically be possible, in case of directives which are effective in the UK in the form of acts of Parliament or secondary legislation, it is impossible both theoretically and practically.

In the first part of this paper I will try to describe the form of Brexit on national level, consequences of Brexit for UK legal order and analyse problematic aspects as regards effects of EU law including the effects of case law of the EU Court of Justice. I will not deal in more detail with Brexit from the EU law or public international law perspective, i.e. with the withdrawal agreement between EU and UK. In the second part of the paper I will briefly outline possible scenarios of future involvement of the UK in economic structures on the European continent and deal with one of the scenarios in detail, namely with involvement in the European Economic Area. For writing up of this paper I will use mainly descriptive and analytical method, partly also comparative method.

## **2. Conversion of EU Law into UK Law**

The key piece of legislation in the UK will be the Great Repeal Bill. Its aim will be to abolish the European Communities Act 1972 (“ECA”) and stipulate transitional provisions for application of EU law after Brexit.

In March 2017 the UK Government published the White Paper for the Great Repeal Bill which contains key rules that are going to govern the status of EU law in the UK. The European Union (Withdrawal) Bill 2017-19, which is the official name for the Great Repeal Bill, is currently debated in the UK Parliament (as to 28<sup>th</sup> February 2018).

The key points of the legislative proposal as regards validity of EU law post-Brexit are:

- Repeal of the ECA
- Conversion of EU law into UK law
- Creation of powers to make secondary legislation

The ECA, i.e. European Communities Act 1972, has been enacted to incorporate the EU law into UK legal order. It enables EU law to have direct effect in the UK and primacy over UK law. Therefore it has to be repealed in order that UK institutions regain all its powers that are vested in the EU institutions.

It is also necessary to give delegated powers to the Government to make secondary legislation since by exiting the EU there will be need to adapt current legislation – remove references to EU institutions and obligations towards the EU that will no longer be applicable and other corrections for the sake of legal clarity and legal certainty.

Due to large number of EU acts that are to date applicable in the member states including UK, it is virtually impossible to replace the legislation with domestic legislation prior to the date of exit. If domestic law changed rapidly on the day of Brexit, it would have an enormous impact

on life in the UK. It would considerably affect trade within the UK and outside. It would be undesirable and quite probably also constitutionally unacceptable.

The only sensible way in this situation therefore is to convert EU law into UK law and make desired changes gradually. This is the approach taken by the UK Parliament.

The Great Repeal Bill (“GRB”) is going to preserve the EU-derived domestic legislation (i.e. Union legal measures which require implementation in member states, namely directives) as domestic law (s. 2 GRB).

As regards acts which are directly effective (namely regulations), they are going to be transformed into domestic law (i.e. they are not going to be copied one by one but there are going to be pronounced as sources of law for the UK) (s. 3 GRB).

It is not only the actual legal measures that matter, it is also essential to take into consideration how they are going to be interpreted and applied.

### ***2.1 Interpretation of EU Law***

On the EU level, the key player as regards interpretation of EU law is the Court of Justice. Member states’ courts have to follow its case law (CJEU, case 29/68). Main tool of the CJEU for achieving uniform interpretation of EU law is the preliminary reference procedure that enables member states’ courts to ask for an explanation or clarification as to correct interpretation of either a Treaty provision or a secondary law provision.

Court of Justice and its decisions, mainly preliminary rulings, have played an enormous role in the evolution of EU law. CJEU not only gives interpretation on all sources of law in the EU, it has also helped to shape the EU legal order as such.

Member states’ courts have to apply EU law in accordance with the interpretation which has been given by the CJEU earlier. They are not allowed to disregard CJEU case law. If a member state’s court deals with a question of EU law, which has already been resolved by the CJEU, it has to apply the CJEU case law or refer the case again to the Court of Justice (Koopmans, 1982). The court may not disregard CJEU decisions. Realistically, this means that EU Court of Justice judgments are given a sort of precedential effect.

### ***2.2 Status of CJEU Case Law after Brexit***

While this approach to Court’s judgments is still rather difficult to comprehend for many lawyers on the European continent, it is nothing unusual for UK lawyers. Since UK is a country with common law tradition, decisions of higher courts are considered as sources of law. Historically, it was the case law that has been perceived as the main and more important source of law (Kiralfy, 1990, pp. 1-5 and 91-98). Accepting the binding, or perhaps more precisely precedential, effect of the Court of Justice decisions has been natural for UK lawyers.

Consequently, it is understandable that the status of CJEU case law is dealt with in the Great Repeal Bill. The elemental rule is that retained EU law (i.e. UK law that originates in EU law and remains effective after exit day) shall be interpreted in accordance with CJEU case law prior to date of exit. Only the Supreme Court is not bound by it. At the same time should the Supreme Court wish to depart from a CJEU decision, it instructed to use the same test as it would apply in deciding whether to depart from its own case law (s. 6 GRB) which basically means that CJEU case law is given a position analogical to decisions of the UK Supreme Court. As a rule, UK Supreme Court is bound by its previous decisions given in factually similar

cases but it may depart from them ‘when it appears right to do so’ (The House of Lords, the predecessor of the Supreme Court, issued a Practice Statement in 1966 which is still applied. Practice Statement [1966] 3 All ER 77). Its practice in this respect is rather moderate; it departs from them only exceptionally in justified cases (Huxley-Binns, 2014, pp. 43-45).

On the other hand, CJEU decisions made after the exit day have no formal legal force but if a court finds it appropriate, it may take account of later CJEU case law too. Furthermore, UK courts may not refer a case to the Court of Justice after the exit day.

### **2.3 Problematic Aspects of Application Post-Brexit CJEU Case Law**

The Great Repeal Bill in its currently proposed wording is correct as to providing for the precedential effect of pre-Brexit CJEU decisions even if they are applied by a UK court after Brexit. Derogating their binding effect would cause confusion regarding correct interpretation and could lead to considerable uncertainty for individuals. However, it is arguable whether the rule confirming precedential effect of CJEU decisions should not be broader and cover also CJEU decisions given after Brexit which interpret EU law effective before Brexit. In other words, the decisive point for establishing whether a particular CJEU decision has precedential effect or not should not be the day of issue of the decision but the date when the dispute originates and to which legal measure it relates (and whether the wording of the legal measure, that is interpreted in the CJEU judgment, was effective before Brexit and thus was applicable also in the UK).

So if CJEU rules after Brexit on interpretation of an EU law provision that was effective before Brexit, UK courts should nonetheless follow the judgment, even in disputes that arose after Brexit on condition that the interpreted provision remained the same. So long as the EU-law derived provisions of UK law remain not amended or repealed, they should be interpreted equally as in the EU.

There is no sensible ground for the opposite solution, if the wording remains the same and if it does not collide with any other legal provision and nothing changes from the teleological perspective since the purpose of the legal regulation and intention of the legislator did not change because the provision simply originates in EU law.

In this situation the opposite solution, i.e. disregarding relevant CJEU case law, would disrupt the unity of the UK legal order and could have serious consequences on legal certainty and thus on the position of individuals.

Horsley claims that UK courts may incline to follow post-Brexit CJEU interpretations of EU law as a matter of practical expediency. At the same time he warns that UK judges may take advantage of their newly acquired freedom to depart from CJEU decisions in specific instances where they appear antagonistic to domestic legal principles or interpretative traditions (Horsley, 2017, p. 85). UK Supreme Court stated that after Brexit ‘*decisions of the Court of Justice will [...] be of no more than persuasive authority*’ (UK Supreme Court, [2017] UKSC 5, ‘Miller case’). This suggests rather reserved approach to CJEU case law, irrespective of the uncertainty that it may cause. The approach may naturally be affected later by the exact wording of the GRB and EU–UK withdrawal agreement that will become effective. It is yet to be seen how this proclamation will affect adjudication in specific cases in the future.

It is important to point out that the need to interpret UK law in euro-conform way even after Brexit does not come from EU law, because that will not be effective in the UK after Brexit, but it stems from general principles of law. Legal certainty and reasonable predictability of law are undoubtedly one of the principles that apply universally in legal orders that are

governed by the principle of rule of law. The requirement of certainty is also mentioned numerous times in UK Government's White Paper. It would therefore be logical to assume that the proposed European Union (Withdrawal) Bill will fully correspond to these principles. Eventually, it will be up to the courts what to determine their approach to CJEU decisions.

#### **2.4 Concluding Remarks on Conversion of EU Law into UK Law**

To conclude, it may be said that on the day of exit not much is going to change. In the short term, I expect virtually no changes in UK law too. In longer term, of course, the situation is going to be different. Much will depend on UK courts, how they are going to cope with the uneasy task of interpreting EU-derived law. Nevertheless, it is probable that the longer the time from the Brexit day, the bigger will be the willingness of UK courts to depart from the previous line of interpretation that originates in times of the UK membership in the EU. The same holds true for the Parliament – with time the number of repeals, amendments and new legislation will grow.

### **3. Withdrawal Agreement and Jurisdiction of CJEU**

An important point worth mentioning is that the withdrawal treaty concluded between the EU and the UK (if there is one and UK membership does not come to an end by expiration of the two-year period which is set out in Art. 50 TEU) may be subject to review by the EU Court of Justice according to the Art. 218 (11) Treaty on the Functioning of the European Union ("TFEU"), (for further details on the topic see European Parliament, Directorate General for Internal Policies, pp. 10-12). It is because the withdrawal treaty is an international treaty, even though it is specific since UK will still be an EU member state at the time when the treaty is concluded. Should the Court of Justice declare the agreement incompatible with Treaties, it could not enter into force before amendments are made to the Treaties or, in this scenario more likely, to the withdrawal agreement.

Another possible intervention to the process of withdrawing from EU may come from the Court of Justice – the agreement as an act of EU law may be subject to review of legality if action for annulment is brought to the Court of Justice (Svoboda, 2016). In this instance, the Court of Justice may declare it void in case it contains provisions contrary to EU Treaties.

In both cases it rather ironically holds true that the escape of the UK from the Court of Justice will eventually depend on review of the Court of Justice.

### **4. Options for EU-UK Trade Relations**

In the previous part it was shown that EU law and CJEU jurisprudence will continue to matter even after Brexit. The degree of influence of EU law will depend largely on future trade relations between EU and UK as it is most likely that both parties will endeavour to resolve them. Negotiating mutually profitable arrangement is especially challenging and uneasy task for both sides. Brexit poses a challenge not only for UK and EU representatives but also for private parties – for UK and EU migrant citizens, who now face insecurity about their future status, for businesses, which cannot plan their business activities accordingly, and for other actors, such as trade unions, that will try to guarantee that the level of protection of workers does not diminish (Gumbrell-McCormick, Hyman, 2017).

The need for an express arrangement of trade relations is particularly pressing on the side of UK since it is more dependent on trade with the rest of EU than the rest of EU is dependent on

UK. If there are barriers to trade between EU and UK, it will be UK that will bear significantly larger proportion of related costs (Belke, Gros, 2017 and Van Reenen, 2016). It is therefore expectable UK will seek access to EU internal market.

There are several options for mutual trade arrangements (European Parliament, Directorate General for Internal Policies). First of them is involvement in the European Economic Community (“EEA”) which represents direct participation in the EU internal market and thus it would be the ‘softest’ possible way of withdrawal from EU.

Second option is to join the European Free Trade Association (“EFTA”) without acceding to EEA Agreement, this option is often denoted as ‘Switzerland model’. Switzerland has entered into a number of bilateral treaties which govern various areas of trade including labour migration (Dhingra, 2016). This option would be more difficult to carry out for EU and UK compared to the first option (and it would naturally take considerably more time), on the other hand it allows larger flexibility.

Becoming a member of EU customs union is another possibility. It would simplify the access to the internal market but only to limited extent (European Parliament, Directorate General for Internal Policies). The greater independence to set its own trade policies and regulations for the UK, the greater will be the disruption for trade.

In the absence of any comprehensive trade arrangement, trade between UK and EU would be governed by WTO rules. This fourth possible option would undoubtedly represent ‘hard Brexit’ with all its benefits (no binding effect of EU law and CJEU decisions) and disadvantages (no preferential access to single market and consequent disruptions for trade).

#### ***4.1 European Economic Area***

Even though the future arrangement between UK and EU is yet unknown and hard to predict, in this chapter I will deal in detail with consequences of the first option as described above, namely UK membership in the European Economic Community.

For proper understanding of today's position of the EEA and its relation to EU, it is necessary to briefly mention its history. The EFTA was founded as a response to the economic success of the European Coal and Steel Community and European Economic Community in 1960. While at the beginning the EFTA and European Communities were comparable as to the number of member states, as years passed, it changed significantly. Nowadays, EU has 28 members (including UK), whereas EFTA has four (Norway, Lichtenstein, Iceland and Switzerland). EEA was formed on the platform of EFTA as a form of enhanced cooperation in 1994 and today has three members Norway, Lichtenstein and Iceland. Switzerland remained a member of the EFTA only.

European Economic Area was founded to extend the four internal market freedoms to the EFTA states (EFTA Court, case E-1/03). It gives an opportunity to participate in the internal market of the EU without being bound by numerous obligations connected to membership in the Union. The cooperation among states in the EEA is limited truly to economic issues. The preamble of EEA Agreement contains no reference to the ‘ever closer union among the peoples of Europe’ and the Agreement itself contains no provisions on citizenship.

Although this may seem as a mere technicality, it has fundamental impact on the law of EEA and the functioning of EEA and EFTA as such. The absence of an alternative to Union citizenship in the EEA has significant implications especially for the free movement of persons, namely for residence rights of non-economic migrants and the existence of positive obligations towards them from the host state.

Even more importantly, the notion of the ever closer union was used by the EU Court of Justice as an aid for inferring the specific character of the founding Treaties, creating the doctrine of direct effect and primacy of EU law (e. g. in the famous *Van Gend en Loos* decision) and thus contributed to the evolution of EU law as a supranational legal order. In contrast, EEA Treaty is an ordinary international treaty and law of EEA is governed solely by international law where principles such as primacy or direct effect do not apply (Frederiksen, 2009. However, opposite opinions may be found in legal doctrine. Baudenbacher claims that „*the EEA Agreement is closer to supranational EC law than to public international law*“ (Baudenbacher, p.2).

Most of legal measures concerning internal market that are adopted by the EU are then adopted by the EEA members. Although EEA members have no opportunity to vote in the Council or in the Parliament in the legislative procedure because this is reserved to EU members, it would be wrong to assume that they have no way to influence the outcome. They take part in consultation procedures prior to voting in the Parliament and Council (see Art. 99 et seq. of the EEA Agreement). The possibility of EEA members to influence legal acts issued by the EU is limited, but far from negligible.

When an EU act in the area covered also by the EEA is enacted, it is not automatically valid in the EEA. The procedure for cooperation between EEA members and EU as regards legislation is very specific (one may also say unique). New EU acts are scrutinized by the EEA Joint Committee, which is composed of representatives of the EU and of the three EEA members. After the approval of the Joint Committee the act is incorporated into an annex of the EEA Agreement and thus becomes a binding part of it. The Joint Committee Decision may include adaptations to ensure the compatibility with the specific regime of the EEA or and its members.

#### **4.2 EFTA Court**

For the purpose of securing uniform interpretation of the EEA Agreement, the EFTA Court has been founded. The jurisdiction of the EFTA Court entails among other things giving advisory opinions on the interpretation of the EEA Agreement (Art 31. et seq.). It is clear that the EFTA Court has its model in the EU Court of Justice.

The reason for it is the simple – it holds true for the whole EEA that it aims to mirror the European Union regarding the functioning of the internal market. The ‘mirroring’ applies not only to law-making but also to the judiciary. It is enshrined in the EEA Agreement which sets forth the principle of homogeneity and also procedures for safeguarding it (Art. 105 et. seq.<sup>1</sup>). Moreover, it expressly stipulates that EEA law shall be interpreted in accordance with the case law of the EU Court of Justice prior to signature of the EEA Agreement (Art. 6 et. seq.). To achieve homogeneity of EEA and EU law after the date of signature of the EEA Agreement, the system of mutual exchange of relevant decisions of the EFTA Court and CJEU is introduced, the system is carried on by the Joint Committee and is intended to ensure awareness about relevant court decisions on both sides – EU and EEA.

It follows from the institutional setting and related procedures that the decision-making of the EFTA Court is a powerful tool for achieving homogeneity too. Nonetheless, it is necessary to note that there are important differences between the EU and EEA preliminary reference procedure. EEA member states’ courts have no obligation to refer a question to the EFTA court and the ruling on interpretation of an EFTA act has no formal binding force for the referring court (Frederiksen, 2009, p.4). The ‘power’ of the EFTA Court is thereby lesser compared to its counterpart in the EU.

From the case law of both courts and from scholarly works on that topic we may see that cooperation between these courts works and they do influence each other. Sometimes it is the EFTA Court that mirrors CJEU case law, sometimes it is the CJEU that gains inspiration from the decisions of its counterpart, decisions of the EFTA Court have found their way to the Advocate Generals' opinions (Sehnálek, 2018, pp. 134-140; or Baudenbacher). Nevertheless, even though the relation between the two courts is parallel, the balance is shifted in favour of the EU Court of Justice (Sehnálek, 2018, p. 133). While EFTA Court is '*essentially [bound] to follow relevant [CJEU] case law*' (Baudenbacher, p. 1), there is no corresponding obligation for the CJEU (Sehnálek, 2018, p. 133).

As follows from the foregoing, if the United Kingdom actually exited the European Union and became a member of the European Free Trade Association and acceded the Agreement on the European Economic Area, it will not escape the EU internal market regulation and related case law of the EU Court of Justice. Most of EU legislation in the area of internal market would become binding for the UK, while the negotiating power during the EU legislative procedure would become considerably smaller. As the EFTA Court strives to achieve homogeneous interpretation of EEA law, it mostly adjudicates in accordance with CJEU case law.

## 5. Conclusion

Exiting from the European Union is no easy task to carry out. Consequences of the UK exit are yet hard to predict because much will depend on the content of the withdrawal agreement concluded between EU and UK and on subsequent agreement on future relations as well. UK legislator has the task to set transitional provisions for application of EU law in the UK post-Brexit era. UK courts will then have the task to bring it to life and deal with problematic aspects should they find some. EU law will preserve to have effects on the UK territory at least for some time after Brexit and the same holds true for the case law of the Court of Justice as it forms inseparable part of EU law. This is the only way that ensures legal certainty which is essential both for citizens and business. As regards future UK-EU trade relations, the greater the continuity and certainty for individuals, the lesser will be the independence for UK to set its own policies and regulations. If UK joins the European Economic Area, it will essentially be bound by EU legislation on internal market and CJEU case law interpreting it.

## How China's Financial Sector Contributed to the European Union Not Granting Market Economy Status to China

### **Abstract**

*In 2016, 15 years after China's entrance into the World Trade Organization (WTO), a large discussion about granting market economy status to China for the purposes of trade defence investigations took place in the European Union (EU). However, instead of granting it automatically, i.e. in compliance with China's Accession Protocol, the EU explored the market conditions in China based on five technical criteria. One of these criteria was focused on the Chinese financial sector. The object of this paper is to evaluate the progress that China had recorded in the area of access to credit by the private sector, interest rates, banking reform, non-performing loans and the role of policy banks in the period 2001–2016. The qualitative research of this paper is based on using logical methods, such as the analysis of the official documents and data, their comparison in the monitored period and the deduction of the main conclusions. Although China had recorded significant progress in the liberalisation of its financial sector in the previous period, some weak points occur there all the time. This is also the reason why the EU did not grant market economy status to China.*

**Keywords:** China, financial sector, market economy status, policy banks, WTO

### **1. Introduction**

China's current leading position in the world economy is connected especially with its significant position in world trade. China has been the leading merchandise exporter since 2009. China's expansion to the foreign markets was followed by the increase of economic openness of other countries, especially due to the growth of their imports. China's main export destinations are the USA, the European Union (EU) and especially Asian countries, such as Hong Kong, Japan, South Korea, Vietnam, etc. While the EU is China's second largest export destination, China is the major source of the EU imports (Staničková, 2015). As China's export structure is similar to the EU (Fojtíková, 2012), and also with respect to the EU–China bilateral trade, which reaches on average over 1 billion euros a day, China has been a frequent target of anti-dumping (AD) investigations. In the period 1995–2016, from the whole number of 1.217 AD initiations filed by all WTO Members against China, the EU filed 129 AD initiations (WTO, 2018).

When China entered into the World Trade Organization (WTO) in December 2001, it was considered as a non-market economy by the other WTO Members. This term was the reason for the calculation of the 'normal value' and the determination of the 'dumping margin' in order to set anti-dumping duty. In the WTO, anti-dumping cases are governed by the Anti-Dumping Agreement (the Agreement on the Implementation of Article I of the GATT 1994).

However, the WTO Anti-Dumping Agreement sets only minimum requirements for using trade defence measures, such as AD duty and the WTO Members use these instruments in compliance with their domestic legislation, which may go beyond the WTO provisions. The WTO agreements do not define the term ‘market economy status’ (MES) either. In the WTO, China’s Protocol of Accession only enabled the importing WTO Members to provisionally apply ADD methodology that was not based on a strict comparison with the domestic prices of costs in China “*if the producers under investigation cannot clearly show that market economy conditions prevail in the industry producing the like product with regard to the manufacture, production and sale of that product*” (WTO, 2001). Based on the fact that besides the Protocol of Accession, which uses the term ‘market economy conditions’ in paragraph 15(a) of the Protocol of Accession, there is no distinction within the WTO system between market and non-market economies, nor any general WTO concept of a non-market economy; MES is, thus, granted solely under the national legislation of the WTO Member States. Although paragraph 15(d) of China’s Accession Protocol set the date until which it was possible to use a substitute methodology, i.e. a maximum of 15 years after China’s entrance into the WTO, i.e. by December 2016, not all WTO Members automatically grant MES to China by this term.

In the EU, although China had already requested MES for the purpose of trade defence investigations in 2003, granting MES to China was connected with the evaluation of the distortions of the Chinese economy that were caused by state interference. This was based on the fact that China is a socialist-market economy, in which the Chinese Communist Party and the central government play a crucial role. Thus, the European Commission explored if the prices and costs in China can reliably be used for the purpose of trade defence investigations. The evaluation of market conditions in China was based on five technical criteria that were set by the European Commission. One of these criteria was focused on the existence of a genuine financial sector, which operates independently of the state. In 2004, the MES Working Group was established in order to exchange information between the Chinese authorities and the European Commission. However, the MES Working Group last met in 2008 and the report of the European Commission showed that distortions prevailed in four out of five criteria, including the financial sector (European Commission, 2008). Except for technical criteria, the other important aspects of the EU-China cooperation included in the EU-China Strategic Partnership (Cihelková et al., 2017), were not considered.

The object of this paper is to depict China’s financial system, the reforms and laws that have contributed to its development since 2001, and to explore the forms of state influence that have distorted the market environment in China until now. The methodology of this paper is based on the analysis of the official documents issued by the EU or the WTO and the laws that were enacted by the Chinese authorities in the area of the financial sector. The structure of the paper is as follows: Firstly, some important specifics of the Chinese financial system are introduced and, secondly, the progress that has been achieved by China in the financial sector, especially the banking sector, is explored. Thirdly, the formulation of the areas in which market distortions remain is provided. In conclusion, some important facts are summarised.

## **2. China’s Financial Sector and its Main Specifics**

China’s financial system has contributed to the expansion of China, which has grown to be the largest economy in the world. While the functions and instruments of the financial system are similar to around the world, the level of state influence on the financial system is different in the individual countries and usually goes hand in hand with the government priorities of the economic development of a country. Thus, the financial system can be organised in multiple

ways that differ in terms of the role of the government, the relative importance of the banks and other financial intermediaries compared to stock and bond markets, the degree of financial leverage in the economy, and other differences. As Elliot and Yan (2013) state, China's national, regional, and local governments play a much bigger role in directing the activities of banks and other financial intermediaries than in America or Europe. This is also introduced in China's Constitution Law that stipulates that the state organs of the People's Republic of China apply the principle of democratic centralism (NPC, 2004), in which the central authorities play the most important role.

In China, the influence of the government on the financial sector is challenged through a complex set of actors, namely: (1) the National People's Congress (NPC), (2) the State Council and its commission, such as the Financial Stability and Development Commission and the State Council in the financial sector, (3) the People's Bank of China (PBC), (4) the Central Huijin Investment, (5) the China Banking Regulatory Commission (CBRC), (6) the China Securities Regulatory Commission (CSRC) and the China Insurance Regulatory Commission (CIRC), (7) the State Administration of Foreign Exchange (SAFE) and the National Council for Social Security Fund (European Commission, 2017). The range of their activities is wide, from the promulgation of financial sector laws and directives through regulatory and supervisory functions in the bank sector and in the field of securities and insurance up to the management of the foreign exchange market. In addition, some of them are also the important investors and stakeholders in some of the largest commercial banks and state-owned financial enterprises.

China's financial system is dominated by the banking sector. Bond and equity financing only account for about one fifth of the total credit to non-financial institutions. Unlike the non-financial sector, the financial sector is predominated by state-owned financial institutions (Song and Xiong, 2017). The importance of the banking sector lies in the allocation of financial resources. In 2016, RMB-denominated bank loans represented 67.4 % of the total 'social financing' (i.e. an indicator to measure the total funding of the non-financial enterprises and households by the financial system) in China compared to only 11.5 % for corporate bonds and 3.7 % for domestic equity financing. The remaining 17.4 % are trust loans, banker's acceptances, designated loans, foreign currency loans, etc. (PBC, 2017).

Regarding the structure of the banking sector in China, three state-owned and controlled banks play an important role, such as large commercial banks, joint-stock commercial banks, and the state policy banks (the China Development Bank, Export-import Bank of China and Agricultural Development Bank of China). Besides these, other banking institutions, such as city-commercial banks, rural commercial banks and foreign banks, etc. operate in China. In 2016, the total share of banking institutions in China's asset accounted for 68.4 %, from which the share of commercial banks reached 53.5 %, while the foreign banks' share was only 0.9 % (IMF, 2017). Although foreign banks have taken up only a small portion of the Chinese banking sector until now, the entrance of China into the WTO had a positive influence on FDI inflows, including the financial market, regardless of the fact that many state regulators and structural obstacles to foreign banks still exist in China (Fojtíková and Kovářová, 2013).

Besides banking institutions, China's financial system includes non-bank financial institutions, such as insurance companies, securities companies, pension funds and public funds and asset management businesses that are represented by trust companies, futures companies, private equity, etc. Although bank institutions have shared in China's financial system (from the view of assets) the most all the time, their share is declining in comparison with the asset management business. While in 2010 the share of bank institutions in the system asset was 84.6 %, it declined to 68.4 % in 2016. In contrast, the share of the asset management business

increased from 2.7 % to 24.9 % during the same period. The share on non-bank financial institutions remained at a similar level, i.e. around 10 % (IMF, 2017).

### **3. China's Financial Reforms on the Way to Granting MES**

The European Commission set criterion 5 for granting MES to China as follows: “*Existence of a genuine financial sector which operates independently from the state and which in law and practice is subject to sufficient guarantee provisions and adequate supervision*” (European Commission, 2008). The Commission focused especially on the evaluation of five areas, namely: (1) access to credit by the private sector, (2) interest rates, (3) the banking reform, improving the lending practice, respecting prudential standards, (4) non-performing loans and credit risk assessment and (5) the role of policy banks. Firstly, some weaknesses of China's financial system will be presented and, secondly, the way in which the Chinese authorities reform and build an independent financial system of the state will be introduced. However, when we evaluate the progress that China has achieved in its financial sector during the last 16 years, we should also take into account that the world financial crisis in 2008-2009 showed many problems also in other countries around the world (Dvoroková, 2014).

#### **3.1 Access to Credit by the Private Sector**

In general, limited access to credit can cause financial vulnerability for enterprises and economic loss for a country. Although the Chinese authorities argued that neither the government nor the banks discriminate against any enterprises with regard to loans, whether they are state-owned, joint-stock or private enterprises, the access to credit by the private sector, i.e. small and medium enterprises, is more difficult than for state-owned enterprises (SOEs) to obtain loans. As has been said, most banks in China are state-owned banks and traditionally favour SOEs over private firms. According to WTO (2016), 70 % of loans made by state-owned commercial banks were directed to SOEs, although their share in GDP was below 30 %. Liu et al. (2018) show that as a result of the implementation of the economic stimulus package in China in the period 2000–2013, SOEs received more bank loans and invested more than non-SOEs. In addition, bank lending became less responsive to firm profitability, and firm investments became less responsive to investment opportunities for SOEs, non-SOEs from favoured industries and regions, and non-SOEs with political connections. The special mission of the financial system to support SOEs has had profound impact on both the efficiency and risks of the financial system. In particular, it made the financial system heavily exposed to the problem of SOEs (Song and Xiong, 2017).

According to the IMF (2017), one of the current problems of China's financial system is the rapid build-up in risky credit that was partly due to the strong political pressures banks face to keep non-viable companies open, rather than letting them fall. Another issue is a rush of moral hazard and excessive risk-taking because of the mindset that the government will bail out troubled SOEs and local government financing vehicles IMF (2017). However, according to PBC (2018), at the end of 2017, loans to micro and small enterprises grew rapidly, i.e. 3.8 and 5.8 percentage points higher than that of loans to large enterprises and medium-sized enterprises respectively.

The different conditions for getting loans between SOEs and the private sector have also had impact on the international environment. The European Commission (2008) states that the exchange of credit guarantees by companies to ensure access to loans appears to be frequent practice among Chinese operators as demonstrated by some recent trade defence instrument investigations. Elliot and Yan (2013) show another issue, i.e. that the Chinese authorities grant loans to industries with overcapacity, such as shipbuilding and solar energy, and to small and

medium-size enterprises that are squeezed by the weaker export environment. This is also documented by the number of China's AD disputes in the WTO. However, in 2014, the Chinese authorities introduced several measures to discourage production in areas where there is overcapacity. Based on the Circular of the State Council on Publishing the Catalogue of Investment Projects, which is subject to Government Approval, projects in industries with excess capacity, such as iron and steel, electrolytic aluminium, cement, plate glasses and vessels industries, are now subject to filing with local governments. The Circular further specifies that the above projects are strictly subject to the Guiding Opinions of the State Council on Resolving Overcapacity, under which local authorities and central departments are not allowed to approve any new capacity expanding projects in those areas (WTO, 2016). This can induce many social problems in those Chinese provinces that are highly dependent on these industries.

On the other hand, it is obvious that the Chinese authorities use the monetary policy instruments, and in their framework also the credit policy, for achieving the national objects announced in the 13<sup>th</sup> Five-Year Plan. For example, in order to improve the efficiency of agricultural production, the PBC has actively promoted financial services, such as supply chain financing and movable assets financing, to support the scale of business in agriculture and to combine the primary, secondary, and tertiary industries in the rural areas. Financial services have been provided to support grain purchases and to accelerate the pace of overseas development of agriculture (PBC, 2017).

On the whole, according to the Chinese authorities the credit policy plays a greater role in structural adjustments to advance the economic restructuring as well as the industrial transformation and upgrading (PBC, 2017). This is also legally anchored in Article 34 of the Law on Commercial Banks that states: "*Commercial banks shall conduct their business of lending in accordance with the needs of the national economic and social development and under the guidance of the industrial policies of the State.*" (NPC, 1995).

### **3.2 Interest Rates**

Setting the interest rates in China is given by Article 38 of the Law on Commercial Banks that states "*Commercial banks shall determine loan interest rate in accordance with the upper and lower limits for loan interest rates prescribed by the People's Bank of China*" (NPC, 1995). Since 2003, the Chinese monetary policy has been driven largely by the need to reduce excess liquidity as well as credit growth and investment. However, instead of relying on the market-based instruments of the monetary policy, the Chinese authorities have attempted to limit credit growth through the 'window guidance', thereby largely avoiding significant increase in administered interest rates, which could hamper indebted companies' ability to repay bank loans.

The guidance has enabled the administrative controls of some sectors over their investment, thereby reducing their demand for credit. Thus, the administrative guidance tends to distort the capital market, preventing it from allocating credit to the most profitable investments. In addition, the administrative controls were not effective and the banking system has continued to accumulate excess reserves. The International Monetary Fund (IMF) also stated that interest rates should be the primary instrument to govern credit expansion rather than administrative limits on bank lending and that emphasis should be put on enhancing the efficiency of capital allocation (IMF, 2011). In 2005, the PBC decided to raise the central bank benchmark interest rates for deposits and lending (for the first time since July 1995), allowing financial institutions to lower the renminbi (RMB) deposit rates and broadening the range of lending rates. The PBC also scrapped a rule that forbade commercial banks from charging more than 1.7 times that

rate, thereby allowing them more freedom to take on riskier loans. The rise in interest rates constituted an important step in moving away from the administrative control of the monetary policy to indirect control involving price mechanisms, such as the interest rate, which could pave the way for a more efficient transmission of the monetary policy to the real economy through the capital market (WTO, 2006).

Besides the ‘window guidance’ and increasing the deposit and lending rates, the PBC issued penalty bonds (which bear interest rates lower than the market rates) to banks that had credit growth in excess of that specified in the ‘window guidance’, and administrative measures that regulated investment in the capital market, real estate sector and new investment projects (WTO, 2008).

Besides China’s administrative measures, in 2008 the European Commission pointed out another problem of the Chinese monetary policy, i.e. that the PBC and state bank interest rates were essentially equal to the prevailing PBC interest rates unlike in most other banking systems, where banks compete for customers based on creditworthiness and interest rates. Thus, it appears that normally less creditworthy SOEs do not pay higher interest rates than more creditworthy borrowers. This means that lending rates banks do not properly reflect the true costs of borrowing (European Commission, 2008).

However, since 2013 the PBC has continued its interest rate liberalisation and enabled financial institutions freedom to determine their lending rates. In March 2014, the PBC removed the upper interest rate limit for small-amount foreign currency deposits within the China (Shanghai) Free Trade Pilot Zone. In May 2015, the PBC removed the upper interest rate limit for small-amount foreign currency deposits nationwide, and cancelled the upper interest rate limit in October. Other important measures included the establishment of Short-Term Liquidity Operations (SLO) and a Standing Lending Facility (SLF), the extension of a part of the matured three-year central bank bills, and an increase in the quota of central bank discount funds to provide liquidity to financial institutions (WTO, 2016). On the whole, since 2011, China has made key progress in the liberalisation of interest rates and the implementation of the market-based interest rate reform (IMF, 2017). The key steps of the PBC included, among other things, the deregulation of the floor for the lending rates and the cap for deposit interest rates in July 2013 and October 2015.

### ***3.3 Banking Reform, Improving Lending Practice, Respecting Prudential Standards***

As Naughton (2006) states, the Chinese banking system entered into the 21<sup>st</sup> century woefully unsuited for the demand of a sophisticated market economy. This inadequacy was, according to Naughton, a result of the fact that the banking system that was created under the planned economy simply did not have the skills, incentives, or culture required to make an effective commercial banking system. Lin and Zhang (2009), who assessed the effect of bank ownership in China on performance over the period 1997–2004, found that the ‘Big Four’ state-owned commercial banks, i.e. the Industrial and Commercial Bank of China, the Bank of China (BOC), the China Construction Bank (CCB), and the Agricultural Bank of China are less profitable, less effective, and have worse asset quality than other types of banks except the ‘policy banks’.

In order to improve the efficiency of the four big banks, the government carried out their partial privatisation in 2002. At the end of 2004 the best two of the ‘Big Four’, i.e. the CCB and the BOC, were restructured into joint-stock corporations wholly owned by the Huijin Corporation, an arm of the central government. Besides this, the government measures were focused on the

corporate governance, non-performing loans, incentive structures, risk management structures, accounting standards, etc. During 2005 a comprehensive bank restructuring and reform program got under way, based on the reasonable degree of success achieved in writing off non-performing loans and recapitalising the banks. The timing of the program was also influenced by the beginning of the foreign-bank entry, mandated for December 11, 2006, by China's WTO Accession Protocol (Naughton, 2006). By 2008, China's banking reform had made significant progress that represented a significant improvement in credit to private enterprises, a gradual increase of loans to private enterprises by state-owned banks and the entire banking system becoming increasingly more diversified.

However, the European Commission (2008) pointed out some of the weak points in China's banking sector even after the reform process, such as the lack of independence supervisory bodies, the persisting constraints in lending and deposit-taking and the fact that international standards were sometimes implemented selectively. Many reasons explain these problems. According to Elliot and Yan (2013), the problem is especially the ownership structure, since few executives are offered stock incentives and their bonuses are not directly related to their economic contributions; another issue is the close linkages between SOEs and state-owned banks. Investors operating in China also complained about delays in obtaining licensing, restrictions on the provisions of services and lending restrictions in compulsory reserve ratios and high capital requirements for branches (European Commission 2008).

As a part of the announced market-oriented reforms over the period 2014–2020, the Chinese authorities issued the Decision on Certain Major Issues Concerning the Comprehensive Deepening of Reform, in which they call for a number of reforms also in the financial system including promoting qualified private capital to set up small and medium-sized banks. The Decision makes reference to liberalising the exchange rate, the capital account, and deposit interest rates, and includes a reform proposal with respect to SOEs, which are to increase the proportion of their operational income to be allocated to public finance to 30% by 2020. (WTO, 2016).

At the end of 2016, the 'Big Four' banks, with larger and more stable deposit bases, benefit from lower funding costs. They have dominated lending to large SOEs all the time, but recently have also diversified towards households. The 12 joint-stock banks lend more to small and medium-sized enterprises, and have moved aggressively into nonstandard credit assets, such as trust loans, entrusted loans, bankers' acceptances, and other relatively illiquid assets. City-commercial banks are more focused on regional SOEs and projects. Profitability has declined with the slowing economy, but remains positive (IMF, 2017). Since 2011, the main achievements of China's financial sector have included namely the upgrade of monetary and macroprudential policy frameworks, the liberalisation of interest rates and the implementation of a market-based interest rate reform, the enhancement of interagency cooperation in addressing macroprudential risks, and the strengthening of systemic risk monitoring by the PBC and regulatory agencies. The Chinese authorities have also implemented the Basel III regulatory framework. However, the financial system has been characterised by a high degree of government ownership all the time, which significantly complicates the valuation of assets and risk pricing IMF (2017).

### ***3.4 Non-performing Loans and Credit Risk Assessment***

Due to the large volume of policy loans and weak internal controls, since the late 1990s non-performing loans (NPLs) and technical insolvency have received the most attention from reform efforts. Elliot and Yan (2013) state that foreign reserves held by the PBC and bonds issued by the Ministry of Finance were the two main sources of funds used to rebuild the

commercial banks' balance sheets. The function of a state-owned company called the Central Huijin Company, which is controlled by the State Council, was to inject equity into the state-owned financial institutions. These equity infusions reached approximately 156 billion USD by 2012 Elliot and Yan (2013). Another approach employed by the government to reduce the NPLs was the establishment of four asset management companies (AMCs). These AMCs purchased NPLs from the banks, in exchange for bonds issued to the banks by the AMCs. The AMCs have resold most of the acquired NPLs, while restructuring loans to companies that are potentially viable (IMF, 2017). A third measure for reducing NPLs was the introduction of strategic investors, generally foreign investment banks or investment companies. As a result of these measures, the share of NPLs in the total loans declined from 25 % in 2002 to 0.95 % in 2012, although it increased moderately to 1.46 % in 2016 (PBC, 2017). However, these figures reflect only NPLs in the balance sheets of banks and do not contain the NPLs which have been transferred to AMCs, i.e. companies owned by the state. The European Commission (2008) also pointed out the 'grey area' between the normal loans and the NPLs, which is represented by the 'special mention loans'.

Despite the progress which the Chinese authorities have achieved in systematic risk oversight and macroprudential policy, some systematic risks, such as regulatory gaps, a weak coordination mechanism and conflicting objectives, have existed all the time. According to (IMF, 2017), the largest banks appear better capitalised, but vulnerabilities at the lower tiers are higher, and there is an increasingly large pool of potentially risky corporate debt. Credit still flows to unprofitable enterprises and the potential losses at banks are obscured by financial engineering.

### **3.5 Role of Policy Banks**

The existence of the 'policy banks', i.e. the Agricultural Development Bank of China (ADBC), the China Development Bank (CDB), and the Export-Import Bank of China (EximBank), in China is dated since 1994. China's policy banks have had the primary role of implementing the development objectives set by the Chinese government. Thus, the policy banks provide loans to different borrowers. While the China Development Bank (CDB) is responsible for increasing funding for large infrastructure projects, the Agriculture Development Bank mainly provides funds to the government to purchase grain, cotton and edible oil. The Exim Bank of China provides credit to the buyer or seller in the export and import sector and also plays an important role in implementing China's 'going-out' strategy. The policy banks are all still majority owned by the Chinese government and have a significant NPLs burden.

In April 2015, the State Council approved plans to reform these policy banks (The State Council, 2015). The reform plan defined the organisation structures, party leadership, responsibilities, business scope, management, the sources of funding, governance, risk control and supervision, information disclosure and the human resources management of the policy banks. The CDB was clearly defined as a development financial institution and the ADBC and the EximBank as policy-oriented banks. Although the governance of the three policy banks has been clarified, according to the PBC (2017), the boards of directors of these banks are appointed by the relevant ministries under the State Council and shareholders, respectively. In addition, in November 2017, China's banking regulator released special rules for three policy banks featuring a capital restraint mechanism to strengthen risk control and a new body, i.e. a cabinet-level committee, to oversee the financial policies, was established (Xinhua, 2017). Thus, the influence of the Chinese authorities on the three policy banks was again strengthened. However, the main intention of the creation of this committee was to insure the financial stability of the country, instead of disturbing the market environment in the Chinese

financial sector. Financial stability has also the reason for preventing the capital outflows of foreign investors (Navrátil, 2016). In 2016, the assets of the three policy banks, including the China Development Bank, reached 22,994 billion RMB, which was 30.6 % of GDP and 6.8 % of the system assets (IMF, 2017). In the long-term perspective, while the share of these banks in the total assets remained similar to the share in 2007, the share of the policy banks in GDP had gradually increased from 16.1 % in 2007 to 30.6 % in 2016 (IMF, 2011). According to IMF (2017), the policy banks' mandates should be further reviewed.

#### 4. Conclusion

Although China made significant progress on the way to a real market economy after its entrance into the WTO, some weak points in its financial sector have existed all the time. The Chinese authorities have gradually improved its monetary and macroprudential policy and announced a number of reform measures, but the state influence (under the leadership of the Central Committee of the Communist Party of China and the State Council) on the Chinese financial sector remained. The existence of the 'Big Four' banks and the three policy banks confirm the fact that the Chinese financial sector has to primarily contribute to achieving China's economic development and social targets.

Despite the reforms that China carried out in its financial sector during the last period, the EU did not grant MES to China by December 2016, although it can have a negative impact on the EU-China Strategic Partnership relations. The main reasons were the continuing restrictions on fixing interest rates by the commercial banks, the preference of the SOEs over private enterprises and commercial banks, the existence of NPLs, etc. These problems are directly relevant to trade defence investigations because the credit provided to companies at non-commercial rates must be regarded as an unfair distortion of the real prices. In addition, to obtain MES for trade defence investigations all five criteria must be met.

Besides the influence on EU's trade, China as a global power has an important influence on the global asset prices, and also the global interconnectedness of Chinese banks is rising. A financial sector shock would reduce domestic demand, giving a contractionary impulse to the global economy through lower commodity prices, reduced import demand, and lower outward investment. Thus, the transition to a market-based financial sector is a necessary condition for ensuring the stability of not only the Chinese economy.

## **Abstract**

*In the contribution, it does draw attention to one degree of integration in a specific European Single Market. The main aim is to assess the current situation within the European Single Market with a focus on labor. Within this topic, it does analyze the evolution of immigration and emigration in the European area, and from a theoretical point of view, it does focuses on a new industry 4.0 that causes jobs to narrow and some jobs will be extinguished. In the field of statistical analyzes, correlations, it does examine the link between the number of jobs and the working time. The current situation in the labor market is characterized by low unemployment. It is importance and necessary to evaluate the number and type of jobs and the possibilities of adapting human resources to new trends in the context of the type of work. Currently, effective arrangement of human resources in the labor market is necessary for the development of new types of jobs and destruction of some.*

**Keywords:** *European Single Market, integration, number of job vacancies, working time*

**JEL Classification:** *M10, M12, M19*

## **1. Introduction**

In the contribution, it does draw attention to European integration in the context of the European Single Market. It does more focused on the free movement of human resources, which play an important role in the global market for the competitiveness of the market. The main aim is to assess the current situation within the European Single Market with a focus on labor. In the first part of the contribution, does focus on European integration, namely the current views that have been influenced by the external impact of the global economic crisis. In the framework of the methodology, it does look through the secondary data and the correlation analysis for the relationship between job vacancies and working time in a flexible working environment. Then it does examine the relationship between working time in classical employment and in the flexible form of employment. It examines these relationships through the SAS statistical system. In the second part of the contribution, it does analyze the European Single Market. In the final part of the contribution it does draw conclusions and analyze the relationship between the number of vacancies and working time.

## **2. Characteristics of European Integration and Methodology**

In the contribution I draw attention to European integration in the context of the European Single Market. According to (Luhmann, 2017). "Many integration theories predict that

heightened integration in Europe will give rise to a European identity. In order to better understand whose identities are impacted or formed most by integration:

- cognitive mobilization,
- optimism,
- support of the EU.”

The impact of the external environment, in particular the global economic crisis, has also affected European integration.

In the meaning (Gill, 2017), Manuel Barroso analyses the European crisis “It argues that in the current situation, the relative unity of Europe's ruling classes contrasts with the relative fragmentation of subaltern forces, mainly along national-popular lines. This situation shapes (but does not necessarily determine) the 'limits of the possible' for political agency in Europe, and it helps explain the persistence of neoliberalism in the European Union in a situation of organic crisis, where the relations of force remain contested, open and politically unstable.”

On the other hand (Freire, Cabrit, Duarte, Lopes, 2017) “The article finds that, on the one hand, in terms of patterns of workers' EU political alignments, there are no systematic differences between countries affected to varying degrees by the Great Recession. On the other hand, workers still feel fundamentally detached from the EU, especially when it comes to the manual workers. However, high levels of generalised detachment from the EU are not clearly translated into preferences for Eurosceptic parties, since there are high levels of vote fragmentation.”

From a theoretical point of view, it is possible to distinguish several forms of integration, according to (Cihelková, 2004, p.37- 40). One of the most significant ones is sector integration, which interconnects the individual sectors or industries. National integration, within which a common body is created. On the contrary, in the case of inter-state integration the common body and its powers do not exceed the scope of the individual national institutions. In case of large integration it is the acceptance of common territory measures, which can include e.g. free trade zones, purpose contracts and others (NAFTA, CEFTA, ASEAN or APEC etc.).

Migration can be defined as “the type of spatial mobility, in which people move across national borders to settle in the country for a certain period of time” (Divinski, 2005, p. 25).

In a contribution through the SAS program I will examine correlation between the number of job vacancies and the number of hours worked with the secondary data from Eurostat. Subsequently, through correlation I will examine the relationship between work at home and vacancies, working hours at work.

Pearson Correlation Calculation:

$$r = \frac{\sum x_i y_i - \frac{\sum x_i \sum y_i}{n}}{\sqrt{(\sum x_i^2 - \frac{(\sum x_i)^2}{n}) (\sum y_i^2 - \frac{(\sum y_i)^2}{n})}} \quad (1)$$

The evaluation of Pearson correlation is as follows:

- 0 < |r| ≤ 0.3 - weak dependence,
- 0.3 < |r| ≤ 0.8 - mild to moderate dependence,
- 0.8 < |r| ≤ 1 - strong dependence.

### 3. Evaluate of European Single Market

According to (Schallbruch, 2017) “By passing a new regulation on network and information security, the Union aims to present a modern regulatory approach to a key issue of the digital economy. The EU directive, set into force in August 2016, is a major step to a stable regulatory environment that might be a raw model for regulators worldwide. However, from a technology perspective, the legislation will predominantly lead to compliance efforts of market operators, not to technological innovations.”

On the basis of (D’Antone, Canning, Franklin-Johnson, Spencer, 2017) “the analysis of market practices integrating, and at the same time, performing values and concerns, leads us to the conceptualization of a theoretical model which shows that one of the difficulties of realizing concerned market innovations resides in the distinction between market and society.” (Camisão, Guimarães, 2017) interpret “the economic and financial crisis opened a window of opportunity to place the Single Market back on top of the European agenda as part of a two-tiered crisis response, which also included reinforced financial supervision and economic co-ordination. Our findings suggest that the Commission's entrepreneurship was constrained by the limited salience of Single Market issues in the crisis context and by the lack of actual political commitment from the other relevant stakeholders. Thus, our research highlights the limits of the Commission's opportunistic behaviour in less advantageous circumstances.”

On the other hand (Krause, Rinne, Zimmermann, 2017) “the experts agree on the SELM’s importance, especially for larger economic welfare, but are not convinced that it has been achieved. To enhance labour mobility across Europe, the respondents identify key factors such as recognizing professional qualifications more efficiently, harmonizing social security systems, and knowing several languages. Moreover, at least 50 percent of the respondents consider positive attitudes – by policy makers and citizens alike – toward free mobility to be important to enhance labour mobility.”

(Kahanec, Guzi, 2017) “show that immigrants have responded to changing labour shortages across EU member states, occupations and sectors at least as much and in many cases more flexibly than natives. The results suggest that immigrants may play an important role in labour adjustment during times of asymmetric economic shocks, and support the case for well-designed immigration policy and free movement of workers within the EU. Some limitations include alternative interpretations of the wage premium as our measure of shortage, as well as possible endogeneity of this measure in the model.”

From historical point of view and within the phase of adulthood of the conception of human resources management work satisfaction has dropped. Work content enrichment program has been introduced as well as an attempt to go beyond the strict scope of traditional organisation of working hours and the introduction of flexible forms. Reorganisation of organised work rules and new forms of job organisation were addressed by management. In the 70s of the last century the institutions introduced telework (work outside the work place, which occurred as a result of means of communication development). At the beginning of the 80s of the last century, a job sharing model became a flexible form of work organisation for managers.

The name Industry 4.0 comes from Germany, where in 2011, certain concept initially originated from an analysis of the consequences of new technologies on the country's economy. The given innovations radically changed everything; the industrial factories changed in a new organisation and would be more efficient by 30 to 40 percent.

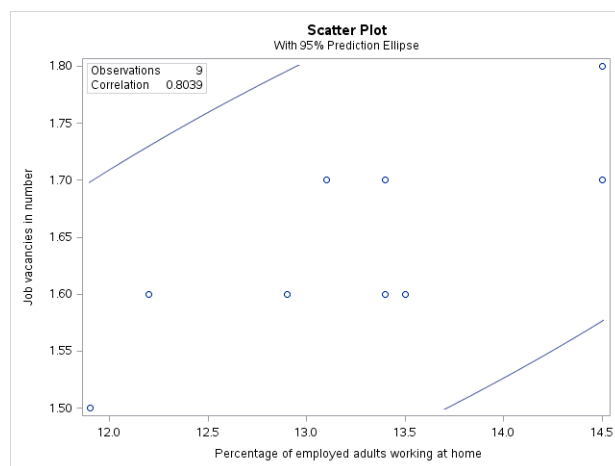

### 3.1 Job Vacancies in the Context of a Flexible Form of Work

In the meaning (GafarovEvgeny, LazarevAleksandr, ZinovyevAleksandr, 2017) “the paper studies a practical problem of resource assignment and optimal human resource allocation scheduling with the objective of minimizing employees' useless working time and retire some workers. We propose numerical results on real data (120 competencies, 250 workers, 1000 tasks) proved potential efficiency and practical value supposed model and algorithms solving the problem. The number of required staff can be reduced by 41,7% and the total salary can be reduced by 16,5%.”

According to (Collewet, Sauermann, 2017) “this paper studies the link between working hours and productivity using daily information on working hours and performance of a sample of call centre agents. We find that as the number of hours worked increases, the average handling time for a call increases, meaning that agents become less productive. This result suggests that fatigue can play an important role, even in jobs with mostly part-time workers.”

The following figure shows the correlation between the number of vacancies and the percentage of the number of working at home. Correlation analysis shows the state from 2009 to 2017.

**Figure 1: Correlation Analysis Job Vacancies and Employed Adults Working at Home**

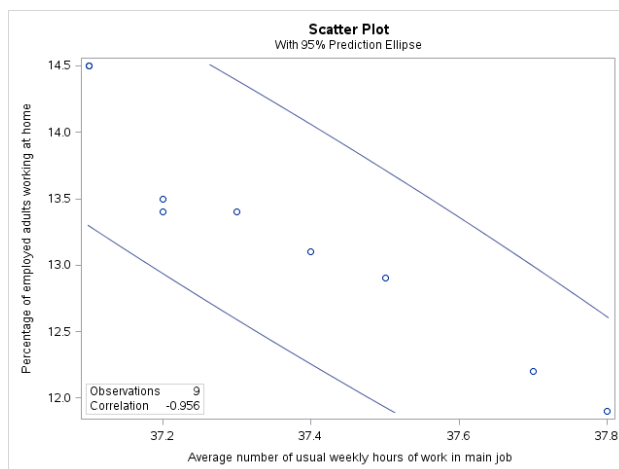

Source: own processing based on data from the Eurostat [online], 2018

The value of the correlation coefficient is 0.8039, which is the strong dependence of the given relationship.

### 3.2 Working Time in the Context of a Flexible Form of Work

Based on (Müller, Mander, Hellert, 2017) study “apparently, trust emerges in a different way in virtual working structures than in face-to-face teams. Control and responsibility move towards the members of the team, which in turn corresponds with a necessity for trust. When taking a closer look at the role of leaders and team members in virtual environments, it becomes clear that reciprocity cannot be taken for granted in virtual teams.”

Through correlation analysis, it does increase the number of working hours at the workplace with the number of hours in flexible employment, working at home.

**Figure 2: Correlation Analysis Working Time and Employed Adults Working at Home**

Source: own processing based on data from the Eurostat [online], 2018

The value of the correlation coefficient is negative  $-0.956$ , which represents a strong dependence of the given relationship.  $N=9$ .

#### 4. Conclusion

Based on the examinations of these relationships, it does find that there is a strong dependence between the number of vacancies and the number of working hours. It does analyses the relationship in the following figure.

**Figure 3: Correlation Analysis Job Vacancies and Working Time**

Source: own processing based on data from the Eurostat [online], 2018

The value of the correlation coefficient is negative  $-0.78$ , which is a slight dependence of the relationship.  $N=9$ .

If an organization wants to be effective and competitive, it must have a good quality human resources according to (Dzieńdziora, Smolarek, 2016) “among the human resources management new challenges, which put stress on the development of the company employees, it is possible to mention the following elements: competences management, talents management, succession planning and empowerment.”

European integration in the sense of (Feber, Petrucijová, 2016) “under the influence of globalization and European integration, there is a revival of interest in economic ethics as precondition of successful integration of culturally varied economic subjects. In our opinion, even economic activities rooted in economic ethics are important but not sufficient preconditions of the European integration. Their crucial prerequisite should be human-focused approach (presented in the idea of good society) corresponding to forming of demos sharing humanism as all-European value.” On the other hand (Fránková, 2016) “support for research, development, and innovation therefore seems to be the best way to achieve cohesion of European countries and gradual European integration. Innovations are considered to be the main driver of economic development of states and regions. Innovation policy is evolving in all developed countries and it is clear that this policy is going to play a crucial role in the future efforts for European integration and joint development of European states.”

In the framework of non - member countries, the following procedure is being followed in assessing European integration (Gazzola, P., Sepashvili, E. and Lo Parco, A., 2016) “the civil society developed a tool to monitor the process of European integration for EaP countries: the European Integration Index for EaP Countries . The index measures countries’ track towards the EU integration. It contains on three main dimensions: deep and sustainable democracy, cross-sector picture of a country in a comparative manner and. independent analysis on country report.”

As a part of evaluation and recommendation I assume the following:

- the number of job vacancies relates to the number or hours worked;
- work from home affects the number of job vacancies and hours worked at the workplace;
- given context in the scope of work organisation has an impact on work productivity and better working relationships in the workplace;
- flexible working environment currently prevails in organisations;
- company culture is based on trust, results and responsibility for the work delivered;
- flexible form of employment helps people balance their work and personal lives;
- for given trends the controlled process is dropped and the emphasis is placed on a completed and timely delivered work.

Dabrowskiego 69, Czestochowa, 42-201  
Poland  
e-mail: iwona.gorzen-mitka@wz.pcz.pl

### **Abstract**

*Real estate is a important sector of national economies and the appropriate financial use of real estate is a driving force for economic sustainability and growth. The objective of this paper is to evaluate the relationship between real estate markets condition and country risk indicators in EU Baltic Sea region countries. This paper proposes the analysis of the relationship between real estate markets condition and country risk in EU Baltic Sea region countries based on statistical data from 2016. The results were optimized by implementing Multi-Objective Optimization by Ratio analysis and Full Multiplicative Form Method (MULTIMOORA). Findings provide evidence for real estate condition being dependent on country risk ratios.*

**Keywords:** country risk, European Union, MULTIMOORA method, real estate markets

**JEL Classification:** R31, F63, C10

### **1. Introduction**

Specificity of real estate markets is broadly discussed in literature (Gorzeń-Mitka et al., 2016; GPG [online], 2018; Lieser and Groh, 2014; Sitek, 2012; Kuraś, 2013). Most often, the complexity and risk of this market is stressed as well as the scale of its interconnections (Gorzeń-Mitka, 2016, 2017; Kuraś, 2013; Lieser and Groh, 2014) and the economic and social significance. Analyzing a given real estate market in the context of other economies, one should stress that such markets' vary in each country due to different economic, financial, social or legal conditions. Properties are also an important area of interest of foreign investors (Gorzeń-Mitka et al., 2016; Sipa, 2017; Kuběnka and Slavíček, 2016; Mesjasz-Lech and Skowron-Grabowska, 2016). Buying properties outside one's own country often generates additional requirement and areas of risk for the buyer, generally referred to as country risk variables.

The multiplicity of variables in these cases is an incentive to seek methods that could it optimize and reduce the level of related risk. One of the methods which allow for taking into consideration multiple decision criteria simultaneously is the MULTIMOORA method developed by Brauers and Zavadskas (2006, 2010).

In this article relationship between selected real estate market variables and country risk will be analysed. The main goal of this study is to determine the relationship between real estate market and country risk. In this article relationship between selected real estate market variables and country risk will be analysed. The data covers 8 EU Baltic Sea region countries, year 2016 (latest available data) and 22 structural indicators (10 concerns real estate market variables, 12 - country risk variables), 176 observations in total. The main tasks of the study

are the following: to identify country risk indicators which have positive and negative effect on real estate market conditions by MULTIMOORA method procedure. The article consists of the following parts: the first one – introduction, the second – some theoretical remarks on Country risk context in real estate markets assessment. The next part explain research problem and describe methodology. The last one presents the results of the analysis.

## **2. Country Risk Context in Real Estate Markets Assessment - Some Theoretical Remarks**

Assessment of real estate markets from country risk perspective is a topic, which is quite rarely approached by researchers. Risk assessment is crucial in developing an investment strategy on real estate market. Risk can be linked to internal or external factors. It has also two main sources: the country risk where the investment is located or within the project itself (Quer et al., 2007; Schroeder, 2008; Gorzeń-Mitka et al., 2017). Country risks are primarily linked to changes in the economic, political or social situation. According many researchers and market experts the main factor to look out for is rising inflation, because it is the barometer for a country's economic health. When it is strays from acceptable levels, currency, imports and exports, lending, purchasing power and consumer or tenant morale are all affected (GPG [online], 2018; Schroeder, 2008; Skibiński, 2017; Stankevičienė and Sviderskė, 2012; Stankevičienė et al., 2013; Lieser and Groh, 2014). Another important factor is currency volatility, aftermath of it include falling GDP, slowing production, shrinking exports and lower purchasing power. Other factors which also have a crucial impact on local and national real estate markets are population growth, mass movements of people or changes to legislation and taxation systems. After analysing of different scientific articles and different opinions of researchers (Gorzeń-Mitka, 2017; Gorzeń-Mitka et al., 2016), it is clear that assessment of real estate market from country risk perspective is complex and dynamic. Its complexity stems from the multitude of economic, social, financial, law variables, which create determinate both country risk and real estate market conditions (Gorzeń-Mitka et al., 2017; Kuběnka and Slaviček, 2016; Sitek, 2012). Its dynamism is caused by the quick pace of the economic processes and phenomena on both national and global level (Stankevičienė and Sviderskė, 2012; Stankevičienė et al., 2013; Gorzeń-Mitka, 2018). Most of the approaches of country risk assessment provided by researchers and institutions from various countries (e.g. rating agencies) (Stankevičienė and Sviderskė, 2012; Schroeder, 2008; Gorzeń-Mitka et al., 2016) is determined by four main components: domestic economic variables, macroeconomic policy evaluation, balance of payments and social indicators.

Further analysis will show how important it is to distinguish the dependence of real estate market indicators on country risk indicators, as by this approach, many decisions could be made, evaluating different types of opportunities. Due to its particular conditions, making investment decisions on the real estate market, especially on foreign markets requires that one takes into account multiple variables. According Lieser and Groh (2014) and Sitek (2012) when we analysing a attractiveness of a property as a subject of an investment, among many factors should be distinguished the following e.g.: the flow of income achieved during the time of owning the property, the appreciation of the value of the subject of the investment, tax advantages (tax breaks systems).

Thus, making decisions on this market, especially in foreign countries, implies the need to assess multiple variables, interactions among them as well as forecasts regarding their potential changes in the future. Scientific literature presents many different methods how to measure market condition and risk and there is a debate which one is more accurate. One of the methods

which allow for taking into account many variables in a decision-making process is the MULTIMOORA method.

### 3. Problem Formulation and Methodology

The main goal of this study is to determine the relationship between real estate market and country risk. In this article relationship between selected real estate market variables and country risk will be analysed. There is an assumption, proposed by the author, that all variables are interrelated with each other dependence.

#### 3.1 Research Method

The current study tackles a assessment of relationship between real estate markets condition and country risk in EU Baltic Sea region countries by applying a multiple criteria decision analysis method i.e., MULTIMOORA.

##### 3.1.1 MULTIMOORA Method

MULTIMOORA method is an extension by Multi-Objective Optimization by Ratio Analysis (MOORA) method. This method consists of three parts, namely Ratio System, Reference Point and Full Multiplicative Form. It was introduced and developed by Brauers and Zavadskas (2006, 2010). These methods have been applied in different studies in many different areas (Brauers et al., 2008; Brauers and Ginevičius, 2010; Gorzeń-Mitka et al., 2016; Stankevičienė and Sviderskė, 2012). In this study it was use MULTIMOORA method procedure describe by Brauers and Zavadskas (2006, 2010).

##### 3.1.2 Real Estate Market and Country Risk Indicators

After consolidating different types of variables', different groups of real estate market assessment and country risk indicators were created (Table 1 and Table 2). For assessment of real estate market, three main groups of variables were distinguished - property prices, property rent and property rights. Each group includes a set of indicators, which describe real estate market conditions (Lieser and Groh, 2014).

**Table 1: Grouping of Indicators for Real Estate Market (REM) Assessment**

Property price variables	Symbol	Property rent variables	Symbol	Property right variables	Symbol
Square meter prices	REM 1	Rental Yields	REM 5	Landlord & Tenant Law	REM 8
Price/GDP per Capita	REM 2	Price/Rent Ratio	REM 6	Economic Freedom	REM 9
Round trip transaction costs	REM 3	Rental Income Tax	REM 7	Property Rights Index	REM 10
Price Change 5 yrs	REM 4

According Schroeder (2008) and Sipa (2017) for country risk, four main groups of variables were distinguished - domestic economic variables, macroeconomic policy evaluation, balance of payments and social indicators. Each group includes a set of three indicators, which mostly describe country risk.

**Table 2: Grouping of Indicators FOR Country Risk (CR) Evaluation**

Domestic economic variables	Symbol	Macro-economic policy evaluation	Symbol	Balance of payments	Symbol	Social indicators	Symbol
Gross domestic investment (% of GDP)	CR 1	Inflation (%)	CR 4	The current account balance (% of GDP - 3 year average)	CR 7	Unemployment Rate (% of Labour Force)	CR 10
GDP (PPP-billion USD)	CR 2	Real effective exchange rate	CR 5	Balance of trade (% of GDP)	CR 8	Natural population change (annual growth %)	CR 11
Private consumption (% of GDP)	CR 3	Current taxes on income, wealth, etc. (% of GDP)	CR 6	Exports of goods and services (% of GDP)	CR 9	Employment (% of total population)	CR 9

### 3.2 Data

The data covers 8 EU Baltic Sea region countries, year 2016 (latest available data) and 22 structural indicators, 176 observations in total.

After data is normalized, the correlation analysis could be presented in order to understand the relationship between each variable for each real estate market characteristic and country risk group (Table 8).

As we can see from Table 8, there are both - positive and negative correlations between variables. The relationship between indicators is strong, the strongest correlation is between i.e. square meter prices (property price variables group) and social indicators i.e. natural population change (measuring as percent of annual growth) (country risk ratio).

Source: own study

Square meter prices (property price variables group) is also negative correlating with value of exports of goods and services (negative correlation) and GDP per capita (domestic economic variables) - (positive correlation). Rate of change price (5 years) (property price variables group) is negative correlating with indicators of macroeconomic policy (i.e. real effective exchange rate), balance of payments (i.e. the current account balance measuring as percent of GDP) and social indicators (employment rate measuring as percent of total population). The strong correlations are between all property right variables (real estate market ratios) and selected variables of each group of country risk indicators. Rating of landlord and tenant law is positive correlating with private consumption measuring as percent of GDP and negative - with unemployment rate. Economic freedom index is positive correlating with balance of trade ratio. Property rights index is positive correlating with GDP per capita and employment rate. Ratios of real estate market such as rental yields, price/rent ratio and rental income tax (property rent variables) do not present a correlation with all country risk ratios.

## 5. Conclusion

By summarise, it was proved that real estate market indicators was related to / dependent on country risk ratios. The system of 22 indicators for eight EU Baltic Sea region countries for real estate market indicators and country risk was introduced. It includes four groups for country risk: domestic economic variables (3 indicators), macroeconomic policy evaluation (3 indicators), balance of payments (3 indicators) and three group for real estate market: property price (4 indicators), property rent (3 indicators) and property right (3 indicators). The MULTIMOORA method could be used while evaluating and standardizing real estate market

condition and country risk, because it is appropriately suit for case, where there are several alternatives (EU Baltic Sea region countries) and several objectives (indicators, which directly describe real estate market condition and country risk).

The strong positive correlation is between: square meter prices and GDP per capita, natural population change; landlord & tenant law rating and private consumption index; economic freedom index and real effective exchange rate; property rights Index and GDP per capita, employment rate. Strong negative correlation is observed between: square meter prices and exports of goods and services ratio; price change 5 years ratio and balance of trade rate, unemployment rate, employment rate; landlord & tenant law rating and unemployment rate. Such elements of real estate market variables as property rent variables are not very influencing all country risk ratios (relationship wasn't detected).

## **Increasing Level of Tertiary Education = Increasing Employability of the Youth**

**Marcela Göttlichová**

### **Abstract**

*Cohesion policy is the principle investment policy of the EU. Its primary goal is to support formation of job opportunities, competitiveness of businesses, to enhance the economic growth, sustainable development, and to improve the life quality of citizens. And despite the fact that each of the member states established their own national goals in these spheres, they all share one interest. To be successful within the world market, one precondition must be met – the high-quality human resources which contribute to the production of the top and innovative goods and services. Tertiary education with the increasing preference of study fields and programs in relation to the narrow link to the economical and social needs as a response to the current needs of the labour market thus become one of the major topics of the cohesion policy for 2014-2020. The article presents the EU tertiary education key data, the specific features of the educational sector in the Czech Republic with the options for employability of university graduates within the labour market in continuity with the regional development.*

**Keywords:** *competitiveness, key competencies, non-profit sector, tertiary education, theory and practice*

**JEL Classification:** *I21, I25, H52, A23*

### **1. Introduction**

The distinctive feature of today is represented by the ever-accelerating changes reflecting in deepening of the long-term issues, being it globalization, the pressure on sources, or ageing of the population, significantly affecting today's Europe. However, it remains that the only eventuality for Europe to succeed in the given hectic era is to act collectively as the Union. The support of cohesion and balanced development together with increasing level of EU competitiveness thus belong to the temporary EU's key development objectives (Melecký, 2015). "New agenda requires a coordinated European response, including with social partners and civil society" (Barroso, 2010). The need of a strategy, which would make the EU an intelligent and sustainable economy supporting inclusion and exhibit the high level of employment, productivity, and social cohesion, gained on a real vision together with the document called *Europe 2020 Strategy* that in 2010 proposed the idea of the Europe's social market economy for the 21st century. *Europe 2020* pitched three priorities mutually supporting one another. The attention was aimed at the preference of the "intelligent (smart) growth" reflecting in the development of the economy based on knowledge and innovations; then to the "sustainable growth" in relation to the support of the more competitive and greener economy which is less demanding on sources, and the last but not least in the list of the priorities focusing on "the inclusive growth" with orientation to the support of the economy

with the high-level employment, which will be notable for social and territorial cohesion (Europe 2020, 2010). This strategy is and still is intended to make Europe the world's leading knowledge-based economy, based on the principle of sustainable development (Staničková, 2016).

### **1.1 EUROPE 2020 Strategy**

Among the prominent steps of the Commission Europe 2020 was particularly the submission of the seven flagship initiatives corresponding in direct continuity to the core priorities: “Innovation Union”; “A digital agenda for Europe”; “Resource efficient Europe”; “An industrial policy for the globalisation era”, and “European platform against poverty.” As for the point of view of the presented contribution, there are two main initiatives, namely the “**Agenda for new skills and jobs**,” whose primary task is to modernize labour markets in connection with the empowerment of citizens by developing their skills throughout their lives, which brings them better employment on the labour market, and at the same time “**Youth on the Move**” aimed at enhancing the performance of education systems in order to facilitate the entry of young people into the labour market. Higher education institutions then become significant partners in implementing the *Europe 2020 strategy* for the renewal and sustaining growth, which is reflected in one of the other aims of the strategy—which is reaching the state in which 40% of the European youth will have graduated from a university by 2020 (Europe 2020, 2010).

### **1.2 Education and Training for Growth and Jobs**

It is, therefore, a higher education linked to research and innovation, and their increasing role both in the development of individuals and the society as a whole. It is precisely the role of higher education institutions (HEI) in shaping the highly skilled labour force, which in the increasingly globalized knowledge-based economy is needed by the EU to compete in terms of productivity, quality and innovation, becomes the primary objective of the present. We can still find “the difference between the competencies required on the labour market and their real supply, which contributes to the unemployment increase, and in reducing the economic growth” (European Commission 2018). Some necessary strategic documents belong to the definition of the basic goals determining the direction of the Czech academic system. At the European level, the *Education and Training 2020* (ET 2020) presents a strategic framework for the European cooperation in education and training (ET 2020) following the *Education and Training 2010* (ET 2010) work program. The *ET 2020* strategy focused its attention primarily on improving the quality and effectiveness of education and training, coupled with improving creativity and innovation and entrepreneurship at all levels of education and training, and at the same time promoting active citizenship. At the level of higher education, *The Strategic Plan for the Scholarly, Scientific, Research, Development and Innovation, Artistic and Other Creative Activities of Higher Education Institutions for 2016-2020* becomes the key strategic material. It is education and training that enhances the personal development of citizens, their social engagement, and that promotes equality, social inclusion and cohesion (MŠMT, 2018).

## **2. Problem Formulation and Methodology**

And what is the real state of the matter? It is about 50% of young people with only secondary qualifications, which is reflected in insufficient satisfaction of the labour market requirements. Less than one in three people aged 25 to 34 then achieved higher education (USA/40%,

Japan/<50%). The priority is to improve the results and international attractiveness of European higher education institutions (OECD, 2017). This is related to an increase in the overall quality of all levels of education and training in the EU, which would combine a high level and a fair approach, encourage the mobility of students and trainees, and improve the employment situation of young people, which is still not without the needful “modernization of higher education system,” whether the curricula, management, or funding. What remains the priority is the implementation of the youth employment policy framework aimed at reducing youth unemployment, which, with the help of the Member States and the social partners, will support the entry of young people into the labour market through *vocational training, traineeships or other forms of professional practice*. This is related to a better targeting of education outcomes to the labour market needs, coupled with improving young people’s entry into the labour market through an integrated activity including, among other things, providing information, advising and consultancy, and the interdependence of the business or non-business sphere.

## 2.1 Current Indicators

What do the particular outcomes show provided we aim our attention to the Czech Republic?

### 2.1.1 Employment Indicators

**Table 1: Employment Indicators in the Czech Republic in 2013-2016**

<b>EMPLOYMENT</b>				
<b>(thous. persons)</b>	<b>2013</b>	<b>2014</b>	<b>2015</b>	<b>2016</b>
<b>Working persons in the national economy<sup>1)</sup></b>	4937.1	4974.3	5041.9	5138.6
Industry	1 431.7	1 478.2	1 521.0	1 569.8
Construction	420.3	413.9	396.0	386.3
Financial and insurance activities	137.3	121.5	118.1	117.2
Education	322.6	326.2	322.8	338.6
Health	339.3	353.5	351.6	360.4
<b>The unemployed, total<sup>1)</sup> (thous. persons)</b>	368.9	323.6	268.0	211.4
<b>By educational attainment</b>				
Primary education	71.5	58.1	58.7	54.0
Secondary educ. without A-level examination	163.3	138.2	108.5	80.4
Secondary educ. with A-level examination	102.9	94.0	72.1	53.3
<b>Higher education</b>	<b>31.3</b>	<b>33.3</b>	<b>28.7</b>	<b>23.6</b>
<b>By age group</b>				
up to 19	12.7	12.6	9.7	6.8
20–29	102.9	86.0	71.5	58.4
30–39	99.4	86.9	72.0	50.7
40–49	71.9	66.7	52.0	41.4
50–59	70.8	61.2	54.4	44.2
60+	11.3	10.1	8.5	9.9
<b>General unemployment rate<sup>1)</sup> (%)</b>	7.0	6.1	5.0	4.0

1) Data are weighted according to data of the demographic statistics, which reflect the 2011 Population and Housing Census results. Source: Labour Force Sample Survey.

Source: Czech Statistical Office— Czech Republic in numbers 2017

The results in Table 1 indicate what the current situation is as viewed in terms of employment, where from an overall viewpoint we can see a gradual increase in the number of jobs (4 937.1–5 138.6 thous.), which illustrates the improving situation on the labour market. We can observe another gradual increase of jobs in the sector of education (322.6–338.6 thous.), health (339.3–360.4 thous.), and industry (1 431.7–1 569.8 thous.), whereas a decrease was recorded in the banking sector (137.3–117.2 thous.), and in construction (420.3–386.3 thous.). The current state of affairs also reflects the number of the unemployed, where the continuation of the number of employed persons decreases (368.9–211.4 thous.), together with the decrease in the general unemployment rate, which decreases in 2016 compared to 2013 by 3% (from 7% to 4%). An important indicator is seen in the comparison of unemployment from the point of view of education, where it is clear that even though we see an improving situation reflected in a gradual decline at all levels of education, the smallest number of unemployed is recorded at the university level (CSO: Employment, 2017). Here again, we can confirm that together with the declining acquired qualification also leads to declining opportunities for employment. The fact that the unemployment rate of tertiary educated Czech citizens is relatively low compared to other EU22 countries represents a positive finding. As revealed by the latest published results, only 3.1% of people with a bachelor's degree are unemployed, compared with an average unemployment rate of 6.3% in the EU22; a similar situation is also with the individuals with a master's degree (2% vs. 5%). Higher levels of education support not only higher employability but, in general, also the potential to receive higher incomes. In comparison with secondary school graduates, a tertiary-educated individual in the Czech Republic has a 92% higher income on average, which is higher than the EU22 average, where tertiary-educated population receive on average 52% higher income than those with a mere secondary education (Country Note Czech Republic EaG 2016, 2017). Compared to the OECD indicators it was confirmed that adult tertiary-educated graduates not only achieved significant returns on their investments because they are more likely to be employed by 10 percentage points, but their earnings are on average 56% higher than of those who completed only higher secondary education. They are also the first to recover from economic downturns, which is confirmed by the employment rate of young graduates of universities returning to the pre-crisis levels, while the employment rate of those who have not completed higher secondary education is still lagging behind (OECD, 2017). The demand for university graduates is historically high, Dombrovský says, who is an analyst at Jobs.cz and who confirms that "businesses search for 140 000 people through the labour office, one quarter of which was designated in 2016 even for university graduates, with only 12% of positions in 2012" (2017, iDnes/ Economics).

### *2.1.2 Educations Indicators*

The rapid quantitative expansion of the number of university students taking place since the 1990s in the Czech Republic has shown the need to stabilize the education sector in connection with the creation of such conditions that would lead to the completion of mechanisms leading to the improvement of the education system not only in terms of efficiency but particularly in terms of quality. The attention is therefore focused on the development of a sufficiently heterogeneous offer of university degree programs in terms of content and form of teaching, in continuity with the increase of the number of highly qualified academic staff (Table 2). The priority is being given to making higher education institutions more open to the interests of employers, broader civil society, as well as of the regions. "Issues of competitiveness and productivity at a regional level have increasingly been a focus for academic and policy concern. Factors directly linked to accumulation of knowledge and innovation have therefore become the main sources of growth" (Staničková, 2014).

**Table 2: Education Indicator in 2013–2016**

<b>EDUCATION*)</b>				
	<b>2013</b>	<b>2014</b>	<b>2015</b>	<b>2016</b>

A good knowledge of the labour market needs is reflected in the creation of the basis for the long-term employability of graduates as well as in the setting up the conditions leading to the easier transition to the labour market from those parts of the educational system that prepare students for their immediate employment. The Czech Republic is currently implementing a reform of higher education from 2016, which aims to increase the accreditation standards, internal quality assurance, and to provide greater autonomy to institutions with functioning internal quality assurance systems. This is also related to the establishment of a new independent *National Accreditation Office*, and the establishment of new accreditation standards. Students themselves are also involved in the accreditation and evaluation program. The current changes in education are reflected in the transformation of the students' position, the student is now in the role of a client in many respects, and they also remain members of the academic community. The reform also includes the support for the diversification of the programs offered, which extend professional-oriented programs with an emphasis on direct practical experience. "A key goal of the university education is a necessity to help students learn responsibility for aspects of their own learning" (Haigh, 1994).

### 3. Problem Solution

Although university graduates are doing better on the labour market than their less qualified peers, as shown by the previous results, higher education systems must provide students with education that prepares them for the changing future. "The world is changing. Globalization is impacting all of us and changing the way we interact in the labour market. The skills needed in today's workplace are different than what was needed several years ago" (Melecký, 2016). The development of an appropriate offer of higher education becomes the priority, which is based on the establishment of links between HEIs and the professional sphere with a focus not merely on teacher-classroom practices but towards student-oriented models and practical approaches in the form of active learning, which brings a necessity reflected in the combination of theory and practice. The aim is to meet the ever-increasing demand for

higher-skilled workers in direct continuity with the corresponding level of key competencies of university graduates required by employers, from whether the commercial or non-commercial sphere.

We are talking about the development of *key competencies* representing “the sum of knowledge, skills, abilities, attitudes, and values necessary for the personal development and empowerment of each member of the society” (Belz and Siegrist, 2001) which contribute to the education of an individual, to their satisfied and successful life, and also to strengthen the functions of the civil society. An overview of the *secondary (industry) sector* employers’ needs has shown that the first three ranks of the focus of universities should primarily be: to bear the responsibility (56.4%), **the art of dealing with people** (54.9%), and foreign language skills (51.8%); whereas as viewed in terms of job titles they then prefer (absolutely necessary/important): to bear responsibility (91.6%/8.4%), decision-making abilities (85.7%/14.0%), and the ability to deal with the problem (90.5%/9.1%) (Doležalová and Vojtěch, 2013). In the case of employers in the *tertiary (service) sector* and the *quaternary (knowledge) sector*, the prevailing consensus prevails in the preference of the first three competencies: **the ability to deal with people** (53.7%; 61.27%), to take responsibility (48.9%; 61.4%), and the ability to deal with stress (48.2%; 58.0%). In terms of employment: mastering information processing (76.6%/23.4%), IT skills (80.4% /19.6%), and **the ability to deal with people** (83.7%/16.3%) are the first and foremost competencies; in the *quaternary sector* it then is: **communication skills** (87.2%/12.2%), reading and comprehension to work instructions (85.9% /13%), and the problem-solving ability (84.1% /15.6%) (Doležalová, 2014, 2014). The results of the IBM CEO Study, which focused its attention on the opinions of more than 1,700 CEOs from 64 countries, bring some interesting findings on the issue. From the perspective of their positions, they considered the overriding key skills in the overwhelming majority to be: **teamwork/cooperation** (75%), **communication/communication skills** (67%), **creativity** (61%), and **flexibility** (61%) (Jaké vlastnosti si cení CEO? (What qualities are the CEO's worth?), 2013), which-as well as the former key skills preferences-fully corresponds with the research surveys conducted at UMC FMC TBU (see Table 3).

### 3.1 Academic Sphere and Non-profit Sector

However, the non-profit sector is also a significant potential in the capacity of university students and graduates for the employment within the labour market, they are especially non-governmental non-profit organizations (NGOs). These are still severely affected by the shortage of workers, whether permanent or external employees (e.g. fundraisers, marketing specialists, etc.), volunteers, trainees and interns. The problem is the lack of marketing professionals, not to mention entire marketing departments. “It is no coincidence that implementation of innovation into business is put to the forefront more often in continuity with marketing, thus representing a major rival in the competitive battlefield, in both the profit sector as well as more prominently in the non-profit sector” (Juříková, 2013). This unchanging situation reflects especially in the persistent ineffective communication of missions and activities, and at the same time in the longstanding insufficient innovative and marketing thinking, as evidenced by the research carried out since 2012 at the Institute of Marketing Communications of the Faculty of Multimedia Communications at Tomas Bata Zlín University (IMC FMC TBU) when at the beginning of the set line stood the project of *Co-operation of Higher Education, Public Administration, Business and Non-Profit Sector for the Socio-Economic Development of the Region (Kooperace vysokého školství, veřejné správy, podnikatelského a neziskového sektoru pro socioekonomický rozvoj regionu*, 2012), fulfilling its essence within the Zlín Region (Göttlichová, 2012).

The solutions addressing the problem also contributed to the results of the research carried out in two phases (the contemporary marketing communications standards of NGOs, and the preference of cooperation forms with the reflection of the requirements for key competencies), with orientation both to the students of the university (120 students of FMC FMC TBU, bachelor study), as well as to the NGOs in the Zlín Region (232 NGOs) through a questionnaire survey.

**Table 3: Preference of Key Competencies in Terms of NGOs and University Students**

Key competencies/preference	NGO		Students	
	%	ranking	%	ranking
<b>Communication skills</b>	<b>81.0</b>	<b>1</b>	<b>77.5</b>	<b>1</b>
<b>Capability of problem-solving</b>	<b>75.9</b>	<b>2</b>	<b>55.0</b>	<b>2</b>
<b>Team working skills</b>	<b>63.8</b>	<b>3</b>	<b>37.5</b>	<b>3</b>
Willingness to learn	58.6	4	12.5	7/8
To take responsibility	53.4	5	30.0	5
Mastering information processing	48.4	6/7	22.5	6
Adaptability and flexibility	48.3	6/7	32.5	4
Ability to make decisions	43.1	8	12.5	7/8
IT skills	32.8	9	2.5	10–13
Reading and comprehension to work instructions	19.0	10/11	7.5	9
Leadership skills	19.0	10/11	2.5	10–13
Foreign language knowledge	12.1	12	2.5	10–13
Work with number in the working process	69	13	2.5	10–13

Source: author's elaboration, 2018

From the point of view of the required competencies (Table 3), the two target groups explicitly preferred the first three entries: **communication skills**, **capability of problem-solving**, and **team working skills**. The specificity that corresponds directly to the NGOs missions is the extension of the list of competencies required by NGOs (33.3% of NGOs perceive the list as complete), whether it is “the respect for the other, ethical and moral stability, etc.” Communication skills (72.5%), the capability of problem-solving (52.5%), and teamwork and the willingness to work represented by the same percentage (32.5%) were claimed by the students in their responses to be the list of three acquired or improved skills and abilities throughout their studies, which the students regard to be the most beneficial. On the other hand, among the competencies which students still experience to be inadequately managed, the respondents assigned to: working with numbers in the working process (65%), IT skills (42.5%), together with proficiency in foreign languages (42.5%).

The confirmation of the growing interest of NGOs in expanding cooperation with the FMC listeners (69%) with a preference for the cooperation in the field of marketing and promotion (75%) represents a significant potential not only in the increasing possibilities of employing the younger generation on the labour market also in the future, but also in strengthening the competitiveness of NGOs, because as the results of the survey show, although there is a gradual improvement in the area of marketing and promotion (29.3% of NGOs confirmed employing a qualified specialist, and 3.4% even facilitating a special marketing department),

51.7% of NGOs confirmed that marketing and promotion are addressed by any of their employees (44.9%), (persistent beliefs of) the “redundancy” of a professional marketer (30.6%), and (gradually decreasing percentage of) human resources shortages (14.3%). The students perceive the state of communication of NGOs to be unconsolidated (47.5%), which is associated with significant deficiencies. They clearly identify with the possibility of the necessary cooperation (50.0%), especially in the area of marketing and promotion in the phase of preparation and realization of projects in continuity with the creativity reflected in the marketing innovations of the organizations. They perceive NGOs, for example, “as entities involved in solving social issues with the development of the plurality of opinions on solutions of such issues, promoting a good cause, empowering citizens to feel responsible for themselves and their surroundings, reinforcing the feeling of cohesion with the cohesion and community, increasing the sense of belonging to a specific municipality, community, or region.”

The acquired knowledge becomes the basis for a special course called *Projects of Non-Profit Organizations (PNPO)*. The course content is an extension of the reciprocal cooperation with NGOs focusing on the elaboration of NGO projects in the contemporary social context of the partner environment, while the emphasis is put on a system theoretical solution of all phases of the marketing process, as well as their practical implementations. It is purely a practical subject where students learn about the work of regional NGOs in practice, not just on a theoretical basis. Students will learn the specifics of teamwork, they will learn to discuss, process, and prepare written documentation, learn about their own abilities and the importance in searching for a proper approach to their solutions, planning, realization and evaluation of the efficiency of the output (Göttlichová, 2015). “They are aware of the necessity of professional communication based on the accurate definition of communication goals based on marketing goals” (Šula, 2017). The benefit is not only to deepen their interest in the region (with possible future profiling on non-commercial marketing communications), but also to try to realize a project with everything that project management involves.

#### 4. Conclusion

As suggested in the title of the article, the aim of the paper was not only to document the current state of higher education in the Czech Republic in continuity with the applicability of current graduates in the labour market, but also to point out the persisting need for improving the quality of tertiary education in relation to the needs of the labour market. Whether we are talking about the key message of “the White Paper on the Future of Europe”, “Investing in Europe’s Youth”, and “the New Skills Agenda for Europe”, as well as the EU’s “pillar of social rights”, and “the reflection paper on harnessing globalisation” – all of them identify education and the necessity of matching skills as a priority in the process for Europe’s better future. The demand for highly qualified and socially committed people has not only been increasing, however, by 2025 half of all jobs will have been requiring high qualifications, but at the same time they are undergoing changes (COM (2017) final, 2017). Although career opportunities ultimately depend on employers and the wider economy, education and training still play a key role. Satisfying the increasingly intense demand for higher skilled workers directly corresponds to the level of key competencies required by employers in university graduates, whether we are speaking about commercial or non-commercial entities, as the results of the presented investigations showed. Graduates thus have to be able to clearly demonstrate the basic knowledge and skills necessary for their employability in practical business, which means the turnover in the persistent tendency of the current declining level of their practical readiness for particular jobs. Higher education institutions have an obligation to ensure that

the content of education is up-to-date, to provide relevant study programs in areas with skill shortages, while developing learning and teaching methods to enable students to acquire the necessary broad and deep skills. It is more than obvious that a high-quality workforce able to participate in the production of top-notch and innovative goods and services is a success in the existing competitive environment of the world market. The aim of the paper was also to show how the non-profit sector represents a significant potential in the possibility of professional involvement of university students and graduates, especially then that NGOs still face the lack of professional staff, presenting one of the possible ways to solve the current poor state in continuity with the regional development. The priority is to form such a curriculum which would be based on the application of key competencies within the educational process, and on the requirements coming from the practice and reflecting in learning innovations.

e-mail: [aleksandra.grabowska@ue.katowice.pl](mailto:aleksandra.grabowska@ue.katowice.pl)

### **Abstract**

*Social Capital defined as „networks together with shared norms, values and understandings that facilitate co-operation within or among groups” (OECD, 2001) is now perceived by economists as one of important resources in economic and social processes (also in integration processes). It influences on the ability of market entities to in the area of cooperation with each other and creation their competitiveness. The level of Social Capital and its role is diversified among European Countries and their Regions i.e. in the Scandinavian Countries the level of Social Capital is higher than in the South or Central Europe. The paper is divided into two parts: a theoretical and an empirical one. In the theoretical part the main purpose is to identify the most crucial issues related to social capital, its role in economic and social development as well as factors that have impact on it. The empirical part presents some aspects of social capital in European Countries and its role in integration processes.*

**Keywords:** *economic development, economic systems, European integration processes, transitional economics, welfare*

### **1. Introduction (Social Capital)**

In response to occurring questions about the sources of rationality of conduct in contemporary management processes, the ability of entities establishing relationships to continuously overcome barriers and expand the limits in the process of adaptation to changing living conditions is often indicated (Czapiński, 2015, p. 54). This ability is the cornerstone of emerging social capital that is one of the most important resources of society's wealth and management effectiveness of individuals nowadays. Social capital is the subject of many discussions conducted in the literature of the subject. J. Coleman's, F. Fukuyama's, P. Bourdieu's or R. Putnam's proposals are most frequently mentioned in the literature. (comp. Tab.1)

It results from definitions presented by the authors that social capital is a multidimensional notion. It can be discussed from the perspective of an individual, their resources and possibilities to establish relationships with other individuals, as well as entire communities, their resources and possibilities to establish internal relationships between their members, and external ones - with other communities (Grabowska-Powaga, 2016).

**Table 1: Selected Definitions of Social Capital**

<b>Author</b>	<b>Year</b>	<b>Definition</b>
<b>P. Bourdieu</b>	1986	Social capital is the aggregate of the actual or potential resources which are linked to possession of a durable network of more or less institutionalized relationships of mutual acquaintance and recognition – or in other words, to membership in a group – which provides each of its members with the backing of the collectivity-owned capital, a ‘credential’ which entitles them to credit, in the various senses of the word”.
<b>R. Putnam</b>	1995	„Social capital refers to such features of social organization as networks, norms, and social trust that may increase society efficiency while facilitating coordination and cooperation. Similarly to other forms of capital, social capital is productive because it enables achievement of some goals that would not have been achieved without it [...]. For example, a group, the members of which show that they are trustworthy and who trust others, can achieve considerably more than a comparable group in which there is no trust [...] Spontaneous cooperation is easier thanks to social capital”.
<b>J.S. Coleman</b>	1998	„A group of social entities that have two characteristics in common: they all consist of some aspect of social structure and they facilitate certain shared actions of individuals and entire institutions within the structure. Similarly to other forms of capital, social capital is productive – it enables implementation of some goals that would not have been achieved in its absence”
<b>F. Fukuyama</b>	2001	„Social capital is objectified, informal norm that promotes cooperation between two entities or their larger number... Social capital is vital for the efficient functioning of modern economies, and is the sine qua non of stable liberal democracy”

Source: Own study

Definitions presented in the literature of the subject, describe social capital as a resource. Beside traditional production factors such as land and labour, as well as contemporary ones, for example knowledge, social capital is becoming an economic resource for entities in market processes. Within social capital approached as a resource, several components are distinguished, including structural capital (networks of relationships between entities), formal institutions, such as legal norms regulating interactions between people, their rights to other resources, and other informal institutions such as trust, shared traditions, beliefs and attitudes. (Matysiak, 1999, pp. 60-61). In W. Eucken’s view, both formal and informal institutions constitute the “rules of the game” (Eucken, 2005, p.161). They control every market mechanism and are the subject of order enforcement in each economic system. There are diverse forms of social capital. However, it must be remembered that at the basis of all its types, regardless of the criterion of social capital division, there are expectations of entities entering relationships that should lead to behaviours aiming at establishment of cooperation. Division into relationship capital and institutional capital is one of suggestions found in the literature. Transaction is the basis for collective activity in institutional capital, whereas in relationship capital, it is the relationship. The roles performed by the entities on market, procedures and principles are the sources of motivation in behaviours of individuals shaping institutional capital, whereas for entities creating relationship capital, the values, beliefs and shared ideologies are the source of motivation. This heterogeneity of both capitals also refers

to behaviours of individuals – in institutional capital they strive for maximisation of their behaviour, in relationship capital they are adequately adjusted to situations in which relationships are established. Therefore, an assumption can be adopted that relationship capital is built on foundation of the institution with predominant informal institutions and institutional capital is primarily shaped by formal institutions. Societies in which both strong institutional capital as well as strong relationship capital occur, are characterised by prominent level of social capital. On the other hand, deficient institutional capital and relationship capital imply the lack of social capital expressed by entities in behaviours devoid of moral principles. Strong organisations are an example of poor relationship capital and strong institutional capital, whereas traditional associations are an example of strong relationship capital and poor institutional capital. Another classification of social capital found in the literature is the one that divides it by the level of its formalisation. Formal and informal social capital are distinguished. Formal capital can be characterised by means of such rates as the level of social trust or the level of altruism in a given society. Formalised social capital helps to shape stronger, more efficient informal relationship networks among the members, and to strengthen cooperation and trust in a given society. Formal organisation acting for formation of civil society can be an example of formal capital. On the other hand, informal social capital is expressed through informal institutions (e.g. relationships between people). This capital is shaped by them either while considering rational behaviour and benefits resulting from establishment of relations, or regarding subjective willingness to have close relationships and establish friendship. Trust of individuals in each other is an example of informal capital (Pichler, Wallace, 2007, pp.423-424) In both classifications some similarities can be observed. Similarly to informal capital, relationship capital is built on the foundation of informal institutions, whereas both informal as well as formal institutions are the basis for establishment of institutional capital and formal capital. Propositions of identification of diverse forms of social capital presented before, do not exhaust classifications presented in the literature of the subject. However, they confirm the thesis about the complex character of the studied issue. Classification of social capital division into formal and informal allowed for making an attempt to describe the level of social capital in the European countries in further part of the paper. Social capital performs a vital role in socio-economic processes as well as in integration processes within communities (e.g. European Community). Consequences of the occurrence of social capital imply both its positive and negative impact on management processes. Thus, just like every resource applied in market processes, social capital has its advantages and disadvantages. Both positive and negative qualities resulting from social capital can be analysed from the point of view of an individual, entire group / community in which a given individual functions, and globally. Social capital is not only a resource of an individual or a group, but it is also perceived as public good. It is a determinant of development, progress, economic growth, as well as a prerequisite for stable liberal democracy. It also implies a series of economic profits (including reduction of risk and transactional costs, impact on contractors' reliability, influence on the growth of innovativeness of communities and organisation on market among others, that are frequently emphasised by the authors), and social benefits (i.e. growth of solidarity between managing entities, among others). On the other hand, restricting the access to resources to people from the outside of the community and intense social control that limits autonomy of individuals and forces independent people either to accept standards functioning in a group, or to leave the group can be its defect.

Due to formal demands, analysed aspects concerning social capital constitute only a part of discussed issue. However, even in such a concise approach they show that it is a crucial resource in economic and social processes and can perform a crucial role in integration processes.

## 2. Social Capital in Europe – Selected Issues

Social capital is a multi-dimensional phenomenon, and a research issue of a qualitative nature rather than quantitative. The authors have made attempts at quantification of social capital while applying various measures for this purpose. The level of trust that is often also applied as an index in research concerning the issue under consideration, is one of the expressions of social capital (Knack & Keefer, 1997, pp.1251-88; Paxton 1999, pp.88-127; Beugelsdijk&Van Schaik, 2005, pp.301-2) (comp. graph 1).

**Figure 1: Level of Trust Towards Each Other in the World in 2014**

Source: Trust, World Values Survey, 2014, online on [www.ourworldindata.org](http://www.ourworldindata.org)

There is a correlation between prominent level of trust of citizens of a given state or region and development of social capital. Considering the subject analysed in this paper, it can be stated that the level of both the trust among the citizens of Europe and the level of social capital in the countries under consideration is diversified. Thanks to secondary research, conducted regularly by world institutions (including Worldbank and Eurostat), it is possible to determine the level of trust of the citizens of Europe towards each other and towards formal institutions (such as legal or political system). (comp. tab. 2)

Scandinavian countries are characterised by prominent level of trust of people towards each other (Denmark inhabitants are characterised by the highest level of trust), and social trust towards formal institutions, e.g. in legal system (the highest in Denmark) or political system (the highest in Finland). On the basis of presented trust index, and while considering other rates (like for example Global Competitiveness Index), it can be concluded that in Scandinavian countries the level of social capital in all its forms is the highest in Europe.

**Table 2: Trust in Different Regions of Europe**

Country	Trust in others	Trust in formal institutions

Source: Eurostat: Subjective well-being and trust items, by country, 2013

<sup>6</sup> On a scale of 0 to 10 where 0 corresponds to the lowest and 10 to the highest level of trust

On the other hand, the countries of Western Europe and British Isles are characterised by lower level of trust and social capital than Scandinavian countries. A comparable lowest level of trust in people in Europe is observed in the countries of southern Europe, Central and Eastern Europe, in the Baltic States and in the Balkans (Bulgaria is in the last place). They are characterised by both lower level of trust as well as lower level of formalised social capital in comparison to other European states. Residents of Southern Europe have the least trust in formal institutions (the lowest level of trust in political system is presented by residents of Portugal). On the other hand, residents of Slovenia have the least trust in legal system. (Pichler, Wallace, 2007, p.426). (comp. tab.3)

**Table 3: Formal and Informal Institutions Creating Social Capital in European Countries**

Regions of Europe	Trust	Formal Social Capital	Informal Social Capital
Nordic Countries	high	high	high
Western-Central Europe and British Irish	average	middle	high
Southern Europe	average	low	high
Eastern-Central, Baltic, Balkan	Average but lower than it other European regions	low	Rather low but with tendency do change (is regarded as important factor in human relations)

Source: own study based on i.a. Pichler, Wallace, 2007, p.426

The low level of social capital in the countries of Central and Eastern Europe, in the Balkan and Baltic States is also proved by other indices and rates, including for example relatively low level of innovativeness (comp. The Global; Competitiveness Report 2016-2017, among others), as well as the level of democracy and civil society.

### 3. Social Capital and Integration Processes

Cooperation (consisting in creation of common economic and foreign policy, security zone or judiciary among others) is the basis of integration processes the goal of which is strengthening mutual relationships and exchange between EU countries. (comp. Mynarzová, M. a Kaňa R., pp. 501-505 among others). This cooperation is more effective if the level of social capital among partners participating in cooperation is higher. Integration processes must include not only integration of market mechanisms existing in individual societies, but also consolidation of institutional architecture (mainly formal institutions). This brings some difficulties because evolution of these institutions proceeded in various countries in different political and economic circumstances. Therefore, the level of both formal and informal institutions, as well as the level of social capital is diversified in Europe. The quality of formal institutions (legal and political institutions) and condition of economy can be indicated as factors determining diverse level of trust and social capital in European countries. These determinants are often significant in subjective feeling of security and stability of the citizens of the European states whereas the qualities that are results of these determinants, including quality of life or optimism among citizens, are often the fundament for creation or complete lack of both the trust as well as social capital (M. Lissowska, 2013, p.191). These reasons explain why Scandinavians are characterised by the highest level of trust and social capital. The most important determinants in these countries include citizen-friendly welfare state, low income inequalities (the level of Gini coefficient measuring inequalities lowest in comparison with other European states), equality (similar chances of men and women in political and economic

life), equal opportunities, low level of corruption, and high level of civil society, measured by participation of citizens in social organisations (compare H. Domański, 2014, [www.wyborcza.pl](http://www.wyborcza.pl)) On the other hand, low social capital in the countries of Central and Eastern Europe results both from historical and cultural determinants as well as economic circumstances. A considerable social cost of transformation processes expressed in pauperisation of large groups of communities and rising wealth of others has not been conducive to development of cooperation and formation of social capital in these countries. The period of economic and political transformation in analysed countries brought destruction of existing institutions. After 1989 formal institutions were implemented rather efficiently, whereas changes in informal institutions were not, and still have not been easy to implement. Attitudes, habits and ways of thinking among citizens acquired in long-lasting socio-political and economic processes were not easy to be adapted to new surrounding political and economic circumstances (A. Grabowska, A. Jakubowska, 2016, s.17). Deep crisis of political debate dominated by political disputes that are additionally fuelled by media may also be one of the reasons for lower level of social trust of the citizens of Central and Eastern Europe, Balkans and Baltic states towards formal institutions. The lack of trust in political sphere is in turn one of the barriers to creation of efficient state that would ensure appropriate institutional infrastructure. Therefore, a thesis can be formulated that the period of transformation did not create institutional infrastructure that would be conducive to formation of social capital in the states that experienced both political and market changes.

#### 4. Conclusion

Emergence of social capital implies a series of external results. The higher the social capital, the more external results can be observed, and the more external results are positive, the more benefits for socio-economic development of a specific community or society can be seen. Europe and integration processes among its members can be indicated here as the example of such a community. Therefore, it can be assumed that there is some feedback between social capital and integration processes. Social capital is a determinant affecting integration processes which also offer a chance for the development and integration of informal and formal institutions in Europe. Thus, integration processes can become an opportunity for growth of social capital in the countries characterised by its low level.

## **Transmission of Interest Rates: EU Leader Versus his Czech Neighbour**

**Jiří Gregor**

VŠB – Technical University of Ostrava  
Economic Faculty, Department of Economics  
Sokolská tř. 33, Ostrava, 70200  
Czech Republic  
e-mail: jiri.gregor@vsb.cz

### **Abstract**

*Interest rate transmission reflects the efficiency of monetary policy. The adequate reaction of commercial banks to changes in the main monetary policy rate is highly important for central bankers. The paper focuses on the interest rate transmission in the Czech Republic and Germany during the period from January 2004 to November 2017. As an analytic tool, I use ARDL and NARDL modelling approach. The results show that in the Czech Republic, the interest rate pass-through is mostly complete for mortgage, SME and corporate lending rates. In Germany, however, I could not confirm any significant long run relationship between the monetary policy rate and commercial bank lending rates. The exception is the interest rate for consumer loans for which I found a weak long-run pass-through. Testing the asymmetry of interest rate pass-through, the results reveal that banks in the Czech Republic react stronger to contractionary monetary policy than expansionary, especially so in case of the mortgage loans' segment.*

**Keywords:** ARDL model, bank lending rates, CNB policy rate, ECB policy rate, NARDL model, transmission of interest rates

**JEL Classification:** E43, E52, C22

### **1. Introduction**

The interest rate channel of monetary policy is highly important channel through which monetary policy leaders affect the credit cycle, inflation and thus the whole economy. Well-functioning transmission process determine the efficiency of monetary policy, particularly in the regime of inflation targeting. The aim of the paper is to examine and compare the interest rate pass-through in the Czech Republic and Germany from January 2004 to November 2017. Moreover, I test the possibilities of an asymmetric pricing behaviour of commercial banks in both economies. For the analysis, I consider four types of lending rates: consumer, mortgage, small and medium enterprises (SME), and corporate lending rates.

To my best knowledge, I am the first one who test possible asymmetries for the interest rate pass-through in the Czech Republic. Other studies focusing on the transmission of interest rates in the Czech Republic such as Horváth and Podpiera (2012), Babecká-Kucharčuková et al. (2013) or Havranek et al. (2016) focus primarily on the symmetric interest rate transmission.

Using the ARDL and NARDL approach, I find substantial asymmetry of interest rates for mortgages and corporate loans in the Czech Republic. On the contrary, German banks does not exhibit such a behaviour. In their case, there exist only minor downward asymmetry for SME lending rates, which is in direct contrast with the Czech baking sector where I confirm a strong upward asymmetry. Moreover, in both economies, lending rates for non-financial sector

react faster and stronger on monetary policy rate changes than household lending rates. Especially interest rates for consumer loans show weak transmission (Germany) or no transmission at all (Czech Republic).

Searching through the empirical literature, I have found that the interest rate pass-through shows signs of heterogeneity across countries and across different loan products. For instance, Égert et al. (2007) detect stronger pass-through in five Central and Eastern European countries than in Germany or Austria. Further, Holton and d'Acri (2015) reveal substantial heterogeneity among euro area banks using the error correction model. Focusing at different loan products, the empirical literature mostly confirm a higher interest rate pass-through for non-financial companies than for household sector (Égert et al. 2007; Belke et al., 2013; Mihaylov, 2016).

During the last decade, with a development of modern econometric methods, the analysis of the interest rate pass-through increasingly focuses on possible non-linearities (asymmetries). Hence, the asymmetric response to monetary policy rate shifts started to be confirmed largely around the world. For instance, Wang and Lee (2009) using TAR and MTAR models reveal asymmetry for several Asian countries such as Hong Kong, Japan, Korea, Indonesia, Malaysia, Thailand, Philippines and Taiwan. Apergis and Cooray (2015) confirm positive asymmetry of lending rates in the UK, US and Australia, or further on, Kleimeier and Sander (2006) find asymmetry in bank pricing behaviour for most of the EMU countries. Considering different loan products, the asymmetry is mostly proofed for mortgages lending rates. To demonstrate, Becker et al. (2012) find a significant asymmetry for mortgage rates in the UK showing that banks react more on monetary policy rate increasing than decreasing. Payne (2006-07) shows the similar results testing the response of fixed mortgages in the US.

## **2. Methodology**

### **2.1 Data**

For the analysis of interest rate pass-through in the Czech Republic and Germany, I distinguish among four categories of interest rates: consumer, mortgages, SME and large corporate loans' rates. While the SME loans are defined as loans to non-financial corporation of up to 1 million EUR, the large corporate loans are defined as loans to non-financial corporation of over 1 million EUR. I use only the time series for new loans. Thus, the interest rates on revolving or outstanding loans are not considered in the analysis. As a source of data served the database of the European Central Bank. The database offers harmonized dataset, which enables me to compare the transmission process between the two countries.

Since the intention is to examine possible asymmetries in the interest rate pass-through, it is important to consider the whole interest rate cycle. The dataset for this paper covers the period from January 2014 to November 2017. For the Czech Republic, the main monetary policy rate has begun to rise in the mid of 2017. Therefore, the interest rate cycle is almost complete. For Germany, however, the policy rate still lies on its zero lower bound (ZLB), which prevents from the completion of the cycle. Figure A1 (in the appendix) displays each category of lending rates against the main monetary policy rate. In addition, table A1 (in the appendix) describes used time series and table A2 (in the appendix) shows descriptive statistics of time series.

### **2.2 Modelling Approach**

For the purpose of estimation, I use the autoregressive distributed lag modelling approach (ARDL) proposed by Pesaran et al. (2001) and its non-linear version the non-linear autoregressive lag modelling approach (NARDL) proposed by Shin et al. (2013). First, to

describe the ARDL model, let's assume an existing long-run cointegration relationship between the main monetary policy rate and a commercial banks' lending rate:

$$br_t = \alpha + \beta mpr_t + \varepsilon_t, \quad (1)$$

where  $br_t$  is commercial bank lending rate,  $\alpha$  shows interest rate spread,  $mpr_t$  is the monetary policy rate, and  $\varepsilon_t$  is the error term. Most importantly, the coefficient  $\beta$  represents the interest rate pass-through. Assuming optimal conditions (perfectly competitive market),  $\beta$  would be equal to one showing complete pass-through. Optimal conditions, however, are rarely met. Therefore, commercial banks may react less than proportionally on the monetary policy shifts and one would talk about incomplete pass-through ( $\beta < 1$ ), or banks may respond more than proportionally on the monetary policy rate changes showing overshooting of the policy rate shifts ( $\beta > 1$ ).

The paper by Pesaran and Shin (1999) shows that the ARDL model exhibits consistency even if the used variables are first order integrated, I(1). Hence, it is possible to estimate the ARDL model using stationary as well as non-stationary time series. Nevertheless, the use of second order integrated time series is not recommended.

The basic ARDL ( $p, q$ ) model can be written as follow:

$$br_t = \delta + \sum_{i=1}^p \mu_i br_{t-i} + \sum_{j=0}^q \psi_j mpr_{t-j} + \varepsilon_t, \quad (2)$$

where symbols  $p$  and  $q$  determine the lag structure of the model. The equation (2) can be further rewritten in the error correction form:

$$\Delta br_t = \sum_{i=1}^{p-1} \mu_i^* \Delta br_{t-i} + \sum_{j=0}^{q-1} \psi_j^* \Delta mpr_{t-j} + \lambda ECT_{t-1} + \varepsilon_t \quad (3)$$

where  $ECT_{t-1}$  is the error correction term defined as:

$$ECT_{t-1} = (br_{t-1} - \alpha - \beta mpr_{t-1}). \quad (4)$$

From the equation (2) – (4), one can define the coefficient of speed of adjustment  $\lambda$ , and the long-run coefficients  $\alpha$  and  $\beta$ :

$$\lambda = -(1 - \sum_{i=1}^p \mu_i), \alpha = \frac{\delta}{(1 - \sum_{i=1}^p \mu_i)}, \beta = \frac{\sum_{j=0}^q \psi_j}{(1 - \sum_{i=1}^p \mu_i)}. \quad (5)$$

If the model is dynamically stable and thus restores to its long-run equilibrium, the coefficient  $\mu_i$  (in absolute term) must be lower than one,  $|\mu_i| < 1$ . In such as circumstances, the long-run relationship between variables exists and it is captured by  $\alpha$  and  $\beta$ . Moreover, the coefficient  $\lambda$  represents the speed of adjustment. Higher  $\lambda$  (in absolute term), assuming  $|\mu_i| < 1$ , means that the model restores faster towards its long-run equilibrium. Coefficients  $\mu^*$  and  $\psi^*$  in the equation (3) capture the short run dynamic effect.

The crucial task, for the ARDL modelling approach, is the appropriate choice of lag-length structure. For this purpose, one can use the Schwarz bayesian criterion (BC) or Akaike information criterion (AIC). Pesaran and Shin (1999) employing Monte Carlo experiments show that BC exhibits slightly better results. Hence, the BC represents the preferred criterion in this paper.

Pesaran et al. (2001) further extended the theoretical approach and proposed bounds testing procedure, which allows to examine the relationship between variables in levels regardless of whether the used variables are I(0), I(1) or mutually cointegrated. Moreover, they provided sets of bounds critical values for bounds testing procedure. The testing procedure compares the estimated F-statistic or Wald statistics with the bounds critical values. When the estimated F-statistic (Wald statistic) lies out of the critical bounds values, one can either confirm or reject the long-run level relationship between variables. In situations, however, when the F-statistic

(Wald statistic) falls into the interval of bounds critical values, the relationship between variables is inconclusive.

Considering the problem of asymmetric behaviour between variables, Shin et al. (2014) developed the Non-linear autoregressive distributed lag modelling approach (NARDL), which is based on the ARDL approach. Therefore, it allows to examine asymmetries in the short-run as well as in the long-run.

To explain NARDL model, I rewrite the basic long-run cointegration relationship from equation (1) into the non-linear form (excluding constant):

$$br_t = \beta^+ mpr_t^+ + \beta^- mpr_t^- + \epsilon_t. \quad (6)$$

One can see that the variable  $mpr_t$  is decomposed as  $mpr_t = mpr_0 + mpr_t^+ + mpr_t^-$ , where  $mpr_t^+$  and  $mpr_t^-$  are describe as a sum of positive and negative changes:  $mpr_t^+ = \sum_{j=1}^t \Delta mpr_j^+$  and  $mpr_t^- = \sum_{j=1}^t \Delta mpr_j^-$ , and  $mpr_0$  represents threshold zero value.

Now, I can define the NARDL( $p, q$ ) model:

$$br_t = \sum_{i=1}^p \mu_i br_{t-i} + \sum_{j=0}^q (\psi_j^+ mpr_{t-j}^+ + \psi_j^- mpr_{t-j}^-) + \epsilon_t. \quad (7)$$

Similarly, as in case of ARDL model, the equation (7) can be rewritten into the error correction form:

$$\Delta br_t = \sum_{i=1}^{p-1} \mu_i^* \Delta br_{t-i} + \sum_{j=0}^{q-1} (\psi_j^{*+} \Delta mpr_{t-j}^+ + \psi_j^{*-} \Delta mpr_{t-j}^-) + \lambda ECT_{t-1} + \epsilon_t, \quad (8)$$

where

$$ECT_{t-1} = (br_{t-1} - \beta^+ mpr_{t-1}^+ - \beta^- mpr_{t-1}^-). \quad (9)$$

Substituting the equation (9) into (8), I obtain following equation:

$$\Delta br_t = \sum_{i=1}^{p-1} \mu_i^* \Delta br_{t-i} + \sum_{j=0}^{q-1} (\psi_j^{*+} \Delta mpr_{t-j}^+ + \psi_j^{*-} \Delta mpr_{t-j}^-) + \lambda (br_{t-1} - \beta^+ mpr_{t-1}^+ - \beta^- mpr_{t-1}^-) + \epsilon_t, \quad (10)$$

where

$$\lambda = -(1 - \sum_{i=1}^p \mu_i), \beta^+ = \frac{\sum_{j=0}^q \psi_j^+}{(1 - \sum_{i=1}^p \mu_i)}, \beta^- = \frac{\sum_{j=0}^q \psi_j^-}{(1 - \sum_{i=1}^p \mu_i)}. \quad (11)$$

Since the NARDL model is linear in all parameters, one can estimate the model using the standard OLS. Shin et al. (2014) also developed the Bounds testing procedure, which allows to test the existence of long-run relationship between variables. The testing procedure is based on t- and F-statistic, where the null for t-statistic is  $\lambda = 0$  against alternative  $\lambda < 0$  (negative coefficient implies restoring of the equilibrium) and the null of F-statistic is:  $\lambda = \psi^+ = \psi^- = 0$ .

### 3. Estimation Results

In this section, I show the results of estimation for the ARDL as well as for the NARDL approach. First, the linear model for the Czech Republic (Table 1) reveals that between consumer lending rate and monetary policy rate is no evident long-run co-integration relationship. Thus, consumer lending rates react on different factors than monetary policy stance. Further, mortgage rates show signs of over-adjustment in the long run. It indicates that mortgage market strongly responds on monetary policy rate changes with tendencies of overshooting the movements in policy rate. In addition, I detect complete interest rate pass-through for SME lending rates and nearly complete for corporate lending rates. According to the ARDL bounds test, however, I cannot confirm a long-run relationship between corporate

rates and the monetary policy rate. The estimated critical values of the bounds test fall into inconclusive region. Hence, it need further co-integration tests for the verification of results.

In the short run, the interest rate pass-through is much weaker. While the lending rates for household sector react in very limited extend, the lending rates for non-financial companies show three times larger pass-through. Nevertheless, even for the non-financial sector, the size of the pass-through is still limited. The speed of adjustment suggests that interest rates for households' loans respond notably less on the shock from the long-term equilibrium than interest rates on loans for non-financial companies.

Source: Author's calculations

In case of Germany (Table 2), the long run co-integration relationship could be confirm only for consumer lending rates. The strength of the pass-through, however, reaches only to 0.18, which suggests a weak and incomplete transmission. For mortgage, SME and corporate lending rates, the ARDL bounds test fails to reject the null hypothesis of non-existing long run co-integration relationship. Therefore, the discussion of the results for those lending rates is irrelevant.

Source: Author's calculations

Using the NARDL approach, I confirm substantial asymmetry for the transmission of interest rates for mortgages, SME and corporate loans in the Czech Republic (Table 3). While the mortgage and corporate lending rates are asymmetric upward, the SME lending rate shows the opposite behaviour. Therefore, considering mortgage and corporate loan segment, commercial banks react more sensitively on monetary policy tightening than easing. For the consumer lending rates, however, the NARDL bounds test again rejects the long-run co-integration relationship. Thus, it confirms results of the linear ARDL model. Apparently, monetary policy rate changes do not affect the consumer lending rates.

The short run pass-through copies the results of the long run pass through but at much lower level. The strongest reaction exhibits corporate lending rates. Similarly, the speed of adjustment confirms that corporate lending rates respond faster on the shock from the long-run equilibrium than others lending rates.

The results of the non-linear model for Germany show a complete interest rate pass-through for corporate lending rates without any sign of asymmetry (Table 4). Thus, commercial banks completely react on the monetary policy rate shift regardless of the direction of a shift. For the SME lending rates, the model reveals a minor downward asymmetry. More precisely, there is a stronger response on decreasing of the monetary policy rate than on increasing. The NARDL bounds test shows inconclusive results for the long-run co-integration relationship between monetary policy rate and mortgage lending rate. Therefore, this result needs to be further examined in future research by other co-integration techniques. For the consumer lending rates, I find a significant asymmetry. Apparently, considering consumer rates, German commercial banks react on monetary policy easing but not on tightening, which demonstrates an upward inelasticity.

Source: Author's calculations

In the short run, I could not confirm any significant asymmetric behaviour. As in case of Czech Republic, the corporate lending rates react stronger in compare to others lending rates. The estimates of speed of adjustment, however, shows that all lending rates respond equally fast regardless of the loan segment. The exception is the mortgage lending rate. Nevertheless, I note that for this lending rate, the NARDL bounds test reveal an inconclusive long-run co-integration relationship.

#### **4. Conclusion**

This paper examined the interest rate transmission from the monetary policy rate to consumer, mortgage, SME, and corporate lending rate in the Czech Republic and Germany from January 2004 to November 2017. Moreover, I tested the asymmetric behaviour of commercial banks in reaction on monetary policy rate shifts.

Using the ARDL and NARDL model, I find mostly complete interest rate pass-through for Czech loan products. The exceptions are consumer lending rates, which do not show any long-run co-integration relationship with the monetary policy rate. Therefore, commercial banks in the Czech Republic set their consumer lending rates according to different criterions than monetary policy stance. Considering the asymmetric behaviour, the results show significant upward asymmetry in the Czech Republic for mortgage and corporate lending rates. Those loans segments represent the major part of all loans (aprox. 75 % of loans). Thus, more than proportional increase of those lending rates, as I confirm by the NARDL model, promises higher returns for commercial banks. As a result, the Czech National Bank should be careful with the contractionary monetary policy knowing about the stronger reaction of commercial banks. More conservative policy stance towards the rising of interest rates, as it is now in Czechia, might be the optimal concept.

The situation differs in Germany. The interest rate pass-through seems to be complete and symmetric for corporate lending rates. Therefore, German banks react in the same manner on monetary policy tightening as well as on easing. SME lending rates respond almost the same but less completely and with mild tendency to downward asymmetry. Interestingly, commercial banks in Germany does not show any signs of stronger reaction on monetary policy tightening in any loan segment, which is in contrast to the behaviour of Czech banks. On the contrary, considering consumer loans, German banks respond only on monetary policy easing, cutting their consumer lending rates with the fall of policy rate.

Overall, the size of the pass-through is comparable for both economies. For the Czech Republic, however, there are evidences of a substantial upward asymmetry of the pass-through. In contrast, the interest rate pass-through in Germany seems to be predominantly symmetric or, in some cases, mildly downward asymmetric.

### **Abstract**

*In 2017 the Court of Justice of the EU offered a new approach to assessing the concept of compensation of damages to human health due to a defective vaccine. In its judgment *N.W. and others v. Sanofi Pasteur MSD and others*, the Court of Justice of the EU relaxed the requirements for proving the causal relationship between the defective product and the onset of harm. The objective of the paper is to discuss the possible implications of the said judgment with respect to the compensation of damages likely to have been caused by vaccination in different jurisdictions within the European Union. Whereas the analyzed case-law refers to a purely internal situation (all the relevant facts of the case occurred in France), consumers in other EU Member States may face cross-border situations when claiming damages for a defective vaccine produced in another EU Member State.*

**Keywords:** *causal relationship, compensation of damages, court of justice of the EU, sanofi pasteur, vaccination*

**JEL Classification:** *I18, K32, K41*

### **1. Introduction**

In 2015 the Court of Justice of the European Union was called upon by the French *Cour de Cassation* (Judgment of the Court of Justice, 20 November 2014) to decide on a preliminary reference concerning the evidence plaintiffs have to show in order to obtain compensation of damages caused by a defective product. In this particular case the defective product was a French vaccine administered to a French citizen who is likely to have died as a result of this inoculation. Even though, making a preliminary reference to the Court of Justice of the European Union may have a political context (Mayoral, 2017), its general objective is to establish a dialogue between the national courts and EU judges to protect, *i.a.* the fundamental rights and freedoms of EU citizens (Fan, 2017).

The liability of the manufacturer for a defective product has been governed at EU level by the Council Directive 85/374/EEC of 25 July 1985 **on the approximation of the laws, regulations and administrative provisions of the Member States concerning liability for defective products**. It is inherent in the nature of a directive not to unify the legislation of the EU Member States, but rather to harmonize some rules which will contribute to a smooth functioning of the internal market (van Dam, 2013). On the other hand, the said Directive shall also be applied in purely domestic situations having no cross-border elements, *i.e.* also in case of a French product causing harm to a French citizen within the French territory. To trigger the application of the national rules transposing the said EU directive no cross-border element has to be present. Such a purely domestic situation occurred in the judgment to be analyzed.

A French consumer (and his heirs following the death of the consumer) were seeking damages caused by a hepatitis B vaccine against the vaccine's manufacturer, the Sanofi Pasteur corporation.

The aim of this paper is to discuss the possible impact of this judgment on compensating "vaccination victims" within the European Union. The paper will set out to compare the legal reasoning of the Advocate General, Michal Bobek, in charge of drafting the opinion in the case to the verdict of the Court of Justice. Subsequently, it will elaborate on the manner in which consumer have to seek compensation of damages in similar situation in cross border cases where no domestic vaccines are being administered. In the Czech Republic, for instance, no Czech vaccines are being produced, hence only imported vaccines are being employed, in particular those made by the British GSK or the French Sanofi Pasteur, which was the defendant in the underlying dispute before the French courts. The impact of this judgment in the Czech Republic can be rather interesting, since the compensation of damages caused by defective vaccines has not been regulated by any act or infra-legal provisions (such as a government or a ministerial decree) having a binding nature. Prchal has also pointed out at the largely unregulated nature of awarding damages resulting from the performance of health care in a number of jurisdictions (Prchal, 2012).

## 2. The Opinion of the Advocate General

Within the highest instance of the EU's judicial body Advocates General provide an independent assessment of the case before the court chamber delivers its judgment. The opinion of the Advocate General is not binding on the chamber, however, as a rule, justices tend to follow the reasoning proposed by the Advocate General. In his opinion delivered on 7 March 2017, Advocate General Michal Bobek first briefly summarized the facts of the case and analyzed the relevant legal regulation at EU level and in France. The longest discussion of the opinion deals with the legal qualification of the case and concludes with proposing a verdict to be delivered by the chamber of the Court of Justice composed of five justices.

The facts of the case can be briefly summarized as follows. In 1998 and 1999 a French citizen, Mr. J.W. was repeatedly vaccinated against type B Hepatitis. In the aftermath of the vaccination his health started to deteriorate dramatically despite his previous excellent health condition. In 2000 Mr. J. W. was diagnosed with multiple sclerosis of which he died in 2011. No medical history or that of his family suggested that J.W. is likely to develop multiple sclerosis. Hence, the sequence between the vaccination and the onset of the disease proved most likely. Under the French Civil Code the plaintiff has to prove the existence of a damage, the defect and a causal link between the two. This is the standard legal formula for claiming damages. The highest French court, however, believed that in case of extra-contractual liability of pharmaceutical companies for the vaccines they have manufactured the causal link can also be inferred from a set of serious, precise and identical presumptions (Opinion of the Advocate General Michal Bobek, 7 March 2017). Based on the case law of the highest French court it is basically possible for a court to conclude that "the short period between the injection of the hepatitis B vaccine and the appearance of the first symptoms of multiple sclerosis, in conjunction with the lack of any personal or family antecedents of that disease, constitute such serious, specific and consistent presumptions" (*Ibidem*). With respect to the existing French case law, the French *Cour de Cassation* has asked the Court of Justice of the European Union if an interpretation of the causal link based on a set of indirect evidence unfounded by prevailing scientific knowledge is compatible with the objectives of Directive 85/374/EEC.

The said Directive does not provide for a complex regulation of how national courts should deal with the burden of proof. Article 4 of the Directive requires the harmed party to prove the damage, the defect and the causal link between the two. The Directive, however, does not elaborate on whether the causal link must rely on scientific studies. Nor does it mention, whether such scientific studies should follow the mainstream view or whether minority scientific opinions suffice. The Directive is silent about a possible requirement of proving the causal link by means of direct scientific evidence. Hence, national courts have a lot of room for maneuver when assessing the evidence produced. This is typical, in general, of procedural rules which are left almost unregulated at EU level. Despite the national procedural autonomy (Zavadilová, 2016), national courts should keep in mind the principles of equivalence and effectiveness of EU law when adopting their decisions (Bobek *et al.*, 2011). The Advocate General uses teleological interpretation of law when stating that the aim of Directive 85/374/EEC is to protect the consumers. If courts interpret the Directive at variance with this objective, obtaining consumer protection would be impossible in practice (Opinion of the Advocate General Michal Bobek, 7 March 2017).

The Advocate General is in favor of recognizing indirect evidence as a causal link in case of missing scientific studies proving a causal link between the administration of a vaccine and the development of multiple sclerosis, in particular in view of a significant information asymmetry between the consumer and the pharmaceutical corporation (*Ibidem*).

### 3. Legal Arguments and the Verdict of the Court

The chamber in charge of deciding about the preliminary reference largely follows the legal reasoning proposed by the Advocate General when citing the applicable French and EU legislation and summarizing the facts of the case. Apart from the case law mentioned by the Advocate General, the justices refer to an earlier judgment of the Court of Justice in case C-310/13 *Novo Nordiska Pharma* (Judgment of the Court of Justice, 20 November 2014).

The court recalls that the directive fails to define the term of causal link. Its Article 6 defines the concept of a “defective product”. Making reference to its previous judgment in case C-503/13 *Boston Scientific Medizintechnik* (Judgment of the Court of Justice, 5 March 2015) the court observes that “As is apparent from Article 6(1) of that directive, a product is defective when it does not provide the safety which a person is entitled to expect, taking all the circumstances into account, including the presentation of the product, the use to which it could reasonably be expected that it would be put and the time when the product was put into circulation. Moreover, according to the sixth recital of that directive, that assessment must be carried out having regard to the reasonable expectations of the public at large” (Judgment of the Court of Justice, 20 November 2014).

The Court of Justice held that “national courts must first ensure that the evidence adduced is sufficiently serious, specific and consistent to warrant the conclusion that, notwithstanding the evidence produced and the arguments put forward by the producer, a defect in the product appears to be the most plausible explanation for the occurrence of the damage, with the result that the defect and the causal link may reasonably be considered to be established” (*Ibidem*).

Based on the above arguments, the Court of Justice concluded that the legal regime of Directive 85/347/EEC does not preclude the French judicial practice to award damages to a harmed consumer (or to its heirs) based on indirect evidence proving the causal link the administration of the vaccine and the suffered harmed, if the evidence produced is sufficiently compelling. Such an assessment, however, shall be based on a case by case basis, and it is not possible to proceed on the basis of some general presumptions. The Court of Justice of the EU

says that a national “court ruling on the merits of an action involving the liability of the producer of a vaccine due to an alleged defect in that vaccine, in the exercise of its exclusive jurisdiction to appraise the facts, may consider that, notwithstanding the finding that medical research neither establishes nor rules out the existence of a link between the administering of the vaccine and the occurrence of the victim’s disease, certain factual evidence relied on by the applicant constitutes serious, specific and consistent evidence enabling it to conclude that there is a defect in the vaccine and that there is a causal link between that defect and that disease“ (*Ibidem*). In protecting the consumer in case of scientific uncertainty the Court of Justice of the EU has adopted the precautionary principle without mentioning this explicitly (Tapinos, 2015).

#### **4. Reception of the Judgment by Legal Writing**

Given the recent date of the delivery of the judgment, the number of analyses thereof available in legal writing is rather low. Shorter analysis published online do not discuss the judgment at great length. A French lawyer with an academic background, Jean-Sébastien Borghetti, commented the judgement for the Nature journal. He believes it is not at all clear how French courts will handle the judgment of the Court of Justice. He is convinced that the impact of the judgment is likely to be different in different EU Member States based on their current judicial practice of (not) awarding damages to “vaccination victims“. Borghetti argues that the said judgment will simplify the recovery of damages in states such as France, Spain and Italy, however, other states such as Germany and the United Kingdom are unlikely to relax their demanding requirements for achieving compensation of damages caused by defective vaccines. The French professor perceives that the most “dangerous” aspect of the judgment consists in debilitating the public’s trust in the safety of vaccines (Castells and Butler, 2017).

In line with the prediction made by Borghetti on the impact of the judgment of the German judiciary, a German attorney, Boris Handorn, summarizes the case by saying that the assessment of evidence remains in the domain of the EU Member States (Handorn, 2017). This may be interpreted as zero impact of the judgment on the German judicial practice. The Court of Justice does not order national courts to proceed to the assessment of evidence with the same care as French courts do. Handorn stresses that national judges shall continue to exercise their discretionary powers when it comes to the assessment of the produced evidence (*Ibidem*).

Given the high number of American vaccines administered in the European Union, the judgment also arose interest with American attorneys. These emphasize the lowering of standards to prove the causal link in cases of manufacturer’s liability for damages to consumers’ health. They also stress that indirect evidence may not only serve as an evidence of the causal link between the product and the harm, but it may also prove the defective nature of a vaccine (van Bael and Bellis, 2017).

#### **5. Possible Impact of the Judgment on Consumers in the Czech Republic**

The analyzed judgment of the Court of Justice of the EU concerned a purely domestic situation, as outlined above. A French consumer (and his heirs) claimed damages for the impairment of health against a French corporation. In a number of Member States of the EU no domestic vaccines are administered. This is also the case of the Czech Republic, which imports about 50 types of French vaccines made by Sanofi Pasteur (Czech Society for Vaccination, 2017). A harmed consumer will thus have to face a cross-border situation. He or she will have to determine the competent court to decide on the case. Should it be the Czech court or the French court in case of a French vaccine? Under Brussels I Regulation recast (European Union, 2012)

the plaintiff may lodge an action before a domestic court based on the place where the damage occurred. However, if a domestic court delivers a judgment (Czech courts cannot be expected to award damages under the same favorable conditions as French courts do), the consumer would have to seek the recognition and the execution of the judgment in France. Since a Czech court is unlikely to award any damages for a defective vaccine, the Czech consumer would be better placed to select the jurisdiction of the court based in the domicile of the defendant (in case of French vaccines it would be a French court), where covering the fees of an attorney might be well worth it in case of successful litigation, as damages awarded by French courts to “vaccination victims” are rather high. For instance, the *Science et Avenir* journal reports that in 2014 the French state compensated a former nurse the amount of 2.4 million EUR as a result of having developed multiple sclerosis following the administration of the type B hepatitis vaccine which she received in 1991 (Jaliniere, 2017).

A judgment delivered by a national court within the EU can be recognized in another EU Member State almost automatically under Brussels I Regulation recast, however, the legal standing of a consumer would be much less favorable, if the manufacturer of the vaccine was established in the United States, where no EU legislation can be enforced. The Czech Republic imports American vaccines against encephalitis made by Baxter. As no bilateral agreement on mutual recognition of judgments is in place between the Czech Republic and the United States of America, an American court may not recognize a Czech judgment, since in the United States vaccine manufactures are exempted from judicial proceedings and damages are awarded by means of an out-of-court procedure. American courts would definitely require clear and sound scientific evidence proving that there is a causal link between the administration of a vaccine and a harm to the consumer’s health. In this respect, American courts could also apply the public order exception for not recognizing a Czech judgment. With respect to the above, the author believes that the real impact of the analyzed judgment of the Court of Justice of the EU on the recovery of damages caused by defective vaccines in the Czech Republic is likely to be insignificant. It should also be stressed that Czech courts are not used to applying case law directly, which is the case of common law judges, unless their decision can be backed by a clear wording of written legislation.

## 6. Conclusion

In its judgment in case *J.W. v. Sanofi Pasteur and others* the Court of Justice of the EU has accepted the possibility of proving the casual link between a defective vaccine and a damage to human health on the basis of indirect evidence. On the other hand, it stressed that indirect evidence must be assessed on a case by case basis and national courts may not use a set of indirect proofs as a general presumption of having complied with the burden of proof in proceedings on compensation of damages to human health. The examined impact of the said judgment on the recovery of damages is likely to be insignificant, due to the fact the national judges continue to exercise their discretion of free assessment of evidence. The author believes that the analyzed judgment will further help vaccination victims in Member States which are already more inclined to compensate vaccine related damages. It is probably not going to improve the standing of consumer in those EU Member States where the recovery of damages due to a defective vaccine is virtually impossible. It is also essential to keep in mind that the examined judgment referred to a purely domestic situation. Should a cross-border situation occur, the recovery of damages caused to human health due to the administration of a defective vaccine will become procedurally more difficult.

### **Abstract**

*The term Western Balkans is designed for a group of the following countries in Southeastern Europe which are not yet EU member states: Albania, Bosnia and Herzegovina (BiH), the Former Yugoslav Republic of Macedonia, Kosovo, Montenegro and Serbia. European Integration of the Western Balkans is currently a widely debated topic during the Bulgarian presidency of the Council of the EU. When analysing the process of European Integration of the Western Balkans many researchers focuses on political and legal issues that these countries need to address to become EU member states. However, this paper attempts to analyse selected macroeconomic measures in these countries such as GDP per capita, inflation rate, unemployment rate, budget deficit, general government debt and trade statistics. The paper implies that potential EU accession of the Western Balkans will increase economic attractiveness of this region.*

**Keywords:** EU accession, european integration, Western Balkans (WBs)

**JEL Classification:** F02, F15, O11

### **1. Introduction**

Western Balkan region that consists of Albania, Bosnia and Herzegovina (BiH), the Former Yugoslav Republic of Macedonia (FYROM), Kosovo (which is a disputed territory), Montenegro and Serbia, is in the centre of European Integration agenda. Western Balkans (WBs) are the countries in Southeastern Europe that are not yet EU member states. Except for Kosovo and BiH which are the potential EU candidates, they are all the EU candidate countries. Croatia used to be a part of the WBs but since its accession to the EU in 2013 it is not considered a part of this region any more. Most of WB countries have common history since there were a part of Yugoslavia (BiH, Croatia, FYROM, Kosovo, Montenegro, Serbia, and Slovenia). Therefore, when analysing the past economic events of the WBs, it is vital to consider Yugoslavia as a starting point. Scalera (2017) indicates that a threshold for the EU membership is set at a higher level than ever before, which corresponds to the following logic of EU officials: the farther from Central Europe, the more difficult it is to become an EU member. Mišćević and Mrak (2017) also underline that there is a new approach to enlargement negotiations which considered experiences of previous EU enlargements what seem to make the EU accession process more difficult for the WB than for previous candidate countries, which now are the EU member states. Horúcková and Lebiezick (2014) underline that within the WBs, Montenegro as first started the accession negotiations of joining the EU that was back in 2012. Then, in 2014 Serbia started the accession negotiations and the other countries from the WBs have not started that process yet.

The Western Balkan countries are perceived to be a special challenge for the EU and require its continued commitment in the form of both political and financial support, to work towards political transformation and economic stabilization in the region (Tošović-Stevanović and Ristanović, 2016).

The EU membership perspective of the Western Balkan countries and their full integration in the EU has played a key role in political, social and economic stabilization, alleviation of internal conflicts and implementation of constitutional reforms by individual countries in the region. Although the countries of the Western Balkans are at various stages of their relations and integration with the EU, it should be emphasized that the prospect of accession acts as a mobiliser for all countries in the region and provides an incentive to continue their efforts. Enlargement of the WBs has been promised by the EU several years ago, however that process seems to be much more complex, time-consuming and difficult than it was the countries from Central and Eastern Europe (Jesić et al., 2011).

## 2. Data

When assessing the impact of the WBs accession to the EU, one should be aware of many limitations. They mainly result from the difficulties in estimating the time horizon of future enlargement, as well as the lack of knowledge as to the specific conditions under which they will join the EU. This, in turn, is important from the point of view of the estimated consequences of EU accession. An important determinant of the possible effects of membership will also be the future shape of EU policies that may be subject to reforms. An additional difficulty is also the unavailability of some statistical data or their inconsistency with the system used in the EU, which limits the reliability of comparisons. Thus the data from the World Bank, IMF, and Eurostat provided in documents by the European Commission were used in order to have the same methodology of particular variable. In addition, Maddison Database by Bolt et al. (2018) is the only database that offers a set of data on population and GDP for the former Yugoslavia (for the period of 1947 – 2016), which is a point of departure for all WBs countries except for Albania.

## 3. Towards Long-Term Economic Growth

After the break-up of Yugoslavia in the 1990s, political situation was instable in the countries of the former Yugoslavia, so does economic one. Instead of focusing of long-term economic growth strategies, these countries faced with numerous conflicts, sanctions, which then had negative consequences on their economic development. This time of political conflicts in Post-Yugoslav countries is often referred in literature as the “lost decade” (Hayoz et al., 2005). Nevertheless, later on, in the period 2001-2008 these countries actually managed to proceed with economic reforms that lead to fast economic growth. According to Uvalić (2010), the problem with this growth was too much reliance on Foreign Direct Investment (FDI) and the so-called ‘credit boom’. Since Post-Yugoslav economies were so much interrelated with global economic architecture, the financial crisis has negatively impacted these countries in the years after 2008. As a result, these economies were slowing down leading to a much lower growth rates and eventually recession.

One of the most common aims of all countries in the World is to be on a fast track of long-term economic growth. Naturally, it is also the case for Post-Yugoslav countries. In order to understand their current economic situation, it is necessary to look at their economic growth path. Figure 1 presents the evolution of GDP per capita in Socialist Federal Republic of Yugoslavia and the successor countries.

**Figure 1: Real GDP per Capita in 2011us\$ in Socialist Federal Republic of Yugoslavia and Its Successors States for the Period of 1947 – 2016**

Source: own elaboration based on the data from Maddison database (Bolt et al., 2018)

Yugoslavia was a fast-growing economy at that time, the growth records up to 1980s were impressive. In 1980s, Yugoslavia ‘stood’ almost in the same place of its GDP per capita. Unfortunately, in the late 1980s and early 1990s due to political conflicts and disputes, what resulted in the break-up of Yugoslavia, the economies of Post-Yugoslav countries were extremely falling down in terms of GDP per capita. Then, they have started their recovery process, except for two breaks: (1) in the late 1990s and then (2) soon after the global financial crisis. One should notice that after the break-up of Yugoslavia, what resulted in a dramatic fall of their economies, the successors states managed to achieve the same level of GDP per capita (as before the break-up) in 2006.

#### 4. Economic Perspectives of the Western Balkans

There were different EU enlargements but it seems that the EU gained a lot in terms of its wealth with 2004 Enlargement of ten new member states (EU-N10) including Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, and Slovenia. However, we cannot compare them and the WBs since they all had different history what affected their human capital, economic growth, and as a result they had different transition processes. Nonetheless, in order to assess their economic potential and eventual contribution to the EU, we need to proceed with the data of economic indicator, starting with GDP.

**Table 1: Share of GDP in Current Prices and Population of the WB Countries in Total EU**

	2016 WBs
% EU GDP	0.53 %
% EU population	3.60 %

Source: own elaboration based on data from IMF

Considering WBs accession to the EU, one should not that the scale of their wealth (0.53 % of EU’s GDP) and population (3.60 % of EU’s population) seems to be rather small and

insignificant. Therefore, from the economic perspective, the EU may not be extremely interested in accession of the WBs since they are not large economies, which would make a difference in the overall EU's wealth, and so does the population. However, as Seroka (2008) rightly notices, one of the most prominent reasons why the EU wants the WBs to be integrated is to ensure security, political stability and economic prosperity in this region. He also admits that the EU accession conditions are set at a higher level for the WBs compared to the 2004 EU Enlargement.

**Table 2: Selected Macroeconomic Measures for the WBs and EU in 2016**

	GDP per capita (current US\$)	GDP growth (annual %)	Inflation rate (annual %)	Unemployment, total (% of total labour force)	Current account balance (% of GDP)	General government gross debt (% of GDP)	Population (Millions of people)
<b>Albania</b>	4125	3.4	1.3	15.0	-7.6	73.2	2.876
<b>BiH</b>	4808	3.1	-1.1	25.8	-4.5	44.7	3.854
<b>FYROM</b>	5237	2.4	-0.2	24.4	-3.1	39	2.073
<b>Kosovo</b>	3661	3.4	0.3	27.5	-9.8	19.9	1.839
<b>Montenegro</b>	7029	2.9	-0.3	17.7	-19	70	0.623
<b>Serbia</b>	5426	2.8	1.1	14.4	-4	74.1	7.058
<b>EU</b>	32242	1.9	0.2	8.0	2.2	85.7	508.773

Source: own elaboration based on the data from the World Bank and IMF

The richest country in terms of the GDP per capita within the WBs is Montenegro with USD 7029 per capita, while the poorest is Kosovo with USD 3661 per capita in 2016. It is quite noticeable that the WB countries are not even close to the EU's GDP per capita which reached the level of USD 32242 in 2016. However, when looking at the GDP growth, the WB economies are growing with the faster pace than the EU. All of them substantially exceeded 2 % of GDP growth in 2016 while the EU's GDP growth accounted for 1.9 %.

In turn, inflation rate was more diversified than the GDP growth. The EU's inflation grew by 0.2 % in 2016 while inflation in Albania, Serbia and Kosovo grew by 1.3 %, 1.1 % and 0.3 % respectively. In remaining countries, inflation fall by 0.2 % in FYROM, 0.3 % in Montenegro and 1.1 % in BiH.

Unemployment rate in the WBs can be seen as one of the most significant problems. The WB countries (except for Albania) faced high unemployment already in 1990, before the Yugoslav Wars and the economic transition process. Then, unemployment increased even more significantly because of the military conflicts and transition process (Gabrielová, 2012). The unemployment rate in the EU accounted for 8.0 % while four out of six WB countries, namely BiH, FYROM and Kosovo, reached the level of more than 20 % of unemployment. Serbia, Albania and Montenegro had the lowest unemployment in the WBs region, which amounted to 14.4 %, 15.0 % and 17.7 % of the total labour force, respectively.

Current account balance in the EU was on average on 2.2 % of surplus in 2016 while all WBs countries noted a deficit. Montenegro was a definite outlier with the largest deficit of 19 % of

GDP in 2016, then Kosovo 9.8 % and Albania 7.6 %, the remaining countries had a deficit which was smaller than 5 %. When considering the situation in different EU countries, one should note that some of them also faced the budget deficit, however none of them noticed the deficit greater than 5 % of GDP in 2016. Nevertheless, according to Causevic (2012), in the pre-crisis time of 2003-2008, the WBs countries made the budget deficit of 0.8 % of GDP on average. In 2008, when the effects of the economic crisis started to be noticeable, the budget deficit of the WBs reached the level of 5.4 % of GDP on average while in the Eastern Europe and the Caucasus region this number was twice higher (11.4 %), e.g. in Slovakia the deficit accounted for 15 % of GDP.

According to European Commission (2018), the WBs continued to grow its GDP by around 2.5 % of GDP per year. Investment and private consumption is an engine of growth and exports in the WBs. Almost all countries managed to decrease their deficits, however they still keep quite high level of public debt. Economic expansion seems to create more jobs but with a slow pace, thus unemployment rate still remains quite high in the WBs.

In addition, in the view of possible WBs accession to the EU, we need to analyse trade, which is a crucial factor in the European Integration process since once a country joins the EU, it also enters the European Single Market. The WBs like all previous EU candidate countries are advised by the EU to liberalise their intraregional trade, what very often result in the establishment of regional free-trade areas. That was also a case for the WBs, which form the Central European Free Trade Agreement 2006, the so-called CEFTA 2006 (Dragutinović-Mitrović and Bjelić, 2015).

In line with the European Commission (2017) statistics, the main trading partners of the WB are: the EU-28 with a share of 74.1 % of total WBs trade, China, and Russia with 5.5 % and 4.7 % respectively, for the year of 2016. Considering only imports: the EU-28 is at the first place (67.9 %), then China (8.2 %) and Turkey (5.3 %). In exports, the EU-28 is obviously leading with 84.7 %, the third place is still for Turkey (2.6 %), however, the second largest trading partner in exports for the WBs is Russia (3.9 %). Due to political reasons, Russia imposed embargo on some products from the EU and therefore some other countries which have a free trade agreement with Russia, like Serbia, take an advantage of that by increasing their level of exports (especially agricultural products) to Russia (Šabotić et al., 2016).

Figure 2 presents the EU-WB trade flows in the period of 2006 – 2016. When comparing year 2006 and 2016, one may notice that imports, exports and balance of trade increased over that period. However, when we take a closer look what happened in between, then we clearly see that the volume of trade between the EU and the WB was affected by the global economic crises in 2008. According to Panagiotou (2014) the WB were significantly hit by the economic crisis what was especially visible in their growth and trade statistics. Since the main trading partner for the WB countries is the EU, the EU-WB trade noted an decrease in its volume. Bartlett and Prica (2011) noticed that countries of the WB with the higher level of trade integration were exposed to the effects of crisis sooner than those which were less integrated.

**Figure 2: Total Goods: EU Trade Flows and Balance with WB Countries for the Period 2006 – 2016**

Source: European Commission, 2017, p. 3

The fact that the WBs is highly connected with the EU in terms of trade seems to be intuitive. However, it is interesting to look at the WB-EU trade from the EU perspective, what is illustrated in table 2. The EU trade with the WBs accounted only for 1.3 % of total EU trade in 2016. Serbia is outstanding in this statistics compared to other WB countries, because its trade with the EU accounted for 0.59 % of total EU trade in 2016.

**Table 3: EU Trade with the Western Balkans as a % of Total Eu Trade in 2016**

Serbia	BiH	FYROM	Albania	Montenegro	Kosovo	Overall
0.59 %	0.29 %	0.24 %	0.12 %	0.03 %	0.03 %	<b>1.30 %</b>

Source: own elaboration based on the data from the World Bank

EU integration process of the WBs is not only a political issue to tackle, but also it is an economic challenge. Therefore, considering current economic development of the WBs, we can clearly see that they still lag behind the EU average, however, we should not forget that it was also a case for most of the EU candidates (e.g. the EU-N10), which are now successful member states.

## 5. Conclusion

The European Integration of the WBs has been a widely debated issue. Although, all these countries (except for Albania) has a common history, since they were a single country – Yugoslavia, they are all at a different level of EU integration process. However, hitherto only Croatia managed to join the EU. However, one should note that this is a two-side process so not only does positive will from the EU side is needed but also from the WBs. The EU wants the WBs in the EU in order to establish political and economic stability in this part of Europe. The WBs countries, however, seem to be tempted by better economic perspectives when being inside the EU, rather than outside the EU. Therefore, based on the economic measures used in this paper, the WBs should now focus on tackling the following problems: high public debt

and budgetary deficit, and high unemployment. That would then foster their economic development and lead them closer towards the EU accession.

### **Abstract**

*Since World War II almost all countries of the Europe has gone through the integration process which can be defined as an European Integration which evolved into European Union institution. The process include many dimensions, such as: economical, legal or political. The new strategy accepted by European Union titled „Europe 2020” determines a new area of European Integration which can be called as the Green Integration. The article focuses on this specific area of integration which can be a new factor in the future development of the countries in European Union. The article attempts to define and present some integration tools in this area of integration. The main goal of this article is to identify pro-ecological management tools and processes which are used in the Green Integration as one of the dimensions of European integration in wider context. This elements have significant influence on green competitiveness of each European country. Therefore the analysis is based on statistical data and related calculations to support green integration theory. In this paper applied modified multi-criteria Belingers’ method.*

**Keywords:** european integration, green jobs, green economy, sustainable development.

**JEL Classification:** O44, Q56, Q57

### **1. Introduction**

Governments around the world increasingly recognize that the creation of long-term citizen society value depends also on a state’s ability to understand and respond to increasingly intense demands from society. No surprise, that the topic of green initiatives has been gaining ground as governments seek to incorporate concepts such as sustainability and responsible corporate behaviour into their assessments of a country’s long term development plan (Rutkowska et al.,2017). The process of greening the economy is focused on investing in sustainable and durable development. The social, economic, environmental and ethical factors directly affects integration strategy. Then combined with the European integration, the green economy creates new process which can be called as the Green European Integration which will be defined and presented in this article.

The article focuses on this specific area of the European integration which can be a new factor in the future development of the countries in European Union. The article attempts to define and present some integration tools in this area of integration. The main goal of this article is to identify pro-ecological management tools and processes which are used in the Green Integration as one of the dimensions of European integration in wider context. This elements have a significant influence on green competitiveness of each European country. Therefore a quantitative analysis is based on statistical data and related calculations to support green integration theory. In this paper applied modified multi-criteria Belingers’ method.

## 2. The Green European Integration

The durable and sustainable development is the source idea of the Green European Integration based on environmental protection, dated back to period 1958-1972 (Kening-Witkowska, 2005). At that time, the key role was played by the 100<sup>th</sup> article of the Treaty of the European Economic Community (EEC) which states as follows "The council shall, acting unanimously a proposal from the commission and after consulting the European Parliament and the Economic and Social Committee, issue directives for the approximation of such laws, regulations or administrative provisions of the Member States as directly affect the establishment or functioning of the common market" (Council of the European Communities and Commission of the European Communities, 1992). This specific normative act gave the European Council the power to unanimously adopt directives in order to harmonize regulations in the member countries (Raux, 1999). Within the framework of European integration it can be also distinguished a field of activities aimed at protecting the environment and much wider action later, which can be described as the Green European Integration. In Table 1 were presented qualitative objectives of the "New Union Environment Action Programme to 2020", that can be treated as development directions for Green European Integration.

**Table 1: Qualitative Goals of the "Union Environment Action Programme to 2020"**

Qualitative goals
1. to protect, conserve and enhance the Union's natural capital
2. to turn the Union into a resource-efficient, green, and competitive low-carbon economy
3. to safeguard the Union's citizens from environment-related pressures and risks to health and wellbeing
4. to maximise the benefits of the Union's environment legislation by improving implementation
5. to increase knowledge about the environment and widen the evidence base for policy
6. to secure investment for environment and climate policy and account for the environmental costs of any societal activities
7. to better integrate environmental concerns into other policy areas and ensure coherence when creating new policy
8. to make the Union's cities more sustainable
9. to help the Union address international environmental and climate challenges more effectively.

Source: European Commission. (2014) *The new general Union Environment Action Programme to 2020* [online]

The most important programs which were leading to the Green Integration were the Environmental Action Programmes (EAP). The turning point of the Green European Integration was the 3<sup>rd</sup> EAP which oriented the activities of EU countries towards the broadly defined sustainable development (UEAPME [online], 2002). And the symptom of this was the correlation of employment policy with environmental policy (Górski, 2006). The result of these activities was the creation idea of the Green Jobs that can be treated as "a job or self-employment that genuinely contributes to a more sustainable world" (Rutkowska-Podołowska et al., 2014). The International Labour Office defined this as "a jobs include direct employment which reduces environmental impact, ultimately to levels that are sustainable. This definition includes jobs that help to reduce the consumption of energy and raw materials, decarbonizes the economy, protect and restore ecosystems and biodiversity and minimize the production of waste and pollution. It is broader concept of "green jobs", which might embrace any new job

in a sector which as a smaller than average environmental footprint and contributes to improving overall performance, albeit perhaps only marginally” (ILO, 2008).

The new general Union Environment Action Programme which is entitled "Living well, within the limits of our planet " and “Europe 2020” strategy play a key role in a Green European Integration. The main mission of this programme is “the EU has agreed to step up its efforts to protect our natural capital, stimulate resource-efficient, low-carbon growth and innovation, and safeguard people’s health and wellbeing – while respecting the Earth’s natural limits” (European Commission [online], 2014). The strategy “Europe 2020” and “Union Environment Action Programme” gives special character to the Green European Integration and treats it as a pillar for sustainable development of each country in EU. Table 2 presents specific goals and measures from “Europe 2020” strategy that can be considered as an integration tool, because it is possible to monitor the implementation of specific goals by individual countries of the community.

**Table 2: Quantitative Goals for the “Europe 2020” Strategy**

Quantitative goals (criterion - C)	Unit	Target
C1: to reduce greenhouse gas emissions (Greenhouse gas emissions should be reduced by 20% compared to 1990)	index 1990 = 100	80
C2: to reduce greenhouse gas emissions in ESD sectors	million tonnes of CO <sub>2</sub> equivalent	2618.17
C3: to reduce primary energy consumption	million tonnes of oil equivalent (TOE)	1483
C4: to reduce final energy consumption	million tonnes of oil equivalent (TOE)	1086
C5: to increase share of renewable energy in gross final energy consumption	per cent %	20

Source: Eurostat (2018). *Europe 2020 strategy. Headline Indicators* [online]

Pro-ecological management plays an important role in the Green European Integration, especially in the implementation of quantitative objectives of the “Europe 2020” strategy. Pro-ecological management has also influence to the green competitiveness of individual European countries (Kasztelan, 2016). Term pro-ecological management should be defined by the management functions. According to the H. Fayol (1917) it is possible to distinguish five functions of management: planning, organizing, commanding, coordinating and controlling. Therefore, pro-ecological management is a process with coordinated activities under the five management functions, which lead to the improvement of the natural environment. This process consists of activities aimed at rational resource management, protection and shaping the environment and creating pro-ecological attitudes (Marciniuk-Kluska, 2013). In each of these aspects management functions can be implemented. The most important activities undertaken by the enterprises is implementation of an environmental management system based on the ISO 14001 standard which is integrated with the entire organization management system (Marciniuk-Kluska, 2013). The second level is local government units and the third is the government level. Both in the second and third level one of the most important activities is the protection of the natural environment and the creation of Green Jobs. Pro-ecological tools can be divided into three categories: instruments in the form of standards and regulations, stimulating instruments, control and repression instruments (Table 3).

**Table 3: Instruments of Pro-ecological Management**

Instruments in the form of standards and regulations	Stimulating instruments	Control and repression instruments
<ul style="list-style-type: none"> <li>• Product and process standards (application of recovery and recycling, manufacture of products from safe substances)</li> <li>• Atmospheric air quality standards</li> <li>• Water quality standard</li> <li>• Soil quality standards</li> <li>• Permits for entering sewage into waters or land</li> <li>• Permission for waste generation</li> <li>• Permits for the introduction of gases and dust</li> <li>• Noise emission license</li> <li>• Concessions for mining natural resources</li> <li>• New technological standards (use of low-waste technologies, low failure rate of manufactured products)</li> </ul>	<ul style="list-style-type: none"> <li>• Subsidies for pro-environmental activities</li> <li>• Tax breaks</li> <li>• Preferred loans (a subholder in the form of a difference in interest rates)</li> <li>• Subventions for a specific type of activity leading to an improvement of the environment</li> <li>• Ecological insurance against legal liability for environmental pollution</li> </ul>	<ul style="list-style-type: none"> <li>• Legal actions aimed at forcing compliance with environmental protection requirements</li> <li>• Charges for the emission of pollutants into the environment</li> <li>• Inspections to determine the level of compliance with environmental regulations</li> <li>• Negotiations with entities violating the environmental regulations in order to direct actions that meet specific standards and regulations</li> <li>• Fees for using the environment (e.g. cutting trees and shrubs)</li> <li>• Product charges (for placing in public trading or using). It applies to products causing pollution in one of the product life phases</li> <li>• Service fees (e.g. for sewage disposal, waste disposal)</li> </ul>

### 3. Problem Formulation and Methodology

In order to achieve the quality goals included in the "Europe 2020" strategy, the countries need a tool to more effectively achieve the assumed objectives (Melecký and Staničková, 2014). Pro-ecological management may be such a tool (Larue, 2018). Therefore, it seems necessary to specify several pro-ecological management instruments (Wren, 2015). However, it is important to point out that pro-ecological actions taken at all levels within one country have a particular impact on the environmental competitiveness. Pro-ecological actions also oriented and directs the activities of individual countries towards sustainable development. The concept of green competitiveness can only be defined by a number of factors (Kasztelan, 2016). Three groups of indicator group define the level of green competitiveness of individual countries: natural resources, anthropopressure and eco-behaviours (Kasztelan, 2016). Countries with rich natural resources such as Sweden, Finland, Latvia, Denmark and Italy have the highest level of green competition. However, it is important to point out that pro-ecological actions taken at all levels within one country have a particular impact on factors from the anthropopressure and

eco-behaviours group of indicator which have influence on the environmental competitiveness. Therefore, pro-ecological management instruments can be the foundation for the green competitiveness of individual countries within the European Community and, in a wider context influence the level of the Green European Integration. Methodology proposed in this paper is based on modified multi-criteria Bellinger's method to analyse chosen factors of Green European Integration. Bellinger's method allows to compare evaluation results where different criteria were used (Malara et.al., 2016). In this paper modified method has six steps, as follow:

1. define criteria which will be used for decision making,
2. identify the measuring units and its desirable changes (in given criteria),
3. determine the target of each criterion,
4. present the result for each criterion as a percentage of the distance from the measured value of criterion to target value,
5. create a table containing the member states assigned to the criteria for all variants in three groups (based on coefficient variation),
6. determine the most frequent (over two occurs) states in the group.

The criteria used in further analysis were based on Table 2, which can be indicators of Green European Integration. Then the groups obtained from analysis can indicate which countries are close to goals appointed in "Europe 2020" strategy. Identification and measurement of quantitative variables combined with qualitative goals are also important pro-ecological management tools for EU member states.

#### 4. Problem Solution

Based on described above methodology as steps of modified Bellinger's method the year 2016 was appointed for the further analysis, due to the availability of statistical data for all European Union countries. Criteria were numbered in Table 4, as in Table 2, which are quantitative goals for the Europe 2020 strategy. The criteria values units are the same as in Table 2. The 2<sup>nd</sup> step of accepted in this paper method requires measuring units and direction of change, which allows to set the lower and upper limit for each change criterion and divide them to three groups of countries involved in achieving goals of Europe 2020. Division in groups is based on standard deviation, which allowed to divide obtained data to numbered three groups. The group I consist an excellent performers, group II average involved states, and group III underperformers (countries which exceed targets listed in Table 2).

**Table 4: Values Ranges for Each of Group of Analysed European Union Countries**

Criterion	Group I	Group II	Group III
C1	41,99 : 66,36	70,71 : 88,93	90,68 : 144,45
C2	1,34 : 14,28	19,74 : 46,48	50,16 : 450,42
C3	0,7 : 14,6	15,5 : 39,9	47,1 : 295,8
C4	0,6 : 9,7	10,4 : 28,1	32,6 : 216,4
C5	5,4 : 12,0	14,2 : 21,3	25,0 : 53,8

Source: Results of own calculations based on Eurostat (2018). *Europe 2020 strategy. Headline Indicators* [online]

In Table 5 were presented the results for each criterion as a percentage of the distance from the measured value of criterion to the target value presented in table 2. First four criteria aims are to reduce their measured values, when 5<sup>th</sup> criterion aim is to increase its measured value, therefore this criterion has reversed values as presented in Table 5.

**Table 5: Values Ranges for Each of Group of Analysed European Union Countries as Per Cent of Distance to Their Own Goals (Negative Numbers in Brackets)**

Criterion	Group I	Group II	Group III
C1 (%)	(-17,05) : (-47,51)	(-11,61) : 11,16	13,35 : 80,56
C2 (%)	(-18,30) : (-4,24)	(-0,87) : 10,32	11,21 : 26,09
C3 (%)	(-12,13) : (-2,31)	(-0,95) : 4,86	5,49 : 27,35
C4 (%)	(-24,31) : (-11,37)	(-7,59) : 3,92	4,76 : 26,40
C5 (%)	41,50 : 4,17	2,35 : (-15,56)	(-17,78) : (-57,14)

Source: Results of own calculations based on Eurostat (2018). *Europe 2020 strategy. Headline Indicators* [online]

Following the next step of the accepted in this paper method was to present the group of countries in Table 6. The groups division is the same as in Table 5. The group I consists countries which do not have to reduce their impact on the natural environment or are excellent performers in share of renewable energy in gross final energy consumption. The group II consists countries with average results of reaching their goals listed in Table 2. Whereas group III presents countries which have to intense their efforts to fulfil set goals.

**Table 6: EU28 Members States Classified in Groups According to Accepted Criteria**

Criterion	Group I	Group II	Group III
C1	United Kingdom, Hungary, Czechia, Bulgaria, Slovakia, Romania, Estonia, Latvia, Lithuania,	Luxembourg, France, Italy, Poland, Belgium, Finland, Sweden, Croatia, Germany, Denmark,	Cyprus, Spain, Portugal, Ireland, Austria, Malta, Greece, Netherlands, Slovenia,
C2	Croatia, Slovakia, Greece, Hungary, Romania, Portugal, Lithuania. Czechia, Latvia, Slovenia,	United Kingdom, Spain, Sweden, Poland, Bulgaria, Italy, Netherlands, Estonia, Denmark,	France, Luxembourg, Austria, Cyprus, Belgium, Germany, Finland, Malta, Ireland,
C3	Croatia, Romania, Latvia, Slovenia, Finland, Lithuania, Luxembourg, Estonia, Italy	Slovakia, Greece, Poland, Spain, Portugal, Denmark, Hungary, Malta, Czechia, Austria	United Kingdom, Bulgaria, Ireland, Netherlands, Germany, France, Sweden, Cyprus, Belgium
C4	Romania, Latvia, Greece, Portugal, Poland, Italy, Croatia, Finland, Netherlands	Luxembourg, Slovenia, Czechia, Ireland, Denmark, Estonia, Cyprus, Spain, United Kingdom, Sweden	Germany, Belgium, Austria, France, Bulgaria, Slovakia, Lithuania, Malta, Hungary
C5	Romania, Denmark, Hungary, Sweden, Lithuania, Czechia, Estonia, Bulgaria, Croatia	Greece, Slovenia, Slovakia, Spain, Portugal, Latvia, Austria, Finland, Italy	Netherlands, Luxembourg, Ireland, Malta, United Kingdom, Belgium, France, Cyprus, Poland, Germany

Source: own calculations results based on Eurostat (2018). *Europe 2020 strategy. Headline Indicators* [online].

Based on this results it is possible to identify most frequent occurring EU-28 member states in each group as presented in Table 7.

**Table 7: The Most Frequent States in Each of Group**

Group I	Group II	Group III
Croatia, Czechia, Estonia, Hungary, Latvia Lithuania, Romania	Denmark, Italy, Poland, Slovakia, Spain, Sweden	Austria, Belgium, Cyprus France, Germany, Malta, Netherlands

Source: own calculations results

The conclusions from the presented analysis are as follows: majority of so-called “old member” states have to increase their efforts to meet goal and criteria set in “Europe 2020” strategy. The reason of this strong division, can be explained by high industrialization of these countries. On the other hand there is a large post-soviet countries visible in group I, which easily meet criteria of Green European Integration. Pro-ecological management and environment protection are subject of matter of “new member” states (who joined EU in 2004), which introduce new clean technologies immediately and are eager to become new green leaders of European Union. Some countries with rich natural resources such as Sweden, Finland, Latvia, Denmark and Italy have the highest level of green competition (Kasztelan, 2016) but it does not mean that they are leaders of environment protection or pro-ecological management as it was proved based on Eurostat data analysis.

## 5. Conclusion

Presented in this article quantitative goals of “Europe 2020” as pro-ecological management tools are measurable and credible based on Eurostat data. Analysis proved also that greening of the economy is easier for relatively new member states than for other countries. Contrary to widely known as pro-ecological countries some countries has not yet earned their new reputation, although they protect natural environment on excellent level and creates new green economy opportunities.

The article focuses on green aspects of the European integration which can be a new factor in the future development of the countries in European Union, therefore they are visible two speeds of development in Europe are also proved in this paper. There are countries better developed and more industrialized (group III), and wider group (in this paper pointed as group I and II) which possess large environmental competitive advantage in process of Green European integration, which is still in its very beginning. Presented in this article analysis requires verification in wider time span and comparison with other methods to examine green competitiveness of each European country.

### **Abstract**

*Political system of democracy, so important for cohesion of EU, is currently being questioned in Hungary, Poland and probably also in the Czech Republic and Slovakia. Modern democracy is unique balance of freedom and equality, when freedom is a precondition for equality and when equality allows for freedom. Nevertheless, under certain circumstances, democracy can be self-destructive: if the extent of freedoms is reduced to such an extent that equality ceases to be necessary, or if equality is over-sized at the expense of freedom. This is close to the concept of illiberal democracy and thus denial of democracy. The ten necessary conditions that underpin the democratic political system and their limitation in Hungary and Poland lead to retreat the political system of democracy and shift to the authoritarian government.*

**Keywords:** *authoritarianism, Central Europe, conditions of democracy, illiberal democracy*

### **1. Introduction**

The political system of democracy, which includes the indwelling political freedom and other freedoms in society (legal, social, biological ...), has been the product of an industrial society, where, as the form of government accelerated the process of modernization, so that led to today's globalization and the information society. Systemic essence of democracy is unique balance between freedom and equality. However democracy, under certain circumstances, can be self-destructive as it can liquidate this unique balance, its value substance. This is especially true when political freedoms in society are reduced.

Political system of democracy has never been perceived as a final form of government, nor in ancient times (Aristotle) nor in modern society (Churchill, Dahl...), so it has a chance to improve. The concept of democracy is culturally determined, it is the achievement of European civilization adopted by other cultures, it is normative - as democracy is most often defined as an ideal norm associated with certain values, it is evolving - because our ideas about democracy also change as a result of changes of political reality, and especially polyvalent. The term democracy is extremely polyvalent, but its homeland is political science, also with number of meanings. In political science, democracy can be understood as a theory (hypothesis system) as well as a scientific theory, science (system of verified hypotheses) ideology (the theory of the world, society and man from which a certain policy is derived, with a tendency to expand by violence) and political practice. The scope of this study allows only the last meaning to be developed. The political system of democracy is probably the core of today's democracy itself, democracy as a certain value-based and institutionally defined way of organizing society. That is why we can distinguish between the political systems of democratic states (states with predominantly this value-based and institutionally defined way

of organizing society) and undemocratic (states with either a value-based and institutionally different structure or only the formal conditions of democracy, i.e. without real democratic content).

The precondition and effect of the democratic political system is the unique in human history balance of political freedom and political equality. Freedom is a condition of equality, and equality allows freedom. Few people have a negative answer to the question of whether they want to be free. Without equality, however, a large proportion of people can imagine their lives. Nevertheless, equality is needed primarily to ensure our freedom. On the scales of democracy, freedom and equality are balanced. When one of them significantly prevails, then one is the opposite of the other. When we reduce equality, we get from freedom to anarchy and hence inequality, when we reduce equality, we get, for example, from socialism to primitive communism and hence system without political freedoms. Democracy, especially in its liberal form, is undoubtedly the best achievement of European civilization development, when the modern state represents a rational approach also against any attempt by a democratic society to create unity by violence. The level of the ratio between freedom and equality is culturally given, in some societies there is more accentuated freedom, and in others societies are equal. This discrepancy is reflected in a specific form of the political system of democracy (for example, freedom in the US and the UK has accent on political and legal freedom, in addition, in Germany, social freedom is accentuated, just as in France). Equality is the leg, freedom is the head. When democratic freedoms are reduced, equality is no longer useful, and therefore it will no longer be important. Legs will not have anything to wear. Although democracy is in its present form the achievement of civilization and is proclaimed by all EU states (European Union Treaties, [online], 2018), its achievement is not the ultimate goal, and end of history (Fukujama [online] 2018), and democracy can under certain circumstances return course. Causes can be both internal (leaders, worsening or, on the contrary, total improvement in economic conditions, sources of energy finding, nationalism, religiosity, bureaucracy) and external (pressure from another state or a group of states: political, military, economic, etc.). At the same time, it can be assumed that along the transition from an industrial society to an information society, the nature of governance will change, as it has always happened in history when basic technology has changed. It should be emphasized that modern democracy began to be created when agricultural technology was gradually supplemented by an industrial one that changed all aspects of human life - perceptions of time and space, human needs, increased human incompetence and dependence on society, ways of communication, social structure, urbanism, leisure time, relations between states - and triggered the need for new governance, new division of power, where the central role of the system is played by parliament as a source of legislative power. Historically, this model was preceded by a model of democracy without a representative parliament (antique Athens), and a model of parliament without democracy, as the parliaments originated originally without democratic elements (House of Lords in UK). Not later than 18-20 century the requirement for election was attached to the parliaments, as a new democratic element of election. Today, we are in the midst of finding a new form of public power. The information society offers technical possibilities to direct democracy (electronic elections in Estonia or Alaska). In this context, delegitimization of the representation (parliaments) is also occurring, and therefore the search for a direct path between the strong leader and the citizens. Some tendencies in Central Europe, but not only there, confirm such a claim. In the essay *The Power of the Powerless* from 1978 (Havel [online] 2018) Vaclav Havel uses the term post-democracy, the shift sees in the gradual replacement of formal to informal and hierarchical to non-hierarchical structures, formulates the concept of nonpolitical politics that negates political parties. Today, the non-political politics takes on new forms. The role of political parties in contemporary politics is changing, as politics today in democratic countries is a special form of show where candidates for civic

voices exhibit public interest in a public space where most of political parties have a very similar inconsistent agenda. Voters, of course, can identify politicians and their policies with a dual approach: rational and emotional. Rational cognition is based on examining the political agenda, considering its consistency and long-term, compare the programs of other political subjects. Of course, this presupposes a certain minimal theoretical training, so it is obvious that rather minority of society is approaching politics in this way. The majority of the society then judges and perceives politics primarily emotionally as something they like or dislike because it raises some negative or positive feelings in them. This way, they approach repeated political slogans and mottos and thus the individual politicians. This approach is particularly strong in the election term, which can be seen as a continuous show, an effort to win at all costs and whatever means.

The following chapter provides a detailed description of the necessary conditions for the political system of democracy.

## **2. The Ten Necessary Conditions of the Political System of Democracy**

The ten necessary conditions of democracy represent the theoretical system with intrinsic consistency. Since the conditions are essential, each democratic country must respect them, when internal rate is given by the cultural specificity. Nevertheless, it can happen that the result of the political development will be the preservation of the form of democracy while emptying the content of democracy. For example, "cementing" the position of the governing party by changing the recount to parliament after the elections, while maintaining the principle of universal suffrage and political pluralism, as has happened in Hungary. Or, the status of media can be changed from public to state and the flow of information in the country to the benefit of the ruling party, as it has already happened in Hungary and Poland. Also, it can be subordinated the central bank by putting in place appropriate implementation descriptions, changing the constitutional court's powers, or manipulating the choice of certain judges, as we watch in Hungary and Poland. Finally, you can give the minority government the same value as the majority government, despite not supporting Parliament, and making, for example, significant personnel changes, as in the Czech Republic. In the countries mentioned, this allows too flexible, unstable political culture, and also - with the exception of the Czech Republic - shallow democratic roots.

Notwithstanding these attempts, European civilization has so far failed to provide a better way of governance than the one that is characterized by ten claims: the sovereignty of citizens in the creation of public power, split political power in the state (legislative, executive and judicial), electoral law, political plurality, government for a predetermined time, decentralization of decision making, majority decision-making and protection of minorities in society, free media and right to information, protection of human rights and freedoms and the legal framework of the system. Below follows a more detailed explanation of each of the ten conditions necessary for democracy.

The sovereignty of citizens in the creation of public power is the basic source for theory of democracy: derivation of political power from the citizens themselves and their equality to the creation of political power. Democracy differs from other political systems at this point - the only limiting factor is citizenship, not membership of a social or national group. Excluded from the creation of power are logically those who do not have a civil-law relationship with the state. Citizens' sovereignty in the formation of political power is a prerequisite for divided political power and elections.

Divided political power in a state - legislative, executive and judicial power - is the opposite of absolute power, centered on one or more people, who are creators, executors and controllers of political power. The relationship between the legislative power (parliament) and the executive power (government, president) is the source of the designation of a democratic state as a presidential or parliamentary democracy. Nowadays, in some democratic countries, the decline in confidence in parliament (Hungary, Poland, the Czech Republic, and Slovakia) reduces the legitimacy of the representation, and the search for a direct path between the strong leader and the citizens. However, both forms (direct and indirect democracy) are useful; the complexity of the agenda favors parliamentary representation and the legitimacy of decisions (issues of common life) favor referendum. Split political power in society is a prerequisite for the elections.

The prerequisites for free elections are, in particular, two: universal suffrage, guaranteeing equality of citizens and political pluralism, which guarantees political freedom for citizens. If we restrict freedom or equality, it will reduce the value of the other, which is certainly wrong for democracy. Political freedom is to have as many political parties as citizens want if their program and activity is not in conflict with the constitution.

Decentralization of decision-making is the need to make decisions at the lowest yet effective level. In this way, it is also possible to characterize decentralization by the principle of subsidiarity, widely used in the European Communities in past.

Majority decision-making goes hand in hand with the protection of minorities. It is a certain balance: when a majority is disadvantaged, it is dominated by a minority (aristocracy or elite, dictator, one political party, national group, biological minority); history confirms countless examples (absolute monarchy, authoritarian regimes and dictatorships, communist states, Yugoslavia and Serbs, South African racism). However, it is more common to deny minority rights: political (opposition), social (seniors), biological (other sexual orientation, race), and national (minorities). Both majority and minority can make a decision inhumane. This also applies to the referendum, decision of the majority. But who, after the referendum, will protect minority interests? Therefore, the only majority decision-making with the protection of minorities is a prerequisite for democracy.

The right to information and only on the basis of free information is it possible to choose alternatives from options, says doyen theory of democracy Robert Dahl (Dahl 1989). That is why most of democratic countries there is a form of public media, financially supported by concessionary fees, to circumvent the natural desire of governments and political authorities to control directly the media, thus challenging public opinion. Of course, there are also a number of private media of various forms that offer information. Consequently, freedom of private mass media, especially the Internet, where it is almost impossible to find authors, donors and advertisers of the information flow, can influence public opinion wherever there is free and anonymous expression space.

The protection of human rights and freedoms is a unique achievement of our civilization. The migratory wave of the last decade has hit Europe not only for its economic attractiveness, but above all as a space that respects the rights and freedoms to all inhabitants of EU, offered by liberal democracies (Hobsbawm 2009, pp.79-95). In Europe, freedom has an individual, not a group dimension. It is based on European liberalism (Svensson 1995) and individual freedom and justice, especially in the political, legal, but also social and biological spheres. Not only in connection with the migratory wave, constitutional security of human rights is currently under the microscope of experts.

It is extremely important for the political system of democracy to have a legal framework. The previous nine necessary conditions would have no meaning without the rule of law. In the rule of law, there is a legally consistent hierarchy of laws where the state and its institutions are also objects of law. By condemning equality before the law and the presumption of innocence, the rule of law creates a space for political equality and political freedom. Denying the rule of law is a boomerang instrument in democracy. Decline of Ancient Greek states was caused by a low respect for the law.

Examples of emptying the necessary conditions of democracy in semi-Byzantine Hungary, the authoritarian Poland also in Czech Republic are included in the following chapter.

### **3. Hungary and Poland - Limits of Democratic Political System**

The modern history of Central Europe region is extremely diversified and discontinuous. Various empires (Habsburg, Russian and Ottoman), and strong national influences (German and Jewish) imprinted its cultural footprint in Central Europe. Therefore, Hungary, Poland and the Czech Republic have interrupted history of statehood, and therefore also interrupted process of state-forming institutions and political culture (Almond, Verba 1980, pp.1-37). Institutionalization of political life is necessary for democracy. Consequently, country with low confidence in political institutions and a strong leadership usually tends to authoritarianism, autocracy or dictatorship. Complicated history of Central Europe is also a cause for potential nationalism and clericalism; the shallow roots of democracy are the cause for political instability.

Hungary's modern history is linked to the Habsburg and Ottoman empires and loss of two thirds of its historical territory after World War 1st is the reason for Hungarian national nostalgia. Hungarian public opinion tends often to authoritarianism and there is strong tendency towards leadership (Lendvai, 2012, p. 7). The Hungarian parliamentary elections in April 2018 will mark the role of the ruling party FIDESZ and its leader, Viktor Orbán. When in 2010 his party won, the constitutional majority started process of fundamental political changes. First of all, the public media has been transformed into state-controlled media, including complete personal exchanges. Then modification of role the Constitutional Court followed, after that electoral system has been changed in favor of big parties, also the functioning of the central bank was modified, with personal changes. Mentioned changes were carried out in the first term of Orbán's government (2010-2014). In the second term (2014-2018) FIDESZ party lost its constitutional majority in the parliament, but retains a simple majority. Other political parties influence on politics is not very important. Very effective tools for influencing public opinion, especially on the outside, are the organization of so-called public consultations. This is a government campaign that asks for answers to a question or a questionnaire, while the wording is guiding and waking up emotional responses. The on-line Dictionary of Czech language contain already the verb "orbanizovat" - to fight fiercely against immigrants, to spread xenophobia and the fear of refugees; also the word "orbanistán" - Hungary under the rule of Viktor Orbán; sometimes also "orbánisztán" ( Čeština 2.0 [online] 2018).

Viktor Orbán, Prime Minister of Hungary, described in his speech Bálbányos Summer Free University in 2014 his views about the future of Hungary as an illiberal state. In his interpretation the illiberal state does not reject the values of the liberalism, such as freedom, but does not adopt the liberalism as the central element of state organization, but instead includes a different, special, national approach. Orbán listed Singapore, Russia, Turkey and China as examples of "successful" nations, "none of which is liberal and some of which aren't even democracies"... (Orbán, [online] 2018). At the same time, however, he advocates „If

someone wants to say that a democracy is necessarily liberal, that person demands privilege for an ideology. Which we cannot grant him”(Orbán, [online] 2018). Orbán has numerous critics, also in Hungary. In 2015, respected Hungarian academician, political scientist and economist, Kornai János, one of the most important Hungarian social scientists, wrote in his study “U-Turn” following: “No matter how hard the authorities try to subdue the organizations which form public opinion, the IT revolution has made their task more difficult... The Fidesz government would love to find a way to prevent this too. Not long ago it proposed the introduction of an internet tax. Each gigabyte data transfer would have been taxed to the tune of 150 forints (roughly 55 USD cents). Within a few days, mass demonstrations had been organized; images of the protesters circulated in the international press. Viktor Orbán retreated half-way: as I write these lines it is not yet clear if the plan has been abandoned for good or merely postponed. Whatever may happen, the image of tens of thousands of demonstrators raising their mobile phones to the sky has become a symbol. The light from the tiny screens might even have illuminated the clouds of the internet - it will prove difficult for any regime today to raise impassable barriers to the flow of free speech „. János Kornai wrote in 2017 “Medical Report. Studies on Hungarian condition”. The consistent book records Hungarian deflection from democracy in the past decade, where author also makes a precise difference between democracy, authoritarianism and dictatorship (Kornai [online] 2018). So, it is possible to summarize, that in Hungary there has been growing a significant imbalance between freedom and equality in last years, necessary conditions of democracy were seriously touched: split of political power in the state, electoral law, decentralization, protection of minorities, right to information and free media, protection of human rights and freedoms and, first of all, legal framework of the political system. Orbán’s political model has its followers and some political leaders in Europe, for example in Poland, are also approaching this model.

Poland has a modern history connected with Russia and Germany, less with Habsburg and has never been an organic part only of Central Europe. Polish Catholicism has a great influence on politics, on formation of social values and public opinion. Poland has great distance between town and countryside, rather agricultural tradition and prevailing political line frequently reflects the mood of the rural majority, despite the fact that intellectual minority has usually high impact to creation of politics. Similar to Hungary, tendency toward leadership is strong enough; public opinion tolerates exceeding of democratic rules (Kucharczyk, Zbieranek, 2010). Poland is in the middle of election term (2016), with one party government (Prawo i Sprawiedliwość), majority in parliament and populist leader Jaroslaw Kaczyński, who controls as well executive and parliament power. The leader of the PiS government party Jaroslaw Kaczyński is completely out of the top structure, yet controls the Polish politics. It is a kind of Puppet Theater when watching the obedience of top Polish politicians. However, the demolition of democratic freedoms is similar to Hungarian. The government takes control of the media and also influences the Constitutional Court, so that the government is not subject to any control - neither by voters nor by independent judiciary authorities. In Poland a similar trend as in Hungary can be observed, when the pro-European Liberal Parties (Magyar Szocialista Párt in Hungary, Platforma Obywatelska in Poland) were changed in rather conservative nationalist parties, with an emphasis on domestic rather than foreign (European) policy, with accent to national interests first and also some conservative values (religion, family.) doing the changes that are on the edge of political system of democracy. Election campaigns target is not the intellectual elite, but above all lower-educated voters, low-income groups, an electoral majority of these societies. Also for Poland it is possible to summarize, that there has been growing a significant imbalance between freedom and equality, there were seriously touched necessary conditions of democracy: split of political power in the state, electoral law, decentralization, protection of minorities, right to information and free media, protection of human rights and freedoms and, first of all, legal framework of the political

system. In December 2017 the European Commission proposed to the Council of EU adopt a decision under Article 7(1) of the Treaty on European Union so the Polish government has moved to the implementation of the Article, which can lead to a reduction in voting rights in the EU Council. The European Commission asserts that the Polish judicial reform undermines the independence of the judiciary and violates the fundamental legal principles of the Union. Currently, Hungary and Poland are also supervised by the Venice Commission of the Council of Europe.

Czech Republic has a modern history connected with Habsburgs, Germany and Russia, but unlike Hungary and Poland, has deep democratic and industrial tradition, as well as some anti-Catholic tradition; however it lacks strong nationalism and clericalism. The leadership tradition has rather ethical content. Populist parties ANO 2011 and SPD (Party of Direct Democracy) with strong leaders did not achieve a constitutional nor simple majority in the last election (2017) and the reality will be either minority government or hybrid coalition government or snap election. In the Czech Republic the necessary conditions of democracy has not been emptied yet although changes are reported by some parties as their goal.

The political developments evoke many questions with regard to the political culture and democracy in the Central Europe. Internal development of states showed in the last two decades fragmented political structure, the existence of extreme right-wing parties (particularly in Hungary and Slovakia), an unstable value structure, low respect to political institution (Gubová 2016), rather strong nationalism in Hungary, partly in the Slovakia and Poland, clericalism in Poland. There is still a lack of confidence in the EU, due to the asymmetry of large and small as well as asymmetry of old and new Member States. Post-communist past was last two decades the strongest connecting link between mentioned countries. There are invoked latent tendencies in the political culture – especially in Hungary and Poland - nationalism, clericalism, tendency to authoritarianism - that challenge necessary condition of political system of democracy.

#### **4. Conclusion**

Democracy, the basis for European integration during process of its development, becomes one of the main values of European Union (European Union Treaties, [online], 2018). Today we can recognize imbalance between the economic and political integration of the EU. Moreover, if some of country, although the EU member state, lacks a democratic tradition, it can be the source for restrictions on human rights and democratic freedoms, so limiting the necessary conditions of the political system of democracy, then it will allow authoritarianism. In the last two decades a development of some Central-European states showed fragmented political structure, the existence of extreme right-wing parties, unstable value structure, low respect to political institutions, thus tendency to leadership. The majority in parliament was than often an instrument for limiting elements of democracy in political system, namely as follows: change of public media to state media, restrictions on the activities of constitutional courts, changes in electoral systems or recount of votes to mandates, the emptying of democratic political freedoms. However, political equality is meaningless without political freedom, this leads to a retreat from democracy and a shift to authoritarian rule. This is, unfortunately, the direction of today's Poland and Hungary, similar attempts are visible also in Slovakia and the Czech Republic.

### Acknowledgements

The article was elaborated with relation to the project VF 61450022 with many thanks to Fredrik Söderbaum for his kind advices, restrained comments and also patience during our discussions in Göteborg in October 2016.

### **Abstract**

*In the time when so much discussion appear on European integration, not only on economic, but also social and cultural level, we must bear in mind the differences that exist between individual European Union countries, their citizens, way of thinking, perception and understanding of different phenomena. This also applies to social responsibility concept differently implemented in EU Member States. The knowledge of the management staff of the characteristics of national cultures can significantly influence the success of the implementation of various managements concepts including social responsibility. In the paper the author analyses national culture dimension of the ten best scored EU countries in sustainability ranking. The four dimensions of national culture according to the Hofstede typology have been taken into account and some patterns have been found.*

**Keywords:** CSR, cultural dimensions, European Union, Hofstede typology, national culture

**JEL Classification:** M14, M16, F23

### **1. Introduction**

Culture can be defined as a set of shared values, assumptions, beliefs, morals, customs and other habits that are learnt through membership in a group, and that influence the attitudes and behaviours of the group members (Hofstede, 1984; Kluckhohn, 1954). The notion of culture exist at many different levels, including organizational, occupational groups, industries, geographical regions, and nations (Leung et al., 2005). National culture has a relevant impact on individuals within a society and the way they act and think. The culture of nations is recognized as fundamental determinants of differences between not only individuals but also organizations from different cultural backgrounds (Hofstede, 1984). Thus national culture plays an important role in forming and impacting corporate cultures within a specific nation, country or region (Thanetsunthorn, 2015). This may results in success or failure of the management concepts adopted by businesses in different regions, including Corporate Social Responsibility (CSR) concept.

The European Union's strategy clearly demonstrates that the positive development of the European economy is closely related to Europe's companies embedding corporate responsibility into practice. In order to facilitate this process, the EU has been creating a political framework and promoting the debate on CSR since 2000. The European Union has been one of the most active entities concerned with the promotion of corporate social responsibility. The implementation of the concept is supported by the EU through many diverse initiatives and strategic documents, which recognize the concept of CSR as a way for

achieving sustainability, competitiveness, and innovation of EU enterprises as well as the EU economy (Adamek, 2016).

As there is still no consensus about the CSR definition and associated business obligations resulting from its implementation the interpretation of the CSR concept and its practice differs according to the context in which the enterprises operates (Hill et al. 2007; Kołodziej and Maruszewska, 2015). The study on the practices of CSR in different EU countries also concludes that the governments and businesses in Europe have different perceptions on CSR and in fact European Union is characterized by a high diversity of combinations of CSR models (Iamandi, 2011). Although there is one EU policy framework on CSR, the concept is implemented differently across EU Member States. The focus of the paper is on the cultural context as factor influencing development of CSR activities. Therefore the aim of this paper is to analyse cultures of the top ten sustainability countries in EU and to identify any cultural patterns which might influence the successful CSR implementation.

The rest of the paper is structured as follows. The next section provides brief overview of EU policy supporting CSR and pay attention to cross-national differences in CSR performance. This is followed by a section dedicated to methodology used in the research process. Then the research findings are presented and the paper ends with conclusions.

## 2. Corporate Social Responsibility at the European Union Level

The European Union policy support for corporate social responsibility concept began with the development of the so-called Green Paper on CSR (Adamek, 2016). In July 2001, the European Commission announced “*Green Paper. Promoting a European Framework for Corporate Social Responsibility*” (COM, 2001), document systematizing the concept of corporate social responsibility at the European level. After the publication of the Green Paper, as the result of the consultation process was released a new document - a strategy for implementation and dissemination of corporate social responsibility. The so-called White Paper. Communication on CSR was published on July 2, 2002 under the name “*Corporate Social Responsibility: A Business Contribution on Sustainable Development*”. Another official paper referring to the issue of corporate social responsibility on EU level is the new strategy Europe 2020 (COM, 2010) which mentions the necessity to resume the EU strategy promoting corporate social responsibility. The next step of the undertaking actions by the European Commission was presenting in 2011 the Communication “*A renewed EU strategy for 2011-2014 regarding corporate social responsibility*”. An important part of the EU policy focused on CSR and improved transparency of business activities was also entry into force the directive on non-financial reporting (Directive 2014/95/EU) which sets out the contours of the reporting obligations concerning non-financial information applicable to a certain category of companies (Hąbek and Brodny, 2017).

Despite the numerous examples of CSR support a recent study prepared for the European Commission demonstrates that the EU’s policy on CSR needs to be supported and improved more in order to reach its targets (Schimanski, 2013). According to this study, only 33 percent sampled EU companies refer to at least one of the UN Global Compact, the OECD Guidelines or ISO 26000 standard, although 75 percent of the Danish companies and more than half of Spanish and Swedish companies refer to internationally recognized CSR instruments more often than the average EU company. Dutch, French and Italian companies were about average in the sample, whereas only less than 15 percent of Czech, German, and Polish companies in the sample refer to CSR instruments (Schimanski, 2013). Although the uniform policy on CSR at the EU level, the concept is implemented differently in individual Member States. Comparative cross-national CSR research supports that CSR performance varies across

countries, and that a company's nationality is important factor that influence the CSR approach (Ringov and Zollo, 2007). Comparative CSR studies explains cross-national differences in CSR performance as a function of difference in political-economic institutions, such as the welfare state, labour unions, educational systems or financial systems. These institutions represent a country-specific framework for companies that impacts on the implementation of CSR (Gjørberg, 2010). The divergences concerning the implementation of CSR in Europe derive also from the lack of common global definition and different understandings that shape the perception and practices of CSR. This all makes CSR's interpretation conditional and relative because it develops over time, in different contexts (Argandona and Hoivik, 2009). A common European framework or a definition on CSR is lacking since the developments and implementation in the member states are diversified depending upon the different historical, cultural, political and socio-economic factors which play a decisive role in conceptualization of CSR (Argandona and Hoivik, 2009). Thus it can be stated that there is no single European Union model of CSR approach but several. According to Argandona and Hoivik there can be identified five models with significant contextual differences: Anglo-Saxon, Central-European, Scandinavian, Mediterranean, Central and Eastern European. This contextual differences refer also to variety of national cultures existing in EU Member States. National culture is something very abstract and has direct impact on the thoughts and behaviours of people who are members of that nation. The same behaviour, which in one culture is perceived as positive, in another can be described as negative. Having the same national cultural background can cause that people could have similar thoughts and behaviours towards the same things or phenomena. According to Hofstede culture is "the collective programming of the mind which distinguishes the members of one group or category of people from another" (Hofstede, 1991), or in other words, culture is what almost every members of a certain group have in common and by which they could distinguish themselves from other groups. It is assumed that each culture is characterized by an individual specificity that makes various management concepts easy to implement, or, on the contrary, that their implementation encounters significant resistance (Hofstede, 1984). As stated by Hofstede "management within a society is very much constrained by its cultural context, because it is impossible to coordinate the actions of people without a deep understanding of their values, beliefs, and expressions". Therefore being aware of cultural context of the country where the company operates is of high importance for managers as companies may achieve higher performance when their management practices are matched with national cultures (Halkos and Skouloudis, 2016). This also applies to CSR concept especially at a time of increasing globalisation and activities of multinational corporations. The author in the paper seeks for the specific features of the national culture which may support CSR implementation by analysing national culture dimensions of the top ten sustainability countries in European Union.

### 3. Methodology

The analysis of the cultural dimensions of the top ten sustainability countries in EU was based on secondary data and is a result of a descriptive research approach. To evaluate national culture it is necessary to use a quantitative scale based on specific indicators. In this paper the national culture is defined by means of Hofstede's cultural dimensions model including Power Distance (PD), Individualism (IDV), Masculinity (MAS) and Uncertainty Avoidance (UA) dimensions. Hofstede established the differences between cultures by assigning each dimension and country a score on a 0-100 scale. The choice of using the Hofstede typology is justified as it is widely accepted and often used by researchers studying the relationship between CSR and national culture (Ringov and Zollo, 2007; Thanetsunthorn, 2015). The values of indexes for the countries were obtained from the Hofstede Insights website -

<https://www.hofstede-insights.com/>. The choice of the best sustainability countries in European Union was based on the country sustainability ranking carry out by RobecoSAM and Robeco. As of October 2017 the top ten sustainability countries in EU was Sweden, Finland, Denmark, Netherlands, Ireland, UK, Luxembourg, Germany, Austria, Czech Republic.

#### 4. Problem Solutions

After collecting data from RobecoSAM and Robeco sustainability country ranking it turned out that the top ten sustainability countries in EU are within the world top twenties sustainability countries. Looking at the position in the world ranking of the top 10 EU countries, the biggest difference in the ranking positions can be found between the last and the second to last position and concerns Austria and Czech Republic (see Table 1).

Data referred to the national cultural dimensions indicate that the top 10 sustainability countries in EU is characterized by low Power Distance and Individualistic culture. In terms of Masculinity and Uncertainty Avoidance dimensions it can be noticed differences among the studied countries. Because of the fact that national culture of almost all of the top ten sustainability countries in EU is characterized by low Power Distance dimension (except Czech Republic) and in order to observe some common patterns in national cultures, figures 1 to 3 present comparisons of scores of the Power Distance and the other three cultural dimensions.

**Table 5: The Culture Dimensions of the Top 10 EU Country Sustainability Ranking**

Country	Position at the world ranking	Power Distance	Individualism	Masculinity	Uncertainty Avoidance
Sweden	1	31	71	5	29
Finland	2	33	63	26	59
Denmark	4	18	74	16	23
Netherlands	9	38	80	14	53
Ireland	10	28	70	68	35
UK	11	35	89	66	35
Luxembourg	12	40	60	50	70
Germany	13	35	67	66	65
Austria	15	11	55	79	70
Czech Republic	19	57	58	57	74

Source: based on Country Sustainability Ranking – <http://www.robecosam.com> and Hofstede Insights calculator - <https://www.hofstede-insights.com> (2018)

When comparing Power Distance and Individualism dimensions (Figure 1) it can be stated that national culture of all of the top ten sustainability countries is characterised by Individualistic rather than Collectivistic culture. In Individualistic culture the good of individual is more important to us than good of a group, people attach more importance on personal self-interest and value their personal time, freedom and independence. In an high Individualistic culture, ties between individuals are loose and individuals stress the primary responsibility for their own action. From the group of the top ten the highest individualistic culture is the one of UK

and the Netherlands and moderate Individualistic culture is represented by Czech Republic and Austria.

Taking into account Masculinity dimension (Figure 2) it can be seen large variation in the results of the top ten sustainability countries in EU. It can be found countries with high Masculinity cultures such as Austria as well as very low masculinity (femininity) country such as Sweden. Masculinity dimension means a preference in society for achievement, heroism, assertiveness and material success. Its opposite, Femininity, means a preference for relationships, modesty, caring for the weak, and the quality of life (Hofstede, 1984). If we assume score of 50 as a border between the culture dimensions, the ten studied countries can be divided into two groups of countries. These which represent masculinity type of national culture (Czech Republic, Germany, UK, Ireland and Austria) and those which represent Femininity type of national culture (Sweden, the Netherlands, Denmark and Finland) and one country in the middle of the scale – Luxembourg.

The similar situation can be observed in the case of Uncertainty Avoidance dimension (see Figure 3). The top ten sustainability countries in EU can be grouped into high and low uncertainty avoidance cultures. Uncertainty Avoidance is the degree to which the members of a society feel uncomfortable with risky and ambiguous situations. Individuals in societies with a high score on Uncertainty Avoidance dislike and feel uncomfortable with uncertain and ambiguous situations. They prefer rigid codes of conduct, strict laws, and regulations to minimize the uncertainty. On the other hand, individuals in societies with a low score on Uncertainty Avoidance tend to have flexible attitudes and behaviours (Hofstede, 1991). Analysing the case of top ten sustainability countries in EU we can observe rather moderate Uncertainty Avoidance dimension, without extreme differences in values of the scores. The countries with low Uncertainty Avoidance cultures are Denmark, Sweden, Ireland, UK. The second group are the countries with high Uncertainty Avoidance: Czech Republic, Austria, Luxembourg, Germany, Finland, the Netherlands.

**Figure 2: National Culture Dimensions of the Ten Top Sustainability Countries in EU (Power Distance Versus Individualism)**

Source: based on data collected from Hofstede Insights calculator – <https://www.hofstede-insights.com> (2018)

**Figure 3: National Culture Dimensions of Ten Top Sustainability Countries in EU (Individualism Versus Masculinity)**

Source: based on data collected from Hofstede Insights calculator – <https://www.hofstede-insights.com> (2018)

**Figure 4: National Culture Dimensions of Ten Top Sustainability Countries in EU (Power Distance Versus Uncertainty Avoidance)**

Source: based on data collected from Hofstede Insights calculator – <https://www.hofstede-insights.com> (2018)

After analysing all dimensions of national culture of the top ten sustainability countries in EU it can be noticed some patterns that may support CSR implementation. The national cultures of the studied countries are characterised by low Power Distance (except Czech Republic) and Individualistic culture. The other two dimensions - Masculinity and Uncertainty Avoidance not seem to be of great importance in encouraging EU countries in CSR activities. Among the top ten sustainability countries in EU can be found Member States with cultures characterized by Masculinity and Femininity as well as countries with high and low Uncertainty Avoidance cultures.

## 5. Conclusions

Companies do not operate in isolation. Managers run their business in a complex environment which influence their decisions and a way they lead the business. When implementing a management concept the culture context is of high importance because it may shape the understanding of this concept. The situation will not be different in case of corporate social responsibility idea. People from different cultural backgrounds will have different perceptions of the roles corporations should play in terms of social responsibility. Therefore cultural differences between countries cannot be ignored when implementing management concepts and it is especially challenging issue for multinational companies. Managing across borders require applying customized CSR strategies in different countries taking into account every cultural context they operate in. Apart from the same political framework on CSR at European Union level there are differences in CSR performance in individual Member States. Therefore searching for similarities of national cultures of the ten best sustainability Member States seems to be of crucial importance. The results reveal similarities in two dimensions of national cultures. All analysed countries are characterised by low Power Distance culture, except Czech Republic with the score a little above the border of 50 on the Hofstede scale. The second national culture dimension which is in common for all of the top ten EU Member States is the dimension of Individualism. It may be stated that low Power Distance and Individualistic cultures may create favourable context for development of CSR activities in EU. It must be noted here that nowadays national cultures' often consist of a range of regional cultures and sub cultures. Therefore we must be cautious when analysing cultural dimensions and treat them as framework for further discussions about cultural similarities or differences especially in a time when in one company we can meet employees representing different national cultures.

### **Abstract**

*The regulation of Czech accounting, reporting and taxation has undergone major changes in the recent years, in line with the ongoing international harmonization. The result should be transparent, comparable and relevant accounting and tax information, which should contribute to the long-term objectives of the European Union. Every year, the Czech accounting and tax legislation undergoes number of significant changes which bring the Czech legislation closer to the European concept. The paper deals with this issue in connection with the new concept of accounting for the period of 2020-2030, which is being prepared by the Ministry of Finance of the Czech Republic. The upcoming changes in accounting are also connected with a major amendment to the Income Tax Act, which represents a shift of accounting away from the taxation and a reduction in existing interconnections. These changes will, among other things, have a significant impact on the increase of tax neutrality, reduction in the administrative burden, simplification of the structure of accounting and tax legislation while respecting European legal norms.*

**Keywords:** *accounting, European regulations, European Union, international harmonization, taxes*

**JEL Classification:** *H25, K34, M40, M41*

### **1. Introduction**

In line with economic globalization, international harmonization, regulatory conditions and requirements of the EU for reporting and a changing view of the relationship between accounting and taxation, accounting and tax information should be provided in the Czech Republic in a transparent and comparable manner. Any ongoing changes as well as changes that are being prepared for the period of 2020-2030 should contribute to achieving the long-term objectives of the European Union. This paper aims to analyse and evaluate the process of harmonization, both for accounting and taxation, in connection with binding European legislation. Another aim of the paper is to analyse the upcoming concept of accounting for the period 2020-2030, which is under the auspices of the Ministry of Finance of the Czech Republic (hereafter only MF CR). The upcoming changes in accounting and taxation are expected to have a significant impact, among other things, on improving stability and maintaining fiscal neutrality, reducing administrative burden, simplifying the structure of accounting, tax and legal regulations and to bring overall simplification of accounting and tax

legislation in the Czech the Republic, while respecting the globalization trends and European harmonization requirements.

## **2. Problem Formulation and Methodology**

Methods used in this paper match its content and focus. This is primarily the method of description. A dialectical benefit, for which each phenomenon can be understood as a part of the whole, can be considered as a methodological basis. Individual economic categories and economic phenomena are not examined in isolation but are based on principles of integrity of economic phenomena and the principle of dialectical unity. Furthermore, the method of procedure was used, which comes from simple categories to their increasingly complex determination, to their mutual relations. The methods of analysis and comparison were also used. The findings are summarized using the method of synthesis and scientific explanation.

## **3. Regulation of Czech Accounting and Taxation from the View of Ongoing Globalization and International Harmonization**

Since 1 January 2016, the Czech Republic has already made steps towards bringing the accounting of business entities closer to International Financial Reporting Standards. The Czech accounting has been harmonized in accordance with EU directives and regulations. Harmonization and globalization trends led to the modernization of accounting procedures, changes in valuation, bookkeeping and especially reporting, so that the financial statements would be prepared in a comprehensible manner and give a true and fair view of the entity's accounting and financial position and thus be comparable to the financial statements of the business entities within the EU. Taxation is another area concerned, where a relatively strong harmonization is taking place. The harmonization with EU regulations currently affects not only direct taxes but also indirect taxes, where significant steps have already been taken to respect the harmonization requirements.

### ***3.1 Harmonization of Czech Accounting Regulations in 2016-2018***

The main benefits of harmonization include mainly the comparability of financial information at the international level. This comparability eliminates current misunderstandings regarding the reliability of foreign financial statements and removes one of the most important barriers to international investment flows (Hakalová, Pšenková, Losová, 2014). The year 2016 brought a number of significant changes in the accounting of business entities in the Czech Republic (hereafter only CR). The reason for that was the transposition of the accounting directive 2013/34/EU and the effort to modernize accounting procedures and bring them closer to International Financial Reporting Standards (hereafter only IAS/IFRS).

The directive 2013/34/EU of the European Parliament and of the Council brought the need to amend the Act on Accounting No. 563/1991 Sb. (hereafter only Accounting Act) and other related accounting regulations, which include Decree No. 500/2002 Sb. and Czech Accounting Standards with effect from 1 January 2016. This relatively extensive amendment of statutory accounting regulations brought a number of new things.

One of the most important ones was the introduction of a new categorization of accounting entities (micro, small, medium-sized and large). The categorization of the entity is determined by achieving or exceeding at least two of the three criteria (the value of total assets - net, net turnover and average number of employees) at the balance sheet date, see Table 1. This fact is

also basis for different accounting obligations. It concerns mainly the content of financial statements and annual report, the preparation of consolidated financial statements, audit of financial statements, disclosure obligation, and other things (Hakalová, Palochová, Pšenková, 2016).

**Table 1: New Categorization of Accounting Entities Since 1. 1. 2016**

Accounting entity category	Turnover (million CZK)	Assets (million CZK)	Number of employees
Micro	up to 18	up to 9	up to 10
Small	up to 200	up to 100	up to 50
Medium-sized	up to 1,000	up to 500	up to 250
Large	over 1,000	over 500	over 250

Source: Act No. 563/1991 Sb., on Accounting, custom processing

Entities which are Public Interest Entity and Selected Accounting Entity are always considered to be a large accounting entity. The amendment to the Accounting Act affected changes in the content of financial statements, the obligation of their disclosure and also brought a new definition of the purpose of financial statements, which is to provide information for economic decision making of external users. This purpose should be a priority for the accounting entity when choosing accounting methods and procedures (Kolektiv autorů, 2016).

According to the new categorization, large and medium-sized entities, in addition to the balance sheet, profit and loss statement and the notes, must also prepare a statement of cash flows and statement of changes in equity; this change relates to the harmonization of Czech accounting legislation with IAS/IFRS. However, small and micro accounting entities are not obliged to prepare the statement of cash flows or the statement of changes in equity. Pursuant to Section 21 of the Act No. 563/1991 Sb. on Accounting, annual report is prepared only by accounting entities that are required to have their financial statements audited under Section 20 of this act. The annual report provides information on the development of company's performance, activity and current economic position. It also contains financial and non-financial information. The Amendment to the Accounting Act brought a relief for micro, small and medium-sized accounting entities that are not obliged to report non-financial information in the annual report.

Although there was a large-scale amendment in 2016, which affected all accounting regulations, it was only a transfer of obligatory (mandatory) provisions. The year 2018 brought another step towards the International Financial Reporting Standards, when it was necessary to transpose the optional (voluntary) provision from the Directive 2013/43/EU of the European Parliament and the Council. This effort brought a number of legislative changes, for example in reporting research and development results, retained earnings and losses of previous years, accruals and deferrals, and also in the accounting method of goodwill amortization and terminological clarification and alignment with EU regulations.

### **3.2 Harmonization of Czech Tax Legislation in 2016-2018**

Since the Czech Republic joined the European Union in 2004, the Czech tax legislation has undergone and is still undergoing number of significant changes, especially in the area of indirect taxes, namely the value added tax. The European Union's single market must work in the same way as the domestic market. The differences between domestic and intra-Community transactions must therefore be eliminated so that entities can limit themselves to only two valid

tax systems, namely intra-EU transactions and transactions with third countries. The logical consequence of processing intra-EU transactions in the same way, as if they occurred in one member state, was the introduction of a single place of taxation.

In the area of indirect taxes, the harmonization process in the Czech Republic focuses not only on value added tax but also excise taxes (octroi) every year. The main direction of harmonization is aimed at balancing individual rates so that domestic products are not favoured by lower or zero tax rates, and the EU single market and economic competition within the EU are not jeopardized.

The Harmonization of direct taxes is entirely different and does not take place in such proportions and to such an extent as for indirect taxes. The reason for that is that direct taxes have a completely different character than indirect taxes. They affect the decision-making on investment activity, formation of trading companies, development of new jobs and thus the employment growth. They also impact the pension of every Czech citizen and entrepreneur. The harmonization of personal income tax is therefore not expected to a greater extent, since such harmonization is not necessary for the proper functioning of the internal market, with the exception of measures for non-residents, especially cross-border workers. Corporate taxes are supposed to help to free capital, not to cause harmful competition between countries. It is for this reason that the harmonization of direct taxes is progressing very slowly throughout the European Union, where it is not even a priority.

The issue of harmonizing direct taxes in EU countries is also often not politically viable. The harmonization process in this area is stagnating mainly due to the differences in accounting systems of individual member states and further due to member states' reluctance to further harmonization, which they regard as interference with sovereign affairs of their internal policies.

As for other direct taxes, namely real estate tax, real estate acquisition tax and road tax, the situation is similar to that of personal and corporate income tax. Harmonization of these taxes is also not among current policy objectives of the European Union, therefore it is only minimal, and it is not given such attention as is given to indirect taxes. The process of tax administration harmonization has advanced the least (Kopřiva, 2011).

Thus, it can be stated that both value added tax and excise duty achieved high levels of harmonization in the Czech Republic at the present time. Value added tax, as a universal general harmonized tax, is currently perceived as a matter-of-course and necessity for the operation of the common market. For VAT, however, each country has different rates that are based on minimum rates set by EU rules, a different classification of individual items, etc. Value added tax is the most harmonized tax in the united Europe though. Even so the harmonization of Czech tax rules cannot be regarded as successful in all respects. The reverse is true as there are some negatives that cannot be ignored. These, for example, include the considerable lack of clarity and complexity of the legal regulation of the Act on Value Added Tax, which is almost immediately obvious to the general public after seeing the ever-changing act.

Basic objectives of the tax policy in the European Union, which are set out in the document "Tax policy in the European Union - Priorities for the years ahead", should be fulfilled during the harmonization process. These are the three major political objectives:

- national tax systems should be more transparent and simple,
- contributing to the effectiveness of the intra-Community market,
- shifts to lower rates and broader bases.

### **3.3 New Concept of Accounting and Taxation in the Czech Republic in 2020-2030**

In the Czech Republic, there are now again talks about preparatory works in relation to the brand new concept of accounting legislation for 2020-2030. Given that the Accounting Act and related accounting regulations are one of the laws with longest period of validity in the Czech Republic, it is desirable to change the accounting legislation and adapt it to the current needs of the national legislation, especially to international requirements in the context of world globalization.

The main reasons for the requirement to amend the Accounting Act and subsequent decrees and standards include in particular the following:

- considering world globalization and the requirement for comparability of statements based on national accounting legislation, the accounting ceases to be a national domain; users are globalising, and the world globalization brings the need to adapt national legislation to valid IAS/IFRS,
- as a member of the European Union, the Czech Republic is subject to its accounting regulation and is obliged to adapt to European directives,
- there are constant changes in regulatory conditions and requirements for world-wide reporting in particular,
- IFRS (International Financial Reporting Standards) was adopted as a global financial reporting standard,
- there has been a significant recodification of civil and commercial law, which changes the terminology used so far, and there is a need to adjust the legislation,
- and most importantly, the view of the relationship between accounting and taxation is currently changing (MF ČR, 2016).

In 2016, the Ministry of Finance of the Czech Republic already set the basic goal to revise the current state of the legislation on accounting and then to prepare a new concept of the Czech Republic for the next decade and ensure its implementation. Accounting and reporting requirements for small business and non-business entities should be minimized, but for large corporations, the existing world globalization determines the need for the application and greater utilization of IFRS in particular.

*There are currently three major lines of international accounting harmonisation. This is a case of the International Financial Reporting Standards (IFRSs), Accounting Directives of the European Union and Generally Accepted Accounting Standards of the United States of America (U.S. GAAP). International Financial Reporting Standards (IFRSs) are a set of standards, which are issued by the International Accounting Standards Board, governing the compilation and presentation of all financial statements (Hakalová, Pšenková, Losová, 2014).*

The system of IAS/IFRS is largely focused on the output of an accounting – financial statement (Krajňák, 2014). According to statistics of IASB (International Accounting Standards Board), the number of countries using IFRS is already 150, and all G20 countries are included. IFRS is used the most in Europe (44 countries), see Figure 1.

**Figure 1: Overview of the Number of Countries Where IFRS is Used (required)**

Source: Zelený (2017) – own processing

As you can see from Figure 1, 126 countries (84% of the total 150 countries where IFRS is used) already require IFRS for all or most of the domestic publicly traded companies or other public interest entities (listed companies and financial institutions). The 150 countries involved include all 31 member states of the European Union (EU) and the European Economic Area (EEA) where IFRS is required for all companies whose securities are traded on the regulated market. 126 countries classified as requiring IFRS for all or most of the domestic public interest entities include the member states of EU and EEA (Zelený, 2017).

The legislators and professional public are also currently discussing the use of IFRS for the purpose of determining the corporate income tax base, and this new concept is one of the possible reasons for the expected change in the Czech Income Tax Act in the context of the need for such harmonization. The tax harmonization is an essential part of the European integration. For this reason as well, accession of the Czech Republic into the European Union meant a significant change in tax policy (Krajňák, Krzikallová, 2016).

The Ministry of Finance of the Czech Republic is currently considering the preparation of a completely new concept of the Income Tax Act, which would be conceived as two separate norms. The first one would concern the taxation of companies and the second one self-employed individuals. This is mainly due to the fact that corporate taxation is slowly starting to harmonize with European directives, as opposed to the taxation of individuals, which will always be only national matter. For more information about tax harmonization within the European Union see e.g. (Randová, Krajňák, Friedrich, 2013).

The main changes of the new concept of the Act No. 586/1992 Sb., On Income Tax, include simplifying the legal norm without any impact on tax liability, improving stability and maintaining fiscal neutrality, as well as changes that would make the act more user-friendly, and other things. The act itself is to be purified from all exceptions and sectoral policies and should not include any parameters (i.e. not even a tax rate). A catalogue of standardized exceptions is to be added to the act, from which the minister will be able to select his program priorities. As for the personal income tax, it is expected that by 1 January 2019, the super-gross wage and solidarity tax increase will be abolished. Instead, the proposal of MF CR expects the introduction of a progressive tax rate of 19% for incomes up to 1.5 million CZK and 24% for incomes exceeding this amount. The proposed income tax rate of 19% is 1.1% less than the current tax burden (20.1%). Along with the abolition of the super-gross wage, the MF CR also proposes to abolish the so-called solidarity tax increase stated in Section 16a of

the Income Tax Act, and the introduction of another tax rate of 24%, an equivalent to today's effective rate, for the corresponding income exceeding approximately 4 times the average wage (MF ČR, 2018). Furthermore, the introduction of the so-called integrated system for managing taxes, social and health insurance, which should bring an advanced collection of both taxes and contributions at one place. A large amount of unnecessary and complex administrative activities should be automated or transferred to electronic communications.

#### 4. Conclusion

The harmonization steps taken during 2016-2018 brought clarity to the reporting and valuation of selected items of financial statements, which again brought the Czech accounting legislation closer to International Financial Reporting Standards. The present Accounting Act in some parts meets the needs of the practice, but some important areas are completely absent and its arrangement is, in fact, unsatisfactory, which is also true for its implementing regulations (decrees and Czech accounting standards). The new upcoming act, which should be in force in 2020, should bring many new things and improvements, and, above all, should respect the globalization and harmonization trends, regulatory conditions and requirements of the EU and take into account the changing relationship between accounting and taxation.

The tax policy has been, was and always will be a symbol of the national sovereignty of each state. This autonomy remains in its general features also in the European Union. For the functioning of the single market, however, the development of European integration requires close cooperation between countries in the area of taxation, whether in the form of information exchange, harmonization or at least coordination of tax systems. Tax co-operation has already been stipulated in the founding treaties of the European Community and is constantly expanding (Šíroký, 2013).

The often complicated process of adopting tax-related legislative acts, efforts to preserve national specificities and tax traditions, negotiations to maintain certain tax benefits lead to a complicated state of affairs and a lack of clarity in tax issues in the European Union.

A tax is income in public budgets, where it in the form of a mandatory and usually regularly recurring payment withdraws a portion of the entity's nominal income on an irreversible basis. The Income Tax Act is one of the most important instruments of public finances, not only from the point of view of the tax system, but also from the point of view of the revenue volume flowing to public budgets. The taxes so represent a major source of public sector financing and have both a microeconomic and a macroeconomic dimension. The basic principles necessary for the functioning of the market economy, namely the principle of tax neutrality and tax universality, have been strengthened. The new tax conception, which is expected to be in force from 2019 to 2020, eliminates some non-systemic institutes that make the Czech tax system unclear and obscure the real rate of taxation. A public debate is currently taking place on the whole concept of the new Income Tax Act draft. The proposed concept has, of course, both its positives and negatives. Against this new concept speaks the fact that part of the related Act on the Income Tax overlaps and could lead to a problem of a different interpretation of various sections that up to now have been part of the same act. Professional organizations, such as the Chamber of Tax Advisers, as well as business associations and the public, support the new version of dividing the act into two norms, mainly because of the difference between small businesses and large corporations (MF ČR, 2016 a 2018). The question to be discussed is whether the legislators manage to prepare a legislative concept that would be consistent with all intentions as well as regulatory requirements of the EU and also be acceptable to taxpayers.

### **Abstract**

*Educational policy is one area of public policies not included among the common European Union policies. The European Union, nevertheless, affects the direction of education of the member states and helps their development. The paper deals with selected indicators of educational policy in European Union countries and analyses total expenditures on education and indicators of education, with a particular focus on indicators in terms of the Europe 2020 strategy (Early leavers from education and training, Tertiary educational attainment) and Participation rate of young people in education and training in years 2010–2015. The indicators of educational policy are evaluated by use of hierarchical cluster analysis. The results show differences in the volume of allocated expenditures on education in EU countries, but also in the attainment of the goals of the Europe 2020 strategy in education.*

**Keywords:** educational policy, Europe 2020 strategy, evaluation, expenditures on educational, indicators

**JEL Classification:** H52, H75, I21

### **1. Introduction**

The strategy Europe 2020 is the main economic agenda of reforms of the European Union with an outlook for the year 2020. It replaces the Lisbon strategy, which expired prior to the year 2010. The Strategy elevates five main goals, which were defined for the EU as a whole. Amongst others, it aims to improve the level of education, mainly through the decrease of the drop-out rate below 10% and the increase of university-educated, or comparably educated, population aged 30–34 to no less than 40% (Staničková, 2017). Education plays a substantial role in the development of human potential and the economic development of a country. According to Cankaya, Kutlu and Cebeci (2015) all member states perceive the need to increase the quality of their education, develop access to learning at all stages of life. Life-long learning has become the fundamental point in EU's educational strategy. Education policy is the key activity of the Europe 2020 strategy focused on supporting education and employment of the youth and is an area of public policies not among the joint EU policies. It pertains to not only education reforms and legislative framework, but also financing as the main tool of education policy.

Adopting a theoretical and empirical approach, the present paper aims to evaluate selected indicators of educational policy in EU countries. In particular, it deals with total general government expenditure on education as one of the crucial indicators of economic competitiveness and on indicators in terms of the Europe 2020 strategy in education (early leavers from education and training, tertiary educational attainment) in years 2010 and 2015.

By use of hierarchic cluster analysis, indicators by the Europe 2020 strategy and participation rate of young people in education and training are evaluated in the period 2010 and 2015.

### ***1.1 Literature Review***

Current issues of educational policy in relation to its development, trends and reforms with respect to the targets of the Europe 2020 strategy are dealt with by, e.g. Pépin (2011); Walkenhorst (2008); Kamkhaji and Radaelli (2016); Johnes et al. (2017), as well as a number of comparative analyses and studies (Philips and Ertl, 2003; European Commission, 2016; OECD, 2017). According to the European Commission (2016), education and training help to equip people with the right skills and to find employment, which presents the best protection against poverty. But education can only play this part if it delivers good results. International surveys show that there is still room for improvement and this is one of the reasons why education and training remain a high priority for Europe. Another study, European Commission/EACEA/Eurydice (2013), presents a focused comparative analysis of national responses to the Europe 2020 priorities in the field of education and training. It concentrates on recent and forthcoming national reforms across four thematic areas that have a direct relevance to the Europe 2020 strategy: early school leaving (ESL), higher education, youth employment and vocational education and training (VET) and lifelong learning. Pepin (2011) explains why the inclusion of education in the Lisbon strategy was a major step forward and presents an assessment that underlines not only the role played by the Lisbon strategy in relaunching and consolidating EU education cooperation. Walkenhorst (2008) explores the evolution, expansion and dynamics of EU education policy and applying standard public policy analysis, it examines EU education policy with regard to context and process. He claims that EU education policy has, in recent years, been subject to a significant turn in functional terms and an assessment of EU documentation from 1970 to 2006 reveals a shift from politico-economic to economic-functional goals. De Witte, et al. (2013) examines how the institutional context and education and labour market policies correlate to the level of early school leaving by exploiting variation over time and across countries. Authors show that differences between countries may be attributable to country specific differences in school systems or influences of the (local) labour market on early school leaving and may thus provide arguments against or in favour of systemic reforms.

## **2. Problem Formulation and Methodology**

Two initiatives dealing with education and employment exist in terms of the Europe 2020 strategy, which concentrate on youngsters. Namely, these are 1) Youth on the Move and 2) Agenda for New Skills and Jobs. Youth on the Move constitutes one out of seven initiatives which are part of the Europe 2020 strategy. It comprises 28 activities which address the fight against unemployment of the youth, improvement of the quality of lifelong and higher education and the support of education and work mobility. The main goals include the reduction of early leaving of schools, support of specialised education and the preparation and attractiveness of higher education. The initiative is financed through existing EU programmes in education and youth (Lifelong Learning Programme) as well as structural funds, mainly the European Social Fund. The initiative Youth on the Move includes three main areas: 1) Improvement of lifelong learning system: the aim is to harmonise the skills and knowledge acquired during studies with demands placed by the labour market. 2) Increase in young people with higher education: the EU strives to reach that 40% of young Europeans graduate from university in 2020 (in 2010, they accounted for 33.6%). 3) Education and work mobility: according to the EU plans, by 2020, all young people in Europe should spend some time of

their studies abroad. The Student Research Projects' Efficiency is further dealt with by Staničková, Melecký and Navrátil (2013).

## ***2.1 Data and Methods***

The paper uses data available from Eurostat Statistic database (Government statistic, Europe 2020 indicator and Education and training) in years 2010–2015. For the sake of the assessment, 2010 was chosen as the first year of the application of the Europe 2020 strategy in education and 2015 as the half of the strategy period. The selected group comprises 28 EU countries (Belgium-BE, Bulgaria-BG, Czech Republic-CZ, Denmark-DK, Germany-DE, Estonia-EE, Ireland-IE, Greece-EL, Spain-ES, France-FR, Croatia-HR, Italy-IT, Cyprus-CY, Latvia-LV, Lithuania-LT, Luxembourg-LU, Hungary-HU, Malta-MT, Netherlands-NL, Austria-AT, Poland-PL, Portugal-PT, Romania-RO, Slovenia-SI, Slovakia-SK, Finland-FI, Sweden-SE, United Kingdom-UK). Indicators of education policy in EU countries in years 2010 and 2015 are compared by use of comparative analysis. The comparison makes use of total general government expenditure on education as % of GDP as a partial indicator of competitiveness of EU countries, and indicators of the Europe 2020 strategy in education (Early leavers from education and training, Tertiary educational attainment and Participation rate of young people in education and training). Further, an evaluation is carried out of selected indicators of education policy (Early leavers from education and training, Tertiary educational attainment and Participation rate of young people education and training) in EU countries in the period 2010–2015 by means of hierarchic cluster analysis. Cluster analysis is a multi-dimensional statistical method used to classify objects. It enables sorting observed units into several groups so that similar units occurred in the same group, and, in turn, so that units from other groups differed fundamentally. Thus, hierarchical tree diagram (i.e. dendrogram) is widely applied for depiction of final distances between objects (Everitt, et al., 2011). The evaluation of similarities and differences, based on indicators of education policy in EU countries, is seen in a box-plot. Box-plot is a form of graphic visualization of numerical data through their quartiles. The data was processed with the software R.

## **3. Results – Evaluation of Selected Indicators of Educational Policy in European Union Countries**

This section deals with selected indicators of educational policy in EU countries and their evaluation in 2010 and 2015.

### ***3.1 Financing and Expenditures on Education in EU Countries***

Throughout the developed and developing worlds, education spending is seen as a key tool for government policy makers in the quest for economic growth. Promoting ‘human capital’ development is a prime objective for economic and education ministries (Wolf and McNally, 2011). Expenditures on education are one indicator of comprehensive indices in the evaluation of competitiveness of countries. The relationship between measurable output indicators of competitiveness in selected EU countries is determined by Majerova and Nevima (2016). Total expenditures on education comprise direct costs on salaries, including taxes, and operating investment and non-investment costs. The comparison of total expenditures on education in EU (28) countries in 2010 and 2015 is seen in Figure 1. The highest expenditures on education as % of GDP is seen in Portugal in 2010 (7.6%). In 2015, the expenditures dropped radically (by 1.6%), which is also the sharpest decrease among all EU countries in the observed period. This situation resulted from general economic problems of the given country, which was also

reflected on the financing of education. As the most stable with the highest share of general government expenditures on education as % of GDP is seen Denmark (approximately 7%) and Sweden (approximately 6.5%). Both countries tend to be associated with a high level and quality of education. Also Finland invests heavily in education (6.6% in 2010 and 6.2% in 2015). This fact is also corroborated by comparative tests of quality in education, dominated by Finland. By contrast, Romania invests minimum resources in education (approximately 3%) as well as Bulgaria (approximately 4%), not only in the initial stage of the Europe 2020 strategy, in 2010, but also in 2015. The results manifest that the considerable difference occur among EU states in allocated total expenditures on education as % of GDP in the observed years. This can be explained by the fact that institutions of education in EU states are in possession of a variety of financial resources (investments, non-investment operating costs, direct costs on employees, other non-investment costs, etc.). The highest item in operating costs on education are expenditures on teaching staff. In more than a third of countries, financial resources on teaching staff are allocated at the central level of ministries directly to schools (Ireland, Spain, Croatia, Cyprus, Netherlands, Portugal and Slovenia) or pay for teachers' salaries (Belgium, Germany, Italy, Hungary, Malta and Liechtenstein). These results are also supported by other studies, e.g. Philips and Ertl (2003); European Commission/EACEA/Eurydice (2013); European Commission (2016); OECD (2017).

**Figure 1: Comparison of Total General Government Expenditures on Education in EU Countries in Year 2010 and 2015 (% of GDP)**

Source: Authors according Eurostat (2018)

### 3.2 Evaluation of Educational Policy Indicators in Terms of the Europe 2020 Strategy

Further, two indicators are compared and evaluated in terms of the Europe 2020 strategy regarding education in EU countries (Early leavers from education and training and Tertiary educational attainment) over the period 2010–2015. According to Eurostat (2018), the indicator “*Early leavers from education and training*” is defined as the percentage of the population aged 18–24 with lower secondary education at most and who were not in further education or training during the last four weeks prior to the conduction of the survey. The indicator “*Tertiary educational attainment*“ is defined as the percentage of the population aged 30–34 who have successfully completed tertiary studies (e.g. university, higher technical institution, etc.). Comparison of indicators of education in EU countries in years 2010 and 2015 is seen in Table 1. The highest % of early leavers of education and training young people until 2020 is set in Italy and Spain, as opposed to Croatia and Poland, with the lowest %. On the defined level of 10% or slightly below are found the majority of the countries, except for RO, BG, ES, IT. The target defined in terms of the Europe 2020 strategy, namely to increase

the number of people aged 30–34 with finished higher or comparable education to no less than 40%, should be attained by more than a half of EU countries by 2020. The lowest fulfilment of this target, below 30%, is set in Italy and Romania.

Source: Authors according Eurostat (2018)

### 3.3 Evaluation of Indicators of Educational Policy Using Cluster Analysis

Next, two indicators of the Europe 2020 strategy are evaluated (Early leavers from education and training by sex, Tertiary educational attainment by sex, age group 30–34) and Participation rate of young people in education and training in the period 2010–2015, by use of cluster analysis and box-plot. The results of the evaluation of the individual indicators of education policy in EU countries by clusters are seen in the box-plot (Figure 2) and appendix (dendrogram). EU countries were divided into four clusters by the level of dissimilarity (distance) of roughly 6.1. **The first cluster** comprises six countries (IE, CY, EE, FR, BE, UK), with low Participation rate of young people in education and training (approximately 40%). With regard to the indicator Early leavers from education and training by sex, these figures reach approximately 11% and in Tertiary educational attainment as the percentage of the population aged 30–34, which account for approximately 45%. Based on the evaluated indicators of education policy, the most similar countries in the first cluster are Ireland and Cyprus. **The second cluster** is composed of ten countries (BG, LV, EL, HU, CZ, HR, SK, PL, DE, AT), with moderate participation rate of young people in education and training (with the median of 36.4%), which reach 9.1% in terms of Early leavers from education and training by sex, with a small share of Tertiary educational attainment as the percentage of the population aged 30–34 (approximately 30%). The highest similarity by the evaluated indicators of education is seen in Greece and Hungary. **The third cluster** includes seven countries (FI, SE, DK, NL, LU, SI, LT) with high participation rate of young people in education and training (with the median of 52.7%). An outlier in Participation rate of young people in education and training is seen in Denmark (62.9%), which reaches the highest value out of all EU countries. With respect to the target of the Europe 2020 strategy – Early leavers from education and

training by sex – these countries reach the median of 7.2% and all countries fulfil the limit below 10% in the observed period 2010–2015. Similarly, in the second target, Tertiary educational attainment, as the percentage of the population aged 30–34 (the median of 45.5%) all countries are above 40% (except for Slovakia, with 39.4%). In the third cluster, the Netherlands and Finland are the most similar. **The fourth cluster** contains five countries (ES, PT, IT, MT, RO), and is the least effective in terms of the evaluated indicators of education. The most similar countries in the fourth cluster are Malta and Romania. With regard to the indicators of the Europe 2020 strategy, countries in the fourth cluster demonstrate the worst results out of all EU countries. The median is higher in Early leavers from education and training, with the value of 20.3% (against the requirement of less than 10%). Also the indicator Tertiary educational attainment as the percentage of the population aged 30–34 shows bad results in these countries (the median of 25.1%). The exception is Spain with an outlier of 41.8%, which, unlike the rest of the countries in the fourth paragraph, fulfils the target of the Europe 2020 strategy (at least 40% of the population aged 30–34 years with university education). Similarly, participation rate of young people in education and training is low (the median of 36.5%), which is comparable to the countries of the second cluster. On the basis of the results, it may be said that differences in education can be observed mainly in particular systems of education of the individual countries, in their structure, priorities, system reforms or disharmony between educational policies and the needs of the labour market.

**Figure 2: Evaluation of Selected Indicators of Education in EU Countries in 2010–2015 Using Box-plot**

Source: Authors' calculation according Eurostat (2018)

#### 4. Conclusion

Educational policy in the EU is based on the implementation of an open method of coordination of education and specialised preparation. National governments of member states are answerable for the educational systems, but collaborate at the EU level in order to reach their common goals. The paper evaluated selected indicators of education policies in EU countries. In both 2010 and 2015, the highest general government expenditures on education

as % of GDP was seen in Scandinavian countries and Portugal, as opposed to Romania and Bulgaria, which invest the least in education. The results acquired by means of cluster analysis showed that the biggest differences in all observed indicators of educational policy are present between the countries of the third (FI, SE, DK, NL, LU, SI, LT) and fourth cluster (ES, PT, IT, MT, RO). All countries in the third cluster are fulfilling both targets of the Europe 2020 strategy in education in the given period 2010–2015. In contrast, countries of the fourth cluster fail to reach any of the goal (with the exception of Spain, which attains the 40% share of people aged 30–34 with a finished higher education). The evaluation of selected indicators of education policy in EU countries in the period 2010–2015 also shows that countries of the first cluster (IE, CY, EE, FR, BE, UK) fulfil the goal of the Europe 2020 strategy, namely Tertiary educational attainment as the percentage of the population aged 30–34. The second target, namely Early leavers from education and training by sex, is fulfilled by 5 out of 10 countries of the second cluster. As regards the participation rate of young people in education and training, the smallest differences were found in all countries (almost 40%), with the exception of the third cluster (53%). Educational policy in EU countries was evaluated exclusively by means of selected indicators with focus on indicators of the Europe 2020 strategy in education. Evaluation of a larger amount of indicators of education, including quality indicators, would substantially exceed the scope of the paper, and can thus serve as a theme for further research.

### **Abstract**

*The importance of the Arctic region leads states to creating their own Arctic policies to promote and secure their interests in the region. The role in the creating future Arctic policies in Europe belongs to the governments of the European Arctic states and intergovernmental authorities. The EU is not a central public actor in the Arctic; however, raising importance of the Arctic forced it to develop an Arctic policy. The paper analyzes the Arctic policies adopted by EU since the European Parliament Resolution on Arctic Governance from 2008 to the newest 2016 Joint Communication "The integrated EU policy for the Arctic". The Joint Communication puts much greater attention to the internal dimension of the EU's Arctic affairs than any of the previous documents dealing with the EU's Arctic policy.*

**Keywords:** Arctic, Arctic policy, European Union

**JEL Classification:** F50, K30, K390

### **1. Introduction**

The Arctic has become the subject of many scientific and political debates in recent decades. It is the subject of an examination of various scientific disciplines. From an international perspective, the most important question is the question of its international status. Antarctica has a stable legal regime that froze the territorial claims of states. But what about the Arctic? According to Kristina Schönfeldt, the Arctic legal regime is built on 3 pillars: international law, national law and soft law. (Schönfeldt, 2017, p. XXXV) All these areas are often overlapping, making the Arctic governance a very complex system. The attractiveness of the Arctic stimulates the interest and activity of not only Arctic states, but also non-Arctic actors (China, India, etc.) and international organizations (EU).

No state or international organization exercises effective control over Arctic as a whole. The main actors in the Arctic, due to its character (the Arctic Ocean and part of the mainland - a territory belonging to the sovereign states) are sovereign Arctic states. "The Arctic Five" is a community of Arctic coastal states whose territories are included in all the definitions of the Arctic and, moreover, have direct access to the Arctic Ocean. The Arctic coastal states have confirmed in the Ilulissat Declaration that the Arctic Ocean is covered by an extensive legal framework and that law of the sea provides all important rights and obligations. (Danish Ministry of Foreign Affairs, 2008) The Ilulissat Declaration is an explicit expression of the Arctic coastal states that they do not plan to surrender their territorial claims in the future, or to allow non-Arctic states to exert their influence in the Arctic. Under UNCLOS, the A5 states have defined the limits of their sovereignty and basically denied any globalization of the Arctic.

The Arctic Council is the only forum where all Arctic states cooperate on an intergovernmental level. The Arctic Council does not have the power to issue legally binding standards and to determine the measures, but has been able to manage the priorities of the Arctic States and to issue authoritative reports (for example on Arctic pollution and climate change of the Arctic) under which other authorities have acted. Despite the lack of powers, the Arctic Council has an enormous influence on the area, and therefore the out-of-state states and the EU have sought to achieve observer status. (Anderson, 2009, p. 105-106)

The Arctic and the EU are interconnected not only by geographical proximity but also by the fact that the EU Member States are also Arctic states. Denmark, Finland and Sweden represent the geographical link between the EU and the Arctic. The Kingdom of Denmark is considered an Arctic state only because of Greenland and Faroe Islands. The relations of the Kingdom of Denmark and its territories towards the EU have heterogeneous nature. (Chuguryan and Kucharčík, 2014, p. 280) It should be noted, however, that France, Germany, Italy, the United Kingdom, the Netherlands and Spain gained the observer status in the Arctic Council. The EU itself has had an ad hoc observer status in the past. In addition, the EU maintains close relations with Iceland and Norway as members of the European Economic Area (EEA) and the European Free Trade Agreement (EFTA), while countries like Canada and the United States are the EU's strategic partners (European Commission, 2016).

## **2. Problem Formulation and Methodology**

The EU involvement in Arctic affairs is important for both EU and Member States, especially those in the Arctic region. The importance lies mainly in the economic interests of individual states or the EU as a whole. The EU is not a central public actor in the Arctic; however, raising importance of the Arctic forced it to develop an Arctic policy. Although the EU as such does not border with Arctic, it shares with it historical, economic, trade and geographical relations, while many existing EU activities, funding, projects and decisions have already had an impact on the sustainable development of the region. EU policies on the environment, climate, energy, research, transport, hunting and fisheries have a direct impact on the Arctic. (European Commission, 2016)

The EU had not been showing any particular interest in the Arctic till 2008. The paper analyzes the Arctic policies adopted by EU since the European Parliament Resolution on Arctic Governance from 2008 to the newest 2016 Joint Communication “The integrated EU policy for the Arctic”.

While concluding the article we used the method of analysis and subsequent synthesis, abstraction, and deduction. The research mostly consisted of analyzing the primary sources of EU's Arctic policies – the documents issues by the European Parliament, Council Commission, respectively High Representative – and their comparison.

## **3. Development of the Arctic policy of the EU**

The intention “to develop an EU Arctic policy based on the evolving geo-strategy of the Arctic region, taking into account i. a. access to resources and the opening of new trade routes” was for the first time mentioned in the paper from the former High Representative Javier Solana and the European Commission to the European Council called “Climate change and International Security” from March 14, 2008. (EU High Representative for the Common Foreign and Security Policy, 2008)

### **3.1 European Parliament Resolution on Arctic Governance (2008)**

In the introduction to the Resolution of October 9, 2008 on Arctic Governance, the European Parliament draws attention to the events, conferences and legal acts that are related to the Arctic and have given rise to the adoption of the Resolution (the International Polar Year 2007-2009, placement of the titanium flag at the bottom of the Arctic Ocean by the Russian submarine in August 2007, UNCLOS, Ilulissat Declaration, Commission Communication “An Integrated Maritime Policy for the European Union”, Political Document of the High Representative “Climate Change and International Security”, etc.). It reflects the environmental changes and their impact on the Arctic flora and fauna, Indigenous Peoples’ livelihood, and underlines the importance of the Arctic for global climate.

The first official document to set the stage for further development of EU’s Arctic Policy was the Parliament’s resolution on Arctic governance from October 7, 2008. “Arguably, the EU did not start with the best possible course with proposals that was not well received by some of the other Arctic states and in particular Canada and its Indigenous Peoples.” (Grøne, 2016, p. 31)

EP called on the Commission to address, at least, the following issues in its communication:

- a. The state of play in relation to climate change, and adaptation to it, in the region;
- b. Policy options that respect the indigenous populations and their livelihoods;
- c. The need to cooperate with our Arctic neighbours on cross-border issues, in particular maritime safety; and
- d. Options for a future cross-border political or legal structure that could provide for the environmental protection and sustainable orderly development of the region or mediate political disagreement over resources and navigable waterways in the High North. (European Parliament, 2008, Article 7).

The most important part of the Resolution is that European Parliament urged the Commission to “to take a proactive role in the Arctic by at least, as a first step, taking up ‘observer status’ on the Arctic Council, and considers that the Commission should set up a dedicated Arctic desk.” (European Parliament, 2008, Article 14). It also suggested that “the Commission should be prepared to pursue the opening of international negotiations designed to lead to the adoption of an international treaty for the protection of the Arctic, having as its inspiration the Antarctic Treaty, as supplemented by the Madrid Protocol signed in 1991, but respecting the fundamental difference represented by the populated nature of the Arctic and the consequent rights and needs of the peoples and nations of the Arctic region.” (European Parliament, 2008, Article 15). This ambitious goal should have its beginnings in establishing such a regime in the uninhabited part of the Arctic - in the middle of the Arctic Ocean, which was not claimed by any state. The EU observer status was requested, but the regime proposed in the Resolution was never applied to the Arctic.

### **3.2 European Commission Arctic Communication (2008)**

This Communication set out EU interests and proposes action for EU Member States and institutions around three main policy objectives:

- a. Protecting and preserving the Arctic in unison with its population;
- b. Promoting sustainable use of resources;
- c. Contributing to enhanced Arctic multilateral governance. (European Commission, 2008)

The Commission proposes measures to protect the environment and climate, support Indigenous Peoples, research, monitoring and assessments. “The Commission is clearly declaring its respect for Indigenous Peoples based on core principles as human rights and democracy and as the Commission specifies: ‘Hunting marine mammals has been crucial for the subsistence of the Arctic population since prehistoric times and the right to maintain their traditional livelihood is clearly recognized.’” (Grøne, 2016, p. 32)

The Communication promotes sustainable use of resources (hydrocarbons, fisheries), new maritime routes and tourism. In the section on Arctic multilateral governance, it refers to international conventions (UNCLOS) and regional or international organizations. The Commission no longer refers to the Antarctic Treaty as a possible model for the codification of the Arctic regime, as was the case in the resolution of the Parliament. In this section, the Commission itself states that it will apply for permanent observer status in the Arctic Council (ad hoc status was granted at that time), (European Commission, 2008).

### ***3.3 Council of the European Union Conclusions on Arctic Issues (2009)***

The Council considered that an EU policy on Arctic issues should be based on effective implementation of adequate measures to mitigate climate change preserving the uniqueness of the Arctic, reinforced multilateral governance, the United Nations Convention on the Law of the Sea (UNCLOS) and other relevant international instruments, respecting the Arctic ecosystems and residents (including indigenous peoples) while formulating and implementing EU actions and policies, and maintaining the Arctic as an area of peace and stability and sustainable conduct of economic activities. (Council of the European Union, 2009).

In order to take a next step towards the formulation of an overarching approach to EU policy on Arctic issues the Council lists 23 aims, for example, sustainable management of all natural resources; importance of supporting sustainable development for indigenous peoples, including on the basis of their traditional means of livelihood; minimising negative environmental impacts of exploitation and use of natural resources in the Arctic as well as promotion of energy efficiency and renewable energy; support for research on Arctic related issues which should be adequately reflected in the work programmes of the Seventh Community Framework Programme for Scientific Research; etc. (Council of the European Union, 2009).

The Council recognized the Arctic Council as the primary competent body for circumpolar regional cooperation and also shown the support for Barents cooperation and Northern Dimension policy. The Council requested the Commission to present a report on progress made in these areas by the end of June 2011. (Council of the European Union, 2009) In this period, the Commission had not been granted the Observer Status yet, so the Council expressed its continued support for the Commission to become an Observer in the Arctic. “The EU is de facto highly active in the Arctic Council on an ad hoc basis, but the relationship still remains to be institutionalised with the formal status of Observer.” (Grøne, 2016, p. 37) As Commission later stated in Joint Communication from 2012: “Observer status, as defined by the Arctic Council itself, would allow the EU to intensify cooperation and make a positive contribution to the work of the Council. It would allow the European Union to gain detailed understanding of the concerns of Arctic partners, which will be important when developing its own internal policies. Observer status would complement the EU’s Arctic engagement through the Barents Euro-Arctic Council and the Northern Dimension.” (European Commission, 2012).

### ***3.4 European Parliament Resolution of 20 January 2011 on a Sustainable EU Policy for the High North***

The Resolution stresses the need for a united, coordinated EU policy on the Arctic region, in which both the EU's priorities and the potential challenges and a strategy are clearly defined. (European Parliament, 2011) New maritime routes, the adoption of the Polar Code (maritime safety), and the opening of current or future routes for international transport are given importance. It also deals with natural resources and their rational use and the impact of climate change and pollution on the Arctic. Sustainable socio-economic development assesses the impact of changes on indigenous peoples - the threat to their original way of life, but also the emerging opportunities for economic development in the Arctic. Parliament noted the special position and recognized the rights of the indigenous peoples of the Arctic and pointed in particular to the legal and political situation of the indigenous peoples in the Arctic States and in their representation in the Arctic Council and stresses the need to adopt special measures to safeguard the culture, language and land rights of indigenous peoples in the way defined in ILO Convention 169. (European Parliament, 2011)

Resolution notes that “the Arctic region is not to be regarded as a legal vacuum, but as an area with well developed tools for governance; nevertheless points out that, due to the challenges of climate change and increasing economic development, those existing rules need to be further developed, strengthened and implemented by all parties concerned.” (European Parliament, 2011).

### ***3.5 Joint Communication to the European Parliament and the Council. Developing a European Union Policy Towards the Arctic region: Progress Since 2008 and next Steps (2012)***

Communication evaluated in detail EU's particular contributions in the Arctic in various areas (e.g. Fighting climate change, Research on the Arctic environment, Shipping and maritime safety). “Previous controversial references to multilateral governance in the Arctic are replaced by value-free headings of international cooperation.” (Grøne, 2016, p. 40) The main theme of Communication is 3 words - knowledge, responsibility, and engagement.

The Commission and High Representative based on EU's Arctic policy on 3 objectives:

- a. Support research and channel knowledge to address the challenges of environmental and climate changes in the Arctic;
- b. Act with responsibility to contribute to ensuring economic development in the Arctic is based on sustainable use of resources and environmental expertise;
- c. Intensify its constructive engagement and dialogue with Arctic States, indigenous peoples and other partners. (European Commission, 2012)

In the first part, the section “Knowledge” targets the actions of the EU on various activities - Arctic research, developing Arctic monitoring from space, supporting information and observation networks, while building know-how and technical expertise. The part “Responsibility” assesses the changes in the Arctic and their affect on the global scale and in particular in Europe. It elaborates the list of activities securing the responsible contribution in the Arctic, as well as promoting safe and sustainable management and use of resources in the region. The part Engagement defines what the involvement of the EU in the Arctic will include (e.g. bilateral dialogues with all EU's Arctic partners, involvement within relevant international frameworks on Arctic issues, ecosystem management, dialogue with Arctic inhabitants and indigenous peoples representatives). Second part of the communication

“Summary of the EU’s Contribution to the Arctic since 2008” highlights the increasing range of activities the EU is already undertaking in the region and reviews the issues outlined in the Commission Communication on ‘The EU and the Arctic Region’ from 2008 (European Commission, 2012).

### ***3.6 Joint Communication of the Commission and the High Representative: An Integrated European Union Policy for the Arctic (2016)***

European Parliament Resolution on the EU Strategy for the Arctic (2014) and Council conclusions on developing a European Union Policy towards the Arctic Region (2014) did not bring any particular changes or ideas to EU’s Arctic policy. Based on previous document, the integrated and coherent Arctic policy should have been adopted by 2015, but the Joint Communication was presented by the Commission and the High Representative with delay, on April 27, 2016.

Whereas in the past attention focused almost solely on the effects of climate change in the Arctic, more recently there has been growing awareness that feedback loops are turning the Arctic into a contributor to climate change. (European Commission and High Representative, 2016) The Communication also elaborates investment opportunities, especially in Barents region (approx. 140 billion €). It states that „EU already contributes substantially to Arctic research, satellite observation and regional development as well to the work of the Arctic Council, wherein countries beyond the Arctic such as China, India, Japan, the Republic of Korea and Singapore now have observer status.“ (European Commission and High Representative, 2016) This provision can sound critically in the context of the fact that the EU did not gain observer status in the Arctic Council in 2015. Countries can obtain the status only with unanimous approval of all members. The EU is therefore evaluating its activities in the region and at the same time points out that other countries, even though they are not geographically located in the Arctic, have nevertheless gained the observer status.

Three priority areas of integrated EU policy were proposed in Communication:

- a. Climate Change and Safeguarding the Arctic Environment;
- b. Sustainable Development in and around the Arctic;
- c. International Cooperation on Arctic Issues. (European Commission and High Representative, 2016)

The Communication states that the EU should attach particular importance to research, science and innovation which will play a key role across all three priority areas. Action in the priority areas should contribute to the implementation of Agenda 2030 and be in line with the 17 Sustainable Development Goals adopted by the United Nations in September 2015. (European Commission and High Representative, 2016)

Part “Climate Change and Safeguarding the Arctic Environment” lists the most serious problems the Arctic is facing, such as diminishing the size of the summer glaciation, the permafrost thawing, which has serious consequences such as landslides, infrastructure disruption, coastal erosion, releasing the pathogens and greenhouse gases. Climate change also affects ecosystems, endemic species and the way of life of indigenous peoples. (European Commission and High Representative, 2016) The EU suggested it could share experience and best practices on the circular economy with Arctic states in the area of waste legislation. “The EU is proposing this to diffuse EU norms into the international community and hence show that they are ready to cooperate on Arctic issues and thereby EU presence in the Arctic

becomes further legitimate.” (Grøne, 2016, p. 48) “The future challenge of the EU is to continue fulfilling its strong commitments and to eventually transform them into the binding secondary law in accordance with the efforts made at the international level, especially the recently adopted Paris Agreement.” (Drastichová, 2016, p. 159)

In the second priority area “Sustainable Development in and around the Arctic” the Communication focuses on challenges in the Arctic region concerning this topic – sparse settlement, underinvestment, and the lack of infrastructure. The Communication states that “the EU can play an influential role in shaping the future development of the European part of the Arctic through the application of EU rules relevant for the EEA and the deployment of financial Instruments” (European Commission and High Representative, 2016), but does not come with any special ways to solve above mentioned problems. It names the projects which are important sources of project financing (the Interreg North Programme; the Botnia-Atlantica Programme; the Baltic Sea Region Programme; and the Northern Periphery and Arctic Programme; as well as the Karelia and Kolarctic cross-border cooperation programmes under the European Neighbourhood Instrument), but not how exactly they contribute to sustainable development in the region. The EU is not creating any new programs to promote this aim.

However, later, the Commission suggests setting up a European Arctic stakeholder forum with the aim of enhancing collaboration and coordination between different EU funding programmes. This temporary forum should bring together EU institutions, Member States, and regional and local authorities to contribute to identifying key investment and research priorities for EU funds in the region. The process will also be open to Norway and Iceland under the European Economic Area Agreement, as well as to Greenland under the EU-Greenland Joint Declaration. (European Commission and High Representative, 2016)

In the final part “International cooperation on Arctic issues” the Communication elaborates the international and regional involvement of the EU in the relevant organizations, forums, and platforms. The Communication states that the EU recognizes and supports existing legal Instruments – UNCLOS; the EU will continue its active participation in the Arctic Council - the primary forum for international cooperation in the region; the EU will continue to support regional and sub-regional cooperation - the Barents Euro-Arctic Council, and the Northern Dimension policy, UN Economic Commission for Europe and in particular the UNECE Convention on Long-Range Transboundary Air Pollution (CLRTAP), the Nordic Council, the Nordic Council of Ministers. Further it states that the EU should cooperate with all Arctic partners - including Canada, Russia and the United States, and those that take an increasing interest in the Arctic such as China, India, Japan, the Republic of Korea and Singapore; already cooperates with Greenland under the EU-Greenland Partnership; has close relations with Iceland and Norway; and the EU will continue to engage with Arctic indigenous peoples and local communities to ensure that their views and rights are respected and promoted in the ongoing development of EU policies affecting the Arctic. (European Commission and High Representative, 2016)

The EU, across its documents, shows that its view of the Arctic is consistent and the EU is constant presenting its priorities. (Trávníčková. 2017, p. 307) According to Hon and Honová, the primary long-term objective of the EU must be its competitiveness (and of its individual member states) in the global economy, because only prosperous economies are able to create enough resources to fulfill the environmental objectives of the EU, expressed by the low-carbon economy. (Hon and Honová, 2012, p. 92) To conclude, as the Communication states in the end, “this policy document should guide the EU’s actions”, it is really rather a “guide” than a binding plan for action. The Communication „communicates“ in which areas and

programs concerning the Arctic the EU is currently present, but does not bring any or just a limited number of new ideas or engagement for the action. The Communication is very careful about statements which could halt the EU's possible observer status in the Arctic Council. On the other hand, the EU promotes its position and awareness about the importance of the Arctic, the European part of the Arctic in particular.

#### 4. Conclusion

The EU began to formulate its Arctic policy in 2008 European Parliament Resolution on Arctic Governance. The Resolution was quite ambitious it proposing the application the Antarctic Treaty regime on the Arctic region. By this proposal, the EU basically questioned or suppressed the rights of the Arctic coastal states and at the same time asked to be a observer in the Arctic Council.

The policies later focused on current environmental changes and protection of the environment, both living and non-living natural resources and their sustainable management, dialogue with indigenous peoples and protection of their livelihoods, scientific cooperation, navigation and its safety, its. The goals or rather proposals of the EU changed in the period of time from the more ambitious to the more acceptable ones. But the EU came with particular solutions and plans for particular problems only in very sparingly way. Policies rather focus on wide range of problems and involvement of the EU in international and regional organizations.

To this day, the EU was not be able to achieve its goal set even in the very first document developing its Arctic policy – to gain the permanent observer status in the Arctic Council which can be granted with the approval of all 8 members of the Arctic Council. The first issue which complicated EU's status was the ban of seal products on the EU market and consecutive objection of Canada (and its indigenous peoples). Later the position of the EU was complicated by the tensions between the EU and Russian federation after Crimea dispute. In a short time horizon, we do not believe this situation will change.

### **Abstract**

*The smart villages' concept is a new direction for rural development policy in the European Union (EU) to bring new opportunities of rural development for villages and rural communities in EU member countries. The aim of the article is to analyze selected options of rural regions, which can be part of the smart villages' concept and their EU support schemes. The analysis includes articles published in two fields - rural development as part of the Common Agriculture Policy of EU and the competitiveness of regions in EU. In the introduction, we describe the concept of smart villages which is presented by official EU documents or some authors who deal with the issue. In the next section we analyze the possibilities of implementing the smart village project within the framework of the rural development plans in EU. In the next part of the article we will compare the basic model of smart cities, which is elaborated in a higher level with the smart village model in the EU. In the final part of the article we compare the smart areas between the two concepts - smart cities and smart villages.*

**Keywords:** *Common agricultural policy of the EU, rural development in the EU, smart villages, support of the EU*

**JEL Classification:** *Q16, Q56, R11*

### **1. Introduction**

The fundamental idea of the economic prosperity of the European Union is to bridge the gap between the regions and increase their competitiveness. Achieving both goals is only possible through their implementation into all EU policies. One of the policies for reducing regional disparities is the rural development policy, which is part of the EU's Common Agricultural Policy. One of the ways to reduce the gap between cities and the countryside is the concept of smart villages.

In the course of its development, the Common Agricultural Policy of the European Union (CAP EU) has been transformed into two pillars of support for EU agriculture - simplified to direct support and rural development. Rural development policy has a wide range of instruments that are implemented in a number of rural areas - a good environment, improved cooperation between the rural community and the local government, the introduction of new technologies and the internet, increasing the educational level of the rural population, development of tourism, rural culture. One of the reasons why II. pillar becomes an increasingly important element of the CAP of EU. Getting closer to the living standards of cities and towns is one of the objectives of preserving rural settlements and stopping rural people from moving to places where their expectations of improving their living conditions are often not met. Similarly, to 20 years ago, Cork's declaration, in Cork (Ireland), in

September 2016, significant stakeholders in rural development, agriculture and the environment presented smart ways of dealing with rural areas in the context of climate change, efficient food production, preservation of traditions and cultural heritage Development. The agriculture and forestry sector are still important for the EU and the Common Agricultural Policy is complementary to other EU policies. CAP and rural development are one of the key instruments for achieving EU priorities - economic growth and sustainability, and these objectives are not mutually exclusive.

In the introductory part of the article, we describe the smart city concepts as presented by the major authors who deal with the issue and the smart village concept as presented by EU official documents. In the second part of the article, we compare the basic concept of smart city according to Giffinger (2007), which is not only the EU developed at a higher level, with the smart village concept, Cork's Declaration and Revitalisation of Rural Areas Through Smart Villages (2017). The European Union has several tools and documents to support rural activation. The main sources of analysis will be official EU documents, expert articles from conferences and expert analysis available on the Internet. The most important document is the Rural Development Plans that Member States have set for the programming period 2014-2020, with some Member States having one or more plans drawn up together with 118. In this article, we will try to identify important trends in determining the development of municipalities and rural areas in general to become smart villages. We will try to design key components for the future intelligent rural framework based on smart areas as suggested by Giffinger (2007). In the final part of the part, a partial swot analysis of the smart village model was created, when the basic smart city model was incorporated.

## **2. Smart Cities and Smart Villages**

The EU has long declared its concern over rural displacement and especially the departure of young people from rural to urban areas. City centres and countryside prefer other priorities and objectives, with the goals of both such areas being modern and contemporary. It is necessary to ensure that rural and rural communities have sufficient access to services and have opportunities to work in traditional rural professions or to gain business support in such areas and / in new sectors.

Securing jobs is a key instrument for rural growth, the fact is that many of the traditional jobs cannot be relocated. The jobs created in this way are important in terms of landscape development, its formation and these sites are related to the protection of water resources, soil and climate protection, air and biodiversity. Jobs that could generate smart rural solutions would be both traditional in nature, but they could also offer applications for knowledge workers who are leaving it because of their inapplicability in rural areas. On the other hand, the lack of knowledge workers may pose a threat to rural development. The age structure of the current rural population also becomes a threat to rural areas. If rural development actors do not respond adequately to the increase in the numbers of the elderly and their special needs, there will be risk to wellbeing of this group of population. To achieve higher quality of life for the rural elderly, willingness and efforts of the locals must be supported by external assistance related to social infrastructure service development. (Kiaušienė, Vazonienė, 2016) The core of the smart city is to create favourable conditions for life in the city. This means that the city should function efficiently and in sustainable way using all its resources. (Baculáková, Viskupič) Authors further state - It can be identified by six features: sustainable economy, sustainable mobility (transport), a well-managed and resource-sparing environment, wise people, high life quality and smart governance.

The project that has been implemented by the Centre of Regional Science at the Vienna University of Technology identifies six main ‘axes’ (dimensions): These axes are: a smart economy; smart mobility; a smart environment; smart people; smart living; and, finally, smart governance. These six axes connect with traditional regional and neoclassical theories of urban growth and development. (Caragliu, Del Bo, Nijkamp, 2011) Giffinger (2007) further characterizes the different smart areas. There are several fields of activity which are described in literature in relation to the term Smart City: industry, education, participation, technical infrastructure, various ‘soft factors’; finally, we can identify six characteristics as a roof for the further elaboration of smart cities which should incorporate the findings but also allow an inclusion of additional factors.

**Table 1: Characteristics and Factors of a Smart City**

<b>SMART ECONOMY</b> (Competitiveness)	<b>SMART PEOPLE</b> (Social and Human Capital)
<ul style="list-style-type: none"> <li>• Innovative spirit</li> <li>• Entrepreneurship</li> <li>• Economic image &amp; trademarks</li> <li>• Productivity</li> <li>• Flexibility of labour market</li> <li>• International embeddedness</li> <li>• Ability to transform</li> </ul>	<ul style="list-style-type: none"> <li>• Level of qualification</li> <li>• Affinity to lifelong learning</li> <li>• Social and ethnic plurality</li> <li>• Flexibility</li> <li>• Creativity</li> <li>• Cosmopolitanism/Open-mindedness</li> <li>• Participation in public life</li> </ul>
<b>SMART GOVERNANCE</b> (Participation)	<b>SMART MOBILITY</b> (Transport and ICT)
<ul style="list-style-type: none"> <li>• Participation in decision-making</li> <li>• Public and social services</li> <li>• Transparent governance</li> <li>• Political strategies &amp; perspectives</li> </ul>	<ul style="list-style-type: none"> <li>• Local accessibility</li> <li>• (Inter-)national accessibility</li> <li>• Availability of ICT-infrastructure</li> <li>• Sustainable, innovative and safe transport systems</li> </ul>
<b>SMART ENVIRONMENT</b> (Natural resources)	<b>SMART LIVING</b> (Quality of life)
<ul style="list-style-type: none"> <li>• Attractivity of natural conditions</li> <li>• Pollution</li> <li>• Environmental protection</li> <li>• Sustainable resource management</li> </ul>	<ul style="list-style-type: none"> <li>• Cultural facilities</li> <li>• Health conditions</li> <li>• Individual safety</li> <li>• Housing quality</li> <li>• Education facilities</li> <li>• Touristic attractivity</li> <li>• Social cohesion</li> </ul>

Source: Giffinger (2007) p.12

We believe a city to be smart when investments in human and social capital and traditional (transport) and modern (ICT) communication infrastructure fuel sustainable economic growth and a high quality of life, with a wise management of natural resources, through participatory governance. (Caragliu A., Del Bo C., Nijkamp P. 2011)

If we want to define smart cities in a comprehensive way, there are several definitions that are conceptually different, often smart is confused with the word smart or digital. Other concepts include flexibility, individuality, strategic behaviour, city and population monitoring systems, social networks, use of information technologies, environmental sustainability issues. For a

better orientation in different concepts, a comprehensive set of factors are proposed that are necessary to create frameworks that may be important for the successful implementation of smart city projects and initiatives. These factors include external and internal factors that affect the sustainability and viability of smart cities projects. The eight clusters of factors include management and organization, technology, governance, policy, people and communities, the economy, built infrastructure, and the natural environment. (Chourabi, H. 2012)

Clark's declaration is considered to be a relatively coherent concept of rural development and the concept of smart villages in the EU. Conference participants recommend that an innovative, inclusive and inclusive rural development policy in the EU be geared towards the following (Clark's declaration 2016):

- promoting rural prosperity
- strengthening rural value chains
- investing in rural viability and vitality
- preserving the rural environment
- managing natural resources
- encouraging climate action
- boosting knowledge and innovation
- enhancing rural governance
- advancing policy delivery and simplification
- improving performance and accountability

The main element of the smart city concept is the use of information technology in order to improve management efficiency and standard of living, while reducing costs and use of resources, and ensuring greater participation of citizens in matters of management and urban development.

So, what is the difference between smart city and smart village, what makes these concepts the same and how they differ? "Smart cities are places where information technology is combined with infrastructure, architecture, everyday objects, and even our bodies to address social, economic and environmental problems." (Dumarey, 2017) The concept of smart city focuses in particular on the deployment of Information and Communication Technologies (ICT), the integration of all citizens in the 'internet for all' way, and other elements to address urban problems - transport, security, sustainability, the environment, waste management, etc. "Smart Villages are rural areas and communities which build on their existing strengths and assets as well as on developing new opportunities", where "traditional and new networks and services are enhanced by means of digital, telecommunication technologies, innovations and the better use of knowledge". (European Commission, 2017) It also follows from this definition that both projects focus mainly on the introduction of new technologies, digitization, innovation and interconnection of services. Smart city smart-model application has its strengths but also risks. According Nowodziński (2015) urban development requires a comprehensive approach to their operation and further development, considering the specific features of a given country, region and metropolitan area.

In the smart city model, Giffinger defines two areas that are focused on human resources and human capital – smart people a smart governance. Successful factors of the implementation of smart city model are management and organization, governance, policy context, people and communities. (Chourabi, 2012). "The primary building block of a smart city is a smart citizen." (Dumarey, 2017) For successfully implement the smart village concept it is necessary to define your local DNA. (Dumarey, 2017) Therefore, it is important to know the needs and problems of the population, to collect all this knowledge and to share it with all the stakeholders. To enhance the objectivity of information, it is necessary to provide support to

local communities, the key to success is to involve all actors. That is why complete information is important, which we can often get only with serious research methods, so this system is a space for academics and researchers.

### 3. Smart Villages According to Smart City

The European Committee of the Regions believes that in common with the Smart City model, a Smart Rural Areas initiative should take a broad approach to development and innovation to include the following six dimensions:

- (a) a smart, innovative, entrepreneurial and productive economy;
- (b) improved mobility, with accessible, modern and sustainable transport networks;
- (c) an environmental and sustainable energy vision;
- (d) qualified and engaged citizens;
- (e) quality of life in terms of culture, health, safety and education;
- (f) an efficient, transparent and ambitious administration; (The European Committee of the Regions, 2017)

Accordingly, we need to take into account the needs of rural areas and, accordingly, we will try to outline a similar model of 6 areas for smart villages while preserving the Clark's declaration.

Revitalization of villages and rural areas is necessary in terms of a sustainable area for the life and work of its inhabitants. In this respect, generational renewal of rural regions is needed, i.e. to acquire the ability of rural areas to attract its new inhabitants. Even the smart village concept considers that a crucial difference in the use of ICT is the crucial factor of the development regions, but especially in the introduction of fixed broadband networks. In 2012, 9.1 million homeless households were in 2012, with 90% of them in rural areas. (European Commission, 2014.)

The introduction of digital networks is one aspect of the problem, the second is the possibility of using them, because the capacity for their use is lower for the majority of the rural population. Therefore, it is necessary to provide education and training that will be targeted at a specific target group, where the priority group should be farmers and employees of the agricultural sector. Funding for education is possible through a number of EU financial instruments, not only through European agricultural funds. Another threat may be the different expectations and needs of the people living in the community, especially due to intergenerational conflicts. Growth of the elderly population in rural areas requires adapting the existing resources to new needs of the elderly in the systems of health care distribution, consumption, ensuring financing, balanced development of high quality services and their accessibility for everyone. (Kiaušienė, Vaznonienė, 2016)

The deficit of coverage of rural areas by digital signal can be eliminated by realizing the digital centres that could not only create new jobs and become new centres of communities where the local community would meet. At the same time, these sites could be centres for providing future services over the Internet - the creation of e-shops, consulting centres for the various needs of the population and other forms of services.. These could be a generator not only of other jobs but also a source of creative upgrading of community potential through community involvement and the support of creative thinking and non-technological innovations. (Baculáková, 2016) Implementation can deal with clusters that can arise through the pooling of all interested groups. Implementation can deal with clusters that can arise through the pooling of all interested groups. The establishment and development of clusters in Slovakia is seen as a chance how to enhance economic growth in regions and eliminate discrepancies among them. Clustering helps the region become much more competitive (Kordos, 2016). In

this context, it is necessary to consider the different needs of different types of municipalities; specific approaches are for municipalities with a small number of inhabitants, municipalities with large cadastral territory, and take into account the administrative and financial possibilities of municipalities. Unlike cities, communities should use the synergy effect of their potential and merits, in no case should they be rivals. In formulating the concept, it is necessary to consider the comparative advantages of the EU Member States, which are diverse and change over time (Fojtíková, 2016).

The opportunity for smart village implementation is undoubtedly the LEADER approach, characterized by the bottom-up policy, the involvement of local action groups (LAGs) and the use of a community-led local development strategy (CLLD). LAGs represent a revolutionary change for the regional development of the micro-regions. LAGs are the major coordinators of the cooperation in the rural areas and may be the driving force for the development of the territory. (Nunvářová, 2016) It can be a threat if we rely on these initiatives without involving local institutions, regional governments. Well-functioning and reliable public administration is an essential factor of economic growth. In terms of long-term trend is possible to state that the level of public administration in EU countries is increasing. (Ardielli, 2016). An efficient, transparent and ambitious administration is part of good governance of municipalities. Another threat is that there are many development strategies in rural development, the objectives of which overlap both horizontally and vertically. Strategic documents are often of a large scale, and more emphasis is often placed on their implementation and not on the achievement of goals, because of the large bureaucracy associated with costly administration.

The concept of smart villages can be implemented through rural development programs within the 2014-2020 programming period through a wide range of measures. The basic document for rural development in the 2014-2020 programming period is the EU Regulation N° 1305/2013. The EU priorities for rural development are based on the Europe 2020 programming document to ensure smart, sustainable and inclusive growth. The concept of EU rural development is conceived slightly differently when, instead of 4 axes, the current regulation for the 2014-2020 programming period defines 6 priorities for rural development and 15 so-called focus areas (Regulation EU, 2013). A new element in rural development policy is the European Innovation Partnership for Agriculture (EIP-AGRI) which is designed to speed up innovation on the ground. Through networking activities and projects, the EIPAGRI supports the development and dissemination of new knowledge, practices, processes and technologies in agri-food and forestry value chains. The European Network for Rural Development is an EU-wide network, bringing together rural development actors (Managing Authorities, stakeholders, researchers, advisors, businesses, local authorities, LAGs etc.) in view of improving the quality of Rural Development Programmes and enhancing participation. Several work streams under the ENRD relate to smart villages. The financial support of the European Regional Development Fund (ERDF) and the Cohesion Fund (CF) is focused on Research and Innovation, ICT, SME competitiveness and Low Carbon Economy. These Funds also deliver important investment in the fields of environment, climate action, transport, poverty reduction and administrative capacity. There is a close cooperation with the European Social Fund (European Commission, 2017).

**Table 2: Comparison of Smart City and Smart Village Concepts - Examples of Opportunities and Threats**

Giffinger's concept	European Committee of the Regions concept	Opportunities	Threats
SMART ECONOMY (Competitiveness)	Smart innovative, entrepreneur and productive economy	digital centres building clusters building partnerships within the framework of EU policies	network unavailability, lack of skills and education
SMART PEOPLE (Social and Human Capital)	Qualified and engaged citizens	community life in villages cooperation with other municipalities	age structure of the population
SMART GOVERNANCE (Participation)	An efficient, transparent and ambitious administration	LEADER, LAG	bureaucracy, complex administrative capacities
SMART MOBILITY (Transport and ICT)	Improved mobility, with accessible, modern and sustainable transport networks	short distances within municipalities	different types of municipalities - the border, small, large municipalities
SMART ENVIRONMENT (Natural resources)	An environmental and sustainable energy vision	environmental aspect of CAP EU, circular economy	deficit of partnerships with other EU policies
SMART LIVING (Quality of life)	Quality of life in terms of culture, safety and education	Social innovations	age structure of the population

Source: Giffinger (2007), The European Committee of the Regions (2017), author's own

#### 4. Conclusion

Like most of the recent EU-funded conceptual documents, the EU Action for Smart Villages document can be considered as little ambitious and just as a complement to all the EU's up-to-date EU support instruments for rural development. It would be necessary to develop a comprehensive and coherent strategy using all smart EU instruments. (The European Committee of the Regions, 2017). The smart village concept should involve all intra-EU partnerships on transport, innovation, energy, environment etc. Good social and economic conditions have a positive effect on the overall social climate that supports the development of the economy and contributes to the development of the region. (Kyjovská, 2014).

The concept of smart villages is one of many EU instruments of improvement of the living conditions in the countryside. When implementing the concept, it is necessary to take into account the specific conditions of the EU countryside, and in our opinion the areas of smart people, smart living and smart governance are important. In the past programming period,

2007 – 2013 staff structures have been developed that can enhance and accelerate the implementation of Smart Village concepts in smart areas defined by Giffinger (2007). The biggest opportunity to build a concept of smart village is the indisputably LEADER approach, the involvement of local action groups (LAGs) and the use of the community-led local development strategy (CLLD). A synergy of the potential of these strategies and the involvement of local governments can be used to provide financial support for a wide range of rural development program financial instruments in all EU regions. At the same time, the synergy of this effect can bring the willingness of all citizens to participate in projects within the smart village concept. In any case, approaches to implementing smart village show differences in urban and community environments. While cities are more focused on technology solutions and innovations, the project of smart village focuses on involvement of local people in the concept so that EU municipalities become a good place to live and work.

### **Abstract**

*Clusters play an important role in developed economies by contributing to the competitiveness of entire region in which they operate. Their support is therefore an integral part of development policies both as Member States as European Union. One of the most important policies appears to be the cluster policy by itself, which can be found at all levels: regional, state and European one. At EU level, cluster policy has been recognized as one of the fundamentals for building EU's competitiveness in world economy and is one of the European Commission's strategic priorities. EU has established its cluster policy to create a suitable environment for clusters development, their financial support and support for their cooperation among science, education and industry. If the EU goals are to be met in this area, it is necessary to initiate these aspects at regional level. The main goal of this paper is to assess selected aspects of cluster policy at the level of individual self-governing regions in Slovak Republic. To achieve this goal, the spider analysis method has been used.*

### **1. Introduction**

Cluster policy is defined as a specific governmental effort to support clusters. Cluster policy depends not only on the type of clusters, current level of cluster development, but also on the ability to use the appropriate support tools. Ideally, cluster policies solve specific cluster problems. Clusters are an essential tool of regional development, and an essential factor in competitiveness. Competitiveness is a key determinant of business activities (Jašková, 2017; Simo et. al. 2016) In addition, for clusters to be working effectively it is important to create appropriate framework conditions that stimulate the development of companies, as well as their emergence (Karlsson, 2007). Clusters' support also helps to improve relations among key economic actors in region, to activate regional authorities, businesses, and academic environment, and to find ways how to collaborate with these stakeholders effectively (Burger, 2013). Modern cluster policy aims to put in place a suitable business environment, in which key economic actors in region could achieve higher level of research, innovation, entrepreneurship (Duřová Spiřáková et al., 2017), business performance and competitiveness.

This paper deals with assessing the selected aspects of cluster policy at the level of individual self-governing regions in Slovak Republic. To achieve this goal, the methodology of Břusková and Pavelková (2016) was used. This methodology was for first used in V4 project named V4 Cluster Policies and their influence on the viability of cluster organisations.

## 2. Theoretical Background & Literature Overview

Active clustering is fundamental tool for a program of growth that is typical for clusters geared to set a regional well-being. It is important to keep in mind that economic growth in region and reaching out to potential foreign investors can be done only by a successful cluster, which does not just form a "cluster of regional companies". For a cluster to work properly, a number of criteria must be met such as: apart from the priority geographic concentration describing the cluster particularly, there are mainly cooperation, strong links among cluster members, trust and social networks that give the cluster its uniqueness (Pavelková and Jirčíková, 2008). Clusters increase the political-administrative and, of course, economic sphere of the region, and hence its growth in all aspects. Stimulating and supporting the emergence of clusters should be a cornerstone for the strategic development of regions. The positive effects of clusters on the economic development of companies, sectors, regions, but also many countries have resulted in targeted cluster support through the implementation of so-called cluster policies. (Vojtovic, 2016) According to Burger (2013), cluster policies can be categorized into three categories, reflecting their motivation as well as political goals. The first category covers support policies aimed at improving the business environment indirectly stimulating the emergence and dynamism of clusters. The second category includes traditional framework policies, such as industrial policy, SME development policies, research and innovation policies or regional policy. The third category contains policies aimed at creating, mobilizing and improving clusters in specific sectors. This category is considered to be as a typical and strict cluster policy. From a territorial point of view, cluster policy can be seen in several dimensions: regional cluster policy, national cluster policy, European cluster policy and global cluster policy. (Štverková and Mynarzová, 2017). In addition, cluster policies can have different goals from local to meta clusters and can be characterized both by top-down and bottom-up approaches (Ivanova and Kordos, 2017b). Cluster policies may include other policies such as industrial, scientific, technological, educational, regional, as well as export promotion strategy policies (Rouvinen, 1999). Cluster development can also be enhanced through standards implementation. Because of sectoral, regional or national specificities, to create a universal cluster policy is not possible. later life stages of clusters formation; and finally on cluster environment or cluster dynamics. This is confirmed also by Kordos (2016) who argues that the need to establish clusters in the process of globalization and development of large multinational corporations and small and medium-sized enterprises is declared at the level of national policies as well as the EU ones. In general, the support for emergence of new emerging clusters is more complicated than the support for already existing clusters (Karlsson, 2007). Cluster policy, unlike sectoral or industrial policy, should be neutral in terms of industry or type of economic activity. In cluster theory, all clusters are appropriate. Cluster externalities enhancement and spillover effects would increase the productivity and prosperity of any cluster. Thus, the government should not pick among clusters, but should create conditions that support the modernization of all clusters. Cluster policy is thus fundamentally different from sectoral or industrial policy, of which a common mistake is, for example, to focus on favoring certain types of activities or picking up the winners (Kačírková, 2009). If the region wants to stimulate the creation and growth of innovative clusters, the investment into university education, science and research areas is also needed. However, it is important that the orientation of R&D workplaces is relevant to particular clusters (Székely, 2008).

## 3. Problem Formulation and Methodology

The clustering issues in the Slovak Republic take on added significance in last decades. The preliminary precondition for development of clustering processes and clusters is the holistic

conception of cluster policy at national as well as regional level. In Slovakia holistic conception is missing. However, there are more than 20 clusters in Slovakia that were formed on a "bottom-up" principle. Such clusters are also labelled as "natural clusters" because they arise from the bottom up approach (Ivanova and Kordos, 2017a). Their emergence is conditioned by market forces and the incentives for its emergence can be, for example local concentration of production factors; the presence of other businesses in the same industry; the allocation of imputes suppliers, subcontractors, sales channels; the presence of education and research institutions in sector; joint venture companies becoming attractive for investors; skilled labor force concentration and others. The existence of clusters brings changes in regional and national competitiveness. That's why the concept of cluster policy takes on significance also in Slovakia. Although the holistic conception is missing, the basic preconditions for clusters policy creation and development exist in form of various documents and supporting programs. The cluster policy at regional as well as national level should take into account the solution of problems in area of support for business and technological and innovation policy. Study in this paper is focused on analysis these preconditions at regional level. This study is based on methodology of Břusková and Pavelková (2016) with modification at some points. We proceeded this study within the following steps:

Step 1: The analysis of clusters in eight Slovak self governing regions.

Step 2: Search out the existing strategic documents in each region that contained issues of cluster policy.

Step 3. The classification of identified documents within 8 categories of indicators and their incorporation in spider analysis. Each indicator is represented by sub-indicators with points:

1. Durability: 3 points - long term (7 years and more), 2. points - mid-term (3 – 6 years), 1 point - short term (1 -2 years);
2. Autonomy: 3 points - specifically devoted to clusters, 2 points – support of selected area of clusters, 1 point - clusters are generally mentioned in existing strategy, 0 points – the issues of clusters is not incorporated into document;
3. Functionality: 3 points - document is fully implemented, 2 points -document is partly implemented, 0 points - document is not implemented;
4. Viability: 3 points – existence of specific body responsible for cluster policy issues, 2 points - incorporated body in existing government body, 1 point – responsible person, 0 points without specific body responsible for cluster policy issues.
5. Continuity: 3 points – cluster policy issues being a permanent part of the document with regular updated, 2 points – valid for actual programming period resp. Actual and previous programming period, 1 point – valid for previous programming period;
6. Integrity: 3 points – covering clusters in all economic branches, 2 points - covering clusters in main sector of 3 smart specialization areas, 1 point – only selected sector/s is/are supported, 0 point – general mentioned.
7. Complexity: 3 points – support of cluster policy, 2 points – support of cluster activities development, 1 point – support of cluster creation. 0 –points – generally mentioned;
8. Consistency: 3 points – system of cluster performance assessment with defined parameters, 2 points – training scheme for cluster stakeholders , 1 point - the cluster concept awareness building, 0 point - support activities are mentioned only in general.

#### **4. Problem Solution**

In the Step 1 of this research .we found out that in 2017 there were 25 active clusters in Slovak regions. In the project VEGA 1/0953/16 we decided that we will classify the clusters according

methodology of Slovak Innovation and Energy Agency (SIEA) into two groups: technological and tourism. We found out that 19 of active clusters belonged to technology clusters and 6 to tourism clusters. The placement of both groups of clusters in Slovak regions illustrates the Figure 1.

**Figure 1: Placement of Technological and Tourism Clusters in Slovak Regions**

Source: own elaboration (2016-2017)

The division of clusters into stated groups and their regional placement is shown in Table 1.

**Table 1: Clusters in Slovak Regions**

Region	Technological clusters	Clusters of tourism
BA	Danube Knowledge cluster, National Energetic Cluster NEK, ABC - Academic Business Cluster	-
TT	Automotive Cluster Slovakia, Electrotechnical Cluster - West Slovakia, Energetic Cluster - West Slovakia, Cluster for Green and Innovative Technologies Support	
TN	Slovak IT cluster	
ZA	Z@ict	Cluster LIPTOV - association of turism, Cluster Orava, Cluster TURIEC - association of tourism
NR	Slovak Plastic Cluster, Bioeconomy Cluster	Cluster Topoľčany - association of tourism
BB	1st Slovak Engineering Cluster	Cluster of Border Castles
PO	Energetic Cluster of region Prešov, Railway Transport Cluster	
KE	Cluster AT+R, Cluster RADAR, BITERAP, Košice IT Valley	Košice- Tourism

Source: author’s research (2016 -2018), BA - Bratislava, TT - Trnava, TN - Trenčín, ZA- Žilina, NR - Nitra, BB - Banská Bystrica, PO - Prešov, KE – Košice

In Step 2 of this study the analysis of strategic documents related to the regional policy in the cluster concept context was realized. The analysis was realized for programming period 2014-

2020. Within this analysis we focused only on mandatory documents, because at regional level the programmes focused on cluster support are missing. For each of regions selected documents were compared. In Table 2 we can see, if document is present in region or not.

**Table 2: The Presence of Strategic Documents in the Regions**

Document	BA	TT	TN	ZA	NR	BB	PO	KE
PESD	x	x	x	x	x	x	x	x
IS	x	x	-	x	x	-	x	x
STD	x	x	x	-	x	x	x	x
RDS	x	x	x	-	x	-	x	-

Source: author’s research (2018) PESD - The program of economic and social development of each self governing region, IS - Innovation strategy of each self governing region, STD - The strategy of tourism development, RDS - Rural development strategy.

Step 3 consists of evaluation of indicators and spider analysis creation. Following figures represent results for each of analysed document.

First types of evaluated documents were the Programs of economic and social development of each self-governing regions. The realized analysis of these documents (Figure 2) in Slovak regions showed differences in indicators 2., 5. and 7. In the context of cluster policy issues the most elaborated PESD documents are in Trnava and Košice region.

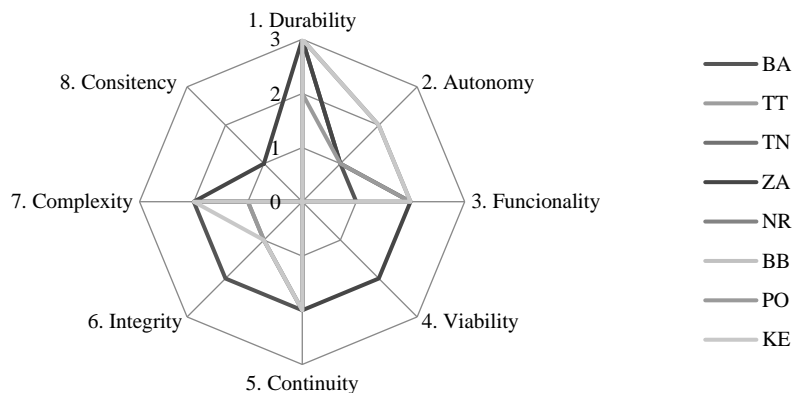

**Figure 2: Spider Analysis of PESD Documents in the Context of Cluster Policy in the Slovak Regions**

Source. Author’s research (2018)

Second type of evaluated documents were documents contained issues of Innovation strategy of each self governing regions. The results are presented in Figure 3. During the evaluation of these documents we found out, that in regions Trnava, Trenčín and Banská Bystrica the actual conception of this strategic document is missing. The concept of cluster policy issues was elaborated in IS documents in a broader context in Žilina, Nitra and Košice region, due to the fact that in these regions the functional clusters are well established. Differences among compared indicators are mainly in case 1., 2. and 7.

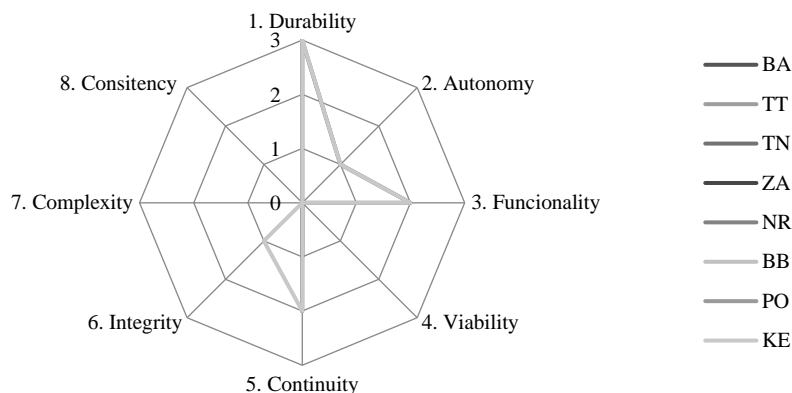

**Figure 3: Spider Analysis of IS Documents in the Context of Cluster Policy in the Slovak Regions**

Source. Author’s research (2018)

Third evaluated types of documents were documents that contain the Strategy of tourism development in each self-governing region (Figure 4). From realized analysis follows that only Košice and Trenčín region have this type of strategic document elaborated, but the issues of clusters is incorporated only in generally and minimal. The reason is that at this programming period the tourism clusters are transformed into new form – regional tourism organizations, which have better support than in form of cluster. Differences among compared indicators are mainly in case 1., 3. and 5.

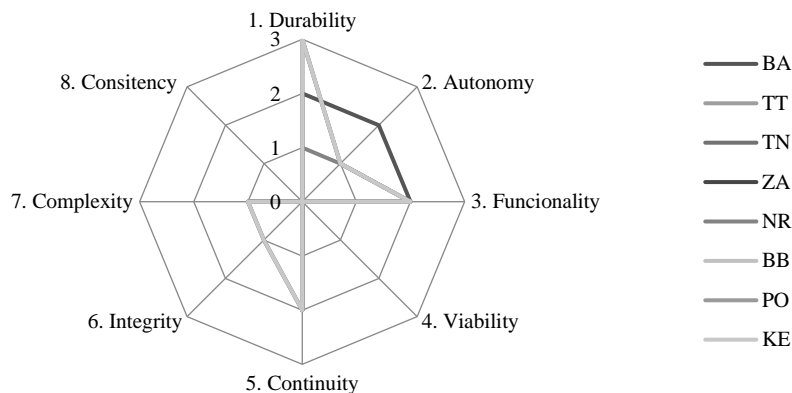

**Figure 4 Spider Analysis of STD Documents in the Context of Cluster Policy in the Slovak Regions**

Source. Author’s research (2018)

The issues of cluster policy are also elaborated in strategic documents that have connection with strategy of Rural development. The analysis of fourth type of documents presents figure 5. This type of document is elaborated in regions Bratislava, Trenčín, Nitra, Prešov and Košice. The highest focus on cluster policy issues is mainly in Košice and Bratislava regions. Differences among compared indicators are mainly in case 1., 2., 3. and 5.

**Figure 5: Spider Analysis of RDS Documents in the Context of Cluster Policy in the Slovak Regions**

Source. Author's research (2018)

## 5. Conclusion

The establishment and development of clusters in Slovakia is seen as a chance how to enhance economic growth in regions and eliminate discrepancies among them. Clustering helps the region become competitive. In addition to regional competitiveness, it also helps Slovak entrepreneurs to foster their business within small and medium-sized companies' environment. For improving of cluster situation in this programming period, the Slovak self governing regions elaborated issues of cluster policy in main strategic documents that have connection with areas in which Slovak clusters provide their activities. As showed the results of this study, the level of cluster policy application at regional level is still low. The best results obtain documents in indicator 1. Durability and 5. Continuity. In indicator 2. Autonomy, the documents obtain in most cases value 2 points, because support of clusters was oriented only on specific economic branch that prevails in region. The documents are implemented only partially (indicator 3. Functionality). The indicator 4. Viability obtain value of 2 points in Žilina region for document - Innovation strategy of each self governing region. Mostly all documents were elaborated also in previous period and some of them contained the issues of cluster policy. That's why the value of 2 points is prevailing. Only Innovation strategy of Bratislava region covers clusters in main sector of 3 smart specialization areas, the rest of documents in mostly cases obtained 1 point – only selected sector/s is/are supported. If documents contained cluster policy issues, these were mentioned only in general (7. Complexity) and also the same apply to support activities (8. Consistency). The analysis of cluster policy in Slovak regions showed, that clusters play important role in regional development also in Slovak Republic, but their support in any direction is still at low level despite the fact, that issues of cluster policy are elaborated in main strategic documents.

### **Abstract**

*Small and medium-sized enterprises (SMEs) play a significant role in the performance of the EU's economies. Due to the size of the domestic market, SMEs that try to maximize profits or gain competitive advantages have almost the need to engage in the internationalization process. The networking approach to internationalization is based on the fact that penetration into foreign markets depends not only on the competitive advantages of the company but also on the creation and involvement of the company in strategic alliances and networks. Cooperation among members of the network is mutually beneficial to all members and synergistic effects are achieved there. One of the network approaches is the cluster cooperation. The article discusses the issues of the internationalization of entrepreneurial activities through the prism of Slovak SMEs that are considering the potential involvement into the clusters. The main aim of the paper is to identify the basic reasons for enterprise entry into the network from point of view of the risks in the context of the internationalization of business activities.*

**Keywords:** *cluster, entrepreneurial activities, international business, small and medium-sized enterprises*

**JEL Classification:** *F23, M21, M22*

### **1. Introduction**

There are many theoretical approaches and models of internationalization of companies in literature dealing with internationalization. As stated by Fonfara (2011), to understand the process of internationalization of a company, it is necessary to identify and study its network of relationships with all entities, including customers, distributors, suppliers and competitors. For the purpose of the article, the so-called “Network Access to Internationalization” was chosen. This is based on the fact that penetration into foreign markets depends not only on the competitive advantages of the company but also on the creation and involvement of the company in strategic alliances and networks. As Balog (2016) stated, network organizations are more effective, more flexible than hierarchical, and more resistant to external influences. An important prerequisite for business development, especially for SMEs, is, therefore, the creation of networks and strategic partnerships. One of the networking approaches is cluster

collaboration. Business involvement in clusters is the foundation for the internationalization of business activities (Mura et al., 2017). The significant stakeholders for cluster cooperation represent the SMEs, which are considered to be the economic pillars and the driving force behind innovation, employment and social integration (Lemanska-Majdzik, Okreglicka and Gorzen-Mitka, 2016; Dziwiński, 2016; Kabus, 2017). 99.8% of enterprises operating in the EU-28 non-financial sector in 2016 were small and medium-sized enterprises. These SMEs employed 93 million people, accounting for 67% of total employment in the EU-28 non-financial sector and 57% of value added in the EU-28 non-financial sector (European Commission [online], 2017a). Also, data for SMEs in Slovakia indicate that they are also an important pillar and a stabilizing factor for the economy of the country and its regions. SMEs contribute significantly to the non-financial business economy in Slovakia, which represented 54.4% of total value added and 72.1% of total employment in 2016 (European Commission [online], 2017b). Empirical studies also show that SMEs tend to grow faster than their larger counterparts (Fiala and Hedija, 2015). Small and medium-sized enterprises could also benefit from clusters and facilitate a broad distribution of know-how, innovation, knowledge and process sharing, and so on (Piperopoulos, 2012; Barcik, 2016; Durkalić, 2016; Barcik and Jakubiec, 2016). SMEs are the most represented category of clusters' members in Slovakia – this category consists of 49 % of all members in clusters. But as follows from preliminary results of scientific project VEGA 1/0918/16 Risk management of SMEs in the context of clusters' involvement activities in the Slovak Republic, among SMEs still missing the awareness of cluster cooperation. But after explanation of the principle of cluster cooperation, they could identify the importance that potential cluster cooperation might have for them. In this context, the main aim of this paper was stated and also the issues of internationalization of business activities were taking into account.

## 2. Theoretical Background

The issue of internationalization of business activities became the subject of the investigation of many researchers who were involved in formulating the theory of internationalization. Within these theories, the evolutionary approach and the global approach can be distinguished. The evolutionary approach underlying this research also assumes that companies are progressing into internationalization at certain stages. The internationalization of the enterprise appears to be a gradual process of accumulating the necessary resources needed to overcome uncertainties in international markets (Zapletalová, 2011; Janatka et al., 2017). These models assume that businesses are growing on the domestic market and that they are beginning to develop their export activities. We can include the Uppsala Model and the I-model as the main representatives of the evolutionary approach. Uppsala Internationalization Model was created by Johanson and Vahle in the 70s of the 20th Century. Their work has probably also been the inspiration for the development of the Innovation-Related Internationalization Models (I-models), which explain the internationalization process in terms of innovation. The models included in the I-model group explain mainly the development of export activities in SMEs. Both the U-models and the I-models can be regarded as behaviorally oriented. Based on the arguments by Andersen (1993), the gradual pattern of the firm's internationalization process can mainly be attributed to two reasons: the lack of knowledge by the firm, especially "experiential knowledge," and uncertainty associated with the decision to internationalize.

There are a number of different approaches explaining the internationalization of business activities. Kauppinen and Juho (2012) divide internationalization theory into process theory, network theory, the resource-based view and international entrepreneurship theory. Companies can work together on a vertical or horizontal level, that is, with competitors entering into networking relationships. Network Access to Internationalization was created in

1988 by Johanson and Mattson, who came to the conclusion that the degree of internationalization of an enterprise depends on both the networks created by the enterprise and the position of the enterprise in that network. They assumed that the network is a key factor in a company's development and is crucial in achieving its long-term goals (Fonfara, 2011). As Zapletalová (2015) says, the networking perspective provides resources for internationalization and offers an extra view of available resources. This model of internationalization is based on the claim that the network of which the enterprise is a part must provide the necessary resources for internationalization. If a business relationship can be understood as a network, it can be argued that companies are internationalizing because they are internationalizing businesses in the network. The networking model for internationalization is appropriate for explaining the internationalization of SMEs, because networking enables businesses to overcome problems with lack of knowledge, technology and capital (Ruzzier and Antoncic, 2007).

In this paper we described the principle of network theory and its place in internationalization of business, because the clusters work on its philosophy. The clusters are groups of independent companies (start-ups, small, medium and large enterprises and research organizations) acting in a specific area, in order to stimulate innovative activity by promoting intensive interactions, the use of common facilities, exchanges of experience and knowledge by contributing to technology transfer, networking and information dissemination among the clusters enterprises (Havierníková, Jašková and Krajňáková, 2016). According to Kordoš (2016) firms that are located within a cluster can transact more efficiently, share technologies and knowledge more readily, operate more flexibly, start new businesses more easily, and perceive and implement innovations more rapidly. Internationalization of clusters is necessary for their activities or even the very existence. The level of these activities has a significant impact on the competitiveness of the cluster-integrated companies (Pavelková et al, 2015; Kordoš, 2015; Jankowska and Glówka, 2016). There are dozens of reasons for SMEs to join the cluster cooperation, reasons relating to the internalization of business including. On the opposite site, although the cluster cooperation brings many opportunities for business, it is associated with risk as well. There are many scientific articles on risk management in business and SMEs, but very few researchers have reported on risk management in various form of network and cluster cooperation (Xia and Chen, 2011; Fazli, Mavi and Vosooghizaji, 2015). According Havierníková, Okreglicka and Lemanska-Majdzik (2016) in particular, economic, financial, technical and political categories of risk are important for SMEs in the context of cluster cooperation and have an impact on the business environment. The most important categories of risk are mainly market, political and technical risks. Market and trade risks are very important in case of SMEs' internalization of business. In the view of above stated, the study in this paper was focused on issues of reasons that motivate SMEs for join the cluster cooperation and assessment of trade and market risks by SMEs, if they are interested in the cluster cooperation.

### **3. Problem Formulation and Methodology**

Due to the needs to fulfill the main aim of this paper, we focused on the evaluation of selected questions that related to the identification of reasons and risks for join the clusters in the context of the internationalization of business activities. We focused on market and trade risks, which are the most relevant to the internalization of business. In developing this paper, two scientific hypotheses were established: *1<sup>st</sup> hypothesis*: The most important reasons that motivate small and medium entrepreneurs to enter into the cluster are not significantly determined by the size of the enterprise. In this research, the reasons were defined as follows: R1. The increasing of employment. R2. The increasing of number of innovation. R3. Common

projects in the area of doing business. R4. Common projects in the area of human resources. R5. The location in new markets. R6. The increasing of competitiveness. R7. Obtaining of new contacts. *2<sup>nd</sup> hypothesis*: The level of risk factors in the context of join cluster does not depend on the size of the enterprise. Entrepreneurs assessed the following risks factors: RF1. The competition. RF2. The logistic. RF3. The quality of products. RF4. The compliance with times of delivery towards the customer. RF5. Economic development. RF6. The sector in which the business operates. RF7. Partners. RF8. The subcontractors. RF9. The changes in energy prices. RF10. The changes in raw material prices.

To evaluate the established scientific hypotheses, the Chi-square test was used. See also Grencikova et al. (2017). For calculation, the program Statistica 6.0 was used.

Test statistic

$$\chi^2 = \sum_{i=1}^m \sum_{j=1}^n \frac{(f_{b_n} - f_{e_n})^2}{f_{e_n}} \quad (1)$$

By this test statistic, we test null hypotheses H0 about no association between two variables against alternative hypothesis H1 about the association between two variables. A large size of the  $\chi^2$  statistic indicates that the observed data are unlikely under an assumption of no association between observed variables. The low level of p-value <0,05 means - H0 is rejected and we accept the alternative hypothesis H1. Large probability (p-value>0,05) means the opposite. To measure the dependence of pairs of variables, the Cramer's V coefficient was used, which can achieve values from 0 to 1. Dependence less than 0.1 is trivial, 0.1-0.3 small, 0.3-0.5 medium and above 0.5 is great. If the value of the coefficient is closer to 1 the dependence between the two qualitative characters is stronger and vice versa (Budíková et al., 2010).

#### 4. Problem Solution

The questionnaire surveys were realized among 250 Slovak SMEs from 8 self-governing regions: Bratislava – BA, Trnava – TT, Trenčín – TN, Nitra – NR, Žilina – ZA, Banská Bystrica – BB, Prešov – PO, Košice – KE. The structure of respondents presents table 1.

**Table 1: Structure of Respondents (%)**

Sized categorization	BA	TT	TN	NR	ZA	BB	PO	KE	Total
less than 10 employees	4.02	1.20	18.88	2.01	4.82	0.40	3.61	1.20	36.14
from 10 to 49 employees	4.82	6.02	12.45	1.61	5.22	0.40	3.61	1.20	35.34
from 50 to 249 employees	2.01	2.81	11.24	0.40	6.43	0.80	3.61	1.20	28.52
<b>Total</b>	10.84	10.04	42.57	4.02	16.47	1.61	10.84	3.61	100

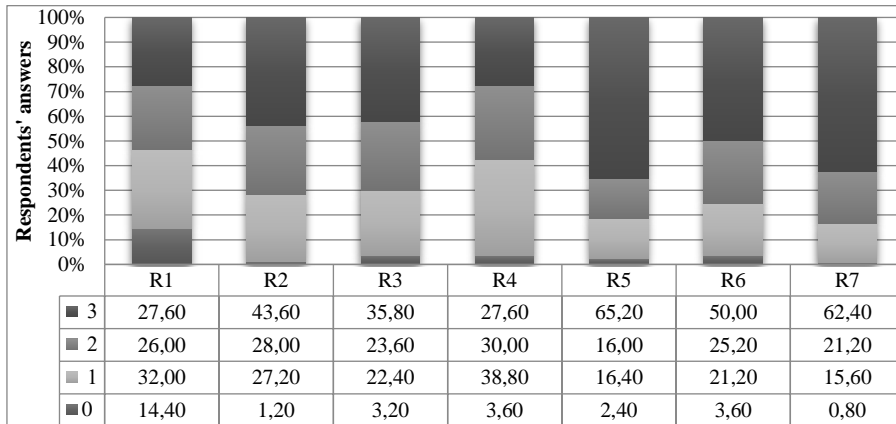

Source: author's research and calculations

The most of the respondents operate in Trenčín region, the lowest number in Banská Bystrica region. The most respondents (36,14%) employee less than 10 employees. There is a specific typology of clusters in Slovakia. Clusters are divided into two groups: tourism and technological. For achieving of the main aim of this paper, we focus on enterprises that operate

in the areas of technology clusters (machinery industry, electrotechnical industry, agriculture, KET industry, research and development, IT and others).

For the needs of this paper, seven reasons for cluster’s engagement in the context of internalization of business were chosen. SMEs’ assessed each reason by Likert scale: 0 - insignificant reason, 5 – the most important reason. Due to the rules of Chi-square test according which the expected variables must be higher than value 5 in 80% of cases, it was necessary to group the obtaining results of questionnaire surveys. The respondents’ answers of value 1 – very low importance was grouped with value 2 – low importance and answers with value 5 – the highest importance were grouped with value 4 – high importance. The percentage of respondent’s answers in grouped categories presents figure 1.

**Figure 1: The Assessment of Reasons for Cluster’s Engagement (%)**

Source: own elaboration (2018)

The results of Chi-square statistics calculated for 1<sup>st</sup> hypothesis are presented in table 2. The H0 was rejected only for reasons R1 and R5. It means that between the reason and answers according to the size of the enterprise is association. The results of Cramer’ V showed the only small level of dependence. For the rest, we can conclude that between the size of the enterprise and by indicating the reason is not association doesn’t determine the reasons that motivate small and medium entrepreneurs to enter into the cluster.

**Table 2: The Results of Chi-square Statistics and Cramer’ V - 1<sup>st</sup> Hypothesis**

Reason	Results of chi sq. statistics	Cramer’ V
<b>R1</b>	<b>Pearson Chi Sq.: 12,8036, df=6, p=,046272</b>	<b>0,1600226</b>
<b>R2</b>	Pearson Chi Sq.: 3.06823, df=6, p=.800234	0.0783356
<b>R3</b>	Pearson Chi Sq.: 11.85339, df=6, p=.06533	0.1539701
<b>R4</b>	Pearson Chi Sq 5.531068, df=6, p=.47771	0.1051767
<b>R5</b>	<b>Pearson Chi Sq.: 18.8307, df=6, p=.004462</b>	<b>0.1940657</b>
<b>R6</b>	Pearson Chi Sq.: 8.96883, df=6, p=.175351	0.1339316
<b>R7</b>	Pearson Chi Sq.: 4.52169, df=6, p=.606449	0.0950967

Source: own elaboration (2018)

Similar situation with a grouping of evaluation of respondents' answers was also in case of risk factors for trade and market risks. The percentage of respondents answers present figure 2. Value 0 means that risk factor is not relevant for the enterprise, value 3 – most important risk factor.

**Figure 2: The Assessment of Risks Factors for Cluster's Engagement (%)**

Source: own elaboration (2018)

The results of Chi-square statistic for 2<sup>nd</sup> scientific hypothesis showed, that H0 was rejected for RF2, RF4 and RF8. It means that between the type of risk factor and size of the enterprise is an association, but as we can see the results of Cramer' V, this dependence is small.

### 5. Conclusion

The network approach is a new promising theoretical framework that is applied to the internationalisation of SMEs. Studies relating networks to internationalization are relatively new to the field. Such studies seek to shed new light on entrepreneurial activities, including internationalization. The results of our study in this paper showed, that SMEs' perception of reasons and risks for involvement in cluster cooperation are various and depends for each

reason and risk factor separately. The paper was focused on assessment of reasons and risks that could have a connection with the internalization of business. As the most important reasons in this context were signed by SMEs the reasons R5. The location in new markets. R6. The increasing of competitiveness. R7. Obtaining of new contacts. Respondents' answers showed that most important risk factors are presenting by RF1. The competition, RF3. The quality of products and RF4. The compliance with times of delivery towards the customer. The cluster concept is a new phenomenon that could contribute for SMEs also in the area of internationalization of their business, that's why we propose to raise the awareness about this concept among Slovak SMEs and contribute to their development by using various tools in national as well as regional cluster policy.

### **Abstract**

*During the last decades, among the challenges of future sustainable development the transforming of consumption pattern has got more and more attention. The main reason of it the twin characteristic of consumption, its relationship with human well-being and its effect on natural resources contributing to a number of environmental problems. Considering the rapidly changing environment raising health awareness and preventing the most frequently occurring chronic diseases have become more and more important both in individual and society level. Therefore, health-conscious behaviour has numerous components such as health status of population, health care system performance or risk factors for health. The current paper is intended to summarize the related literature and offers a brief introspection into the current situation of Hungary's health status – compared with EU. The research methods are: analysis of different related articles and reports, examination of current situation in Hungary and European Union based on OECD Health Statistics and European Commission Reports.*

**Keywords:** consumer behaviour, European Union, health awareness, sustainability

**JEL Classification:** I12, I14, I31, N34

### **1. Introduction**

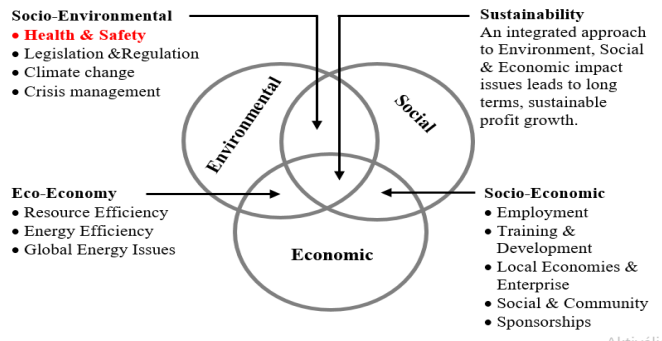

In the last few decades, attention to sustainability or sustainable development is increasing – more and more researchers started to deal with this area. Original definition of sustainability derives from the Brundtland Report of 1987 which said that “Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs.” (WCED, 1987). Similarly to the original concept, major part of researchers evaluate the sustainability in a traditional way – they started out from the side of production and use of resources, and are mainly connected to its different dimensions. For example, Daly (1996) defined sustainable development as “development without growth beyond environmental limits.” Keszi Szeremlei and Magda (2015) provided a wider description, however, still remaining the production side – according to them sustainability comprises of production and utilization that are sustainable from environmental, social and economic aspects as well as of the highest level of energy efficiency that current technology allows.

Nevertheless, recently a more practical and detailed approach has spread which said that sustainability is simply the ability to continue a well-defined behaviour indefinitely without the degradation of natural, physical, human, and intellectual capital (Crittenden et al. 2011). Despite of many different definitions it is clear that sustainability is universally thought to have the following three components as pillars: environment, society and economy. Moreover it is

also true, that nowadays researchers have not been talking about only three well-known main categories, but also the following sub-dimensions can be evaluated – expanding the original structure and starting out from the side of consumers: socio-economic (common section of social and economic dimensions), socio-environmental (as the common section of social and environmental dimensions), and eco-efficiency (as the common section of economic and environmental dimensions) as can be seen in Figure 1.

**Figure 1: Pillars of Sustainability**

Source: Own edition based on Barcan (2016)

There is no doubt that sustainable consumption is a megatrend influencing consumer habits today (Szakály et al. 2015). It is also a fact that attention to health conscious consumer behaviour in terms of sustainability is more and more increasing. Consumer behaviour means not only the consumption of physical goods but also the services related to the lifestyle. Thus, health conditions and healthy lifestyle are also considerably linked to sustainability.

The main objective of this paper is to find the role of smart lifestyle in health promotion and disease prevention in terms of sustainability through the related literature. Moreover, the study also offers a brief introspection into the situation of Hungary compared with the European Union in terms of health conscious behaviour through the most recent reports of European Commission. In analysis this particular paper primarily focuses on the different determinants of health which are in relation to environmental issue of health, nutrition and healthy lifestyle.

## 2. Problem Formulation and Methodology

Since the 1980's, the issue of sustainability has been given more and more attention. Through the information society came to the fore, and all elements of our environment change rapidly, knowledge transfer has a continuously increasing role – not only in our daily life but in long term consumer patterns. Due to the changing and expanding concept of sustainability researchers determined and evaluated new sub-dimensions which are significantly connected to the economic and social well-being. As a loop, also health and healthy lifestyle are important components of well-being and they have a huge impact to the sustainability itself. Therefore, most important health issues are related to all pillars of sustainability – they have different economic, environmental and social effects. The increasing cost of health promotion, disease prevention and the results of nutritional and health research have fundamentally changed also the consumer's needs and habits. There is also a growing understanding that investing in population health is not only valuable in and of itself, but contributes to economic growth and social inclusion (OECD/European Observatory on Health Systems and Policies, 2017a).

Therefore, it is necessary to evaluate the different health issues in relation to environmental problems, nutrition and lifestyle.

The current paper is intended to summarize the most important related literature and provide a better understanding of healthy lifestyle and health conscious behaviour in terms of sustainability. Furthermore, the study offers a brief introspection into the current situation of Hungary's health profile and status – compared with the European Union. The research methods are the analysis of different related articles and reports in order to demonstrate the most important determinants of health in Hungary and European Union based on the reports and data published by the OECD/European Observatory on Health Systems and Policies and the European Commission (Eurostat).

### 3. Problem Solution

In order to understand the role of health in achieving the reformulated sustainable goals of the United Nations, it is necessary to know the most important definitions in relation to health and public health system. Namely, “the 2030 Agenda for Sustainable Development aims to shape a very different world. The factors that now govern the well-being of the human condition, and the planet that sustains it, are no longer so discrete.” (Chan, 2016)

Health is not only the lack of diseases as most people guess. Although health has a lot of different approaches, the most integrated, accepted and commonly used definition of health was defined by the World Health Organization (WHO) in 1948. According to the Preamble to the Constitution of the WHO: “Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.” (WHO, 2006). Health awareness or health-conscious behaviour is all of the individual attitudes, behaviours and activities in order to live longer and remain healthier (WHO, 2016).

The key pillars of health promotion can be found primarily in our lifestyle. According to the statement of World Health Organization (WHO) main causes of premature mortality are mainly the lifestyle (43%), then the environment (23%), the genetic conditions (25%) and the healthcare system (only 11%) (WHO, 2001). However, in order to maintain our health, in addition to above, we have to count on several other factors – for example work and life conditions (stress level, relationships with others, more or less supporting environment), our mental health, our skills or our behaviour patterns to the environment. Furthermore, income, education, working and living conditions can be also important factors – with a sufficient income consumers can purchase more healthy and nutritious goods, though higher income can cause more stress because of longer working hours and responsibility (Fuchs, 2004). Similarly, education or living conditions can influence the health status – more educated people may be better informed about health-seeking activities and can access more health care activities (Mackenbach et al. 2008), or living in an unsafe and unsanitary environment can raise the risk of different chronic diseases or death (Gibson et al., 2011; Deguen and Zmirou-Navier, 2010).

Chronic diseases are defined by the WHO as “noncommunicable diseases” or “diseases of long duration and generally slow progression” (WHO, 2013). Different chronic diseases are currently the leading causes of the mortality and disability in developed countries. The consequences of chronic diseases are very serious: forecasts demonstrate that the population aged over 65 will rise from 87.5 million in 2010 to 152.6 million in 2060, and chronic diseases has significant effect more than 80% of people in these ages (European Commission, 2013). According to the European Commission people in OECD countries are living longer, but the burden of mental illness and chronic disease is continuously increasing (OECD/European Observatory on Health Systems and Policies, 2017a).

If we look at the most frequently occurring chronic diseases in Hungary, it is obvious that cardiovascular diseases still remain the leading position among both men and women. OECD/European Observatory on Health Systems and Policies (2017b) states that in 2014, cardiovascular diseases accounted for the deaths of 35 000 women (55% of all deaths) and over 27 000 men (45% of all deaths). The second leading cause is cancer – almost 15 000 women and 18 000 men died from cancer in 2014 (23% and 29% of all deaths, respectively).

The questions are: what can we do in order to reduce the risks and/or avoid the above-mentioned chronic diseases as leading causes of mortality; and how can we measure the health status related to smart lifestyle of a certain population? In order to find the answer, the following risk factors should be analysed and summarized.

### ***3.1 Environmental Issues (Environment-related Risk Factors)***

According to Dannenberg, Frumkin and Jackson (2011) relationships between public health, health awareness and sustainability is determined in the definition of environmental health. Environmental health as the subcategory of public health, focuses on the relationships between people and their environments. There are many goals of environmental health, but the most important objectives are to control environmental threats and hazards and also to promote healthy environments. Traditional environmental health focused on sanitation issues, such as clean water, sewage, waste management, food safety and rodent control. In recent decades, environmental health has expanded its scope to address chemical and radiological hazards, such as pesticides and air pollution. And most recently, environmental health has addressed cross-cutting issues, including the built environment, climate change and sustainability (Dannenberg, Frumkin and Jackson, 2011). Population exposure to air pollution is also a critical non-medical determinant of health. Due to the urbanization the amount of built areas are constantly increasing, CO<sub>2</sub> emission is also continuously growing, however, forests and other green areas as the absorbing basis are decreasing. This can cause different problems in water quality, air quality or air pollution. Air pollution is a major environment-related health threat, it can cause respiratory diseases (e.g. asthma or COPD), lung cancer, and cardiovascular diseases. It has also been linked to low birth-weight, dementia, and damage to DNA and the immune system (WHO, 2017). The WHO estimates that indoor and outdoor air pollution cause approximately 7 million premature deaths per year (WHO, 2014a).

### ***3.2 Risk Factors Related to Nutrition***

If we focus on healthy lifestyle, it is also essential to understand the most relevant trends in food consumer patterns nowadays. Based on the studies written by Lutzenberger and Gottwald (1999), Vossen and Reinhardt (2002), Rützler (2005) Horváth et al. summarized the following consumer trends what can play a decisive role in the food market and consumption patterns: health food, anti-fat food, ethic food, naturfood, whole food, mood food, hand held food, fast casual food, sensual food, slow food and D.O.C. food (Horváth et al. 2005).

The change of food consumption structure and patterns are also related to the other dimensions such as consumption of fruits and vegetables or water and land demand. The increase of fruit and vegetable consumption, for example, would require more technological developments in several areas. As nutrition is an important determinant of health, inadequate consumption of fruit and vegetables is one factor that can play a role in increased morbidity (OECD, 2016). According to WHO, a healthy diet can help to protect against malnutrition in all its forms, as well as noncommunicable diseases, including diabetes, heart disease, stroke and cancer. Based on the recommendations of WHO for adults a healthy diet contains at least 400 g (5 portions) of fruits and vegetables per day; less than 10% of total energy intake from free sugars (for a

person of healthy body weight consuming approximately 2000 calories per day); less than 30% of total energy intake from fats and less than 5 g of salt per day (WHO, 2015). Formerly, the goal was to satisfy the food demand quantitatively. However, later, in developed countries, quality has primarily become the focus in higher income groups. Moreover, the demographic structure has also changed already. Nowadays, due to the industrialization and social well-being, people eat more unnecessary calories and industrially processed food, while the consumption of fruits and vegetables are less. Worldwide, low fruit diets caused of nearly 3 million deaths in 2015, while low vegetable consumption caused nearly 2 million deaths, and low physical activity caused 1.6 million deaths (OECD, 2017). On average across EU member states, 57% of adults reported eating fruit daily. Women are eating fruit and vegetables more often than men in all. Data varied from less than 40% in Bulgaria, Latvia and Romania, to more than 70% in Italy and Portugal. In Hungary, almost 60% of total adult population consume fruits in a daily level, which is higher than the EU average (Figure 3). Daily vegetable consumption ranged from less than 30% in Romania, to nearly 80% in Belgium. The average across the 28 EU countries was 51%, while in Hungary it was more than 46% (Eurostat database, 2017).

### 3.3 Risk Factors Related to Lifestyle

Healthy lifestyle choices such as exercising regularly, managing weight, and not smoking may substantially reduce the most frequently occurring chronic diseases (Chiuvet et al. 2006). Physical inactivity, and low fruit/vegetable consumption are among the 10 leading risk factors (Forouzanfar et al., 2016). With technology developments the physical activity of population is decreasing, as jobs have shifted to less physical activity and have required more intellectual work. However, the level of stress is continuously increasing which can increase the risks of certain chronic diseases such as depression or cardiovascular diseases. Smoking, alcohol consumption and obesity are three major risk factors for noncommunicable diseases. Health experts of the WHO estimate that tobacco smoking is responsible for 7 million people's death per year, yet, on average 18.5% of adults still report daily smoking across the OECD. Alcohol consumption among adults is slowly decreasing, however it is also a considerable risk factor as it increases the risk for diverse chronic diseases – such as cancer stroke, liver disease etc. – and causes an estimated 2.3 million deaths each year. Alcohol was the third major risk factor after tobacco and high blood pressure in Europe in 2012 and accounted for an estimated 7.6% of all men's deaths and 4% of all women's deaths, though there is evidence that women may be more vulnerable to some alcohol-related health conditions compared to men (WHO, 2014b). Also obesity is a serious health burden associated to increased risk for several chronic diseases (e.g. diabetes, cancer, cardiovascular diseases) – 54% of the total population of OECD countries is overweight and 19% of people are obese.

**Figure 2: Adults Smoking Daily, 2000 and 2014 (%)**

Source: Adapted from OECD/EU (2016) (data refer to 2000 and 2014)

Figure 2 shows the differences in smoking between 2000 and 2014. It is clearly seen that the number of smokers decreased in the vast majority of observed countries. Hungarians are among the heaviest smokers in Europe – 26% of Hungarian adults are daily smokers, down from 30% in 2000, but still the third highest rate among all EU countries (OECD/EU, 2016).

Life expectancy at birth in Hungary increased by almost 4 years between 2000 and 2015, to 75.7 years, but still remains nearly 5 years below the EU average of 80.9 years (increased by more than 6 years since 1990). Large gaps exist between men and women, with men living on average nearly 7 years less than women. The gap in life expectancy by socioeconomic status is even larger: Hungarian men with the lowest level of education live on average about 9 years less than men with the highest level of education.

It is not surprising that amount of regular physical activity is generally more in higher income group. The part of the population with lower incomes is usually less likely to get the recommended level of physical activity (150 minutes per week) in the vast majority of Member States. The greatest differences between the two observed groups were in United Kingdom, Slovenia and Luxembourg. However, in case of some Member States – such as Ireland, Sweden and Denmark – there is no significant difference between the diverse income groups. Hungary has a better position in lower income group than the average of the European Union, however the regular physical activity is less common among Hungarians with higher income than the average. This type of leisure activity means a modern lifestyle which can be caused not only by the lifestyle change, but also the constraint because of the lack of physical activity (especially during work). If physical activity is missing from the daily life of people because of the above-mentioned reasons it must be replaced by “artificial” activity. Thus, a new industry was evolved.

If we talk about health conscious lifestyle it is necessary to mention that there is a relatively new consumer group devoted to sustainable consumption: the so-called LOHAS segment (Lifestyle of Health and Sustainability). According to the study written by Szakály et al. (2015) an important feature of the segment is that they consider all the three above-mentioned pillars of sustainable development in their decision making processes. They are health-conscious and their devotion to sustainability is reflected in purchasing environmental-friendly, socially responsible products (Szakály et al. 2015).

#### **4. Conclusion and Recommendations**

This current paper primarily focused on the relationships among health, health awareness and healthy lifestyle in terms of sustainability. The most relevant health issues are connected to all pillars of sustainability – they have different economic, environmental and social effects. The key pillars of health promotion can be found primarily in our lifestyle, therefore, we can influence and improve our health condition primarily with changes in our lifestyle. Also literature and statistical data supported the importance of healthy lifestyle as a crucial factor of social sustainability. Nevertheless, changes of lifestyle have several impacts to the other dimensions (environmental and economic) of a country’s operation. For example, more fruit and vegetable consumption requires us to produce more products which would lead to the needs of more water, more soil and land which is not possible without significant environmental effects and these effects react to the health condition again (as a loop). Similarly, long term lifestyle changes would require more technological developments and also several sub-political interventions would be essential in the economy in the future.

As a limitation the above-mentioned interactions were not examined during this study, therefore further research will be required in this area. The main findings of the study demonstrated that the different health conditions of Hungarians slightly improved in last few

years, however, further developments are recommended since Hungary is a medium or high risk country among the Member States of the European Union. Moreover, the relationships and interactions among the increase of health awareness, income trends, public policies and other channels of knowledge transfer are also recommended to analyse in the future.

### **Abstract**

*One of the consequences of globalization is the pressure on universities to internationalize and support student mobility for further European cohesion and competitiveness, therefore resources used in teaching should be multidisciplinary, critical, and obviously innovative to help students as future entrepreneurs to be able to cope with market demands on their knowledge, skills, and attitudes from the international perspective. The article introduces a unique Erasmus+ programme developed by the consortium of 7 European universities titled Entrepreneurship and Communication in Multicultural Teams (2016-2019) with the aim to teach students communicate effectively within multicultural teams during a ten-day course while solving and creating case studies being guided by a team of experts from partner institutions and companies. Except for obtaining theoretical and practical issues, students learn about themselves using a reflective method of a self-reflective journal and essay. The goal of the article is to present the outcomes of the comparison of two groups of students to identify students' opinions to be able to implement the results into further activities within the International Programme and it could help teachers to enhance the curricula at universities.*

**Keywords:** communication, Erasmus+, European integration, globalization, international business project

**JEL Classification:** A12, A23, F16, F66, I20

### **1. Introduction**

Nowadays, the process of economic globalisation increases, therefore global issues and important decisions in business, politics, education, health, and culture tend to affect citizens across borders. New attitudes and skills are required to work in global teams and deal with business partners or customers across cultures (Bobakova, Chylkova, 2014). The question of setting up an international business and effective communication between people of different nations is essential to ensure that all parties emerge with the same understanding. Without the right approach, cultural differences can greatly affect governments, businesses, organisations and individuals (Heinz, 2014).

One of the consequences of globalization is the pressure on universities to internationalize and support student mobility for further European cohesion and competitiveness, therefore resources used in teaching should be multidisciplinary, critical, and obviously innovative. Nowadays, tertiary education students are challenged only when teachers create learning experience that supports critical thinking and assembling parts of different knowledge for

students to be able to draw conclusions in the rapidly changing circumstances, which leads to knowledge dispersion and intensification (Dale and Robertson, 2009).

The program Erasmus+ Intensive Course offers to university students effective communication within multicultural teams within the designed ten-day course that significantly contributes to the development of intercultural and communicative competence while solving and creating case studies in multidisciplinary and multicultural groups, being supported by a team of experts from partner institutions and companies. During the course programme, students are given a balance of experience and theoretical issues, have an opportunity to introduce the various actors of the programme and set clear guidelines for multicultural team working (methodology used, self-assessment tools, expectations and learning outcomes).

Multicultural teamwork skills present a significant demand in the modern globalized world, therefore it is important to understand the different mindset of team members coming from different countries. The best way to learn the mentioned skills is learning by doing as authentic learning experiences provide good learning results within an authentic context where realistic tasks and performances are used in the multicultural setting (Saarikoski, et al., 2015). In the process of business education it is also crucial to follow pedagogical methods supporting the development of intercultural competence (Zelenková, 2010).

The programme Erasmus IP (International Project) involved intensive two weeks of working together both of students and teachers from six different institutions and different disciplines in order to reflect and develop their communication skills while working in multicultural workgroups. At the same time, they received input from teachers and practitioners from various backgrounds, who encouraged them to adopt a wide range of approaches. The project was aimed at providing a hands-on experience over a ten-day period to enable all the participants to develop and reflect on the necessary skills and strategies to achieve effective intercultural communication, using case studies and games (Robinson, 2011).

The project also emphasized the development of business education in terms of using innovative teaching methods as critical incidents, case studies, and games, and devoted a lot of attention to intercultural communication issues in managerial education. It confirmed the necessity to integrate intercultural communication in the university curricula to develop their cross-cultural communication and international business communication skills (Heinz, Orszulik 2014).

Intercultural skills development within the IP seems to be a definite benefit as it gives a chance for the students to widen their own views by sharing and discussing their ideas with their teammates. Nowadays intercultural competencies are sought after by many researchers and employers as they enable to understand critically or analytically one's own and other cultures' perspectives (Dervin et al., 2012).

Having finalized the mentioned IP, former 4 partner universities and 3 new partners continued working on developing a similar course, but at the same time focused more on the establishment of businesses in multicultural teams and in accordance with the new market demands, progressing diversity in European societies, and advanced information technologies. Intensive partners' negotiating related to the methodological approach, contents, and forms, responsibilities, submitting the project, and finally agreeing on the programme of the course took more than one year. The result of the common effort came in 2016 when the project was accepted and after a partner meeting in Paisley, Scotland, in autumn 2016, each partner university began working on the work package they were responsible for.

Currently, the project submitted, accepted and financed within the programme Erasmus+ Strategic Partnership involves Karelia University of Applied Sciences, Joensuu (Finland), Université Jean Monnet de Saint-Etienne (France) Technische Hochschule, Wildau (Germany), University of the West of Scotland, Paisley (Scotland), VIVES University College, Kortrijk (Belgium), and Politechnika Poznanska, Poznań (Poland). The project develops cooperation focusing on Intensive Programmes, preparation, and implementation of common courses related to start-ups, sharing curricula, workshops for teachers, and creating a common communication platform for all the participants of the project. The main goal of the project is the promotion of business education realized during common English workshops for students developing knowledge and skills in the area of management, marketing, communication, communication, etc. The Intensive Programme itself enables recruitment of 6 students from each partner universities every year who will work in multicultural teams on their real start-ups under the supervision of international tutors and entrepreneurs. The project also involves a broader community of students and teachers who will be able to use the course related output, which will definitely contribute to interconnecting of the theoretical and practical level of business education.

## **2. Method of Research**

In the last decade, using reflective learning practices as part of reflective learning methodology has become a very effective way of students' reflection on their learning experiences and making them engaged in the learning process. Reflective techniques help teachers to recognize patterns of thought and behaviour that shape students' thinking and actions, but especially shows how students perceive what they are learning and how they connect the new knowledge to the old one and what their attitude to that they are learning is (Zelenková, 2016).

One of the reflective methods is a learning journal, also called a diary or a self-reflective journal. Self-reflective learning diaries enable tutors to find out students' attitudes, feelings, and also their views related to the progress they made in the area of intercultural communication, developing their specialist, and language skills. Students can express themselves without fear and embarrassment, and improve their language skills. Moreover, writing a diary contributes to students' becoming more autonomous, taking control of their own learning, and in this way becoming more self-motivated.

Learning journals can involve reflective writing, dialogue, and role play writing. Reflective writing is related to writing about what and why they succeeded or failed at certain tasks, and about their impressions related to their learning currently. As it seems to be fairly difficult to make students write something insightful, it is recommended to list a set of questions helping students to be more specific, like for example questions about the focus of the lesson, grammar and vocabulary input, difficult issues, and any new information or skill students acquired.

Other reflective methods involve a self-reflective essay which is a brief paper where students describe an experience and how it has changed them or helped them to grow. Self-reflective essays often require students to reflect on their academic growth from specific projects or assignments, though others might require thinking about the impact of a specific event in your life. By describing the overall experience for readers, discussing current strengths and weaknesses as they relate to the experience they wrote about and sharing future plans for using this new information, it is possible to paint a vivid picture of how learners have grown and changed.

Self-reflective essays may challenge students to think critically about what they are doing well and what needs to be changed as a result of the described experience. Learners can begin by

talking about skills, responses, and actions that have been strengthened by this experience, then move into a discussion of areas that need working on.

By the conclusion, readers should have a clear, specific idea of how the experience affected learners and particular ways they have made progress. In a reflective essay, it is recommended to approach the conclusion by talking about how students plan to use what they learned from this experience in the future, in future classes, jobs, relationships and other aspects of life (Evans, 2009).

### **3. Results**

The presented research is related to the analysis of students' reflective learning journals and essays created during the IP course held in Joensuu, Finland in March 2017. The target group involves 2 teams of participants – the Belgian and the Polish ones. Conducting the analysis, it was necessary to set criteria for evaluating students' learning. They are connected to the following areas: 1 Pre-course activities–expectation and estimation of the course content, 2 Acquired knowledge about yourself, 3 Relationship with others, 4 Personal development, 5 Innovative pedagogical methods, 6 Culture issues, 7 Impact on the future life, 8 Language proficiency, 9 Especially appreciated issues, 10 Overall evaluation.

#### ***3.1 Belgian Students' Feedback***

The Belgian team involved 6 students of VIVES, University College, Kortrijk in Belgium.

1 None of the Belgian students has mentioned any pre-course activities, therefore they were not able to provide any information about their expectations related to the Erasmus+ IP course.

2 The students' knowledge about their progress during the course refers to the fact that they were the most experienced part of multicultural teams and brought the project to a successful end. However, they realize that they learned more about themselves during the interaction and are more opened to socializing, discovering other people's personalities, and widening the network of international contacts. A Belgian student declares that participating in the IP course taught students to be able to talk in front of everybody, to manage the stress, and when necessary to overtake the role of the leader.

3 The IP course is perceived as a good opportunity of the networking programme as it brought contacts for life and it was also possible to get in touch with different ways of working, which is very valuable for working in multicultural teams in the future.

4 The students appreciated the acquired skills like leading the team, using knowledge, working on negative issues, and especially listening to people, and working together. Solving problems, and particularly getting tools needed in future careers seem to be highly appreciated. One of the students has stated that participants of the IP course needed self-confidence related to starting their own businesses and can look for suitable internships. Belgian students have come to the conclusion that patience is one of the most appreciated features required while working in a team where its members come from different culture background.

5 In terms of new teaching methods, the students have declared that the teaching methods are similar to those used in their home country, but they highly appreciated the workshop on creativity when they were taught how to come with an idea to make the product useful and functional. They have also learned a lot from the workshop on visualizing business ideas leading to a better understanding of a product or a service and found useful the sessions aimed at introducing national teams.

6 The Belgian students have stated that they could not notice any big differences related to cultures as the majority of participants came from Europe where thanks to the Bologna Process education systems work in a similar way. However, they have noticed differences in legislative systems in the issues related especially to tax and payment policies, copyright laws, etc., the knowledge of which is useful when expanding to foreign markets. The students have reported that nationalities like the Germans, the Scottish and the Belgians tended to overtake leadership in multicultural teams.

7 The students have listed that in the future they will definitely use the broad knowledge about start-ups, expertise and delegating tasks to the right people. The ECMT certificate is a proof of what university graduates bring to the market including the knowledge about which sectors are profitable and promising, and about the behaviour of the current business generation. The Belgians have appreciated the skills needed for their professional life as pitching, drafting a business plan, and presenting the results.

8 Language and culture barriers were not important for Belgian students. They have just learnt several new words like pitching, a pitch competition, and generally the concept of the word *pitch*. However, the students have stated that after the IP course they are more fluent in English and they are not afraid of speaking English in public.

9 Belgian students have also mentioned non-appreciated issues connected mainly with a big number of lectures in the morning during the first week of the IP, which, for exhausted students, resulted in having a shortage of time for working in multicultural teams. Moreover, the testimonies delivered by Finnish businessmen seemed to be similar to each other and in students opinions they should have focused only on specific problems. It would have been better if students had been working in smaller groups where they could have asked specific questions and have had a direct interaction with speakers.

10 The Belgians are grateful for working together, for an inspiring environment as well as for working and playing hard, but they feel they were overloaded having to work in groups mainly in the evening. They think that a workshop on visual aspects would be very useful. They definitely criticize working with two or three coaches during the IP course as each of them had a different vision of their output and there was not any continuity in coaching. There were also too many changes in the schedule, but on the other hand, changing plans enabled the participants of the course to be more flexible.

### **3.2 Polish Students' Feedback**

The Polish team involved 6 students – 4 females and 2 males - from the University of Technology in Poznań who study Safety Engineering or Engineering Management. They had had experience in the field of organizational, managerial, creative thinking, analytical, and social skills.

1 The Polish students did not mention any pre-course activities, therefore they were not able to provide any information about their expectations related to the Erasmus+ IP course.

2 The students' knowledge about their progress during the course refers to feeling ready to work in any team, being more open, and being aware of the facts which skills it is necessary to improve. They realize that there is not only a need for professional skills but also soft skills, especially having an emphatic approach. They also came to the conclusion that networking leads to a change in life related to learning about themselves as in relationships it is easier to understand one's strengths and weaknesses and an individual is able to understand what should

be changed. They were also surprised at the fact how big their teammates' knowledge was and felt a little backward in the beginning.

3 Relationship with other students did not seem to be easy in the beginning as the IP course was the first international experience for the students in terms of presenting their own ideas to the team. However, the students reported they were not involved in any conflicts and met interesting people with different culture background.

4 The students appreciated the acquired knowledge very much, especially developing a business plan, using a canvas model and market penetration. However, the most valuable facts are gaining self-confidence in contracts and seeing how international companies work to develop a project. Now, the students are aware of the fact that a team of people from various cultures has bigger chances to achieve a success if it is capable to have a complex view of new experience in a new situation.

5 In terms of new teaching methods, the students declared that education in other countries is more modern and practical than in Poland. They also experienced new management skills and innovative teaching methods used by teachers. They appreciated a close cooperation with teachers and admitted that pitch presentations forced teams to develop business ideas faster and more efficiently.

6 The Polish students stated that Czech culture seems to be the most similar to Polish culture, but it was interesting to learn new facts about other European countries and standards related to teamwork. The trip to the Finnish countryside was a source of information about Finnish culture and it helped to understand its unique character.

7 The students could see big differences between Polish entrepreneurial conditions and entrepreneurship in Poland. The meeting with Finnish businessmen showed a significantly different concept of doing business and a more positive perceiving a businessman than in Poland, which can help Polish students to be more open and acquire a professional background and the ability to use it in the future. They were also surprised at the fact that the Finnish businessmen invest in self-development. This new approach helped the students to change their attitudes and gave them self-confidence in starting up their own businesses.

8 It was reported that overcoming language and culture barriers was difficult but brought a different vision of doing business. The students acquired the knowledge of numerous new words and phrases, like for example a very popular collocation *entrepreneurial mindset*, especially in the field of business English, and had an opportunity to use them in common conversation. The biggest challenge seems to be related to understanding the Scottish accent.

9 One of the most appreciated IP issues is connected with the local businessmen and their testimonials about their achievements and failures as well. However, the students consider the most useful developing a business plan and working with the Business Canvas Model. They also highly appreciate learning how to prepare a few minutes pitches to encourage potential investors to invest in their future businesses.

10 The Polish students evaluate practical part of the IP course in a more positive way than lectures. The most beneficial issue seems to be a discussion with motivated people, well prepared consulting and the chance to work with international students. However, the students criticize schedule changes, or even a mess and a lot of cancelled lectures, in the second week of the course. They also expressed the opinion that the communication platform is not user-friendly and should definitely be improved in the future.

### ***3.3 Comparison of Belgian and Polish Students' Views expressed in Self-reflective Diaries and Essays***

Comparison of opinions expressed by Belgian and Polish teams show that team members had different expectations related to the output of the IP course as they come from different culture, educational, and entrepreneurial background.

Both Belgian and Polish teams did not provide any information about the pre-IP activities, which means they were either not developed at all or were not paid proper attention.

The Polish students were surprised at the big knowledge of their teammates from other countries and felt a little backward in the initial stage of the IP course. On the contrary, the Belgians proved to be self-confident expressing an opinion that they were the most experienced members of multicultural teams.

Most Polish and Belgian team members evaluated their personal progress related to the ability to become part of the process of company establishment as well as the acquisition of specific professional and social skills. Both teams appreciate the possibility of networking, but relationship building was not easy for Polish students as the IP was the first international experience for them to present their ideas in multicultural teams.

Innovation related to teaching methods was highly appreciated by Polish students who have declared that education in other countries is more modern and practical than in Poland, but the Belgians seem to be involved in innovative teaching on a daily basis. However, they have learned a lot from the workshops on creativity and visualizing business ideas and they have become more self-confident in speaking English in public.

Polish students could see big differences between entrepreneurial conditions in Poland and Finland as the meeting with Finnish entrepreneurs showed a different concept of doing business, which helped Polish students to change their attitudes and provided them with self-confidence in starting up their own businesses. The Belgians were grateful for the skills needed for their professional life as pitching, drafting a business plan, and presenting the results.

For Polish students, it was difficult to overcome the language and culture barriers and they learned a lot of new words and collocations while language and culture barriers were not important for the Belgians, but a great benefit is that they are not afraid of using English in various situations.

Polish students consider meeting Finnish entrepreneurs, professional debating about business models, and getting a valuable feedback from tutors to be the most valuable issues of the IP, but for some Belgian students businessmen's testimonies were similar to each other, and took too much time, which resulted in the lack of time for working in multicultural teams. Both teams criticized frequent schedule changes and agreed on the fact that the communication platform was not user-friendly. They would also prefer having one coach during the whole IP course.

There are significant differences in command of English between the Polish and the Belgians, which can also be observed in the level of the written language used in self-reflective essays and diaries, with the Belgians being advanced in the written language.

To summarize the comparison of Polish and Belgian opinions, it can be stated that a certain degree the difference between Polish and Belgian students' views is related to a different social, economic and entrepreneurial background in Poland and Belgium, which is definitely connected with different historical development, related especially to the entrepreneurial

mindset and the length of its existence as well as to the degree of innovation occurring in the Polish and Belgian systems of education.

#### 4. Conclusion

After the analysis of Belgian and Polish students' self-reflective essays and diaries, it can be stated that the Polish have made a bigger progress in numerous aspects of business education as their starting point was different from the Belgian one. The Belgian students seem to be accustomed to more innovative teaching methods and they also have an opportunity to work in international groups of students. Polish students could see big differences between entrepreneurial conditions in Poland and Finland, therefore they learnt more and their attitudes have changed after the IP.

The recommendations for all the staff involved in the preparation and running the IP in the following year involve improving the communication platform, better organizing of pre-course activities, changing the system of coaching in multicultural teams as well as providing more time for working in teams.

In conclusion, most Polish and Belgian team members evaluated their personal progress related to the ability to become part of the process of company establishment as well as the acquisition of specific professional and social skills. Both teams appreciate the possibility of networking, relationship building, and acquiring more confidence in speaking English in public.

It is necessary to state that the acquired data is significant for business educators designing university curricula, which are expected to meet undergraduates' expectations when they enter the labour market. The information collected in the self-reflective essays and diaries has proved that there is a gap between students' expectations, especially in the case of the Polish students, who indicate a need of a stronger connection between theory and practice.

### **Abstract**

*The aim of the article is the analysis of the Trans-Pacific Partnership (TPP) in relation to member countries of this partnership. The article introduces the terminological basis of the TPP in part two. In this part of the article is described the level of knowledge, recent theoretical approaches, and their application. The third part of the article is about positive and negative impacts of the TPP. In this key part of the article, the author describes results of research about positive and negative impacts of the TPP. In the fourth part of the article, the author evaluates and also explains opportunities and threats for member countries from the TPP agreement. In the end, it is not clear whether the impacts are positive or negative, based on the results of studies dealing with the impact of the TPP on world trade. Economic models do not provide unambiguous results and therefore cannot decide on accession or block accession to the TPP. It is clear that governments must also consider other important criteria for them. What is more, the agreement between the EU and Japan (EU-Japan Economic Partnership Agreement - EPA) gained prominence for Tokyo when the U.S. President Donald Trump decided to withdraw the U.S. from talks on the TPP.*

**Keywords:** *Trans-Pacific Partnership, positive and negative impacts, Free Trade Agreements, Preferential Trade Agreements, EU-Japan Economic Partnership Agreement, the U.S., Japan, China, ASEAN, and the EU.*

**JEL Classification:** *F49, F53, F63*

### **1. Introduction**

The Trans-Pacific Strategic Economic Partnership Agreement (TPSEP) is the original name of the TPP agreement. In the 2003, the TPP agreement was proposed as a tool for Singapore, New Zealand, and Chile to liberalize trade in the Asia-Pacific region. Brunei joined the agreement as the fourth member in 2005. Shortly afterwards, the United States, Australia, Peru, and Vietnam joined it likewise. (Fergusson et al., 2016, p. 86) As Vice President J. Biden pointed out in 2013: *Our goal is for high standards for the Trans-Pacific Partnership to enter the bloodstream of the global system and improve the rules and norms.* (Fergusson et al., 2016, p. 86) In 2009, the Obama administration announced that it would continue to negotiate the TPP [...] *with the goal of shaping a regional agreement that will have broad-based membership and the high standards worthy of a 21<sup>st</sup> -century trade agreement.* (Fergusson et al., 2016, p. 89) The TPP served several purposes. Firstly, the agreement was focused on to keep the region open to Washington and its leadership. (Dian, 2017, p. 584) In October 2015, the TPP negotiations were terminated.

However, [...] highlighting the risks of open multilateral trade borders became one of the main themes in the campaign of President Trump. (Helble, 2017, p. 406) *So, when Trump promised to withdraw U.S. from the TPP and take strong action against China, he tapped into the deep vein of resentment that was brewing in parts of American society* (Elms, Sriganesh, 2017, p. 253). The new administration of Donald Trump has made several crucial decisions from the start. These included the signing of the withdrawal of the United States from the TPP on January 23, 2017. However, the withdrawal of the United States from the agreement of the 12 Pacific states was not surprising after the victory of Donald Trump. Donald Trump has promised withdrawal from the TPP because of protecting American workers in his pre-election promise. (Donald J. Trump, 2016) In the presidential memorandum, we can read that [...] *the policy of my Administration to represent the American people and their financial well-being in all negotiations, particularly the American worker, and to create fair and economically beneficial trade deals that serve their interests.* (The Whitehouse, 2017) In addition, it is important to note that it may not be dead. The Secretary of State Rex Tillerson publicly broke with Trump by saying that he was not actually against the TPP. (Griffith et al., 2017, p. 574)

## **2. The Impacts of the TPP (Problem of Formulation and Methodology)**

We can find the roots of the current situation by examining the economic, political, and geostrategic aspects of the Transpacific Partnership (TPP). Research can also help to find positive and negative impacts of this agreement. The aim of the study is to analyze relations and relevant research which brings us the basic framework of the economic, geopolitical, and geostrategic aspects of the TPP. The research question has been set in the context of the research plan: Can the economic impacts be the criterion of acceptance or rejection of the TPP? The main research question can be further divided into a sub-questions: What is the main significance of the TPP for its members? What is the interrelationship between the TPP and the EPA? The applied research method is content analysis.

Wesley argues in his research that the TPP and the RCEP [The Regional Comprehensive Economic Partnership] are the means of a new phase of competitive regionalism in Asia. (Wesley, 2015, p. 481) Wesley argues that the TPP and the RCEP really represent the new phase of competitive regionalism in Asia. In his opinion, the complexity of this phase arises from two factors. First, rivalry is not done for size or leadership but for regional organization. Secondly, this time there are four major rival parties. According to Wesley, the main competitors of the competition are the United States, China, Japan, and ASEAN. (Wesley, 2015, p. 481-482) Furthermore, Capling and Ravenhill argue that it is important to determine the underlying differences according to the individual actors of the agreements. In Preferential Trade Agreements (PTAs) it is also possible to recognize some versatile competition models. (Capling, Ravenhill, 2011, p. 555) Capling and Ravenhill state that PTAs involving the U.S. are by far the most comprehensive (covering goods and trade in services, WTO plus commitments, labor and environmental standards) Australia and New Zealand appear to be a subset of the U.S. model PTAs fully cover products but less WTO plus commitments than the U.S. agreements. Japanese (South Korean) agreements are similar to those of the United States in their interest of a wide range but are characterized by their inclusion of technical assistance for capacity building with developing countries. Chinese and ASEAN countries agreements are typically much less ambitious, narrower in their coverage of trade in goods and services and, with some exceptions do not contain any WTO plus commitments. (Capling, Ravenhill, 2011, p. 555)

In addition, Lee claims in his research that China thanks to its economic development could lead a wide range of economic and strategic ties that were built in the new millennium. This network is a big challenge for new economic integration and the strategic alliance of the United States. (Lee, 2015, p. 345) Lee argues that the ultimate success of the TPP will depend on the proactive link between G2 [Big Two, China-USA]. Many countries are tied to economic and political institutions led by the U.S. and China in this area. What is more, [...] *it is also important to notice that China's entry to WTO was accompanied by liberalisation steps before and several years after China entered WTO.* (Končíková, Hloušek, 2014, p. 332-333) Moreover, seven countries in the TPP participating at the same time in the RCEP. In addition, all twelve the TPP member countries, including four, who wish to join the TPP (Indonesia, South Korea, Philippines, and Thailand) are members of the FTAAP [The Free Trade Area of the Asia-Pacific]. Furthermore, all of these countries are linked by bilateral or regional free trade agreements [FTAs]. (Lee, 2015, p. 345) Furthermore, Nedelka shows in his research that [...] *their world economic integration rate is different, but their trade relationships strongly intraregional, therefore when the import demand of the western countries decreased, the intraregional trade helped the recovering of their trade balance.* (Erzsébet Nedelka, 2012, p. 246).

### 3. The Positive and Negative Impacts

On October 5, 2015, the TPP was signed by representatives of twelve Asian-Pacific countries. The importance of this step is clear, especially for possible positive impacts of TPP on global trade directives. As President Obama reminded [...] *the TPP means that America will write the rules of the road in the 21st century [...] if America doesn't write those rules—then countries like China will.* (Allee, Lugg, 2016, p. 1) Among positive impacts of the TPP can be the introduction of a uniform standard of trade agreements within regions or international institutions. Allee and Lugg point out in their research that the TPP could become a new standard for future trade agreements and possibly the basis for future multilateral negotiations in the WTO as the first regional agreement. (Allee, Lugg 2016: 2) Allee and Lugg believe that the one [...] *whose model prevails in negotiations is determined largely by bargaining power. Thus notable initiatives like the TPP cannot be separated from power politics and their geopolitical context.* (Allee, Lugg, 2016, p. 8) The World Bank explains its positive attitude towards the TPP because [...] *deepening global and regional trade and investment integration through lower non-tariff barriers would further boost productivity and competitiveness.* (The World Bank, 2016, p. 106)

Petri and Plummer's research shows the following positive effects, the TPP will substantially benefit its members, and especially raise real incomes in the U.S. by \$131 billion in 2030. (Petri, Plummer, 2016, p. 17) Petri and Plummer determine the negative impacts as follows [...] *the TPP will also generate adjustment costs; some workers may face difficult transitions as less productive jobs are lost and more productive jobs are created.* (Petri, Plummer, 2016, p. 17) According to Petri and Plummer, geopolitical aspects are also at stake, and therefore the TPP will be a key point in the balancing strategy towards the Asia-Pacific region. The United States has close economic and political relations in this area, and therefore deeper economic ties and political stability are the U.S. central interests in the Asia-Pacific region. (Petri, Plummer, 2016, p. 18) What is more, the positive effects of Free Trade Agreements (FTAs) were also examined by Liu and Ornelas, who focused on the relationship between the country's participation in the FTAs and the sustainability of its democracy. Their research has brought these major results. Firstly, the deeper the commitment of the countries in the FTAs, the more the durability of democracies increases. Secondly, the

political instability of the country helps to promote participation in FTAs. (Liu, Ornelas, 2014, p. 34).

However, researchers point out that it is clear from their results that [...] *that participation in FTAs is, unsurprisingly, no panacea: they can help to consolidate democracies, but their reach is limited. Our estimates make this limit clear.* (Liu, Ornelas, 2014, p. 35).

Positive results from engaging in FTAs include a team-led research conducted by Mansfield, dealing with the links between political regimes according to the classification (democracy, autocracy) and their relationship to international trade. In their results, they say that [...] *aggregate trade barriers will be lower between democracies than between a democracy and an autocracy.* (Mansfield et al., 2000, p. 35) They further state that [...] *trade between democracies tends to be more extensive than commerce within mixed pairs [democracy and autocracy].* (Mansfield et al., 2000, p. 35) Their results show that the average of the pair, which consisted of democracy and autocracy accounts for roughly 15% to 20% less trade than the one made up of two democracies. These results are confirmed over time, for example, in the 1990s, the average trade between democracy and autocracy was roughly 40% smaller than that between democracies. (Mansfield et al., 2000, p. 35) These differences can be attributed to the Cold War period largely covered by Mansfield's research (1960-1990). Researchers offer an explanation based on the fact that [...] *it might be the case that democratic pairs trade more because they tend to be allies because they belong to the same commercial institutions (GATT and other PTAs), or because they are not involved in military conflicts.* (Mansfield et al., 2000, p. 35).

We can also include a mechanism for resolving disputes between the investor and the state (ISDS - investor-state dispute settlement) among the negative impacts. For example, Labonté states in his research that [...] *ISDS is one of the most controversial inclusions in FTAs. Most of the environmental disputes have important indirect health implications.* (Labonté et al., 2016, p. 3) There are several critical views on how ISDS works today, according to Labonté as follows: lawyers who make decisions have had links with multinational companies in the past, a small group of these elite lawyers will decide on the majority of cases, the increasing amount of rewards, there is no possibility to appeal. (Labonté et al., 2016: 3-4) The study led by Capaldo focuses on strictly economic effects and states that [...] *projections indicate increases of less than 2.5 percent by 2025 for nine of the eleven participating economies.* (Capaldo et al., 2016, p. 5) Another negative impact of the TPP may be the loss of jobs. Capaldo says the biggest loss will be suffered by the U.S. (approximately 450,000 jobs in 2025, followed by Canada (75,000) and Japan (58,000), while the smallest loss will suffer from New Zealand (approximately 5,000). In the TPP countries is estimated about 771 thousand loss of jobs. (Capaldo et al., 2016, p. 18) The simulation of Capaldo's team also states that the TTIP negotiations and the recent BRICS trade agreement proposals show that global competition for higher competitiveness may indeed exist. Risk with this quest for competitiveness is that all countries will cut costs, lose jobs, and attract even high levels of inequality so that total demand and supply will suffer. This can dangerously threaten the ability of countries to achieve sustainable growth. (Capaldo et al., 2016, p. 18) In conclusion, Capaldo sums up [...] *the TPP is projected to generate small gains in GDP in most participating economies. We also project job losses and higher inequality in all participating economies.* (Capaldo et al. 2016, p. 19) Conclusions of Capaldo also confirm the results of Lankner's and Milanovic's research, which was based on global income distribution over the period 1988-2008. Lakner and Milanovic, show that [...] *the level of global inequality remains high [...]* (Lakner, Milanovic, 2013, p. 48).

Furthermore, among other impacts, we can include the link between the wars and the trade that the team under Martin led. Their results show that the claim that trade promotes peace is only partially true: bilateral trade increases the price of bilateral war and really prevents this war. On the other hand, multilateral trade openness increases the likelihood of war between any pair of countries, because it shrinks the cost of waging war with any given country. (Martin et al., 2008, p. 29) Martin further argues that *...trade globalization also affects the nature of war: multilateral trade openness increases the probability of local wars and deters multilateral conflicts.*(Martin et al., 2008, p. 29-30) These results are supported by further research by Martin's team in 2008, in which they conclude that commercial openness affects the risk of civil war. Business openness increases the risk of low-level conflict but reduces the risk of high-intensity conflicts. (Martin et al., 2008b, p. 549) In 2010, Martin's team explored the relationship between conflict geographies and Free Trade (FTAs) agreements. Their results confirmed that *[...] economic and security gains are complementary to explain the evolving geography of trade agreements. Trade gains may be instrumentalized for a superior objective of peace but that makes them more, not less, important.* (Martin et al. 2010, p. 29-30).

In addition, Mayer and Thoenig also explored the relationship between trade agreements and war conflicts. The issue was explored on the example of the East African Commonwealth (EAC). Researchers conducted a simulation of how much the trade agreement would have affected the risk of conflict. Their results are that *[...] we see that [...] on average a common market would decrease conflict risk by 4%. We also point to an non-negligible increase in the potential risk of internal conflicts (+2% on average) [...]* (Mayer, Thoenig, 2016, p. 20).

#### **4. The TPP in relation to the EU-Japan Economic Partnership Agreement**

In 2017, the European Commission is reaping the fruits of the Global Europe strategy (2007) that is *[...] formalized the EU's policy of expanding trade relationships via FTAs.* (Söderberg, 2012, p. 261) The negotiations lasted for a long time because there was a traditional barrier to negotiating between the EU and Japan. Nelson argues that Japan tendency is business policy before political and social politics while the EU tends to put politics and social policy before business policy. (Nelson, 2012, p. 362) Furthermore, Nelson states that the EPA was in competition with the TPP. The EU has already concluded a trade agreement with Korea (the EU-Korea FTA, 2011) that has favored Korean products on the EU market. The Japanese Government was encouraged by the industry in the same agreement. (Nelson, 2012, p. 362) *The Korean FTA [with the EU] has been a watershed in terms of reaction from the Japanese... Industry has been galvanised and is now piling pressure on the Japanese government [...]* (Nelson, 2012, p. 363) In 2017, the EU has concluded negotiations on a trade agreement with Japan. The EU firms already export more than 58 billion euros per year to goods and 28 billion euros in services to Japan each year. The EU-Japan Economic Partnership Agreement (the EPA) will remove trade barriers, help shape global trade rules, and *[...] send a powerful signal that two of the world's biggest economies reject protectionism.* (The European Commission, 2017)

Suzuki argues in his research that if the EPA is closed and ratified before the TPP, this would be a historic breakthrough. This would mean a shift away from the Japanese "America First" approach, which prevailed during the post-war era. On the other hand, [...] the fact remains that the US is a larger trade partner than the EU for Japan. (Suzuki 2017: 885) What is more, Suzuki's research shows that [...] *the uncertainty caused by the Trump administration's abandonment of the TPP and by the UK's Brexit referendum of June 2016 have complicated Japan's trade policy, making it unpredictable than ever.* (Suzuki 2017, p. 886) In addition, as Suzuki confirms Japan is strongly declare its commitment to defining future global trade rules. (Suzuki, 2017, p. 886)

Frenkel and Walter also point to the political considerations of the agreement: the official name of the agreement does not contain the word "trade". The name "Economic Partnership agreement" is more likely to emphasize that cooperation goes beyond trade and should be considered as a strategic partnership, including cooperation on many levels. (Frenkel, Walter, 2017, p. 358) Berkovsky reminds that EU-Japan cooperation is in a positive development in international security issues. These countries work together in Afghanistan and the Somali coastal regions. (Berkovsky, 2012, p. 286) As Berkovsky shows [...] *the day-to-day cooperation between Japanese and European NGOs in Afghanistan is also noteworthy and provides evidence that Japanese and Europeans can successfully work together in international politics and security.* (Berkovsky, 2012, p. 286) In addition, Frenkel and Walter claim that the EPA [...] *it could become a vehicle to fill the vacuum created by the withdrawal of the United States from the Trans-Pacific Partnership (TPP).* (Frenkel, Walter, 2017, p. 358) However, Its completion is a remarkable success with regard to the current business agreement, economic size of the contractual relationship, and the scope of the agreement. (Frenkel, Walter, 2017, p. 358) Frenkel and Walter show in their research that the conclusion of the EPA had considerable economic and political reasons for both parties. *The economic gains that an agreement would be able to reap are considerable. Politically, the agreement is an opportunity for the EU to solidify its position in the Pacific Rim [...]* (Frenkel, Walter, 2017, p. 363) Researchers argue that the US withdrawal from the TPP has created an opportunity to strengthen the role that the EU plays in generating global trade standards. (Frenkel, Walter, 2017, p. 363) Hilpert reports about specific profits from the EPA that supports the current situation of the TPP and Brexit. In his view, the deal will have a positive impact on Europe by attracting Japanese investors. Japanese companies have so far been reluctant to invest in continental Europe compared to competitive locations such as Asia, the US, and the United Kingdom. (Hilpert, 2018, p. 6) Hilpert shows further that the agreement strengthens the relations of both countries in the current era of uncertainty. *While uncertainty has increased in the fields of trade and security policy during the Trump administration's first year in office, the chances and potential for closer EU-Japan cooperation are considerable.* (Hilpert, 2018, p. 8)

## 5. Conclusion

From the theoretical concept (Wesley, 2015), one can conclude that there are now four main competing forces in the Asia-Pacific region: the U.S., Japan, China, and ASEAN. These actors compete in the field of economic regionalism. If we continue with theoretical approaches, we can see that the reasons for joining different regional FTAs are both economic, geopolitical and strategic as some scholars say (Capling, Ravenhill, 2011). As some of the results (Lee, 2015) point out, this is mainly a power struggle between the U.S. and China, although there is a lot more players here. Some research (Lee, 2015) also shows that the Asia-Pacific countries are largely inter-linked by bilateral or regional FTAs to such an extent that they will have to

find a consensus in some important ways. Some research (Fergusson, 2016) confirm that if we focus directly on the process of negotiating the TPP, it is clear that most countries have negotiated the TPP in 2010-2014, with Americans, in particular, taking the TPP as a growing platform for regional economic integration.

Based on the results of some studies dealing with the impact of the TPP on world trade. It is not clear whether the impacts are positive or negative. Some researchers claim that the TPP will have a positive impact. In their research, Allee and Lugg (Allee, Lugg, 2016), point out that TPP will create a new single standard of trade agreements within regions or international institutions (WTO). In particular, the United States sees this idea as the basis for multilateral WTO negotiations. Furthermore, other positive effects are reported by Petri, Plummer (Petri, Plummer, 2016), who confirm the increase in real income (especially for the U.S.). The results of the Liu and Ornelas (Liu, Ornelas, 2014) research confirm that PTAs can consolidate democracies if the surrounding countries are stable democracies. What is more, other positive impacts include the Mansfield research, which states in its results that the democratic countries are more trading together because they tend to be allies because they belong to the same trade institutions (PTAs). Labonté describes as problematic in his research the investor-state dispute settlement mechanism (ISDS). For example, Capaldo (Capaldo, 2016) lists the following purely economic negative impacts: revenue cuts and small profits, job losses and acceleration of race to the bottom. Research by Capaldo (Capaldo, 2016) confirms the research by other experts (Lakner, Milanovic, 2013) who said that TPP could lead to further increases in global inequality. The relationship between war conflicts and trade agreements was explored by Martin and Mayer and Thoenig, both surveys confirming that regional FTAs can increase the risk of local conflicts while reducing the risk of more intensive conflicts.

As can be seen from the results of the researchers on the positive and negative impacts, the ambiguity of the results of studies based in particular on economic models leads to the conclusion that they cannot be the main decision-making aspect of the TPP. Now we come to the answer to the main research question (and the subquestions). As described above, economic models do not produce very clear results and therefore I believe that it is not possible to decide on the accession or block accession to the TPP solely on the basis of the economic impacts of the TPP, but the individual governments must also consider other important criteria for them. On the basis of the findings, I believe that the current proposal for the TPP has another major importance for each actor. For smaller countries, it is mainly economic, but key non-purely economic criteria may be more important for key players (USA, China, Japan, ASEAN). For the U.S., it is mainly about the "Pivot to Asia-Pacific" strategy with all aspects (geostrategic, geopolitical and economic). For Japan, it is important to limit the economic dominance of China in this region. Furthermore, I think it is important to mention that Japan has also now ended the negotiation on the EU-Japan Economic Partnership Agreement (EPA). This is sending a message to other countries about the importance of shaping globalization. (European Commission, 2017) For China, it was important to monitor the development of the TPP, build up its economic communities in the region, and after the current, the U.S. withdrawal, consider whether to aspire to join the TPP. And for ASEAN, the TPP can be a suitable alternative to the regional economic communities being led by China. The answer to the last question is that the interrelationship between the TPP and the EPA is such that these two contracts have competed together for the favor of Japan. Finally, the U.S. withdrew from the TPP and the EPA was concluded. In the era of current uncertainties, it is a historic signal to consolidate the Japanese and European roles in world trade.

### **Abstract**

*The European integration includes several dimension that altogether form the European society as a supranational community based on voluntary community of Member States. By other social sciences focusing on the actual challenge of the European integration project from various points of view (compare Cini and Šuplata, 2017; Dinan, 2017, Verdun, 2017) no doubt the economic dimension represents one of the most fundamental impacts on the shape of the integration which in the optimal case should prefer economic laws before political declarations. The actual integration problems reveal that it was to great extent not the case in the past EU integration developments. The main aim of the paper is to identify selected problems of the contemporary European economic integration developments with a special emphasis on economic processes on both national and supranational level. The paper argues for redirecting state interventionism towards solving of traditional political problems - related especially to security and defense – as a part of fundamental reform of integration processes. On the other hand it prefers that economic activities should be reserved preferably by main economic actors composed of firms and households.*

**Keywords:** *economic integration, Europe, Europe in crisis, European integration, future of Europe*

### **1. Introduction**

The conflict between politics and economics, between political power, and economic laws exists since the very beginning of economics as a science (Sinn, 2016) that had formulated these market-based laws as a natural and free social order. The market system that was in the 19<sup>th</sup> century the closest to the ideal of perfect competition has enabled the unprecedented development of the industrial economy. Developments in the first half of the 20<sup>th</sup> century characterized by two major military conflicts in the history of humanity and consequently by historically the most serious economic crisis, led to the prevailing beliefs of the loss of the market self-regulatory capabilities demanding - to remedy market failures by power, i. e. by the state. Emerging influence of socialist doctrines in this period demanded even radical solutions such as replacement of market and private ownership by social ownership and by the centrally planned economy. In some parts of the world, these ideas in real terms realized through state ownership and state regulation, while grasping the political power in the socialist revolution was a decisive precondition for fundamental societal and economic changes. Consequently, the world after the World War II broke into two antagonistic systems.

Both - the end of the most destructive world war in history and the emergence of a new societal system – became the most evident in Europe. It had significant influence on its post-war

developments, *inter alia* by searching and shaping a new form of international relations – the integration. The difference between the two systems was reflected in two different concepts and perception of integration. However, not even the socialist economic integration concept was able to save the system, which - after a few decades of existence on purely ideological principles and political power – in the end collapsed.

Integration in the western part of the continent was primarily motivated politically - to prevent further war conflicts in Europe as well as to build barriers against the spread of Soviet communism. The development of economic integration in democratic countries was conditioned by overcoming national differences and interests. This was also reflected in different and sometimes even opposite views on the nature and the objectives of the integration processes. There were two main approaches realized in practice: first, based on the idea of ever closer intergovernmental cooperation between sovereign states (European Free Trade Association), second, arguing for the necessity to create a common supranational single economic and political entity (European Union).

## **2. Problem Formulation and Methodology**

The developments in integration process of the past turbulent decades confirm that the second approach prevailed. This led to relatively swift creation of common market and to monetary union. The beginning of the third millennium following the collapse of centrally planned economies brought widening of the western integration further to the of Central and Eastern countries of the “old continent”. In the second half of the first decade, the integration was tested by the financial and economic crisis, which affected particularly the economically most developed countries with the most harmful impacts in the post-war history.

The last crisis has shown it was not just one of the stages of a more or less regular business cycle with more or less "traditional impacts" – like a decline in growth, trade, investment, employment. It revealed serious problems in the integration process that destabilized the European Union and threatened its further development. The impacts of the crisis have motivated to take measures in order to mitigate the downturn in the economy. However, the consequences of the measures also contributed to the rise of another problem - the debt crisis. The accumulation and severity of crisis problems has become a subject of numerous analyses trying to find out about their origin and proposing options for their solution and for the future direction of the whole integration process.

Our approach is based on the assumption that the actual cumulation of crisis problems is not accidental but it rather occurred as a (direct) consequence of the chosen integration concept and of its implementation over the past fifty years - under the conditions of a mixed economy, which in reality led to growing state interventionism.

## **3. Market Versus State**

The main economic preconditions of the real integration were the small size of most western European economies and the high level of their industrial development requiring a substantially larger market for their production. It is, however, more important to emphasize that integration is a deliberately politically driven process based on predetermined goals, using selected tools and institutions with distinctive subjective elements. The former process of internationalization of economic relations, naturally regulated by the market, has been in the “new” integration form largely under the control of political power.

The supremacy of political goals and tools over economic integration processes accompanied the general transformation of the market economy into a mixed economy based of Keynesian principles. The Great Depression followed by the World War II have strengthened the position of the state (policy), and its interventions and regulation have become an indispensable and a permanent part not only of economic life. Economic policy has been institutionalized by numerous political bodies, dozens of ministries or departments with hundreds or thousands of officials daily carrying out their political-interventionist agenda (Vaubel, 2010).

Particularly important became the formation of a social mentality accepting these fundamental changes, especially under the influence of the negative experiences of Great Depression and War Destruction in the 1930s and 1940s. It seemed logical that only an institution with legitimate power tools could prevent the destructive development in the future. In the social consciousness, the state ceased to be the "necessary evil" and turned to be a source of benefits. Economic theory contributed to the development of market failures theory (Samuelson, 1947) and the gradual transformation to mathematical modelling of the conditions of economic equilibrium under conditions of permanent state interventions.

In such changing circumstances, immediately after the war, the parallel expanding idea of integration was reflecting, primarily a need for an international guarantee to ensure lasting peace. With the start of the "Cold War" the cooperation of western countries in this area became institutionalized by creation of the NATO in 1949. The priority of cooperation focused on the politico-military area was natural, although the western European attempts were not quite successful. Also, the economic cooperation was originally motivated politically with aim to subordinate under the joint supranational control the German and French mountain industries. These efforts started by six founding member states (France, Germany, Italy, Belgium, Luxembourg the Netherlands), led to creation of the European Coal and Steel Community (ESCS) in 1952. The subsequent developments of economic integration and creation of European Economic Area (EEC) firstly, defined the political goal of creating a single economic and political entity. Secondly the economic integration was taking place in national economies of Western European countries in times of growing interventionism when large companies are being privatized, and the economic policy permanently affects the socio-economic system.

The proportion between the market and the state in individual Member states, or, the extent of the state's influence, as well as the instruments and the application of economic policy, were different and changed by further developments, however, the mixed economy became a prevailing reality. State interventions and regulations have spread to other areas - social security, the environment, the expansion of public goods (education, health) - justified by the inability of the market to efficiently respond to the needs in these areas.

Nowadays, confronting the immediate mixed economy with the market economy on the macro level is impossible, as all world economies (except North Korea and Cuba) are perceived as mixed. On the other hand, the comparison of the market or mixed (partly market) economy, on the one hand, with a centrally regulated economy, on the other hand, speaks clearly in favour of the market (or partly market) economy and against state-regulated economy. Although in case of centrally regulated economies it was about a connection of politics with an ideology contradicting to simple economic rules, the negative influence of politics itself cannot be denied, i.e. a power element in the whole system that directly controlled the processes of the socialist economy and which in the end collapsed.

Therefore, the assumption that the power elements of politics can be more destructive than "market failures" or that, in general, voluntary market relations are more effective than

involuntary, power relations, is a legitimate theoretical premise. Just as the assumption that market failures are not automatically remedied by a power measure.

There are many examples from the economic practice that actually document these assumptions. For example, monopolization is not only a privileged position for increasing prices and profits, but also a more efficient use of resources through economies of scale, the development of cutting-edge science and technology, and the employment of hundreds of thousands of workers. Similarly, public education or public healthcare does not automatically offer higher standards than the private providing of these services. The externality of environmental damage is often not only the result of the lack of protection and use of property rights, which is to be guaranteed by the legal system, i.e. the state.

On the other hand, state failures like corruption, clientelism, wastage of public funds, increasing bureaucracy of economic and social activity underline serious shortcomings in the intervention-regulatory system. Especially in countries of Central and Eastern Europe there is mostly (or only to a lesser extent) no historical experience with the democratic system, and market regulation was interrupted for decades. However, such experiences also exist in western countries, where interventionist economic policies have spread since the World War II.

The differences among countries, their economic level, are related not only to their overall historical development but also to the post-economic impact of economic policy. Extensive state interventions, nationalization of ownership of large corporations, and expanding post-war planning in many advanced Western countries, often accompanied by an increase of trade union influence and welfare state building, resulted in stagflation of the economy in the 1970s. Its solution was associated with the emergence of neoconservative theory and economic policy based on the limitation of state interventions, on deregulations and on the expansion of market regulatory elements. This liberalization has made it possible to reduce inflation, to accelerate economic growth and create space for the rapid development of modern information technologies since the 1980s.

It is worth mentioning that the post-war development in Germany, where the rapid restoration of the ruined country and economic growth, known as the German "economic miracle," was the result of L. Erhard's successful *ordo-liberal* economic policy. The state had an irreplaceable place in it however its measures were focused in particular, on creating a political and legal framework for the efficient functioning of the market system. Similarly, developments in many developing countries have recorded significantly faster economic growth since the 1990s, mainly due to pro-market reforms and restrictions on government interventions and regulations.

If we add to this the necessity of transforming the centrally planned economies into market ones - after decades of total state regulation and economic (societal) effects in the form of their significant lagging behind, which will take decades to overcome - it is clear which element of the mixed economy seems to be more efficient. Obviously, there is no need for the cancellation of the state, but for a serious reconsideration of the mix of the market and the state in the mixed economy in favour of the market economy.

#### **4. Selected Challenges for the Future Concept of European Economic Integration**

This principle is valid not only for the national level, but generally, as well as for the integration on the supranational level. Hayek, during the war in his famous work, *Road to Serfdom* (1944),

warned that: "*the problems raised by a conscious direction of economic affairs on a national scale inevitably assume even greater dimensions when the same is attempted internationally.*" (Hayek, 1990, p. 168). Although he formulated these views in different societal conditions, even today, attempts to manage and plan on the national, supranational or international level are largely just the "*exposed majesty of power*".

The up-to-date progress of integration and its outcome in the financial, economic and debt crisis in principle confirm these ideas. Directing the integration process towards closer economic, monetary and political union - the creation of the "super-state" - is not only a clearly politically determined goal but, above all, a political project implemented from the centre mainly by political instruments and institutions. Adjusting differentiated views of individual countries or their representatives in the process of deepening integration is increasingly demanding, and therefore requires more centralized decision-making.

The realization of the original integration goal of building-up "the United States of Europe", and in particular the attempt to centrally accelerate these processes, reveals several problems. One of them is the fact that the differences of opinions and interests do not separate only the national borders of individual countries. National interests can also be defined, but the border between different views in different areas of integration goes across countries and differentiates society within them. It is also documented by a variety of political parties in each member country with different contents of their programs on integration issues. They are the result of democracy and its manifestations in various political activities of citizens - elections, petitions, referendums - demonstrating the natural diversity of the society.

The problem is if the differences between opinions (interests) bring increased tensions, conflicts and threats that an obstacle for a serious discussion. One of the consequences is division into so-called "Euro-optimists" and "Euro-pessimists". This has been usually labelled by so called "Euro-optimists", considering all the others, as well as considerably differentiated views in principle as anti-European ones.). Such simplification among other, avoids open debates and clear differentiation and distinction between genuinely nationalistic and xenophobic views.

This is closely related to another problem of limiting democracy. One of the positive expectations of the accession of the eastern European countries to the EU was the enlargement and the firm establishment of democracy in their political systems (Gubová, 2016; Loužek, 2017) which historically were suffering from various transformational problems (e.g. 1990's in Slovakia). This crisis development, together with the migration crisis and by its impacts, is accompanied by an increased pessimism on democracy, and its ability to effectively influence future developments. This is reflected, for example, in the rejection of the results of democratic processes - repeated referendums in some Member States (Ireland, Denmark...), or pressure to repeat the referendum on the Brexit in the United Kingdom.

The problem of democratic deficit in the formation and functioning of several EU institutions is well known (Vaubel, 2010). It appears by the limited competencies of the European Parliament as the only supranational body elected by citizens (compare Shackleton, 2017), by appointments to the highest positions in the other institutions and the practical irrevocability of the appointed ones, asymmetric influence on the decision-making processes according to the size of a member country etc. Generally restricting democracy also strengthens the centralized and autocratic tendencies in managing and designing further integration developments that increase tensions and instability in the EU.

## **5. Problems of the Financial System**

The most serious problems in the relationship between the economy and the policy on all levels, but the most pronounced in the last decade in the EU include the functioning of the financial system, the euro area. Here, the predominance of the power over the economic laws is the most significant, conditioned by both long-term historical development and by the specificities of this system.

Historically, the issue of money and the financial system is linked, on the one hand, to the particular interests of the political sphere, for which the concentration of wealth in monetary form and its power of dominance has a fundamental or even existential significance. At the same time, the peculiarity of the original money exchange function has allowed, together with gradual development of trade, to turn from the form from "metallic" money into "fiat money". The connection of power with the "fiat money" has had, especially in the age of modern economics, a very contradictory effect. On the one hand, it encouraged faster economic growth, which became an economic synonym of progress and of creation of social wealth. On the other hand, the power of decision-making that does not respect economic laws (even with good intentions) has repeatedly led to crises and to destruction of wealth. Changes of the amount of money determined by the power greatly affect the functioning of the economy. That is why some authors consider the credit expansion, initiated and executed by the state, to be a decisive cause of the crisis and which was able both to predict and consistently explain the two most serious economic crises in the last hundred years.

The original intention of Keynes to regulate the amount of money according to the actual development of the economic cycle was disturbed by other elements that led to a constant increase of the money supply and caused more or less inflationary tendencies deforming real market conditions. Failure to respect elementary economic rules and their replacement by policy objectives has had serious impacts on the economic stability. Another grave problem (with even more harmful implications) is the disrespect towards own, self-created standards, rules, laws, agreements, violations and purposeful replacement in a short term by other ones. This increases destabilization of the economic system and contributes to deepening the crises and prolongs its duration.

As shown by the crisis in the Eurozone on the supranational level this can lead not only to serious economic problems but also to a threat of the integration process as such. The "quasi-positive" aspect may be considered that numerous analyses of the financial crisis and the Eurozone have revealed practical shortcomings and problems that before the crisis were considered to be only a theory (Bagus, Woods, Sinn, Gonda, Louzek). It can be summarized from analysis that the financial market is an extremely regulated market. Central banks define money supply, base interest rates; create space for unsecured lending, debt, inflation, risk of massive withdrawals of bank deposits, rescue bankrupt banks contribute to excessive cyclical fluctuations, including financial crises. As monetary-financial monopolies, by influencing money quantity, they prevent currency competition and bring fake signals to the market. The risk of such a system has increased with the break-up of the Bretton Woods Monetary System in the 1970s.

According to Gonda, financial problems are primarily a result of central distortion and the destruction of finances by government interventions, central banks and by supranational institutions. He considers the universal causes to be the creation of a system of uncovered symbolic currencies and over-funded public spending leading to growing debt. The fundamental distortion of the financial system is deepened especially by the tendency to increase the government redistribution supported by "entitlement" to public resources, various models of the welfare state, and increasing reliance on the state (Gonda, 2012).

Even on the euro level, there are the universal causes of financial system problems that are followed by other systemic causes:

- '1. The Eurozone as a currency union with a supranational monetary monopoly of fiat money,
  2. The Euro as part of European economic integration, increasingly built on centrally managed harmonization and central regulations,
  3. Monetary-fiscal institutional set-up in the EMU, in the Eurosystem and in the ECB's policy,
  4. Non-Flexible, Regulated Conditions, and Other systemic euro-causes of problems'
- (Gonda, 2012, p. 25).

## 6. Conclusion

The conclusions of the analyses (not only of the authors of the paper) are in principle calling for the necessity to reform the financial system as a main precondition for the fundamental solution to the financial and debt crisis but also for the further development of economic integration in Europe. This approach does not imply an equal or uniform view of EU reform. There are several options for EU development, in which economic decisions do not have to play a secondary role after the political ones (Navrátil, 2016). More options were presented by the European Commission in March 2017 in the Future of Europe (European Commission, 2017)

An initial common feature of this approach is the rejection of the only and the necessary solution (a “medicament for all actual problems of Europe” is an increasingly narrower and deeper integration. Increase of regulations and the growing welfare state are hampering economic growth. The euro has not become an “engine”, but rather a “brake” of prosperity. Or, the comparison of the pace of growth of the member and non-euro area countries does not show any significant differences (Riedel, 2017). The reason lies in the policy making that turned the European project into a myth.

The public choice theory emphasizes that integration is not a result of the altruism of its actors but rather the pursuit of their individual or group interests. If politicians are, under increasing public pressure, are able to change these interests into public interests, a more fundamental reform might be possible, without having to abolish the common currency (Loužek, 2017). Similarly, Bagus, favours the option to preserve the euro provided that politicians will respects economic rules preventing the changeover of the monetary union to the transfer union.

Gonda argues that external pressure in the form of serious financial shocks - inflation, depreciation of savings, and so on - can help solve problems in the euro area - together with the public pressure on politicians. This however requires also changes in the social mentality leading for instance to refusal: to live “on a debt”; a belief in a state of no failures, including issuing any quantity of money and high state expenditures. Part of the formation of the “new mentality” should be the understanding of the importance of personal freedom, responsibility, decision making and initiative, respect for property rights, competition, diversity, voluntary cooperation, solidarity, diligence, honesty, etc. that have in long term shaped the expansion of the market system. Gonda is in principle not advocating the abolition of the euro, provided that it would be exposed to market competition by other currencies.

Sinn, also accepts keeping the common currency, but only following "a cure" that involves, for example, the exit of highly indebted Eurozone countries, new Euro-system arrangements

in order to prevent debt bubbles, the creation of options and clear entry and exit rules into and from the Eurozone, bankruptcy rules for Eurozone countries (Sinn, 2016).

The authors of this paper share the view that it is less important whether one common currency or national currencies is functioning. What is more important is that the entire financial system is gradually transformed into a truly market-based economy, enabling extensive use of market regulation in the economy at national and transnational levels.

It is also not decisive today whether a supranational state entity or a system of closer relations between sovereign nation states will be created in the future. It is, however, important that further European economic integration would be set up as the formation of a system of relations, in particular, between economic actors in the market economy space and that space for natural evolution in the field of international integration would be created. Developments at the inter-subject economic level for which policy-making should create an adequate legal framework should be the decisive creator of the form and nature of economic integration as well as of its future direction.

It is needed to take into account the resistances arising from the connection of the current politico-bureaucratic apparatus, with the ever more centralized model of further integration development. The EU is a colossus that is hitting barriers and is under a constant threat of disintegration. When thinking about further developments, it is necessary to lose sight of the real meaning of the original vision of a lasting, peaceful Europe, especially in growing global turbulence. Last but not least, it is also necessary to respect the economic norms that enable the active participation of economic subjects (citizens, households, enterprises) in the formation of an effective (optimal) form of integration relations.

### **Abstract**

*The article deals with the European Union's evolution, some key issues and reasons that should be investigated for its next hopeful development and perspective future. What has been happening with the Union? Why does the Union have a hazy future? These questions are actual just now, when all Member States endeavour to discuss the EU's future and to find its most acceptable format. The weakness of these debates consists in exploring mainly some issues belonging to the Union's politico-economic superstructure, not to its value basis including decisive pillars of its existence. However, the European elite till now have not offered any vision of the future EU generally acceptable by Member States and, mainly, by their citizens. The main goal of the article is so to present a critical reaction to the mentioned problems and to submit some key open issues for debates on the future EU.*

**Key words:** *challenges to the Union, future EU, key issues for EU debates, White Paper*

**JEL Classification:** *F15, K49, P17*

### **1. Introduction**

European integration is occurring on a key crossroads of its evolution. A goal of next evolution should be the shaping and strengthening of a general and rigorously respected democratic, community and decision-making bases, and all that have to be done with active participation of European citizens. The European integration process is to be inevitably revised and shaped, first of all, with a goal to decrease democracy deficit and to reduce influences of one-sided interests of European globalist elite. This process should be so expressively improved and actually redefined to ensure again the respecting and applying of the traditional (original) principles, fundamentals and values of the successful starting and initial routing of European integration. The routing of integration must not move away the EU's citizens, but it must approach them as much as possible.

In search of a new shape of European integration, there is inevitable strictly to consider carefully also those facts that characterize and determine today's globalized world and exercise an influence on character, form and contents of very integration. These cover e.g. the bigger interconnecting of the world, diffusing the sovereignty of nation states into crisscrossing of roped state subjects and various other actors with a significant impact on international relations, the growing stronger of processes of decentralization, disintegration and regionalization of the world as a counter-balance towards globalization, or spontaneous enlargement of a catalogue of collective human rights (Hrivik, 2008).

The European Union (EU) has faced the most challenging political environment since the starting of post-war European integration by foundation of the first three European Communities (Hooghe, 2016). This includes economic consequences of the Eurozone crisis and persistently high levels of inequality, the aftermath of the largest refugee crisis since the Second World War, the running withdrawal of the United Kingdom (UK) from the EU (Brexit), and the rise of populist, radical, extremist and anti-EU parties in the EU's Member States (Stockemer, 2017) alongside a drift towards illiberal and Eurosceptic politics in Central and Eastern Europe (CEE). These issues have eroded the EU's legitimacy and solidarity, as well as the capacity and ability of Member States to build consensus on a way forward, on the Union's future.

These challenges demand those, committed to the value of European integration, to reconsider carefully the EU's routing, including what its future scope and structure should be. Such a discussion is a key component of steering the Union from crisis management to political and economic renewal. However, a prerequisite for a meaningful debate and effective responses is to understand better current public and elite attitudes to the Union, as this is the foundation upon which its future will be built (Raines et al., 2017).

## **2. Critique of the Commission's Conception of Forming the Next EU**

The Union is now mired in a deep existential crisis, and its future is very much in doubt. The symptoms are everywhere – above-mentioned Brexit, crushing levels of youth unemployment in Greece and Spain, debt of Italy (up-to 132 % GDP) and its stagnation as the third most powerful economics of the Eurozone, the rise of populist, extremist and radical movements in all Member States of the Union (Wagner, Meyer, 2017), a backlash against the euro, massive, non-regular migration and mainly against the Unitarian way of redistributing migrants (Kelemen, 2017). All these symptoms point to the need for revision of the EU's Founding Treaties in Lisbon wording, reforming and balancing relations between supranational and intergovernmental subjects of integration and for a major overhaul of the Union's institutions.

In an effort to react to these serious issues, on 1 March 2017 the Commission published its document under the name "White Paper on the Future of Europe (Reflections and Scenarios for the EU27 by 2025)". The Paper sets out the five following possible paths of the EU-27's evolution by the year of 2025 (European Commission, 2017):

1. "Carry on with the current agenda in next routing of the EU" means the Union will focus on implementing and upgrading its current reform agenda.
2. "Focus just on the EU's single market" – the Union will gradually put mind, mainly and first of all, to its supranational common internal market and corresponding policies.
3. "Allow those who want more do more" – the Union creates a space to those Member States wishing to cooperate more and deeply in some concrete spheres.
4. "Do less but more efficiently in integration evolution" – the Union will concentrate on selected spheres of some European policies in which it will act more and faster whereby in other political fields it will do less.
5. "Do much more together" – the Union will decide to act much more jointly in all European policies.

The presented White Paper pertains mainly to some EU's policies, especially their development within the frame of a supranational integrating paradigm. The document is too general, less tangible, "optimistically" tuned and unilaterally directed mainly for the needs of some main global players of the Union.

The scenarios of the EU's future development are formulated exclusively in its top floors (i.e. within the Union's superstructure). These variants so do not come from the needs of the EU's structural basis where existential symptoms of the very Union are situated. A priority issue is thus, and first of all, the today's destiny of essential ideological principles, fundamentals and characteristics on which the successful development of European integration was founded with a long-term evolutionary perspective. Here can be included in e.g. principles of general non-discrimination, transparency in commercial relations and free economic competition in a space of the supranational European market, moreover community principles of building and functioning of the European Communities and EU, universal political principles and structural law fundamentals in the present Union, individual human rights, or the functioning axioms of the Eurozone and so on. Pursuant to them, new aims, priorities or strategic documents of the EU are often formulated, which some of them belong above all to competencies of a centralized (federal) state than an integration formation (e.g. achievement of saving in taxation and social areas, respecting and applying of questionable ideologies of gender, LGBTI, political correctness and multiculturalism in decision-making and legislative processes, or an issue of shaping any common European armed forces).

The White Paper one-sidedly determines the frame and routing of following discussions on the future EU. It presents conceptions and notions formulated at the highest European political level, similarly as in a case of the failed EU Constitutional Treaty (2004). Despite an undoubted effort of the Commission to bravely meet solving some relevant issues of the Union's functioning and evolution, the Paper can be regarded as an expressive disappointment. It namely confines itself, more or less, to some selected super-structural questions of the EU, outside its structural basis where are situated fundamental pillars of the EU's existence, security, stability and solidarity which should be preferentially discussed because their weakening does not predict a promising future to the Union.

Moreover, the Commission's document sidesteps the central challenge that the EU must confront and overcome. If European democracies are to regain their welfare, economic and political dimensions of integration cannot remain out of sync. Either the political dimension catches up with economic one, or economic integration needs to be scaled back. As long as this decision is evaded, the EU will remain dysfunctional (Rodrik, [online] 2017). When confronted with this stark choice, Member States are likely to end up in different positions along the continuum of economic-political integration. This implies that the Union must develop the flexibility, decisiveness, ability of redefining of the content and forms of actual integration paradigms and feasible institutional arrangements to accommodate them. From the very beginning, the EU was first of all built on a functionalist reasoning – political integration should follow economic one.

The "dreaming" of the governmental European elite, expressed first of all in some expressively optimistic scenarios (namely in scenarios No. 4 or 5), hardly finds a major approval of Member States, first of all a major support at their citizens. The presented scenarios are nothing especial in the evolution of European integration. They appeared in the past in various forms in the effort to incorporate some sensitive political and security themes into the mainstream of economic integration. These integration initiatives were indeed unsuccessful but, on the other hand, they meant a very good source of new findings, information and experiences (Hrivik, 2013) or (Kana, Mynarzova, 2014).

The White Paper does not mention some issues being problematic for promising evolution of the EU. We can start with national egoism of some great Member States (mainly Germany and France) and their enormous impact on decision-making which are strongly present in the life of the contemporary Union. The Paper says nothing on existence of democracy deficit in the

very Union, on its reasons and removing, on problematic shaping the European identity, on hazy finality of the EU, on disintegrating phenomena and their reasons, on advantages, disadvantages and consequences of the applying of political correctness and multiculturalism being controversially perceived in many Member States (mainly in CEE) and their impact on the Union's life and its stability, and finally which cultural-civilization values, according to the Commission, should be spiritual and mental pillars for the future EU.

Moreover, in the text of the White Paper there is missing information on the possible reducing of an anomalously large-scale, still growing and, in its extent, "sick" bureaucratic centralism in Brussels. The document does not put forward any reasons and expected consequences of Brexit on the EU and its Members, any reasons of strengthening of populism, extremism, radicalism and anti-EU political movements in the contemporary Union, nor analysis of their origin. These are extraordinarily important for avoiding of further possible disintegrating the Union which is today extremely probable (Hrivík, 2017).

In the foreign-political sphere, the White Paper does not evaluate an issue of developing the Union's relations with the US after inauguration of Donald Trump as a new American President. The Commission should have clearly reacted to Trump's governmental strategy preferring the USA's bilateral contacts and negotiations with Member States to the EU as a bloc. Will the US still remain as a strategic partner for the EU like before?

### **3. Some Open Issues for Debates on the Future EU**

The EU is today caught between competing pressures along three fronts: a disconnect between the elite and public, a public that is divided over values, and the elite that lacks consensus on key issues that will shape Europe's future. Among these divisions, EU leaders are trying to steady the ship. Shows of unity in response to Brexit and more positive economic growth figures in the previous year have helped provide greater calm. There is a sense that there may now be a space for the EU to consider its long-term shape and identity in the post-Brexit period, and a process of political renewal might now supplant constant crisis management. This will require that the Union undertakes the issue of political legitimacy.

The EU may lack the intrinsic legitimacy of a nation state but it has historically sought to derive legitimacy in two ways. In the first, political legitimacy is built upon the profits and advantages that integration brings in terms of inducements and rights for citizens (sometimes named as 'output' legitimacy). In the second, political legitimacy comes from greater citizen participation in and constant oversight of the EU's decision-making through enhanced democracy, transparency and accountability (sometimes named as 'input' legitimacy). Both these approaches to the EU's legitimacy appear weak at present. Recent crises, particularly over the euro, have corroded the economic fortunes of southern Member States and have generated divergence rather than convergence between its economies and societies, undermining the sense that the Union is an engine of prosperity (Raines et al., 2017).

Some challenges do not have simple solutions. However, they are covering the important implications for the discussion about the future of the EU. The Union's politics has moved from a period in which it was mediating between an integrationist political class and an occasionally sceptical public to one in which there is a more mixed picture among the public and elite. The two greatest policy challenges of the past decade – the Eurozone and massive refugee crises – were amplified by the same issue: a partial process of integration with EMU without Fiscal Union and the removal of internal EU borders without a full-valued common EU external border. The process of integration is incomplete, but the way forwards (or even backwards) is highly contested.

While the EU's Head-office in Brussels may be convinced of the longer-term need for deeper integration (and so it is), there is no consensus among the elite about the balance of powers between the Union and Member States or about a federalist vision. In the absence of a majority view on the way forward, this creates the need and opportunity for political leadership based on a longer-term vision for the future, if there is the political space for such leadership to emerge. The improving of EU economy and the relative political stability, which after the 2017 year's elections in some Member States could perhaps descend also on Germany and France as the engines of integration, may create a once-in-a-generation opportunity for a process of political and economic renewal.

As part of this political renewal process, decision-makers and leaders within the EU should recognize the diversity of perspectives over its future. At times, the debate has been reduced to a crude binary choice between 'more' or 'less' Europe, between a loosely defined notion of deeper integration and full-blown fragmentation. But, actual development of European integration undoubtedly confirms that there is a far broader diversity of perspectives among the public and elite (Raines et al., 2017).

A European debate that does not reflect the breadth of the public's attitudes or give space to critics, and that delegitimizes opposition too quickly, will inevitably alienate many among the public and may serve to strengthen anti-EU forces rather than to undermine them. The last period has demonstrated the way the political actions of the Union can affect the very fundamentals of political life. However, its approach still often reflects 'policy without politics' where the market place of ideas, the true essence of democracy, has too often been replaced by bland consensus (Schmidt, 2010). Genuine political renewal in Europe will require a richer, broader and perhaps even a more conflicting discussion.

Strong and entrenched public anxiety over identity issues, which is increasingly merging with security concerns, is likely to increase as the EU experiences further acts of terrorism and rising rates of ethnic, cultural and religious diversity. Populist right movements will continue to find resonance among the public when they try to amplify such concerns into broader opposition towards the EU. Wider strategies could be suitable to engage more authoritarian-minded voters and to reframe debates about non-regular massive immigration in such a way as to openly discuss and better understand it (Nenicka, 2016), to impartially investigate reasons of the public's perceiving it as a cultural and security threat and, if possible, to reduce such perceptions, and, finally, to try to find the best concrete solutions for massive migration.

Over the longer term, the leadership of the EU institutions, civil society and business will have to invest far more in attempting to close the gap between their own attitudes and those of many citizens in the realm of identity politics and, specifically, immigration (Nova, 2016). For all the challenges and prevailing pessimism, the EU still has extraordinary strength. It should remain politically stable compared with much of the globe, some of its economies are among the most competitive in the world, and it has some of the healthiest, wealthiest and most equal societies. The challenge for the EU is to utilize these strengths and to build on the historic achievements of integration in a way that reflects economic needs and political realities over the coming decades. If it is to succeed and to thrive, the EU's leaders must think boldly and act quickly, prioritizing flexibility over a dogmatic access and engaging frankly with political realities as the first stage in a process of political renewal (Raines et al., 2017).

In the long term, solidarity requires not just a budget that reflects it, but also a public that believes in it. A lack of solidarity among Europeans reduces legitimacy of the EU institutions, lowers the costs that citizens will bear in pursuit of reforms and fans the flames of populist politics. But, there is a reservoir of support among the public and elite for some community or union based on solidarity.

#### 4. Conclusion

The European integration process can be successfully progressing also in this century if there will be respected original integrating and cultural-value principles, fundamentals and characteristics, which created the firm ideological basis for starting of post-war integration. Non-democratic governmental elite, carriers of ideology of political correctness and multiculturalism cannot be exclusive decisive actors of shaping this process (as we can see today). A great role will have to remain in the hands of Member States, their citizens and some legitimate European structures without external influence of those who account to none, only to themselves. Integration will probably obtain a new configuration and form, but must not lose its original sense and mission, fundamental human-rights' and citizen's features.

The Commission's White Paper should introduce a start of the decision-making process of the EU-27 on its next future. The single scenarios of expected evolution of the EU by 2025, which belong to the EU superstructure being too remote from citizens, are mutually overlapped in some cases. They are therefore neither mutually exclusive, nor exhaustive. It is assumed that the final outcome will undoubtedly look different to the way the scenarios are presented now. It can happen only at that time, if the all-European discussion will also include in itself key issues belonging to the structural basis of the Union with wide participation of European public. Only then the Union and its Member States can decide which attributes, principles and features, resulting from the discussion, should be crucial for advance in shaping the future stable, secure and prosperous EU, evidently in the general interest of European citizens. Alternatively, will some Member States make decision to leave the Union and so to follow a case of the UK?

Challenges, the EU must face today, have frequently generated divisive narratives between Member States on the known cleavages: north versus south, east versus west, creditors versus debtors. However, the importance and significance of the divide among different groups within the public are principally driven by differing conceptions of identity and community. If such a crucial fault line in the EU runs not between Member States but within them, this has important implications for how those who wish to strengthen the EU should respond.

One implication is that strategies for future European relations, that emphasize a differentiated way of integration among Member States in a 'multi-speed' system, do not reflect this fault line which cuts across the continent (Navratil, 2016). This suggests the need for a flexible approach to future integration that is built on more than one EU's hard-core and periphery. Secondly, it suggests such attitudes are unlikely to be changed solely by an improvement in economic status. Those, who wish to bolster a public support for the EU, cannot focus only on improving the economic experiences of the disadvantaged in society. The rise of Eurosceptic movements during previous periods of relative economic stability and growth should serve as a powerful reminder of the way in which perceptions of unfairness and relative deprivation are not always influenced by the immediate environment.

## **Abstract**

*In the context of European integration, the competitiveness of EU companies is very important due to the dynamics of international developments. The economic freedom index is one of the most important indexes on the basis of which the global economies are ranked, assessing the 12 measures of economic freedom (divided into four main categories) and grouping the countries according to the best conditions for the development of enterprises (defining them as liberal economies), then good, average and those that are completely non-marketable (illiberal) and do not create opportunities for growth for their businesses. The aim of the article is to classify the 28 EU countries into individual groups and to characterize them in comparison to the five countries of the world that create the best and worst development conditions for their businesses. The article was developed on the basis of the latest report (data from 2018) published for 24 years by The Heritage Foundation, assessing 186 countries in the world.*

**Keywords:** competitiveness, economic freedom index, European integration, ranking, UE

**JEL Classification:** M21, O17, F50

## **1. Introduction**

One of the most important sources of data used to create the Index of the Economic Freedom is the Report by the World Economic Forum, where the authors present a ranking of countries on the basis of the Growth Competitiveness Index (GCI). It assesses the countries according to the business-friendly climate, from the most to the least friendly ones. The evaluation is carried out in 10 areas (The Global..., 2018, pp.317-325). Apart from the GCI indicator, the World Economic Forum also publishes the Business Competitiveness Index (BCI), taking into account the quality of the national business environment as well as business activities and strategies. The final classification is based on the weighted sum of the resultant and the factorial measurement indicators. Another source of data are the reports published by the International Institute for Management Development (IMD), entitled "World Competitiveness Yearbook". They assess the competitiveness of each country. The main criteria taken into account are as follows: economic growth, price level, public finances, fiscal policy, business efficiency and others. It also uses the ranking of attractiveness, i.e. the Global Services Location Index. It assesses the tendency of investors to locate business services in these countries. The index includes over 40 indicators that compare financial attractiveness, employee competencies and business environment. It also uses data from many other institutions from every country, such as statistical offices, particular ministries and the police. Due to the fact that the Economic Freedom Index for the final assessment uses data from the significant research centres, in my opinion, it can be considered as one of the best sources of

information on individual countries in terms of their competitiveness and creating conditions for the business area. The aim of the paper is to classify the 28 EU countries into individual groups and to characterize them against those countries in the world that create the best and the worst development conditions for their businesses. The article was developed on the basis of the latest report (data from 2018) published by The Heritage Foundation, assessing 186 countries and analyzing scientific articles addressing this issue.

The assessment of the competitiveness of enterprises from the point of view of their ability to engage in economic activities is very important both for the individual countries involved and for potential foreign investors. The literature assesses competitiveness at various angles, e.g. business services (Wyszkowska-Kuna, 2016), or the promotion of competitiveness through ICT (Zoroja, 2015); it can also be seen in terms of green environmental competitiveness (Kasztelan, 2016). Thus, the definition of the competitiveness itself (Voinescu 2015, Stankiewicz 2005, Olczyk 2008, Flak, Głód 2009) and the ways of measuring it (Misala 2011, Karol 2013, Borowski 2014) were presented in many scientific articles. In view of the limited volume framework of this article, they are not presented here in full. In general it can be said that the European Commission in its reports understands competitiveness as a "*sustainable increase in the standard of living in the country or region, at the lowest possible level of involuntary unemployment (...); with regard to industrial sectors - preservation and improvement of their position in the global market*" (Kotyński 2008).

From the point of view of global economies and companies already operating or wishing to operate, the ranking allows for:

- assessing, among others: normative acts (laws, regulations, recommendations) regarding business activities and comparing them with those in other countries,
- assessing their position over several years and thus assessing the direction of occurring changes,
- taking advantage of the experience and proven solutions of countries where the situation is better,
- making changes that will be beneficial for both the economy and the potential domestic and foreign investors.

### ***1.1 Economic Freedom Index - the Construction of the Index***

The Economic Freedom Index has been published annually (for over 24 years) by The Heritage Foundation. The latest one was published in February 2018. It examines the development of economic policies in 186 countries, which were classified according to 12 measures of economic freedom grouped in the main four categories, as follows (Miller 2018, pp.452-467):

- legal regulations (protection of property rights, judicial effectiveness, reliability of the government measured by the magnitude of corruption),
- government interventions (tax burden, government expenditure, budgetary deficit status),
- effectiveness of legal regulations (freedom to conduct business, employment, the stability and control of monetary policy),
- openness of the market (trade policy, foreign policy, financial policy).

The country's final result and its ranking is the average value of the twelve economic freedoms, but an important element in the construction of the indicator is that each of the twelve freedoms is attributed equal importance and is then drawn to the average.

The construction of the entire index (Karateev, 2017, Ott 2018) was developed on the basis of data published by all major global institutes and research centres such as the World Economic Forum, the World Bank, Eurostat data, International Monetary Fund, government publications of each country. Each of the 12 economic freedoms is assessed on the scale from 0 to 100, and so:

- for liberal economies (free) the economic freedom index is in the range of 80-100,
- for rather liberal economies (mostly free) the index is in the range of 70-79.9,
- for medium-liberal economies (moderately free) the index is between 60-69.9,
- for rather illiberal economies (mostly non-free) the index is between 50-59.9,
- for illiberal economies (repressed) the index is between 0-49.9.

However, in six countries (Iraq, Libya, Lichtenstein, Somalia, Syria, Yemen) an overall assessment was not made due to the unavailability of relevant statistics concerning all aspects of the economy (no precise data in several of the twelve areas). Obviously, it is difficult to talk about the competitiveness of the economies in the countries engaged in civil wars.

## **2. Economic Freedom in the Most and Least Competitive Economies**

Of all 186 countries, the group of the most liberal economies, and thus posing the world's best conditions for the development of economic operators, includes six countries, i.e. Hong Kong, Singapore, New Zealand, Switzerland, Australia and Ireland. Hong Kong is ranked the top place and its score is 90.2. It is considered the most liberal and at the same time the most competitive country all over the world, despite the fact, that only 10 years ago, the competitiveness of Hong Kong was questioned (Thompson 2004). There are 7.4 million people living in this country; the average economic growth over the past five years was 2.4%; unemployment remained at 3.4%, inflation at 2.6%, and GDP per capita was just over 58000 USD. It is worth noting that the public debt in relation to GDP was 0.1% and is thus more than 540 times lower than in Poland. Such good economic indicators are the result from multi-annual actions undertaken systematically by the government. Corruption is not tolerated in that country, the protection of private property rights is of great importance, also for businesses, providing them with appropriate conditions for development through the creation of among others, transparent rules for start-ups, as well as efficient judiciary to ensure swift enforcement of contracts and litigation. This, at the same time at low taxes (15% of natural persons and up to 16.5% of legal persons) allows for creating excellent conditions, which are reflected in high development of the country and thus its economy is the most competitive in the whole world (Miller, 2018, pp.214-215).

Singapore is ranked 2nd, which has about 1.8 million inhabitants less than Hong Kong, and its overall rating is 88.8. Like Hong Kong, it creates a stable political and legal environment that forms the basis for entrepreneurial development and competitiveness. The process of setting up a business is transparent and does not require equity. In 2015, Singapore was ranked 1st in terms of contract enforcement effectiveness. Such a policy influences the country's macroeconomic indicators. The average economic growth over the past five years was 3.3%, unemployment remained at a lower level as in Hong Kong (1.8%), while the GDP per capita was 29 thousand USD higher than in Hong Kong. Trade policy also plays an important role, as the total export and import value was 318% of GDP (Miller, 2018, pp. 27, 38, 368-369).

New Zealand is ranked 3rd by achieving a total rating of 84.2. There are 4 million people living in this country and unemployment is 5.2%. On the other hand, 2.9% of the average economic growth over the last five years is a reflection of the stability of the economy, where a strong emphasis is put on monetary policy, property rights, and the fight against corruption. In 2016,

New Zealand was ranked 1st in terms of the index of corruption, aiming to create a transparent, competitive and free-of-corruption public procurement system. Taxes in this country are twice as high as in Hong Kong, while public debt in relation to GDP is less than 30%, and thus the amount of tax is close to the value in EU countries, significantly deviating from Hong Kong and Singapore. Economic activity and business environment are the most competitive (indicator was 91.5) in the world thanks to the high flexibility of legal regulations and protection of property rights (the indicator was 95.1). The total value of trade policy in relation to GDP is almost six times lower than in Singapore. The main reason for this may be the amount of duty rates, where the average rate was 1.3%, while in Hong Kong and Singapore there were zero rates. (Miller, 2018, pp.27, 38, 314-315)

Switzerland is ranked 4th, being part of liberal economies, and achieving a comprehensive assessment of 81.7. The country is inhabited by 8.3 million people, GDP per capita was 59 thousand USD, and unemployment was 4.6%. The average economic growth was 1.4% over the last five years. A well-functioning system of institutional environment, including, above all, a lack of corruption (first place in the world), a fair judicial system, effectiveness of business rules, and also solving problems addressed to courts, all these result in high competitiveness of the economy and businesses operating there. Trade is important for the Swiss economy and the total value of exports and imports equals 114% of GDP, so it belongs to economies open to investment and trade, thus creating favorable conditions for business competitiveness. (Miller, 2018, pp.46, 392-393)

The fifth most liberal country in the world is Australia obtaining an overall assessment of 80.9. This country, compared with the four previous ones, is inhabited by the largest population of just over 24 million people. Australia is one of the richest countries of Asia and the Pacific. Australian legal environment (including business start-up rules) is relatively transparent and has a positive impact on the development of entrepreneurship. However, there are high tax rates in the country (maximum personal income tax rate is 45%, and corporate income tax rate is 30%), which also has an impact on trade (the total import and export value amounted to 40% of GDP). (Miller, 2018, pp. 27, 38, 84,85)

The last sixth country that creates the best conditions for business development is Ireland, which is the only one from EU countries in this range. The overall rate is slightly higher than the lower limit for this range (80.4), which allows for taking the sixth place in the world ranking. The result obtained here exceeds the regional average. Despite the relatively high public debt in relation to GDP (6.4%), this country is attractive for businesses primarily because of the lowest taxes (maximum tax rate for enterprises is 12.5%). Trade policy also plays an important role as the total export and import value is 217% of GDP. (Miller, 2018, pp. 46, 228-229)

The country that has obtained the lowest number of points in the world ranking and is regarded as a wholly illiberal economy is North Korea (with overall rating of 4.9) and thus occupies the 180th position in the world. This country is irredeemable and closed, maintaining an absolute regime and resistant to all economic reforms. There is no private property in this country, and everything is controlled by the government. The judicial authority does not exist, and corruption is commonplace. International trade and investments are also fully controlled by the government. (Miller, 2018, pp. 142-143).

Among the countries considered to be wholly illiberal (apart from North Korea) and thus considered to be non-competitive, there are 20 countries (ranked between 160th and 180th place in the world), achieving an overall assessment within the range between 40 and 49.9 points. These countries are, among others, as follows: Sudan, Chad, Angola, Algeria, Ecuador, Turkmenistan, Mozambique, Bolivia, Cuba, Venezuela and Zimbabwe. These are the

countries where legal regulations are ineffective (there is no transparency of rules), there is a high rate of corruption, no judicial independence, excessive bureaucracy is encountered and difficult access to external financing for business operators. These factors, combined with incoherent systems, hamper the development of entrepreneurship. The dictatorship and state control influence the inefficiency of economies and thus their competitiveness on the international stage.

### 3. Economic Freedom in EU Countries

The impact on the final assessment in the ranking of EU countries and thus the competitiveness of economic operators pursuing their business activities there, is related to the economic data of individual countries, which means among others: population, average economic growth over the last five years, public debt, unemployment and GDP per capita. In terms of population, Malta, Luxembourg, Cyprus and Estonia are the smallest, with a population of 0.4 to 1.3 million. In five countries (Latvia, Slovenia, Lithuania, Ireland) the population is between 2 and 5 million. In the next seven countries (Slovakia, Finland, Denmark, Bulgaria, Austria, Hungary and Sweden), the population is between 5 and 10 million people. 10 to 20 million people live in six countries: Portugal, Czech Republic, Greece, Belgium, the Netherlands and Romania. In the next range there are two countries: Poland and Spain (38 and 46.3 million people respectively). In Italy, France, and the United Kingdom there are between 60 and 67 million inhabitants. The largest population live in Germany - about 82.7 million people.

With regard to the next indicator of average economic growth (in percentage terms) over the last five years, there is a significant link between economic freedom and economic growth in EU countries. (Kacprzyk 2016). The highest growth was reported in Ireland - i.e. 8%, while Malta with 5.6% was ranked 2nd. In three countries (Lithuania, Romania and Luxembourg), there was also relatively high economic growth in the last five years, ranging from 3 to 3.3%. In the following six EU countries (UK, Sweden, Estonia, Slovakia, Poland, Latvia), the economic growth was from 2.1 to 2.7%. In the following five countries (Denmark, Germany, Czech Republic, Bulgaria, Hungary), the growth varied from 1.1 to 1.9%. In seven other countries (Croatia, Spain France, Austria, the Netherlands, Belgium), the growth was at a low level of 0.1-0.9%. In five other countries, however, it was negative, which means that the economies of these countries and their competitiveness compared to previous years have fallen. The largest decrease has been reported in Greece (-2.1% during the last five years), which among the EU countries located in the last place regarding the economic freedom index and has been recognized as a rather non-liberal economy, not aiming at the development of business. Other economic indicators in Greece were also at low levels. The country has also the highest unemployment rate (about 24%) and a poor state of public finances which is reflected by the public debt of slightly over 180% in relation to GDP. Negative economic growth over the last five years has been reported in Cyprus (-1.2%), in Italy (-0.6%), and also in Portugal (-0.2%), which has a direct impact on the state of public finances (public debt in relation to GDP was between 108 and 133%). Unemployment in these countries is approximately 11.5%.

An important measure is public debt (Law of 2009), which, as defined in the Public Finance Act, shows the total nominal debt of the public finance sector in the financial market (including banking). Public debt can be expressed in nominal values (the amount of total liabilities) or in relation to the value of gross domestic product. Consequently, its amount in relation to GDP is one of the measures used to assess the country's credibility on the international stage and thus has a significant impact on its competitiveness, trade, investments. It should be noted that in 2011, due to the European Commission's decision, the member states have been required to

report the amount of debt and public deficit according to standardized calculation method, which was aimed at reducing the impact of various fiscal procedures used to conceal them. The relatively high public debt related to GDP was observed in eight EU countries (Spain, France, UK, Croatia, Austria, Slovenia, Ireland, Hungary). In the following six countries (Germany, Finland, the Netherlands, Malta, Poland and Slovakia), the debt was 52-68%. Countries such as Sweden, Lithuania, Denmark, Romania, Czech Republic, Latvia have a relatively low public debt in relation to GDP (between 34-41%). The best public finance situation occurred in Bulgaria, Luxembourg and Estonia (respectively: 27.8%, 22.6%, 9.5%).

An important economic indicator reflecting the economic situation in the country concerned and thus its competitiveness is GDP per capita. Because it takes into account that GDP in its entirety does not reflect the actual situation of the economy, but GDP per capita is far more precise. In ten EU countries (Bulgaria, Romania, Croatia, Latvia, Greece, Hungary, Poland, Portugal, Estonia, Lithuania) GDP per capita was within 20-30 thousand USD, and so it was the lowest. For the seven countries (Slovakia, Slovenia, Czech Republic, Cyprus, Spain, Italy and Malta) it was between 31-39 thousand USD. In this respect, Finland, France, UK, Belgium, Denmark, Austria, Germany, Sweden, the Netherlands, with GDP per capita between 42 and 51 thousand USD are favorably placed. By far the highest GDP in relation to population occurred in Luxembourg (i.e. 104 thousand USD), which ranked 14th in the global ranking of economic freedoms, and in Ireland, which was found on the 6th place in the world (GDP per capita 69 thousand USD) and in the first place among the EU countries and as the only one has been included in very liberal economies and thus friendly and competitive for businesses and business environment.

From the point of view of the country's attractiveness in terms of economic activities, the freedom to conduct a business is primarily taken into account (by evaluating in this respect the transparency of legislation for companies) and employability of employees. The business freedom index in all EU countries was within 58-92.5%. Nine EU countries were in the lowest range between 58 and 69% (Croatia, Hungary, Slovakia, Malta, Bulgaria, Romania, Spain, Poland, Luxembourg). Countries such as Italy, Czech Republic, Lithuania, Greece, Austria, Estonia, Cyprus, Slovenia were within the limit of 70-79%. Very good and transparent business rules have occurred in Latvia, France, the Netherlands, Belgium, Ireland, Portugal, Germany, Sweden and Finland (the indicator between 80-90). The most business-friendly environment and the highest rate of freedom to conduct business have been observed in Denmark and the UK (respectively: 92.5%, 91.1%); in these countries it is also the easiest to find a suitably qualified workforce.

In view of the diversity of economies of the analyzed EU countries, a number of conclusions emerge from the table 1, and among the most important ones are:

- In the 2018 ranking, 12 EU countries were classified as rather liberal economies (mostly free); the overall score was between 70-79.9, and two of them (UK and Estonia) ranked the top ten in the world.
- The rather non-liberal economies include Greece, which has thus been in the last position among the EU countries. As the most liberal economy, Ireland was recognized as the only EU country to be in the highest range.
- Moderately liberal economies include 14 EU countries (range 60-69), Poland included.
- Having regard to the country's position in the world, there are three EU countries in the top ten: Ireland, Estonia and the United Kingdom.

**Table1: Economic Freedom Index - The Country's Overall Result and its Position in the World According to the 2018 Ranking**

Country	Overall score	Word rank	Country	Overall score	Word rank
80-100					
Ireland	80.4	6			
70-79.9					
Austria	71.8	32	Luxemburg	76.4	14
Czech Republic	74.2	24	Latvia	73.6	18
Denmark	76.6	12	Netherlands	76.2	17
Estonia	78.8	7	Germany	74.2	25
Finland	74.1	26	Sweden	76.3	15
Lithuania	75.3	19	United Kingdom	78.0	8
60-69.9					
Belgium	67.5	52	Poland	68.5	45
Bulgaria	68.3	47	Portugal	63.4	72
Cyprus	67.8	48	Romania	69.4	37
France	63.9	71	Slovakia	65.3	59
Spain	65.1	60	Hungary	66.7	55
Malta	68.5	46	Italy	62.5	79
Croatia	61.0	92	Slovenia	64.8	64
50-59.9					
Greece	57.3	115

#### 4. Conclusion

The competitiveness of EU companies varies greatly and depends on the many factors assigned to each country in which they operate. These are geographical measures such as the country area, may not be able geographical location, soil type, and access to areas rich in natural resources. There are also economic measures such as GDP, public debt, economic growth, and the unemployment rate. Cultural ones, which are not measurable, but have an impact on the competitiveness of businesses, also play an important role. The construction of the Economic Freedom Index allows for the classification of countries from the point of view of their attractiveness in the business area, and therefore influences business competitiveness. According to the last ranking published in February 2018, Ireland is the most liberal economy and thus creates the best conditions for business development among the EU countries. It is ranked 6th in the world, earning a total of 80.4 points. Further research is needed in the area of competitiveness and its impact on companies operating in the EU.

### **Abstract**

*Since centralization and outsourcing of business services is a globally growing trend, this industry has enormous potential. Business Services Centres (BSC) is considered to be a model in the European Union that leads to improved performance and results achieved by the company. Within the framework of EU free trade, up to 70% of European centres state that standardization and process transformation is the first corner in deciding to set up the BSC. The aim of the article is the market evaluation of business service centres in the Slovak Republic and their impact on employment. The competitive advantage of Slovakia lies above all in economic and political stability, geographic location, skilled workforce and European currency. Thanks to positive business experiences in Slovakia, most investors remain and large numbers of them are expanding their activities. Based on the use of quantitative methods, we analyse secondary data on business service centres. Higher education graduates are often the main source of workforce for business service centres.*

**Keywords:** Business Process Outsourcing (BPO), Business Service Centre (BSC), employment EU free trade, Shared Service Centre (SSC)

**JEL Classification:** F23, M21, O31

### **1. Introduction**

Trade liberalisation within the European Union and globalisation of the world economy together with easier access to foreign markets leads companies to enhance the efficiency of their management activities and centralise the processes. This led in the 80s of the last century to the establishment of the first business service centres. The first business service centre outside its region was opened by IBM in India in 1998.

The business service centres (BSC) are defined as branches of foreign or domestic companies performing services for their mother and sister companies, and/or for third parties. Most commonly it concerns the area of finances, IT services, customer services, purchase, human resource support, sales and others (Skorková, Tarišková, 2017). Depending on who the client of BSC is, we distinguish the following BSCs:

- Shared service centres - they perform specific in-house processes and hereby provide support to mother and sister organisations.
- Centres of Business Process Outsourcing - these companies provide services in the field of company processes for third parties.

From the aspect of functioning, these two types are very similar - in both cases centralisation of the in-house processes takes place, aimed at their standardisation and increase of efficiency. The basic difference from the aspect of employees is that while in the shared service centres

each of the activities are directly performed by the employees of the given company, in centres for external service provision the employees perform these activities for their client - a third party.

Kislingerová (2008) defines the shared service centre as a special unit, an internal outsourcing centre, which takes over the joint activities from other branches, and/or companies within the group or region, with the aim to optimise and formalise the process of their solving. Andrišin (2015) sees the shared service centre as a specialised company branch that assumes and performs additional operating activities in order to achieve their standardisation, simplification, higher efficiency and lower costs.

According to Bergeron (2002) shared services is a collaborative strategy in which a subset of existing business functions are concentrated in a new, semiautonomous, business unit that has a management structure designed to promote; efficiency, value generation, cost savings and improved service for internal customers of the parent corporation, like a business competing in the open market.

Tammel (2017) points out the importance of the BSC in reducing the costs of the parent company and the affiliated companies. Since centralisation and outsourcing of corporate services is a globally growing trend, this sector has an enormous potential. Recently the model of these activities has been changing within the European Union. In the past, the main motive for providing such services was exclusively cost reduction. However, lately a new model has been formed leading to improved efficiency and results achieved by the company. Process standardisation and transformation take the first place when making a decision on opening a BSC. The cost reduction factor seems to come only on the second place.

Rothwell, Herbert, Seal (2011) joins BSC with professional employability and professional carriers. On an example, he says that companies are setting up a BSC among other things, where there are enough workers with professional qualification.

Maatman, Meijering (2017) shown that the consolidated dynamic capabilities of a BSC are also positively related to service value through improving its operational capabilities. Using of formal control mechanisms by the business units positively contributes to shared service value through their capacity to institute the use of informal control mechanisms.

Slusarczyk (2017) states the multitasking is also the characteristic feature of these centres- in the majority of entities the processes connected with more than one area are realised. It causes that the units that are located in the central Europe are able to provide services for their clients in a more complex manner.

Central Europe is European sub-region with a non-accurate demarcation geographical, and geopolitical. There is some construction historical affected the specific distribution of political power. Centre of Europe forms are logically buffer belt between the western and eastern parts of Europe, in the geographical context, between the West and the East in political and institutional terms. Also, the economic characteristics of the Central European countries were and are still some transition between the western prosperity and eastern poverty by mainly contrast in the performance of the economies, labour productivity, and qualification structure of the labour force. The Region of Central Europe is defined flexible depending not only on the geographical affiliation, but often they are rather historical reminiscences, institutional, political, and economic parameters connecting the different states of this part of Europe (Kučerová, 2016).

## 2. Problem Formulation and Methodology

The aim of the article is the market evaluation of business service centres in the Slovak Republic and their impact on employment. Based on using quantitative methods in the article, we analyse the secondary BSC data in Slovakia from the aspect of their number, structure, and number of employees. The secondary data was for 2016. At the end, we would like to draw attention to the benefits of BSC for the economy of the Slovak Republic.

## 3. Business Service Centres in Region V4

Among European countries, countries like Ireland, Poland, Czech Republic and Slovakia are attractive for BSCs. The Czech Republic is immediately after Poland the second biggest market for BSCs in the region of Central and Eastern Europe (Figure 1).

**Figure 1: BSC Number in V4 Countries in 2016**

Source: Grafton recruitment, own elaboration

The advantage of these countries is not only their geographical position but also concentration of educated and multilingual employees. Figure 2 shows the number of employees in BSCs in V4. The most centres with the highest number of employees were established in Poland, which may be related to the lowest wage costs.

**Figure 2: Number of Employees in BSC in V4 Countries in 2016**

Source: Grafton recruitment, own elaboration

Table 1 shows us the total costs of labour in a position with a salary of EUR 1,000. The best position from the V4 countries has Poland with salary cost only 22%. Second position belongs to Hungary with salary cost higher by 6.5 % than in Poland, follow Slovakia 33.0% and Czech Republic 34.0%.

**Table 1: Total Cost of Labour for Positions with a Salary of 1000€ in 2016**

Country	Salary cost in %	Cost of labour
<b>Poland</b>	22.0	1220
<b>Czech republic</b>	34.0	1340
<b>Hungary</b>	28.5	1285
<b>Slovakia</b>	33.0	1330

Source: own elaboration

V4 countries, which lie at the middle of Europe, have become the most attractive destinations for many business subjects thanks to its advantageous geographic location, foreign investment incentives and transport infrastructure. Language skills are a competitive advantage for all job seeker. Business services centres request candidates for job with various language combinations, English is considered a matter of course.

#### **4. Business Service Centres in Slovakia**

Nowadays multinational corporations already form an inseparable part of the Slovak economy. Apart from the direct impact on employment and GDP, foreign companies also indirectly develop the Slovak economy. A large number of small and medium enterprises are connected to these companies. Another positive externality is that foreign investors act as role models of business options in Slovakia for other companies from their home country. The competitive advantage of Slovakia consists mainly in economic and political stability, geographical location, qualified labour and common European currency.

An important part of foreign direct investments in Slovakia is represented by BSCs. They are branches of foreign or Slovak companies performing in-house services for their mothers and sister companies, or for third parties in different areas. The most common areas include finances, IT services, customer services, human resource support, purchase, sale and others. In the future, we can probably expect an increase in these activities, mainly in the field of cybersecurity, logistics, banking and insurance processes and others.

The majority of BSCs is based on young, educated and linguistically competent labour that Slovakia has owing to its 35 higher education establishments. As shown by survey conducted by the Grafton recruitment agency, the most wanted candidates are graduates from economic and language faculties, since the most of the job positions are part of providing support to the branches abroad.

The wide network of higher education establishments in Slovakia is a part of the European area of higher education. We have 35 higher education establishments in Slovakia, out of that 20 public ones, 3 state ones and 12 private ones. Higher education establishments in Slovakia offer professional studies in the following areas:

- Economy, management and law
- Human and social sciences

- Technology
- Health care and veterinary education
- Agriculture
- Culture and art
- Catholic school
- Safety, policy force

Figure 3 shows the number of students according to field of study. The most students study human and social sciences, followed by technical education, economy, management, law, and others.

**Figure 3: Number of Students According to Field of Study in Slovak Republic in 2016**

Source: portalvs.sk

At the moment, BSC centres in Slovakia grow at a rate of 70% to 80% representing the growth of the already existing centres, and the remaining 20% represent newly established BSCs. More than 30,000 people are employed at business centres. The distribution of BSC market in Slovakia is not proportional (Figure 4) even if for the past few years the appetite of investors to establish their business centres also in other regions of Slovakia not only in the capital has been on the rise. 78% of all BSC employees work in Bratislava. There are only five BSCs in the Eastern Slovakia region but from the number of employees working there, it represents 17%. When compared with a study from 2014, the number of employees increased in the sector by 5,000 representing an approximate 10% year-to-year growth.

**Figure 4: Number of Business Service Centres in Regions of Slovakia in 2016**

Source: Grafton, own elaboration

Based on the survey conducted by the Business Service Centre Forum (BSCF), more than 71% of BSC employees have university education and more than 95% of them use English or German at work. Other languages, such as Italian, French, Spanish, Dutch, and Hungarian are also used. 90% of the BSC employees are citizens of the Slovak Republic, which is in contrast with the Czech Republic, where in some BSCs more than 60% of the employees are foreigners. The average age of employees is 33 years. From the gender perspective, the BSC sector has a balanced structure (48% women) and at the same time also enables women to hold managerial positions (40% are women), as well as find employment in technical fields. Flexible employment forms highly contribute to the balanced gender structure.

As presented by the results of the survey conducted by the Grafton recruitment agency, the wages at BSCs rank, depending on the region and the job position, from EUR 700 (specialist of telesales in Prešov) up to a BSC director from EUR 4,000 to EUR 10,000. Customer services have the highest share in the activities of the Slovak BSCs. In this field the salaries and wages rank from at least EUR 650 in Back Office specialist position in Žilina up to a maximum of EUR 1,200 in Bratislava. The salary in the Customer Operations Manager position starts from the minimum of EUR 1,500 in Žilina up to a maximum of EUR 3,200 in Bratislava. The average salary in BSCs achieves almost the double of the average salary in Slovakia.

BSCs are evidently very attractive not only for graduates, but also experienced workers, who would like to use their professional and language skills and acquire experience within an international environment. Grafton's survey shows that 68% job seekers speak English, up to 17% English and German, 8% of seekers speak English and French, 7% English and Spanish, 6% English and Italian, while 2% of the total number of seekers speak a combination of English and Russian. Except English an additional European language at fluent level is frequently expected by BSCs. The most desirable are German, French, Italian and Dutch. Up to 46% of job applicants speak at least one foreign language at level B2, with 18% achieving level B1 language skills, which is enough to manage in-house communication or instruction in English. However, it is quite alarming that there is data declaring that only 4% of candidates speak a foreign language at fluent level C2.

#### ***4.1 The Biggest Benefits of BSC for the Slovak Economy***

The Business Service Centres have significant advantages for the Slovak Economy. It increases stability and add value of the existing foreign investments. BSCs support of non-industrial economy with a higher added value. It brings increasing of professional employment in the regions. BSCs increase employment of young people, efficient re-qualification of graduates and continuous education of employees. BSCs represent an alternative to working abroad.

On the other hand, BSCs currently start to struggle with increasing unavailability of free workforce with suitable soft and hard skills, high quality language skills and different language combinations. The lack of suitable workforce is also related to the fluctuation of employees and with the problem to maintain them.

## 5. Conclusion

BSCs represent a significant part of the Slovak economy. The Slovak Republic supports the position of BSCs. Currently there are already two forms of aid that they can exploit, and that is investment aid and programmes for foreign investor support. One of the main reasons why BSCs come to Slovakia is the qualified workforce. With the increasing number of BSCs and the increasing competition in the region of Central and Eastern Europe, as well as on the global scale, it is necessary to ensure maintaining this competitive advantage and take appropriate measures. It is essential to align the labour market with the supply and contents of school subjects - to put emphasis on teaching business, digital and soft skills at all levels of the educational system. Working in Business Service Centres is very interesting due to specialization and language options. In the future, we can see how the number of centres in Slovak republic is changing and whether there is an increasing interest in working in these centres.

### **Abstract**

*State aid for enterprises is applied in the European Union as derogation from a rule of creating equal opportunities for starting and running a business in the Single European Market. The rules of State interventionism in the economy has been defined precisely in this field and they tend to seek a compromise between the position of the European Commission and the position of the Member State concerned with the admissibility of State aid. Economic activity consisting in running a community pharmacy is in Poland subject to strict regulation of the Act of 6 September 2001 on Pharmaceutical Law. With the aim of increasing the standard of pharmaceutical services in 2017 the legislator made significant changes in the rules of undertaking the above-mentioned activity. Pharmacy activity is most often carried out by enterprises classified into the group of small and medium-sized enterprises (SMEs). The subject of the article is to define a pharmacy as an SMEs group enterprises and to analyze available forms of State aid for this group of enterprises.*

**Keywords:** *competition policy, European Union, pharmacy activity, SMEs, State aid*

**JEL Classification:** *E62, K20, K32, K33*

### **1. Introduction**

State aid for enterprises is applied in the European Union as derogation from a rule of creating equal opportunities for starting and running a business in the Single European Market. The rules of state interventionism in the economy has been defined precisely in this field and they tend to seek a compromise between the position of the European Commission and the position of the Member State concerned with the admissibility of State aid. These rules, on the one hand, prohibit providing State aid so as not to lead to distortions of competition in the market of integrating countries, while on the other hand, they allow for providing the aid by public authorities in order to correct the imbalance in development between regions, stimulate or accelerate necessary changes and development of certain sectors of the economy.

From the economic point of view relating to State interventionism it ought to be noted that State aid can be a justified action mainly because of the social prosperity if free competition market mechanism does not bring satisfactory results (Mause and Gröteke, 2017). In this case, a well-planned State intervention may improve the allocation of production factors, reduce the irregularity in the market functioning and enable the achievement of common interest. The

major criterion for providing State aid should be rationality, which is the highest determinant of the admissibility of using the aid measures. It results from the fact that in a market economy the competition is essential for the proper functioning of the market and protecting the interests of its participants. State aid should not violate it unless its violation will be compensated by positive market phenomena that were caused by providing the aid (Nicolaidis, 2013). With the use of the aid instrument the State realizes the objectives that are considered a priority for socioeconomic development (Veebel, Ploom and Kulu, 2015).

In the provisions of EU competition law, the concept of an enterprise includes two elements, i.e. the subjective element (enterprise unit) and the objective element (conducting business activity). These elements make up the uniform, subject-object concept of the enterprise. A necessary condition, defining the concept of an enterprise in the context of EU state aid law is, therefore, to have legal capacity that allows for the performance of assets-disposing and liabilities-creating legal acts without which it is not possible to conduct business activity (Botta and Schwellnus, 2015). Economic activity consisting in running a community pharmacy is in Poland subject to strict regulation of the Act of 6 September 2001 on Pharmaceutical Law. With the aim of increasing the standard of pharmaceutical services in 2017 the legislator made significant changes in the rules of undertaking the above-mentioned activity, including limiting the catalogue of permissible forms of conducting it, excluding among others undertaking the pharmacy activity in the form of capital companies and binding it with the personal financial liability of the entrepreneur.

The aim of the article is to present the possibilities of financing the activities of pharmacies in Poland in the light of legislative changes concerning the principles of undertaking pharmacy activities from the perspective of the admissibility of State aid for the sector of small and medium-sized enterprises (SMEs) in the European Union.

### ***1.1 The Admissibility of State Aid in the European Union***

Legal regulation of the issue of State aid is an element of protection of the mechanism of competition, which has been recognized in the Treaty on the Functioning of the European Union (TFEU, OJ 2012 C 326/1) as one of the basic tools for the realization of the tasks assigned in it. The general prohibition of providing state aid has been formulated in Article 107 par. 1 TFEU, whereas this provision does not specify the definition of State aid, but indicates the criteria taken into account when assessing the specific actual circumstances. These criteria were formulated in the catalogues of terms defining State aid, i.e. the origin from the State or from State resources, selectivity, economic advantage to the beneficiary or beneficiaries of the aid and the disruption or threat to distort competition and affecting the trade between Member States. The primary objective pursued by the precise determination of the means which form State aid is not establishing an absolute prohibition on their use, but only a selection of the action circle which is subject to testing for their possible negative impact on competition in the Internal market level. Further study mostly comes down to the analysis if the binding specific provisions of the European law allow for providing State aid in the given case (Podsiadło, 2016).

The criterion for determining the prohibited aid is a public quality of the funds provided. The Court of Justice in its judgment on *Steinike & Weinlig* indicates that the concept of State resources contains the funds financed by the burdens imposed statutory, managed and distributed on the legally regulated basis, even if the administration of such funds is done by the private entities and separate from the structures of public administration (Case: 78-76). Also, the forms which involve increasing the benefits can be optional, as they depend on the rules applicable in the Member States. Treaties and secondary legislation do not contain the

catalogue or examples of forms of aid, limiting itself merely to stating that the form can be optional (Case: 234/84, para 13). It results from the broad definition of State organs that may provide State aid, as well as the overall concept of aid that has been defined by definitional conditions in Article 107 par. 1 of the Treaty. This implies that the provisions of Article 107 TFEU involve a variety of direct financial transfers from the public authorities. These include grants and increasing the company's capital (Cases: 296 and 318/82), interest-free loans (Case: T-214/95), loans given on preferential interest terms (Cases: C-15/98 and C 105/99), or without adequate security (Case: C-457/00) and extra payments to the loans or credit interest (Case: C-114/00). It's also a sale of goods for a given enterprise at a reduced price (Case: 40-75, para 2;), the return of the part cost of purchased goods or services (Case: C-100/92, para 13) and extra payment to the premiums for social security plan created under the program of collective redundancies (Case: C-241/94) implemented by the enterprise. Interpretation of Article 107 TFEU also applies to aid measures taking the form of indirect financial transfers, among which one can indicate the resignation of public claims (Case: T-217/02, para 169) and exemption from the duty of paying the fines or other financial penalties (Case: C-200/97, para 43), the postponement of the claims payment term (Case: T-46/97), as well as informal tolerance of persistent state of not paying the taxes, fees and other receivables (Case: C-415/03). State aid may also include the state guarantees and various other protections of credits or loans payment in the situation where they allow the enterprise to obtain favourable interest rates compared to the currently adopted (Case: C-404/97, paras 47-48), and in the situation when the loan would not at all have been provided without presenting the appropriate guarantees from the public authorities (Case: C-288/96). Considered as State aid are often tax exemption or reduced tax rate (Case: C-172/03), as well as tax deductions (Case: C-6/97), reduction of the tax base (Cases: T-346/99, T-347/99 and T-348/99), reduction in employers' contributions to social security (Case: C-251/97), as well as the postponement of tax payment (Case: C-256/97) and causing a similar effect the special depreciation allowances (Case: C-408/04 P). Furthermore, the aid can be a system in which the taxable profit of the enterprise is flat-rate defined as a percentage of the entire amount of operating expenses and costs, excluding the personnel costs and financial costs (cost plus method) (Cases: C-182/03 and C-217/03, paras 90-102). The aid may also include the provision of goods or services below the market value or on preferential terms, including for example the sale of land (Case: T-274/01), the supply of electricity at a preferential tariff for selected enterprises (Case: C-56/93, para 10) providing logistical and commercial support (Cases: C-341/06 P and C-342/06 P), provision of intangible assets of economic value without mutual consideration (e.g. providing a list of clients) (Case: T-613/97, paras 164-171), or concluding agreements on mutual provisions between public and private enterprises under the terms of the economic benefit to a private enterprise (Case: T-158/99, para 107). In certain circumstances the prohibition of providing State aid formed by the Treaty will apply to the payments for public services (Case: C-280/00, paras 87-95). This will apply to the purchase of services, which are not in fact necessary and required (Case: T-14/96).

State aid according to Article 107 par. 1 TFEU brings an economic advantage for certain enterprises or productions of certain goods, excluding the others. In other words, the given measure cannot be regarded as State aid, if it does not bring any benefits to the addressed entity (Milhet, 2017). State aid may therefore be described as selective increment of financial benefits to an enterprise or a group of enterprises, which at the same time is accompanied by formation of a financial burden on the side of public finances. This burden may be in the form of public spending to enterprises or reducing the regulatory burdens imposed on the enterprises. In the first case it will be the aid provided by the active support mechanisms, such as grants, interest rate subsidies on bank credits, refunds, preferential and conditionally discharged loans, sureties and credit guarantees. In the second case it will be the aid provided by the exemption and

remission of tax (tax subsidies), the conversion of enterprise debt to a capital, or postponing the payment of specific public contributions.

Therefore, it should be emphasized that the measures of State intervention classified as State aid within the meaning of Article 107 par. 1 TFEU are not only of the subsidy character, because beside direct transfers of payments they also include indirect measures (Micheau, 2015). The aid may result from normative act, which will provide a legal basis for providing the aid, thus accepting the form of the aid program directed to all that fulfil the specified conditions of enterprises. The aid may be provided on the basis of an administrative decision, which takes place in relation to exemptions from taxation, reduction of taxes and other preferences in compulsory charges of public law resting on enterprises (Nicolaidis, 2015). Furthermore, the basis for providing the aid by public authorities can be civil law contract, which is used for example in the case of grant, preferential credit and preferential loan or guarantee. The State aid may take the form of taking up shares or stocks in commercial enterprises, carrying out public procurement on preferential terms, and also it can occur in connection with the execution of contract for public-private partnerships and purchase-sale transactions. This last form takes place in a situation of selling goods by the state at a reduced price, the purchase by the enterprise of land or buildings on preferential terms, or the purchase of goods or services from the enterprise at prices lower than market prices.

## **2. Problem Formulation and Methodology**

The subject of this article is the analysis of the State aid law in the light of statutory changes in conducting pharmacy activities in Poland made in 2017. The considerations are included in the context of the admissibility and rules for granting State aid for small and medium-sized enterprises in the European Union, taking into account the specific nature of the pharmacy activities as a public health protection facility, justifying the increased interference of the State in shaping the market of pharmaceutical services and the principles of conducting pharmacy activities. The article uses the method of legal regulation analysis and method of description.

## **3. Problem Solution**

Determining the perspective of State aid in the context of pharmacy operations is justified by the subjective structure of the operation of the pharmacy as a small or medium-sized enterprise, and therefore within the framework of the qualification of the above-mentioned aid. The legal basis for the admissibility of State aid in order to promote the increase of competitiveness of small and medium-sized enterprises is art. 107 para. 3 lit. c) TFEU. According to this provision, aid is allowed to facilitate the development of certain activities, provided that it does not affect competition in the internal market and does not change the conditions for trade between Member States. State aid for small and medium-sized enterprises fulfils the conditions for the application of this exemption from the Treaty prohibition of granting State aid, as this sector plays an important role in the economy of the country. It is a source of income for the State budget and budgets of local governments, has a significant impact on GDP, creates new jobs and contributes to the creation of social and functional changes in individual regions.

### **3.1 Legal Framework for Undertaking Pharmacy Activities in Poland**

Conducting economic activity in Poland in the frame of an enterprise as a generally accessible pharmacy is a subject to the regulation of the Pharmaceutical Law of 6 September 2001 (consolidated text JoL of 2017, item 2211, hereinafter: a.p.l. or Pharmaceutical Law). This activity is characterized by the duality of the goals pursued, i.e. primary public goal and minor in its context economic goal. According to art. 86 para. 1 a.p.l. *the pharmacy is a public health protection facility in which the authorized persons provide in particular pharmaceutical services*. The basic scope of pharmaceutical services provided in a pharmacy includes: 1) the issuance of medicinal products and medical devices, specified in separate regulations; 2) preparing magistral drugs, within no more than 48 hours from submitting the prescription by the patient and in the case of prescription for magistral drugs containing narcotic drugs or labelled "to be issued immediately" - within 4 hours; 3) preparation of pharmacy drugs; 4) providing information on medicinal products and medical devices. In addition, pursuant to art. 86 para. 8 a.p.l. in generally accessible pharmacies, it is possible to sell on separate stands products specified by law, possessing the required approvals or permits, provided that their storage and sale will not interfere with the basic activities of the pharmacy. The subject of the pharmacy activities described in the above manner may overlap in a certain scope with the commercial activity of the enterprise which is not a pharmacy. According to art. 71 para. 1 a.p.l., *except for pharmacies and pharmaceutical points, retail sale of medicinal products issued without a doctor's prescription, excluding veterinary medicinal products, may be carried out by: 1) herbal medical stores, 2) specialized medical supply stores, 3) general stores – hereinafter referred to as "non-pharmacy trading facilities"*. The indicated subjective differentiation is of particular importance, as the enterprise selling medicinal products, which is a non-pharmacy trading facility, realizes a specific range of services competitive to the pharmacy activity, but not being in principle limited by a wide range of restrictions applicable to the pharmacy activities as a public health protection facility. Exceptions should include solutions limiting the freedom of economic activity of both pharmacies and non-pharmacy trading facilities, an example of which is a ban formulated pursuant to art. 94a para. 1 and para.1a, a.p.l. on the advertising of pharmacies, pharmacy points and within a certain scope also non-pharmacy trading facilities. According to its content, it is forbidden to advertise pharmacies and pharmacy points and their activities, as well as it is forbidden to advertise non-pharmacy trading facilities and their activities, whereas in the case of non-pharmacy trading facilities, only advertising which refers to medicinal products or medical devices is prohibited. In the remaining scope, advertising of non-pharmacy trading facilities and their activities is allowed, subject to separate regulations limiting advertising in other sales areas (e.g. alcohol). The comparative approach to the activities of pharmacy and non-pharmacy trading facility, in the context of the subject scope of their activities, is justified only in a normatively defined, common level of retail trade of specific medicinal products. However, assuming the analysis of subjective conditions, the above list raises important conclusions, in particular in light of changes in the Pharmaceutical Law made in 2017.

Recognizing the special nature of pharmacy activity, expressed in the undisputed primacy of the implementation of public health protection as a public goal of pharmacy activity, it is impossible to depart from perceiving a pharmacy as an enterprise pursuing specific economic assumptions, whose subsidiarity is only apparent. Considering that every community pharmacy is an enterprise functioning as an entity subject to market conditions, achieving the economic goal understood as economizing of pharmacy activities towards generating profit remains the basic factor shaping the economic ability to implement a primary goal by the pharmacy, i.e. public health protection. Due to the priority given to the objective of public health protection, as well as due to the essential connection of pharmacy services with the

profession of pharmacist as a profession of public trust, pharmacy activity is regulated by acts of state authority at every stage of its implementation. Both taking up pharmacy activities and its operation were subject under the provisions of the Pharmaceutical Law to the decisions as well as the supervision and control of the authorities of the State Pharmaceutical Inspection. Having the above in mind, the subject of a particular analysis should be made of all the conditions determining the right to undertake pharmacy activities, determining the categories of sources of its financing and the property liability of the entrepreneur.

The Polish market of pharmacy services underwent significant subject polarization in 2017. With the aim of ensuring the highest standard for the provision of pharmaceutical services, the legislator amended Pharmaceutical Law in a way differentiating the legal and economic position of entrepreneurs that ran a pharmacy or at least applied for a permission to run it before the act came into force, and for entrepreneurs that made the above application after the change of regulation. The legal basis for the change is the Act of 7 April 2017 amending the Pharmaceutical Law Act (consolidated text JoL of 2017, item 1015, hereinafter: the amending Act), the provisions of which entered into force on June 25 2017. The scope of changes included, in particular, the principles of undertaking pharmacy activities by introducing, among others, the previously non-binding coefficients: demographic and geographical, determining the localization structure of pharmacies. In accordance with the current content of art. 99 para. 3b a.p.l. permission to run pharmacies *is issued if, as of the date of submission of the application for a permit, the number of residents in a given commune, calculated per one community pharmacy, is at least 3,000 people and the distance from the planned location of the pharmacy to the nearest community pharmacy, counted between entries to the dispatch centres of pharmacies in a straight line, is at least 500 meters.* According to art. 99 para. 3d point 1 a.p.l., the indicated demographic coefficient is not taken into account if, *as at the date of submitting the application for the permit, the distance from the place of the planned location of the pharmacy to the nearest community pharmacy, counted between the entries to the dispatch centres of pharmacies in a straight line is at least 1000 meters.* Limiting the scope of the analysis to strictly subjective changes, it should be pointed out that pursuant to art. 99 para. 1 a.p.l. in the current wording (i.e. in force prior to the amendment of the Act), the right to obtain a permission for running a pharmacy was held by a natural person, a legal person and a commercial law company without legal personality. Therefore, the entity authorized to obtain a permission was an entrepreneur conducting economic activity: 1) as part of an individual economic activity, 2) in the form of a limited company, i.e. limited liability company or joint-stock company, 3) in a form without legal personality but having a legal subject of a commercial law company, i.e. a general partnership, limited partnership, limited joint-stock partnership and a limited liability partnership (Kondrat, Masełbas, Stefańczyk-Kaczmarzyk, and Zieliński, 2016). The legislator did not, therefore, restrict the forms of economic activity proper for running a pharmacy, as well as did not condition taking up the activity with the applicant's right to practice as a pharmacist. Perceiving the activity of the pharmacy as a complex economic activity, conducting it by an entity with specific business competences was assessed as complementary to the statutory requirement of employment as a pharmacy manager (having at least a 5-year work experience in a pharmacy or a 3-year work experience in a pharmacy, if they have a specialization in the field of retail pharmacy), what was seen as a guarantee of proper provision of pharmaceutical services. The above conviction corresponded with the view expressed in the Constitutional Tribunal jurisdiction, according to which *"from the very fact that someone may be subject to rights and obligations resulting from economic activity in the form of running a pharmacy, it cannot be concluded that without having specialist knowledge it is dangerous for legally protected goods. Such a danger may result only from factual acts, and these are strictly regulated and reserved for persons with appropriate qualifications in the field of running a pharmacy"* (Constitutional Tribunal,

Judgement of 20/08/1992, Ref. K4/92, OTK 1986-1995/t3/1992/cz2/22). The above liberal concept at the base of shaping the pharmaceutical market, and thus the pharmaceutical services market in Poland, met with criticism expressed in the justification of the draft law amending Pharmaceutical Law, according to which *"current experience of highly developed countries indicates that the proper functioning of pharmacies and carrying out their tasks cannot be accomplished by fully liberalizing the rules for their creation. Only the pharmacist, as the owner of the pharmacy, can guarantee that the basic objective of the pharmacy activities will be properly implemented. A close relationship of an independent pharmacist with a pharmacy run strengthens the pharmacist sense of responsibility, strengthens the necessary relationship of trust to representatives of other medical professions and patient, and guarantees optimal supply of medicinal products"* (Rationale for the parliamentary draft amendment to the Pharmaceutical Law Act). As a consequence, the legislator decided to fundamentally change the subjective requirements for obtaining a license to operate a pharmacy, which is expressed in the current wording of art. 99 para. 4 a.p.l., according to which the right to receive a permit to run a community pharmacy is obtained by: 1) a pharmacist with the right to practice conducting individual economic activity; or 2) a general partnership or a limited liability partnership whose subject of activity is only to run pharmacies and in which associates (partners) are only pharmacists with the right to practice. Considering that according to art. 2 para. 1 of the amending Act, the provisions of Pharmaceutical Law, as amended, apply only to proceedings for permits to operate pharmacies initiated after the amendment to the Act came into force, the structure of the pharmaceutical market in Poland may be significantly divided into entrepreneurs operating under the existing rules, including economically advantageous forms of activity (in particular within limited companies) and entrepreneurs subject to the restrictions of freedom of economic activity. The particular importance in the context of the indicated polarization should be given to a limitation of the forms of conducted pharmacy activity to: 1) individual economic activity, 2) general partnership and 3) limited liability partnership. The indicated restriction should be perceived in two ways, i.e. both as 1) resulting in the exclusion of activities form that reduce the financial liability of the entrepreneur and shape the protection of their personal property and as 2) excluding specific sources of financing economic activity. Each of the currently accepted forms of undertaking pharmacy activities in the scope of newly-opened pharmacies combines responsibility for obligations resulting from the conducted activity with the possibility of execution concerning the entrepreneur personal property. In the case of running a pharmacy in the form of a one-person (individual) economic activity, the entrepreneur is responsible for the obligations undertaken with all their assets without any restrictions and regardless of the moment of acquiring the components of this property. Conducting pharmacy activity in the form of a general partnership or a limited liability partnership also finds reference to the sphere of personal property. According to art. 22 § 2 and art. 31 of the Act of 15 September 2000, the Commercial Companies Code (consolidated text JoL of 2017, item 1577, hereinafter: CCC), each partner of a general partnership is liable for the company obligations without limitation with all their assets jointly and severally with other partners and with the company, provided that this liability is of a subsidiary nature, which means that the creditor of the company can only execute the property of the partner if the execution of the company assets proves to be ineffective. A similar relationship in property relations of an entrepreneur running a pharmacy with respect to third parties occurs in the case of a limited liability partnership, i.e. created by partners for the purpose of free profession (pharmacist) in a company running an enterprise under its own name, to which (in accordance with art. 89 of the CCC) the above rules on property liability applicable to a general partnership, provided that (in accordance with art. 95 § 1 of the CCC) a partner in a limited liability partnership is not liable for company obligations arising in connection with pursuing a liberal profession by other partners in the company, as well as

obligations of the company as a result of actions or omissions of persons employed by the company under a contract of employment or other legal relationship, which were subject to the management of another partner in the provision of services related to the subject of the company activities. As a consequence, the responsibility for the limited liability partnership obligations can be divided into: 1) obligations related to the organization and operation of the company – for which each partner responds with all their assets in a subsidiary way jointly and severally with the other partners and the company; 2) obligations related to the performance of a free profession by a given partner or resulting from actions or omissions of subordinates – for which only this partner is subsidiary, jointly and severally responsible. The indicated limitation of the forms of undertaking pharmacy activities eventually affects a significant limitation of the financing sources of this activity. The exclusion of undertaking pharmacy activities in the form of limited companies and a limited partnership eliminates the possibility to raise capital by taking up shares or stocks in a limited company on a monetary or non-monetary basis, and making such contributions by the investor as a limited partner in a limited partnership. An entrepreneur undertaking pharmacy activities after the entry into force of the amendment of the Pharmaceutical Law remains, in principle, limited to the use of own sources of financing or the offer of services of an external financing institution. The justification for the above solution should be seen primarily in the legislator efforts to eliminate the influence of any non-pharmacists on the functioning of the pharmacy, with particular emphasis on protecting the public interest. Recognizing in principle the direction of the changes chosen as accurate, surprising, however, may be to exclude a limited partnership from the scope of permissible forms of undertaking the pharmacy activity. The activity in the form of a limited partnership is characterized by the special position of a partner with the status of a limited partner, thus realizing primarily the function of a "passive investor" (Kidyba, 2016). An associate who is a limited partner has a very limited influence on managing the company affairs, consisting mainly in granting permits to activities exceeding the scope of ordinary management and in certain control rights expressing primarily by the right to request a copy of the financial statements for the financial year and reviewing the books and documents to check its reliability. It seems, therefore, that a limited partnership is a form of activity which, on the one hand, is not subject to the interference of an investor (as a limited partner) in running a company, management rights belong in fact to an active partner called a general partner. On the other hand, a limited partnership allows for the acquisition of an external investor whose asset contribution could provide or secure sources of funding for pharmacy operations in a significant way. It is to be noted only on the side of the above comments that, for example, in accordance with art. 4a para. 1 point 3 of the Act of May 26, 1982, the Law on Advocates (uniform text JoL of 2017, item 2368, as amended), practising the profession of advocate may take place, among others, in the form of a limited partnership, provided that *the general partners are advocates, legal advisers, patent attorneys, tax advisors or foreign lawyers performing a permanent practice on the basis of the provisions of the Act of 5 July 2002 on the legal assistance provided by foreign lawyers in the Republic of Poland*. Therefore, it cannot be reasonably argued that the form of a limited partnership does not guarantee an adequate standard of performance of the profession of public trust.

Considering the indicated diversification of admissible forms of pharmaceutical activity, which constitute an important contribution to the diversification of the competitive factor of the pharmacy services market in Poland, as well as taking into account conducting in a certain scope of trade in medicinal products by non-pharmacy trading facilities, the identification of the widest possible spectrum financing of pharmacy activities, including the perspective of the EU state aid law should be considered a particularly important issue. The above issue is the more important that regardless of the moment of undertaking pharmacy activity and the related economic limitations, the pharmacy activity should, by its very nature, always remain focused

on realizing the public goal, understood as protection of public health, and creating a framework for effective, economic security of conducting this activity is an indispensable condition for achieving this goal.

### ***3.2 Small and Medium-Sized Enterprise as a Beneficiary of State Aid***

Small and medium-sized enterprises play a critical role in the EU development strategy for economic growth and social welfare (Bacon, 2009). The European Commission sees SMEs as crucial for the development of the internal market, because SMEs are regarded as important for the development of jobs and encouraging an entrepreneurial drive throughout the European Union (Florio, Vallino and Vignetti, 2017). The promotion and nurturing of SMEs allows new and smaller businesses to be created, develop and grow, which increases the pool of competitors (Vasin and Gamidullaeva, 2015). Better competition drives down consumer prices, increases innovation and efficiency and adds to the long term stability of the EU. But SMEs usually have difficulties obtaining and securing capital for all types of expenditures. This is due to financial institutions being unwilling to accept the risk against the limited guarantees that SMEs are able to provide. In addition, due to their size SMEs will have limited access to certain types of information, such as new technology and new markets.

Small and medium-sized enterprises are specified as including any entity engaged in an economic activity, irrespective of its legal form, including self-employed persons and family businesses, and partnerships or associations regularly engaged in an economic activity (Kekelekis, 2008). The category of SMEs is sub-divided in three classifications. The category of micro, small and medium-sized enterprises is made up of enterprises which employ fewer than 250 persons and which have an annual turnover not exceeding €50 million and/or an annual balance sheet total not exceeding €43 million. Within the SMEs category, a small enterprise is defined as an enterprise which employs fewer than 50 persons and whose annual turnover and/or annual balance sheet total does not exceed €10 million, and a micro-enterprise is defined as an enterprise which employs fewer than 10 persons and whose annual turnover and/or annual balance sheet total does not exceed €2 million. SME must be autonomous. An autonomous SME is any enterprise which is not classified as a partner enterprise or as a linked enterprise.

In line with the strategic importance of SMEs, the Commission has consistently taken a favourable approach to aid to encourage the development and sustainability of SMEs. In other words, the particular interests of SMEs entitle the Commission to afford them special consideration, whilst noting that the Commission need not approve systematically all schemes giving special and preferential treatment to such enterprises. On the basis of its experience in assessing aid to SMEs, the Commission issued guidelines on the compatibility with the common market of investment and start-up aid in 1992 (OJ 1992 C 213/2), which were revised and extended in 1996 (OJ 1996 C 213/4). Council Regulations No. 1588/2015 (OJ 2015 L 248/1) - earlier Council Regulations No. 994/98 (OJ 1998 L 142/1) - now provides for the Commission to adopt regulations declaring certain aid for SMEs to be compatible with the internal market and not to be subject to the notification requirements of Article 108 par. 3 TFEU. On the basis of this power the Commission adopted a block exemption for certain types of State aid to SMEs, i.e. Regulation (EC) No. 70/2001 on aid to SMEs (OJ 2001 L 10/33) and first general block exemption regulation (GBER), i.e. Regulation (EC) No. 800/2008 (OJ 2008 L 214/3), which contained specific provisions concerning SMEs in relation to investment and employment aid, regional start-up aid for small enterprises, aid for small enterprises created by female entrepreneurs, aid for consultancy and for participation in fairs and aid in the form of risk capital, as well as preferential provisions concerning aspects of environmental

protection and research and development. This has now been superseded by the new general block exemption in Commission Regulation No. 651/2014 (OJ 2014 L 187/1). SMEs are also afforded preferential consideration under many other European Union State aid policies, such as regional aid, employment aid, training aid, aid for research, development and innovation, and aid for environmental protection.

The GBER, together with the Commission's general rules for the approval of aid measures, establishes the following methodology for the assessment of aid for SMEs.

Firstly, a number of SMEs support measures do not constitute State aid. For State aid to arise, all of the criteria under Article 107 par. 1 TFEU must be met. In most cases involving aid to SMEs, it will be straightforward to establish the existence of aid within Article 107 par. 1. The doubtful cases are likely to be those where the nature of the SMEs business makes it questionable whether the aid would affect trade between Member States, and cases of *de minimis* aids. The criterion of effect on inter-state trade may well not be satisfied where aid is granted to enterprise in relation to products or services which by their nature are not traded between Member States. This may well be the case for SMEs, particularly micro enterprises, providing local services for example. Aid to SMEs may also fall within the scope of the *de minimis* block exemptions, i.e. Commission's Regulation No. 1998/2006 (OJ 2006 L 379/5), which was replaced by Regulation No. 1407/2013 (OJ 2013 L 352/1). In such cases, the aid is deemed not to meet the criteria of Article 107 par. 1 TFEU and does not need to be notified under Article 108 par. 3 TFEU. *De minimis* aid may be granted up to a ceiling of €200,000 per enterprise, over any period of three years, or €100,000 per enterprise in the road transport sector. The aid must also be "transparent", such that it is possible to calculate precisely the gross grant equivalent of the aid ex ante without need to enterprise a risk assessment.

Secondly, where there is aid, the GBER enables aid to SMEs that complies with certain substantive and transparency requirements to be implemented without prior notification and approval. The GBER contains exemptions of categories of SME aid that are similar to the exemptions in the SME block exemption, i.e. investment aid and aid for the participation in fairs (Podsiadło, 2014). In addition the GBER covers a number of new categories of aid to SMEs, such as aid for consultancy in favour of SMEs, aid for cooperation costs incurred by SMEs participating in European Territorial Cooperation projects, risk finance aid, aid for start-ups, aid to alternative trading platforms specialised in SMEs, aid for scouting costs (Nicolaidis, 2014). SMEs also generally benefit for more favourable treatment under other GBER exemptions for horizontal aid and regional aid.

Thirdly, SME aid measures not eligible under the GBER may still be individually approved by the Commission under Article 107 par. 2 and par. 3 TFEU. Of these, the main provision under which State aid for SMEs is likely to be approved is Article 107 par. 3 point c. In addition, some forms of aid to SMEs may fall under the derogation in Article 107 par. 3 point d for aid to promote culture and heritage conservation, or the categories in Article 107 par. 2 of aids which are always exempted such as social aids and disaster aid.

Taking the above into account, the aid addressed to small and medium-sized enterprises conducting pharmacy activities may be – in addition to the above-mentioned specific objectives of granting such aid – primarily *de minimis* aid, which does not constitute aid subject to the prohibition in art. 107 para. 1 TFEU. This aid does not have to meet the requirements set out in the relevant provisions regulating the terms of admissibility of State aid, because if the conditions set out in Commission Regulation No. 1998/2006 are met, *de minimis* aid is not a State aid in the light of EU competition law. This principle has been preserved in the new Commission Regulation No. 1407/2013. This means that this type of aid does not have to be one of the exceptions to the general prohibition of granting aid and can take forms that the

European Commission is not very favourable to. This is mainly about operational aid, which is granted in connection with the current activities of the enterprise (Nicolini, Scarpa and Valbonesi, 2017). This may be aid for an enterprise operating in an area not eligible for regional aid or aid allowing to finance expenses that are not eligible for regional aid, such as interest on loans, insurance and leasing margins. However, it should be taken into account that, unlike any other aid, *de minimis* aid is cumulated both for the project and the beneficiary. If *de minimis* aid and aid subject to a Treaty prohibition on the basis of a specific exception (regional aid, horizontal aid, sectoral aid) are granted for the implementation of a given investment project, this leads to a situation in which both these aids if they concern the same eligible expenses, may not exceed the maximum intensity of State aid appropriate for a given project (De Cecco, 2013). In addition, the *de minimis* aid granted is cumulated with other *de minimis* aid granted three years back, even if this aid was granted for other projects and other eligible expenses.

#### 4. Conclusion

The reform of the State aid system in the European Union results in the simplification and rationalization of State aid rules in general block exemption regulations (GBER, New GBER), thanks to which Member States are now able to introduce a wide range of support measures for small and medium-sized enterprises with a minimum administrative burden. The GBER regulations set a framework that allows Member States to grant aid targeted at creating jobs, improving competitiveness and improving the environment without having to contact the European Commission. The measures specified in the GBER and meeting the conditions and criteria they contain are exempt from the notification requirement. However, due to the high risk of distortion of competition, the Commission assesses a large part of the aid in each individual case in order to examine its effect on competition and the contribution to the common interest. State aid granted as part of block exemptions is also *de minimis* aid (so-called soft aid), under which the threshold of admissible aid, which does not require notification, has been defined. Aid provided on the basis of regulations of the European Commission in this respect is admissible by virtue of law, and therefore exempted from the obligation to notify provided that all conditions contained therein are met.

Conducting a pharmacy activity as part of a small or medium-sized enterprise, which is a community pharmacy, is subjected in general to the use of legally acceptable State aid, provided that the polarization of the pharmaceutical market to entities with diverse forms of activity may determine its scope. However, bearing in mind the social importance of a community pharmacy, as a public health facility, the search for a wide range of sources of financing the activities of pharmacies, including taking into account the prospects of State aid, should be considered legitimate, asserting and significantly strengthening the economic guarantee of the public purpose of the pharmacy activities, i.e. the protection of public health.

### ***Abstract***

*Management and improvement of products' quality in the European framework could be realized on two ways: obligatory and non-obligatory. Obligatory way concerns law sphere. It is regulated by general regulations, directives, decisions, suggestions concerning directives and by national regulations of each EU member. Two main directives are important in this area: Council Directive 85/374/EEC concerning liability for defective products and Directive 2001/95/EC of the European Parliament and of the Council of 3 December 2001 on general product safety. Mentioned above constitutes one side of products' quality management and improvement. From the other side, non-obligatory ways of following activities exist, like quality management concepts (Total Quality Management), ISO norms concerning quality management and improvement systems as well as European and national quality awards, presenting self-assessment way of quality creating. The main purpose of the article is to present obligatory and non-obligatory instruments of products' quality management and improvement.*

**Keywords:** *European Foundation for Quality Management, European regulations for products' quality, improvement, ISO, management*

**JEL Classification:** *K23, L15, O19*

### **1. Introduction**

Instruments of competitiveness on European market are very differentiated. Not only brand, image, size of a company, technology progress and others are relevant, but above all wide meaning quality. Ensuring of proper quality of processes, products and services is one of the biggest challenge of contemporary companies. Creating a proper policy of quality guarantees functioning of a company.

The following article constitutes a theoretical-cognitive study showing European policy of products' quality management and improvement. The author presented two ways of products' quality creating and developing: obligatory and non-obligatory. The first one concentrates around law acts, being an element of each the EU member national system. Mainly, acts relate to directives, defining manufacturing processes, customer safety and analysed products' quality. Non-obligatory sphere makes up a wide catalogue of instruments created by international and European institutions like: International Organization for Standardization (ISO), European Normalization Committee and European Foundation for Quality Management. The most practical instruments are: concept Total Quality Management, European Quality Award as well as quality management systems organized according to ISO norm 9001. Mentioned instruments were described briefly.

The main purpose of the article is to present obligatory and non-obligatory instruments of products' quality management and improvement.

## **2. Obligatory European Framework of Products' Quality Management and Improvement**

Obligatory European framework of products' quality management and improvement is realized by law acts.

European Union (EU) law consists of following types of acts (Ładoński, Szoltysek, 2007):

1. Regulations, have the biggest influence. They are addressed to all EU members as well as to their citizens. They must be realized fully. Regulations constitute so called secondary acts of EU, interfering in national law systems of members, becoming their integral part. They are used to unify law system in the EU and unified areas become their only domain.
2. Directives, obligatory acts for members, except individual parties which are obliged, in exact time, to create national act realizing a task defined by a directive. Forms of realization are selected by a member.
3. Decisions, addressed to exact EU member.
4. Suggestions, non-obligatory, except situations, when they interpret directives.

One of many barriers blocking creating of common union market was technical barrier. They were coming from different in each Community country norms and technical acts, defining requirements concerning manufacturing process, launching products on the market and supervision over the market of products being a subject of transaction or use (ex post supervision). Union acts were not enough to realize a real liberty of products' exchange. Removing of barriers was realized by technical harmonization, using so called norms of "old approach" and "new approach" (Kawecka-Wyrzykowska, Synowiec, 2004).

"Old approach" directives have mandatory character. Their advantage is easiness of conformity assessment realization, because they present detailed requirements, what makes easy conformity control. In this situation simple comparison of parameters of exact product with parameters defined in a directive is enough. Their disadvantage is slow update, what was causing that they were a barrier stopping research-development works. Following approach exists presently, but in selected sectors (Ładoński, Szoltysek, 2007).

"New approach" to technical harmonization was created in 1985. It has following characteristics (Zalewski, 2004):

- a. harmonization concerns only basic requirements relating to safety,
- b. normalization organizations prepare detailed technical norms (voluntary) for products, taking into account directives,
- c. free trade of products is guaranteed, according to harmonized norms,
- d. directives are transformed into national law.

Harmonized directives have basic requirements concerning: specific characteristics, relevant for safety, health protection, environment, research and measuring procedures and organization accrediting research and measuring laboratories. These directives ensure that in trade safe products for health, life and environment appear.

Existing of Community market, enabling free products trade, intensified quality oriented adjusting activities. Obligation of each EU member to protect its citizens as well as issues concerning wide meaning quality achieved status of important and constitute one of the most important area of law activities in the EU. Many normative acts exist regulating problems of

quality assurance and development by system and product certification. Achieving by consumer policy so called status of horizontal policy caused that improvement of life quality in the framework of availability, variety, quality and safety of products must be accepted in all lawful and economic aspects (Krawczyk, 2008).

Policy of a consumer protection includes three main spheres: public health, products safety and consumer rights. Products safety in the EU is ensured by normalization system, warning system RAPEX, monitoring of consumers problems and placing on labels detailed information about products (Szczepańska, 2007).

Many different European law acts regulate policy of products' quality management and improvement. Two of them are vitally important:

1. Directive 1999/34/EC of the European Parliament and of the Council of 10 May 1999 amending Council Directive 85/374/EEC on the approximation of the laws, regulations and administrative provisions of the Member States concerning liability for defective products (eur-lex.europa.eu. [online], 2018).

Directive defines meaning of a defective product. It means defective, when it does not provide the safety which a person is entitled to expect, taking all circumstances into account, including:

- a. the presentation of the product,
- b. the use to which it could reasonably be expected that the product would be put,
- c. the time when the product was put into circulation.

The producer shall not be liable as a result of this Directive if he proves:

- a. that he did not put the product into circulation,
- b. that, having regard to the circumstances, it is probable that the defect which caused the damage did not exist at the time when the product was put into circulation by him or that this defect came into being afterwards,
- c. that the product was neither manufactured by him for sale or any form of distribution for economic purpose nor manufactured or distributed by him in the course of his business,
- d. that the defect is due to compliance of the product with mandatory regulations issued by the public authorities,
- e. that the state of scientific and technical knowledge at the time when he put the product into circulation was not such as to enable the existence of the defect to be discovered,
- f. in the case of a manufacturer of a component, that the defect is attributable to the design of the product in which the component has been fitted or to the instructions given by the manufacturer of the product.

2. Directive 2001/95/EC of the European Parliament and of the Council of 3 December 2001 on general product safety (eur-lex.europa.eu. [online], 2018).

The purpose of this Directive is to ensure that products placed on the market are safe. "Safe product" shall mean any product which, under normal or reasonably foreseeable conditions of use including duration and, where applicable, putting into service, installation and maintenance requirements, does not present any risk or only the minimum risks compatible with the product's use, considered to be acceptable and consistent with a high level of protection for the safety and health of persons, taking into account the following points in particular:

- a. the characteristics of the product, including its composition, packaging, instructions for assembly and, where applicable, for installation and maintenance,
- b. the effect on other products, where it is reasonably foreseeable that it will be used with other products,

- c. the presentation of the product, the labelling, any warnings and instructions for its use and disposal and any other indication or information regarding the product,
- d. the categories of consumers at risk when using the product, in particular children and the elderly.

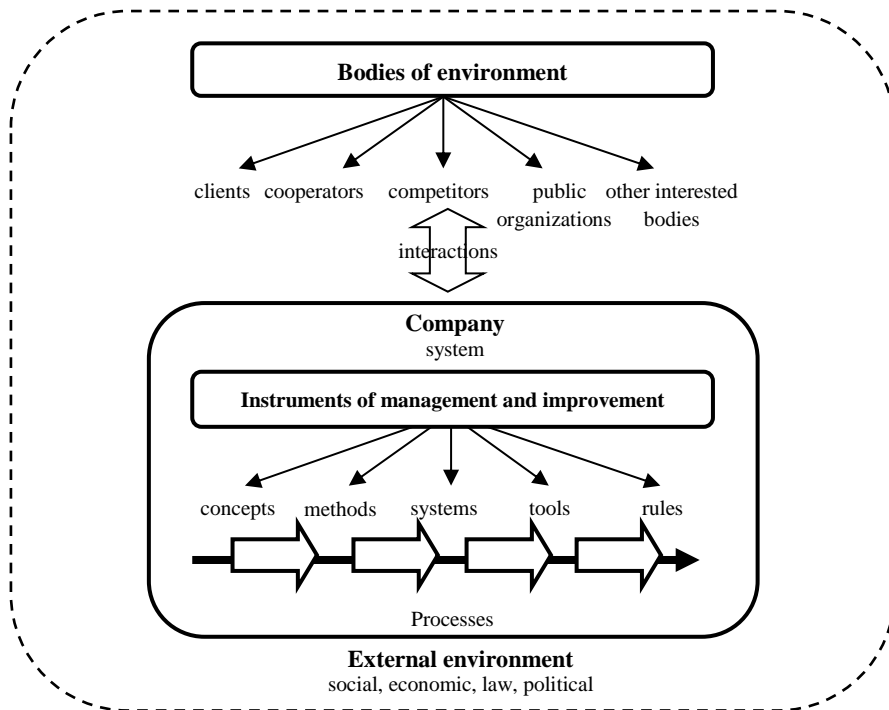

Producers shall be obliged to place only safe products on the market.

Presented directives protect customers by ensuring quality of products on the market.

### 3. Non-Obligatory Instruments of Products’ Quality Management and Improvement – International and European Dimension

Non-obligatory instruments of products’ quality management and improvement could be defined as presented on the figure 1.

**Figure 1: Non-Obligatory Instruments of Products’ Quality Management and Improvement**

Source: personal elaboration

They could be classified as following (Jakubiec, 2016):

1. Concepts of products’ quality management and improvement, like Total Quality Management, Lean Management, Kaizen, Six Sigma, self-assessment concepts defined by European Quality Award (EQA) (organized by European Foundation for Quality Management), Polish Quality Award, ISO 10014 and ISO 9004.

2. Rules of quality management and improvement described as: Deming rules, rules of continuous improvement (Kaizen), rules of excellence (EQA) and quality rules coming from ISO 9001.
3. Quality management systems, being system solution for quality management and improvement, concerning all processes in a company. The most popular quality management system is organized according to ISO 9001. Following quality management and improvement standard is the most popular normative solution in this area around the world.
4. Methods of quality management are classified into two groups: concerning designing process and concerning control process. The most popular among companies are methods: Failure Mode and Effect Analysis, Quality Function Deployment and Statistical Process Control. They constitute middle term interactions, planned and repeatable acting relating to quality ensuring tasks.
5. Tools of quality management and improvement are useful instruments in short time decisions making. They collect quantitative and qualitative data supporting ensuring of proper quality. The most popular tools are as follows: brain storm, flowchart, control chart, Ishikawa figure, Pareto figure, histogram and correlation diagram.

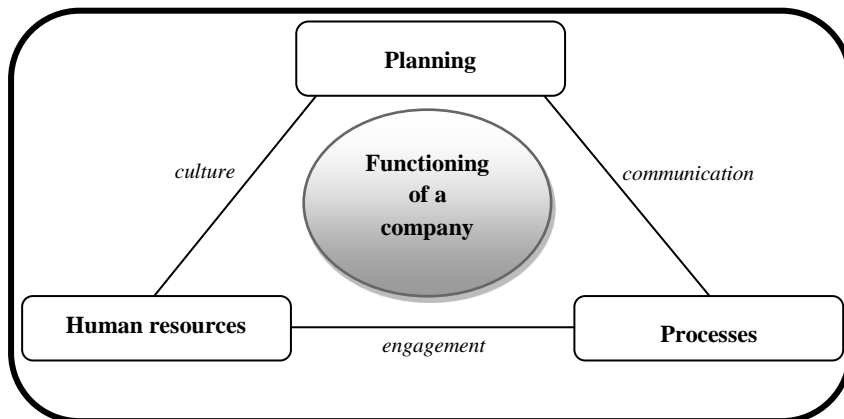

Below, brief characteristic relating to non-obligatory instruments of European policy of products' quality management and improvement was presented.

Total Quality Management (TQM) constitutes complex methodology of quality management and improvement, especially quality of processes and products. Main assumptions of TQM are as follows (Certo, Certo, 2009; Jakubiec, 2017):

1. Customer approach, needs and expectations of customers create a policy of a company.
2. Process approach, companies are organized as a system of processes, connected and measured.
3. People engagement, all employees are engaged in quality matters.
4. Continuous improvement, processes are improved continuously.

Figure 2 shows contemporary model of TQM. Mentioned above assumptions base on culture, communication and engagement.

**Figure 2: Contemporary Model of Quality Management and Improvement**

Source: Wiśniewska, Grudowski (2014)

Another instrument of non-obligatory area of products' quality management and improvement constitutes a family of ISO norms 9000. Norms were prepared by International Organization for Standardization in 1987 and updated a few times. Norms present requirements to implement, functioning and improving of quality management system. Following family of ISO norms presents figure 3.

**Figure 3: ISO Norms Concerning Quality Management System**

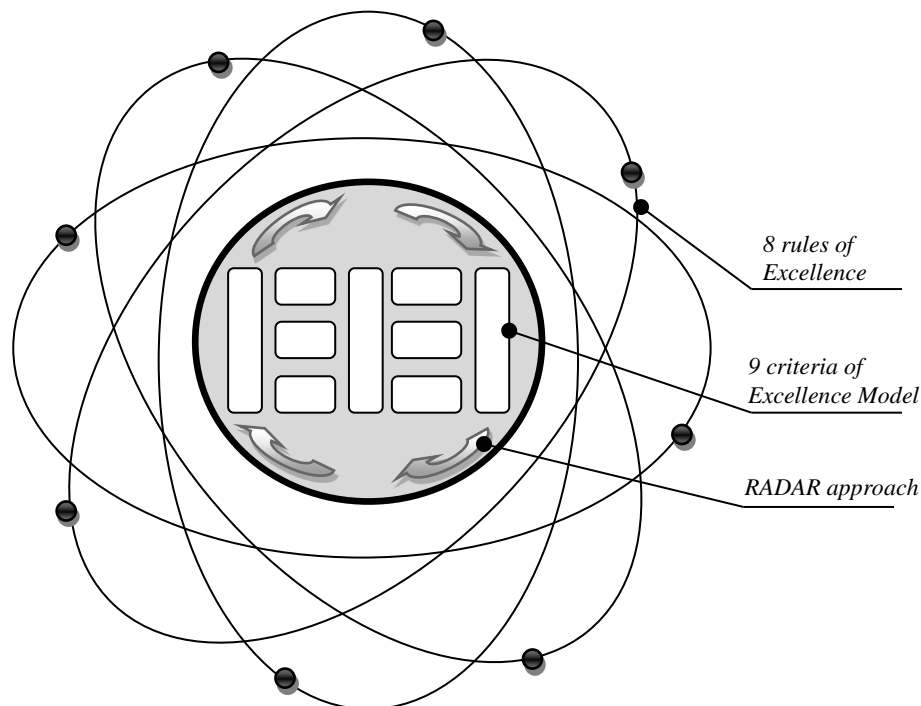

Source: personal elaboration

Quality management system organized according to ISO 9001 is the most popular solution in quality area around the world and very often is a first step to realize TQM assumptions (Adámek, 2016). Rules relating to organization of quality management system are following (Quality Management System. Terminology, 2015; Quality Management System. Requirements. 2015): customer approach, leadership, people engagement, process approach, improvement, decisions making based on facts and relations management. Following rules correspondent with TQM assumptions.

Important instrument in non-obligatory policy of quality creating presents quality awards. European level is completed by European Quality Award established in 1992 by European Foundation for Quality Management (EFQM). Organization created Excellence Model including quality award. EFQM model shows figure 4. Model consists of 8 rules of Excellence, 9 criteria of Excellence Model and improvement approach RADAR (Results, Approaches, Deploy, Assess and Refine). Rules of Excellence are similar to TQM assumptions and ISO quality management rules, and are as follows: adding value for customers, creating a sustainable future, developing organizational capability, harnessing creativity and innovation, leading with vision, inspiration and integrity, managing with agility, succeeding throw the talent of people, sustaining of outstanding results.

Criteria of EQA are divided into two groups: potential concerning: leadership, people, strategy, partnership, resources, processes, products, services and results presenting: people results, customer results, society results and business results. Criteria based on learning, creativeness and innovativeness.

Polish Quality Award as national answer for EQA was established in 1995. Criteria of Polish Quality Award are very common with EQA criteria. This way of quality ensuring is very popular among polish companies and organizations and constitutes important non-obligatory instrument of wide meaning European policy of products' quality management and improvement.

**Figure 4: EFQM Model**

Source: EFQM Model [online], 2018

Presented non-obligatory instruments of products' quality management and improvement express only a part of wider catalogue of instruments ensuring proper quality of processes and products. They were showed in following paper because their popularity and practical use. The author plans to continue this topic in next papers, taking into consideration further instruments.

#### 4. Conclusion

Following article presents European Union law acts regulating quality and safety of products and non-obligatory instruments of management prepared mainly by international and European organizations like ISO or EFQM. Both spheres, obligatory and non-obligatory are used to realize products' quality management and improvement. Main law acts concern two directives: Directive 1999/34/EC of the European Parliament and of the Council of 10 May 1999 amending Council Directive 85/374/EEC on the approximation of the laws, regulations and administrative provisions of the Member States concerning liability for defective products and Directive 2001/95/EC of the European Parliament and of the Council of 3 December 2001 on general product safety. Non-obligatory area concerns management instruments like: Total Quality Management, ISO 9001 and rules and criteria of European Quality Award. Directives and instruments were presented in the following article.

### **Abstract**

*Trust can be examined on micro- and macroeconomic level. That is why, when we describe trust on macroeconomic level, we consider its impact on various macro indexes like for example Development and Economic Growth. There are no doubts, that trust is one of crucial elements in Social and economic life. F. Fukuyama was right, when he claimed, that "the minimum level of trust and honesty we assume as a certainty and we forget, that these values are inherent element of economic life, essential factor that has impact on correct functioning Economy" (Fukuyama 1997, p. 179). Trust as a factor influencing Social and Economic Development and Growth has become more important in Institutional Economics. D.C. North said that trust and various kinds of norms, legal rules are important for Economic effectiveness. The main purpose of this article is to identify the impact of trust on Development and Economic Growth in different Countries. The research is based on secondary sources, and research results which present relation between trust and Development and Economic Growth in societies.*

**Keywords:** *economic development, economic growth, integration process, the European Union, trust*

**JEL Classification:** *O11, I30, I39, Z10*

### **1. Introduction**

Economic growth and development reach various levels in individual countries (comp. Mynarzová, a Kaňa, 2014, s.499 and next). While discussing economic growth, we primarily mean the process of growth of resources and consumer goods. Economic growth is most commonly measured by real GDP growth rate in a given year. Economic growth is a component of a broader notion of economic development that considers not only the increase in quantitative indices but also qualitative changes in living conditions of the population.

Many researchers make an attempt to explain the causes of diverse level of economic development in individual countries, identify determinants affecting economic growth, as well as relationships between specific determinants and economic growth. Trust which is an example of informal institutions is one of these determinants. In institutional economics the notion of institutions represents both formal and informal principles and norms that control the way in which individuals behave in the society (Groenewegen, Spithoven, van den Berg, 2012, p. 24). Institutions establish some framework that determines the area of implementation of decisions and transactions in economy. Therefore, many economists emphasise their remarkable impact on the possibilities of socio-economic development (comp. D. Rodrik, A. Subramanian, F. Trebbi, 2004, p. 131 – 165).

Considering the studies of impact of trust on economic growth, S. Knack and P. Keefer (Knack and P. Keefer, 1997, pp. 1251 – 1288) were the forerunners in this area. Using indicators of trust and civic norms from the World Value Survey for 1981 and 1991 in 29 countries, they analysed the impact of these determinants on economic growth. Research conducted by P. F. Whiteley (Whiteley, 2000, pp. 443 – 466) is another example of studies on the level of trust on economic growth (measured by the size of GDP per capita). Data from World Value Survey for the period between 1970 and 1992 from 34 countries were used. Research performed by P. J. Zak and S. Knack (Zak and Knack, 2001, pp. 295 – 321) who used the data for the period 1970 – 1992 from 41 countries for their research concerning the impact of trust on economic growth is another example. Studies conducted by J. J. Sztaudynger, P. Starosta and E. Ambroziak (Sztaudynger, Starosta, Ambroziak, 2016, pp. 647 – 673) based on panel data of the European Social Survey for the years 2006 – 2012 including 22 countries is still one more example of research on the impact of trust on economy and its growth.

Further part of the paper is an attempt to compare the above research results and indication (proving) of relationships between the level of trust and economic growth in selected countries. Critical analysis of secondary sources of information including results of research on relationships between trust and economic development is the research method applied in the paper.

## **2. Trust as an Example of Institution Affecting Economic Development**

In institutional economics the notion of “institution” represents the rules of the game in the society, established limitations of formal and informal character, durable systems of determined and implemented social rules, collective actions including non-arranged habits, as well as organised and well-functioning organisations and general habits existing in the sphere of economy. D.C. North defines institutions as “the rules of the game in a society or, more formally, are the humanly devised constraints that shape human interaction. In consequence they structure incentives in human exchange, whether political, social, or economic. Institutional change shapes the way societies evolve through time and hence is the key to understanding historical change” (North, 1990, p. 11). He continues to state that “Institutions include any form of constraint that human being devises to shape human interaction. (...) formal constraints – such as rules that human being devise (...) informal constraints such as conventions and codes of behaviour” (North, 1990, p. 12). On the other hand, G.M. Hodgson writes that “Institutions are the kinds of structures that matter most in the social realm: they make up the stuff of social life. The increasing acknowledgement of the role of institutions in social life involves the recognition that much of human interaction and activity is structured in terms of overt or implicit rules. Without doing much violence to the relevant literature, we may define institutions as systems of established and prevalent social rules that structure social interactions” (Hodgson, 2006, p. 2, 18).

The fact that institutions affect economic development is unquestionable, however, only some of them have a positive impact. As G.W. Kołodko writes “Institutions can be good and bad. Bad institutions – causing stagnation – are those that discourage to make efforts and take risk accompanying business activity while hampering people’s entrepreneurship. Stiff bureaucracy and centralized management of state-owned enterprises are institutions. Mafia and organized crime are institutions. Money laundering is an institution. (...) Good institutions – supporting development – are those that firstly guarantee security of business transactions and are also conducive to technological and social progress. The countries are successful if they provide their stability, but at the same time are able to take care of their necessary flexibility and enable

smooth adaptation to changing natural and cultural conditions of management” (Kołodko, 2008, p. 294). Good institutions should perform specific functions that may include:

1. Functions of regulatory nature (Scott, (2008), pp. 35 – 40). Institutions affect people’s (entities’) behaviours; they determine both the actions that are expected by the entities, and those that are unwanted; in general way they control activities of individual entities and entire groups. This function is also related to reduction of uncertainty and coordination of entities’ operations.
2. Cognitive function, i.e. thanks to institutions it is possible to gain knowledge about the environment (close and distant), features and behaviours of entities rooted in traditions or customs.
3. Stabilisation function, i.e. thanks to institutions, rights are protected, social and economic order is created and higher predictability of behaviours of entities is possible. Thanks to institutions it is possible to determine some safe space of activity, and decision-making freedom within this space is provided.
4. Integration function, i.e. institutions establish relationships between individual entities and enable cooperation and collaboration thanks to the fact that these entities share the same system of values.
5. Function of the instruments of impact, i.e. the institutions determine certain limits while creating sanctions related to conduct against the principles; they also define admissible forms of entities’ operation (Comp. Bal – Woźniak, 2012, p. 134).

Trust as an example of informal institution has been the subject of research of many scientists in the area of its influence on various spheres of social and economic life. The notion of “trust”, similarly to the notion of “institution” has no unequivocal definition. One of them is the definitions by Fukuyama who states that “trust is the expectation that arises within a community of regular, honest, and cooperative behaviour, based on commonly shared norms, on the part of other members of that community” (Fukuyama, 1995, p. 26 – 27). On the other hand, according to Lin “trust is confidence or expectation that an alter will take ego's interests into account in exchanges” (Lin, 2001, p. 147). T. Zieliński describes trust in the following way: “trust is a conviction exposed to subjective assessment of probability on the basis of which an individual (A) in a specific situation agrees to be dependent of an individual (B) – a person, institution, thing, etc. while having the sense of relative, specific security determined by this probability, even though negative consequences are possible” (Zieliński, 2012, p. 76). R. Hardin’s definition is also worth mentioning. He states that “(...) Trust is a three-sided relationship: A shows trusts in B, that they will comply with X or regarding X (...) (Hardin, 2009, p. 27).

Analysing various definitions of trust, some of its characteristic features can be distinguished, like for example orientation on future, connection with risk, parties that trust each other or join some structure as well as various level of intensity (Zieliński, 2012, p. 76).

1. Attention should also be paid to the fact that majority of definitions of trust primarily refer to general understanding of this notion and that trust is an element of social capital (comp. Grabowska, Jakubowska, 2016). Therefore, it may be wondered why the level of trust in the society translates into economic growth and development. Major arguments supporting this fact include among others (Ambroziak, Starosta, Sztudynger, 2016, p. 651):
2. Reduction of transaction costs related to reduction in financial contribution on control in the processes of contract conclusion or reduction of risk at transaction conclusion (North, 1990). Therefore, the higher the level of trust in the society, the lower the costs related to financing of institutions exercising control.

3. Benefiting from expansion of cooperative networks. Communities are more willing to start cooperative actions in the situation when there is trust between individual members. Economic benefits resulting from trust and cooperation occur in two ways. Firstly, thanks to the fact that entities trust each other, they may have access to larger part of resources that are not their own, which in turn translates into the possibility of achievement of additional benefits. Secondly, thanks to trust and cooperation small business entities and their financial or physical capital can be joined to make more complex decisions leading to improvement of their competitiveness on market, and achievement of a larger scale of production (return to scale).
4. Defusing tensions and conflicts that result from conflicting economic interests of various social groups. The larger the level of trust, the higher the inclination to legitimisation of existing social inequalities, and also lower vulnerability to initiate conflicts that weaken efficiency of existing socio-economic system. At high trust, national authorities have larger freedom of acting within pursued economic policy. It must be emphasised that the goals of economic policy are long-term, therefore, important level of trust of the society in authorities allows them to make even such decisions within pursued economic policy that are not beneficial for the society in a short time.

Depending on adopted criterion, several types of trust can be distinguished. For example, if we consider the criterion of the scope of influence and / or type of entity or phenomenon, horizontal or vertical, as well as generalised or interpersonal trust can be identified. In the research on the impact of trust on economic development, generalised trust measured by the rate of responses to the question “whether majority of people can be trusted” is considered. On the other hand, the dynamics of economic development is measured with the use of the measure of GDP per capita.

Knack and Keefer (1997) were the first to study the phenomenon of relationship between the level of trust and economic growth. They conducted research based on World Value Survey data from 1981 and 1991 in 29 states from various continents, functioning within market economy (Knack, Keefer, 1997, p. 1255). In the research they stated, among others, that:

1. „Ten-percentage-point rise in that variable is associated with an increase in growth of four-fifths of a percentage point.”
2. „The impact of trust on growth should be higher in poorer countries, if trust is more essential where contracts are not reliably enforced by the legal system, and where access to formal sources of credit is more limited due to an underdeveloped financial sector”.
3. “Each seven – percentage – point rise in trust is associated with a one – percentage – point rise in investment’s share of GDP” (Knack, Keefer, 1997, p. 1260 – 1263).

Research conducted by Whiteley (2000, p. 443 – 466) is another example of studies concerning the impact of trust on dynamics of economic development measured with GDP per capita. In his study, the author started with the neoclassical model by Barro and Sala-i-Martin (1995) and complemented it with the variable of the “level of trust” measured by the rate of responses to the question of “whether majority of people can be trusted”, and the questions concerning the level of trust in family members and own nation. The following conclusions were formulated. Firstly, for the respondents the most important is trust in the members of own nation, then in the family and finally in most people. Secondly, “the comparison of the impact of human and social capital on economic growth must be made with caution. However, overall results of analysis show that social capital (measured with trust index) is a stronger and more

significant cause of economic growth” (Barro, Sala –and- Martin, 1995, quoting Ambroziak at al., 2016, p. 654). He also showed that growth of trust by 1% brings GDP increase by 0.63 percentage point.

Research by Zak and Knack (2001) is another example of empirical studies on the impact of trust on dynamics of GDP per capita. They assumed that:

1. „Higher trust increases investment and growth;
2. Homogeneous societies exhibit higher trust, and thereby investment and growth;
3. Egalitarian distributions of income enhance trust, and thereby raise investment and growth;
4. Discrimination lowers trust, reducing investment and growth;
5. There is a low – trust poverty trap” (Zak, Knack, 2001, p. 306).

While interpreting results of research obtained by Zak and Knack, (they estimated for example the model of GDP growth per capita with the method of least squares), “it can be estimated that growth in trust by 10 percentage points would increase the annual rate of income growth per person (...) by around 0.5 percentage point, which represents the growth of average dynamics of economic growth in studied countries by around a quarter” (Ambroziak, Starosta, Sztadynger, 2016, p. 655).

Studies performed by Sztadynger, Starosta and Ambroziak are another example of research on the impact of trust on economic development. In their research, beside generalised trust, the authors also considered the willingness to help and honesty, and they defined cooperation capital (determined on the basis of these variables) as the primary part of social capital.

In their research, the authors assumed the following:

1. “Cooperative capital” has long-term and short-term impact on economic growth,
2. Three-element cooperative capital explains economic growth better than (most frequently applied) generalised trust” (Ambroziak, Starosta, Sztadynger, 2016, p. 649).

What differs the research by Sztadynger and his team from previous research is first of all showing “the impact of increase in cooperative capital (generalised trust, honesty and subsidiarity) on economic growth, while considering delays in time” (Ambroziak, Starosta, Sztadynger, 2016, p. 649), and long-term as well as short-time analysis.

The most important conclusions from the studies mainly include:

1. “The rate of GDP growth is highly affected by increase in subsidiarity (...),
2. Increase in honesty influences the rate of economic growth with a delay of a year and two years (...),
3. Increase in trust affects the rate of economic growth with a delay of three years,
4. Economic growth in European countries between 2006 and 2012 depended on cooperative capital (...),
5. Increase in three-element index of cooperative capital (trust, honesty and willingness to help) explains considerably better economic growth than the traditional single-element trust index (...) (more in Ambroziak, Starosta, Sztadynger, 2016, pp. 657 – 668).

The above examples of empirical studies concerning the impact of trust on economic growth confirm the adopted assumption that trust as an informal institution has a remarkable impact on socio-economic development. The table below presents the models of long-term impact of the level of trust on GDP growth.

**Table 1: Models of Long-Term Impact of the Level of Trust on GDP Growth**

Model	Data	Averages	Definition of trust	Growth of trust by:	GDP growth
<b>Knack, Keefer</b>	29 countries (and observations)	1980 – 1992	Generalised	10 p.p.	0.8 p.p.
<b>Whiteley</b>	34 countries (and observations)	1970 - 1992	In family members, countrymen, people in general	1 % (index)	0.63 p.p.
<b>Zak, Knack</b>	41 countries (and observations)	1970 - 1992	Generalised	10 p.p.	0.45 p.p.
<b>Ambroziak, Starosta, Sztadynger</b>	22 countries (and observations – three to six for each country)	2002 - 2012	Generalised, additionally the willingness to help, honesty	0,1 p.p.*	0.35 p.p.

Source: own case study based on E. Ambroziak, P. Starosta, J.J. Sztadynger, Trust, willingness to help and honesty towards economic growth in Europe, *Economist* 2016/5

\*” increase in trust affects the rate of economic growth with a delay of three years – its growth by 0.1 point (in the year  $t - 3$ ) causes acceleration of the pace of GDP change by around 0.35 percentage points”.

### 3. Conclusion

Considerations conducted above are only an attempt to join the discussions concerning the subject of increasingly higher role of informal institutions in economy. Trust is one of these institutions. The higher the level of trust of the entities between each other and towards each other, the greater the chance of best selection of all the parties to transaction, reduction of transaction costs and consequently economic growth and development.

Presented research validate importance of trust in economic development. of a country, Apart from trust, which is one of the example of informel institutions, there are also other formal institutions which have impact on economic growth just like legal norms or rules which regulate functioning of economic entities. That is why further analysis is needed in the area of impact of formal and informal institutions on economic development and growth in individual countries.

### **Abstract**

*Money laundering and terrorism financing can have potentially devastating social, economic, and security consequences. The negative impacts of money laundering tend to be magnified in these markets because they tend to have less stable financial systems, a lack of banking regulations and effective law enforcement, and, therefore, are more susceptible to disruption from criminal or terrorism influences. Combating Money laundering is an important part of the overall fight to drug dealing, organised crime and since a number of years, also against terrorist financing. The EU has instituted new rules designed to make it tougher for terrorist groups and criminal organizations to hide their money by moving it into European countries. The aim of this paper is to define the situation in prevention of money laundering in Slovak republic, to analyse the new EU directive known as “fourth anti-money laundering directive” and its incorporation into the legal system of Slovak republic.*

**Keywords:** EU Anti-Money Laundering Directive, financing of terrorism, legal system of SR, Money Laundering

**JEL Classification:** F20, K42, G21

### **1. Introduction**

Money laundering and terrorism financing can have potentially devastating social, economic, and security consequences. The negative impacts of money laundering tend to be magnified in these markets because they tend to have less stable financial systems, a lack of banking regulations and effective law enforcement, and, therefore, are more susceptible to disruption from criminal or terrorism influences. The EU has instituted new rules designed to make it tougher for terrorist groups and criminal organizations to hide their money by moving it into European countries. The aim of this paper is to define the situation in prevention of money laundering in Slovak republic, to analyse the new EU directive known as “fourth anti-money laundering directive” and its incorporation into the legal system of Slovak republic.

Money laundering is a dangerous international criminal activity that includes not only the activities of the underworld, but also the politicians or governments of some states. The global character and size of the laundry is also proven by the fact that, according to expert estimates, \$ 1.5 billion to \$ 2 trillion per year is spent in the world. A large margin between the estimated sums is due to the fact that the discovered cases of washing form only a small part of its actual state.

But before asking the question of how to combat money laundering, perhaps the first question should be: What is causing it? One viable answer is embedded in the globalization and technological advancement that has shaped the world these past few decades. For all the good

that open-borders and online-bank transfers have given us, it has also given criminals a whole new playing field in which to transfer and conceal illicitly gained money, allowing them to lower the transaction costs of crimes. Controlling the hundreds of billions of transnational transactions that take place yearly all over the world has proved to be difficult to say the least. This challenge has been made potentially more difficult with the gaining momentum of a technology named Bitcoin. (Bååth, Zellhorn Handledare, 2016)

Uniformity of AML laws among different countries may deter criminals from laundering money. The ratification of the Vienna Convention can help to facilitate uniformity of legal rules. States need robust domestic laws to tackle money laundering. Money laundering is an international crime, although not always a specific crime in international law. Moreover, it is generally advantageous to consider money laundering to be a specific crime under international law. (Keesoony, 2016)

The system for countering the financing of terrorism can be improved to lower costs and risks to financial institutions and to enhance actionable intelligence. A balance must be sought between the objective, actionable intelligence and the mechanism used to advance that objective. (Simsler, 2011)

The skeptical way (ethical relativism) asserts that there cannot be any intrinsic notion of good/evil. The legally focused way (legal positivism) presupposes that ethics is irrelevant, when lawmakers are doing their job. The distorting way (legal moralism) takes for granted that lawmakers are deciding what is moral/immoral. The ethically focused way (normative ethics) means that ethics say something different than law. Each of the four philosophical positions about money laundering has its own pitfalls. (Dion, 2015)

In 1988, the United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances with the purpose to promote co-operation among the parties so that they may address more effectively the various aspects of illicit traffic in narcotic drugs and psychotropic substances having an international dimension and to take necessary measures, including legislative and administrative measures, in conformity with the fundamental provisions of their respective domestic legislative systems. (UN Office on Drugs and Crime, 2013). The United Nations Convention against Transnational Organized Crime was adopted by the Palermo Convention on 15 November 2000. Its protocols introduced the duty to criminalize money laundering, which no longer concerns only narcotics trafficking, but also various other criminal cases. (United Nations Office on Drugs and Crime [online], 2004).

In 1989, the Financial Action Task Force on Money Laundering (FATF) was set up in Paris at the G7 meeting. Its aim is to analyse the trends in money laundering and how to mitigate them. Its most prominent result is the formulation of 40 recommendations to combat dirty laundry, which were supplemented by 9 recommendations for combating terrorist financing after September 11, 2001. FATF recommendations can also be described as a comprehensive anti-money laundering strategy. The FATF currently has 37 members, including countries not only from Europe, North and South America and Australia, but also from Asia and Africa. (FATF [online], 2012-2018).

The Egmont Group is a united body of financial intelligence units (FIUs) from 151 jurisdictions which provides a platform for the secure exchange of expertise and financial intelligence to combat money laundering and terrorist financing (ML/TF). This is especially relevant as FIUs are uniquely positioned to cooperate and support national and international efforts to counter terrorist financing and are the trusted gateway for sharing financial information domestically and internationally in accordance with global AML/CFT standards.

The Slovak Republic became part of this organization in 1998. (EGMONT GROUP [online], 2017).

## **2. Legislation on Money Laundering and Terrorist Financing in EU**

In 1990, the Convention on Laundering, Search, Seizure and Confiscation of the Proceeds from Crime (also known as the Strasbourg Convention) was adopted by the Council of Europe to create an international legal framework for cooperation in the investigation, search, seizure and confiscation of criminal proceeds, as well as, to implement a unified crime policy with a view to protecting society and using modern and effective methods at an international level. In a wider context it was agreed that each party shall adopt the legislative and other measures necessary to classify listed acts as criminal offenses under national law if these acts were deliberately committed. (Council of Europe [online], 1990).

The next Council of Europe Convention on Laundering, Search, Seizure and Confiscation of the Proceeds of Crime and on the Financing of Terrorism (the Warsaw Convention) further upgraded and extended the Strasbourg Convention with a view to penalizing not only the financing of terrorism through money laundering but also through legal activities. The Convention regards access to information on the financial resources of criminal organizations, including terrorist groups, as a key instrument in their fight against terrorism. (Council of Europe [online], 2005).

The Committee of Experts on the Evaluation of Anti-Money Laundering Measures and the Financing of Terrorism - MONEYVAL is a permanent monitoring body of the Council of Europe entrusted with the task of assessing compliance with the principal international standards to counter money laundering and the financing of terrorism and the effectiveness of their implementation, as well as with the task of making recommendations to national authorities in respect of necessary improvements to their systems. Through a dynamic process of mutual evaluations, peer review and regular follow-up of its reports, MONEYVAL aims to improve the capacities of national authorities to fight money laundering and the financing of terrorism more effectively. (Council of Europe [online], 2018)

The Treaty on European Union provides the legal basis for the adoption of directives on the approximation of the laws of the Member States where their object is the establishment and functioning of the internal market, including the regulation of anti-money laundering measures. In order to safeguard the proper functioning of the financial system and the internal market, European legislation has been adopted. Given the changing nature of the dangers of money laundering and terrorist financing, supported by the continued development of technologies and means available to offenders, it is still necessary to adjust the legal framework in response to these threats.

European Anti-Money Laundering is governed by the following Directives:

1. Council Directive of 10 June 1991 on prevention of the use of the financial system for the purpose of money laundering (91/308/EEC)
2. Directive 2001/97/EC of the European Parliament and of the Council of 4 December 2001 amending Council Directive 91/308/EEC on prevention of the use of the financial system for the purpose of money laundering – Commission Declaration,
3. Directive 2005/60/ EC of the European Parliament and of the Council of 26 October 2005 on the prevention of the use of the financial system for the purpose of money laundering and terrorist financing and

4. Commission Directive 2006/70/EC of 1 August 2006 laying down implementing measures for Directive 2005/60/EC of the European Parliament and of the Council as regards the definition of 'politically exposed person' and the technical criteria for simplified customer due diligence procedures and for exemption on grounds of a financial activity conducted on an occasional or very limited basis.
5. Directive 2015/849 of the European Parliament and the Council of 20 May 2015 on the prevention of the use of the financial system for the purposes of money laundering or terrorist financing, amending Regulation (EU) No 648/2012 of the European Parliament and of the Council, and repealing Directive 2005/60/EC of the European Parliament and of the Council and Commission Directive 2006/70/EC

The first and second Directives did not sufficiently cover all the areas where precautionary measures to protect the financial sector had to be applied and did not respond to the many practices that criminals could use to legalize illegal proceeds or which could be used by terrorist financing. Persons covered by the Directive were required to identify and verify the identity of their clients and their associated end-user, as well as to monitor their business relationship with the customer; to report to public authorities (usually a financial intelligence unit) a suspicion of money laundering or terrorist financing and to adopt support measures such as proper staff training and the introduction of adequate internal strategies and practices for prevention.

The third directive defined more precisely the terms "money laundering" and "terrorist financing". Money laundering means deliberate action consisting in the transfer or transfer of property, knowing that the property is based on criminal activity in order to conceal the unlawful origin of the property, its true nature, the secrecy of the true nature of the source, the location, the transfer of the right to such property, as well as the acquisition, possession or use of such property, as well as participation in such proceedings, attempted, aided, directed and counselling related to these actions. This Directive defined the term 'beneficial owner' for the first time. It is a natural person who actually owns or controls a client - a legal person or on whose behalf an operation is carried out, that is, a person who benefits from a financial operation or related operations. The novelty is the specification of "politically exposed persons" (PEPs) defined by the Directive as natural persons to whom important public functions are or have been entrusted, as well as their close family members or persons known to be close partners of such persons. It is also important to define the term "shell banks". Shell Bank (shell or debenture bank) is a credit institution or an institution carrying on business activities registered in a business register of a particular State but whose registered office is only formal and commercial in that State and whose management is in fact taking place outside the territory of that State. The Directive requires Member States to prohibit credit institutions from entering a correspondence relationship with a shell bank or a foreign correspondent bank known to be using its accounts also a shell bank. (Vyhnálik, Fendeková)

The Fourth Anti-Money Laundering Directive reinforces the existing rules by introducing the following changes:

1. reinforcing the risk assessment obligation for banks, lawyers, and accountants;
2. setting clear transparency requirements about beneficial ownership for companies. This information will be stored in a central register, such as commercial registers, and will be available to national authorities and obliged entities
3. facilitating cooperation and exchange of information between Financial Intelligence Units from different Member States to identify and follow suspicious transfers of money to prevent and detect crime or terrorist activities;
4. establishing a coherent policy towards non-EU countries that have deficient anti-money laundering and counter-terrorist financing rules;

#### 5. reinforcing the sanctioning powers of competent authorities.

Full public access to the beneficial ownership registers: Member States will make public certain information of the beneficial ownership registers on companies and business-related trusts. Information on all other trusts will be included in the national registers and available to parties who can show a legitimate interest. The beneficial owners who have 10% ownership in certain companies that present a risk of being used for money laundering and tax evasion will be included in the registries. The threshold remains at 25% for all other companies. The Commission has proposed that existing, as well as new, accounts should be subject to due diligence controls. This will prevent accounts that are potentially used for illicit activities from escaping detection. Passive companies and trusts, such as those highlighted in the Panama Papers, will also be subject to greater scrutiny and tighter rules. (European Commission [online], 2016).

Every legal entity, not only the obliged persons, must enter into the Commercial Register the details of their end-user benefits. The obligation is required to be met during the transition period until 31 December 2019.

According to the information provided by the entities that maintain the relevant registers and lists, approximately 548,000 of obliged persons have been identified in summary. This number is not final. It is several times higher, as some entities may be included among obliged persons on the basis of multiple business activities. (British Chamber of Commerce in SR [online], 2018)

On 20 December 2017, EU ambassadors confirmed the political agreement reached between the presidency and the European Parliament on strengthened EU rules to prevent money laundering and terrorist financing with two main objectives: preventing the use of the financial system for the funding of criminal activities and strengthening transparency rules to prevent the large-scale concealment of funds. The aim is to close down criminal finance without hindering the normal functioning of financial markets and payment systems. Amending directive 2015/849, the agreed text seeks to balance the need for increased security with the protection of fundamental rights and economic freedoms.

### **3. Legislation on Money Laundering and Terrorist Financing in SR**

In 1994, the Slovak Parliament passed the Act of the National Council of the Slovak Republic no. 249/1994 Coll. the fight against the legalization of income from the most serious, especially organized forms of crime designed to create specific legal means to prevent, detect and punish the legal and natural persons involved in these illegal activities. One of the most serious shortcomings of this Act was its low enforceability, as it did not impose a penalty mechanism for failing to comply with statutory obligations for liable persons, nor the responsible authority for supervising the application of the law and compliance with its obligations. Another problem was the limitation of the obligation to report suspicious transactions only to banks, not to other financial market participants. In application practice, the law caused interpretative ambiguity and during its effectiveness it failed to meet the objectives. (National Council, 1994) Most of the deficiencies have been eliminated by Act No. 367/2000 Coll. on the Protection against the Legalization of Income from Crime. The law contained more restrictive definition of legalization of proceeds from crime but retained all its decisive and essential features and adapted it to the international requirements at the most. This Law adopted a new basic philosophy of legal norms defining only the detection and prevention of the legalization of criminal proceeds in order to focus it primarily on the prevention of money laundering. (National Council, 2000)

The Act No. 297/2008 Coll. on Protection against the Legalization of Income from Crime and on the Protection against the Financing of Terrorism adopted in 2008 brought these changes: supplemented and clarified the terms used, including a more precise definition of the liable persons, they listed some unusual business transactions relating to legalization as well as to the financing of terrorism, increased the protection of the employee of a liable person who reports (finds) an unusual business transaction before being exposed to threats from third parties or by a person in an unusual business transaction, between the obliged persons limited the ban on the exchange of information on unusual commercial operations, laid down the obligation to draw up a program of the person's own activities aimed at the legalization and financing of terrorism and to specify in more detail its obligatory parts, effective, proportionate and dissuasive sanctions (National Council, 2008)

Regarding the control of the fulfilment of the obligations of the obliged persons, the law was also included among the supervisory authorities by the National Bank of Slovakia and the Ministry of Finance of the Slovak Republic, thus ensuring greater control efficiency. Both institutions have the power to control only the entities in their competence. If the supervising or state supervisor of a liable entity detects a violation of the law, the information shall be immediately notified to the FIU. For banks, it is necessary to define the basic standards of bank behaviour towards itself, within the bank and especially towards clients. In addition to ethical principles, it is important for the bank to identify also regulated rules of conduct in relation to clients and investors regarding integrity, transparency and avoidance of conflicts of interest in the conduct of banking activities.

The Act on the Protection of Legalization of Income from Crime and Terrorist Financing also defines the Financial Intelligence Unit as a special unit within the framework of the Financial Police Service and defines its tasks and powers. We can see the positive results of this Act in increasing dynamic development of received unusual transaction reports (UTR) after 2008 (Figure 1).

**Figure 1: Dynamic Development of Received UTRs Between 2007-2016**

Source: Author's calculations based on Annual Reports of Financial Intelligence Unit of the SR 2009-2016 available on <https://www.minv.sk/?informacie-o-cinnosti-1>

From March 15, 2018, the Amendment to the Act on Protection against the Legalization of Proceeds from Crime and Terrorist Financing, adopted by Slovakia on the basis of a European Parliament Directive, will enter into force. A law that regulates the rights and obligations of the obliged person, concerns more than 500,000 companies. Possible sanctions for its violation may amount up to Euro 5,000,000. These legislative changes are mainly a response to the ongoing developments in money laundering and terrorist financing. The amendment increases

the requirements for client control. The Slovak Republic has been reproached of shortcomings by the MONEYVAL Committee of the Council of Europe. The reason is also an increase in unusual box-office business transactions (e.g. PANAMA Papers), increasing the involvement of grey knights in carousel VAT scams, a 100% increase in phishing, a significant increase in deposits on corporate accounts with tax havens maintained by the Slovak banks, conducted by Chinese citizens living in Hungary, abuse of stolen identity (also corporate), increased fraud, network security breaches, cybercrime and many other activities. (British Chamber of Commerce in SR [online], 2018).

The methods used for money laundering are increasingly sophisticated and complicated, which also makes them more difficult to detect. It is anticipated that in the coming period the attention of the perpetrators of this activity will focus mainly on:

- a. the misuse of electronic money by using more sophisticated ways of committing crime using false identification documents and people in need who are usually resident outside the European Union,
- b. establishment of specialized companies and profiling of professionals carrying out hiding and placing of proceeds from crime and their legalization to order,
- c. investments of foreign entities committing criminal activity in the Slovak Republic and vice versa; investments in real estate, securities, goods of high value and in the shares of companies,
- d. private banking, which offers, in particular, wealthy clients comprehensive banking services, securities transactions issued by the client's bank,
- e. increased organizer and flexibility of offenders to place illegally acquired funds, mainly from Internet fraud and phishing; in the case of organized groups, it is often a national community, and there is a prerequisite for the mutual cooperation of several such groups of different nationalities,
- f. use of domestic and foreign accounts for on-line betting,
- g. expansion of high gambling on the territory of the Slovak Republic,
- h. gradual transfer of trafficking in human beings, drugs, weapons and stolen motor vehicles from natural persons to commercial companies,
- i. gradual engagement of the non-financial sector (notably notaries, lawyers, auditors, tax advisers, accountants and estate agents) into the legalization process,
- j. actively engaging tax advisers and accountants in placing, blending and integrating illegally acquired money into the legal economy,
- k. increasing the number of non-profit organizations, non-investment funds and foundations, while increasing the number of foreign financial transactions through these organizations,
- l. placement of proceeds from crime on life insurance accounts and other alternative savings products outside banks,
- m. increasing the number of transactions realized in favour of companies with headquarters in the so- tax havens or in favour of companies that are registered in a European Union country but which are property linked to companies registered in offshore areas,
- n. enforcement of claims for the refund of value added tax and subsequent placement of revenues in a legal business environment.

#### **4. Conclusion**

Combating Money laundering is an important part of the overall fight to drug traffic, organised crime and since a number of years, also against terrorist financing. Thirty years after adoption

of the first international convention, the United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances we can see that this fight is not over yet. Just the opposite. Every day we can realize new challenges to combat money laundering and terrorist financing. The globalisation and new technologies has shaped the world these past few decades. For all the good the open borders and online-bank transfers have given us, it has also given criminals a whole new playing field in which to transfer and conceal illicitly gained money, allowing them to lower the transaction costs of crime. It is more and more difficult to control the hundreds of billions of transnational transactions that take place yearly all over the world.

The Treaty on European Union provides the legal basis for the adoption of directives on the approximation of the laws of the Member States where their object is the establishment and functioning of the internal market, including the regulation of anti-money laundering measures. In order to safeguard the proper functioning of the financial system and the internal market, European legislation has been adopted. Given the changing nature of the dangers of money laundering and terrorist financing, supported by the continued development of technologies and means available to offenders, it is still necessary to adjust the legal framework in response to these threats. We have just implemented the Fourth Directive to our legal system and a new political agreement was reached between European Parliament and the presidency to strengthened EU rules to prevent money laundering and terrorist financing. The main objectives of this new initiatives are to prevent the use of the financial system for the funding of criminal activities and strengthening transparency rules to prevent the large-scale concealment of funds. The aim is to close down criminal finance without hindering the normal functioning of financial markets and payment systems. Amending directive 2015/849, the agreed text seeks to balance the need for increased security with the protection of fundamental rights and economic freedoms.

The anti-money laundering legislation in Slovak Republic is in accordance with international and European Union standards but still we can still see reserves in their application in practice.

## **Abstract**

*The aim of this paper is to analyse the spatial and spatio-temporal dependences in matters related to the consumption structure of the Europe across countries in the years 1999-2015. The division of this area into two parts (north-west and central-east) considering the wealth of countries was investigated. This accurateness is the basis for verifying, whether, the consumption structures in these parts of Europe are similar and rely on the values of disposable income observed in countries. The spatial and spatio-temporal tendencies and dependences are surveyed using the conception of spatial and spatio-temporal trends and spatial autocorrelation. The relationship between consumption of the individual groups of goods and the disposable income is investigated using regressive-autoregressive spatial models.*

**Keywords:** *consumption structure, disposable income, spatial autocorrelation, spatial trend*

**JEL Classification:** *C10, D13, E21, I0*

## **1. Introduction**

Consumption is the main factor in Gross Domestic Product (GDP) in all economies. Richer countries are characterised by a higher income, which is then spend for purchasing goods. Therefore the disposable income of households is the main consumption factor. Moreover richer households can afford to buy more luxury goods than the others. It means that the wealth of households influences its consumption structure.

Household final consumption expenditures on chosen groups of goods have been converging for a long time. It means that the consumption structure in the European countries is becoming more and more similar (Nowak and Kochkova; 2011). It can be the result of the convergence process in Europe. This process was investigated by many researchers in their papers, e.g. Carnicky et al. (2016), Corrado et al. (2005), Dall'Erba and Le Gallo (2008), Kulhánek (2012) and von Lyncker and Thoennessen (2017).

The issues of diversification of consumption structure in the European countries have already been discussed, e.g. by Kuśmierczyk and Piskiewicz (2012) and Grzega (2015). They concern noticeable disproportions in the households consumption in Europe. In their papers they look at north-west and east Europe as regions with different consumption structures. Nevertheless, it is difficult to find application of spatial econometrics methods in this topic, although the processes are observed in the spatial units. According to the author, it is significant supplement

to previous studies. Spatial econometrics methods can confirm significance of the spatial differences in the shape of spatial processes.

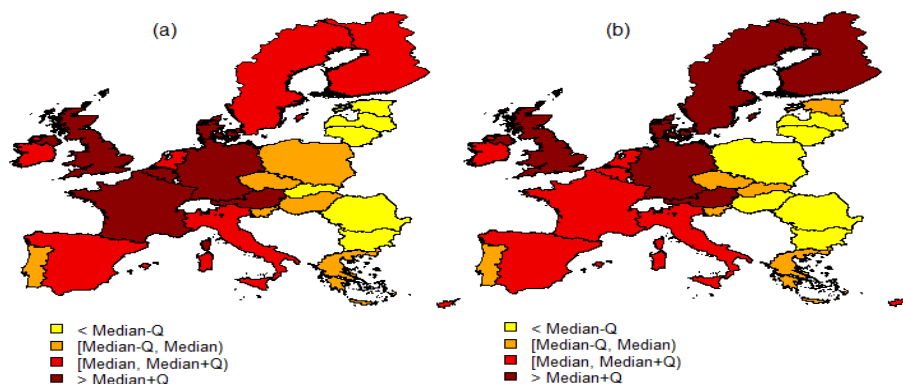

The primary aim of the study is to analyse spatial and spatio-temporal dependence in the consumption structure of the European Union countries (excluding Croatia, Cyprus and Malta) in the period of 1999-2015. There are two groups of goods to be analysed: food and non-alcoholic beverages and also recreation and culture. The first group represents necessity goods, the second – luxury goods. The next step is to analyse influence of the disposable income on these consumption groups considering spatial tendencies and dependence. For the author, from all groups of the Classification of Individual Consumption According to Purpose (COICOP), chosen groups of goods best reflect the character of necessity and luxury goods. In turn, this research indicates the opposite influence of the disposable income on these two groups of goods. That is why these consumption groups have been analysed.

### 1.1 Disposable Income and Consumption

Households disposable income is the main factor determining their consumption level and consumption structure. The consumption of households with higher income are much more diverse than the poorer ones. Thus, the structure of consumption between countries is different.

Figure 1 shows the spatial differentiation of the disposable income (per capita) in the European Union in the years 1999 and 2015.

**Figure 1: Disposable Income per Capita in Europe in the Years 1999 (a) and 2015 (b)**

Source: own elaboration (2018).

Figure 1 presents the certain tendency in both years of investigation. High level of the disposable income (more than median) is observed in west and north part of Europe. Central-east part of the continent is dominated by countries with lower level of disposable income. Maps in Figure 1 clearly indicate the fact that the EU is divided into two parts. The first is north-west Europe and the second is central-east Europe.

## 2. Problem Formulation and Methodology

The study concerns the influence of the disposable income on the consumption structure in EU countries (excluding Croatia, Cyprus and Malta) in the period of 1999-2015. The following indicators have been analysed: the share of final consumption expenditures of households on two groups of goods – food and non-alcoholic beverages and also recreation and culture – in total final consumption expenditures.

The adopted time range and spatial aggregation of this study makes it easy to see the spatial and spatio-temporal tendencies in the shape of the analysed variables. These tendencies and dependence are investigated using the conception of the spatial and spatio-temporal trend, and spatial autocorrelation. For each year of the research classical regression models or spatial models of the impact of disposable income on chosen consumption groups are estimated and verified. Next the spatio-temporal models of the dependence of consumption structure on the disposable income are estimated and verified.

The first hypothesis in this study concerns the large diversity of final consumption expenditures on food and non-alcoholic beverages and also recreation and culture across Europe. The second one applies to the influence of an increase in the disposable income: (1) the negative influence on the share of final consumption expenditures of households on food and non-alcoholic beverages in total final consumption expenditures, and (2) the positive one on the share of final consumption expenditures of households on recreation and culture in total final consumption expenditures.

## 2.1 Data and Model

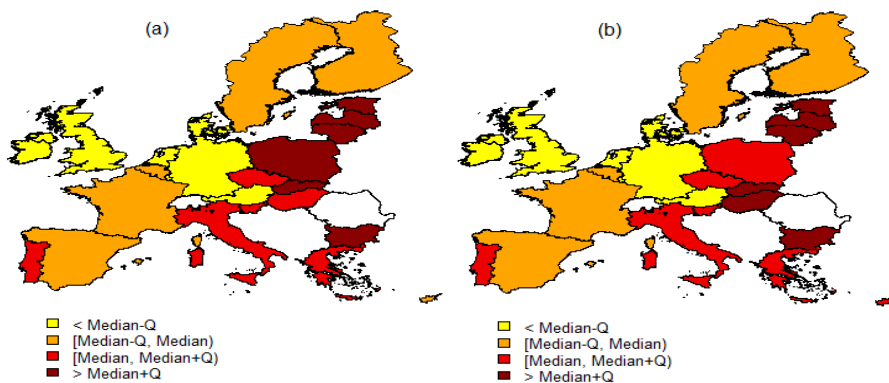

In subsections 2.1.1, 2.1.2 and 2.1.3 source and character of the data, used methodology and results of study are described.

### 2.1.1 Data

The data applied in this study come from the European Statistical Office database. Variables regarding the share of final consumption expenditures of individual categories of goods in total final consumption expenditures are taken directly from database. The values of disposable income per capita are obtained through own calculations. The calculations and figures are made using R-Cran software (version 3.4.1).

Figure 2 shows the spatial differentiation of the share of final consumption expenditures on food and non-alcoholic beverages in total final consumption expenditures ( $Y_1$ ). The highest value of analysed variable in both years is noted in Romania. All EU countries from central-east Europe are characterized by values higher than median. The spatial distribution of this variable displays an opposite regularity as compare with the distribution characterising the level of disposable income per capita.

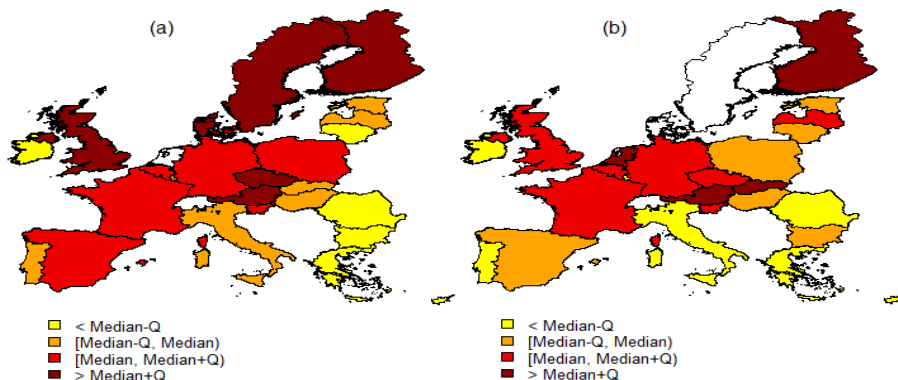

**Figure 2: Share of Final Consumption Expenditures on Food and Non-alcoholic Beverages in Total Final Consumption Expenditures Across Europe in the Years 1999 (a) and 2015 (b)**

Source: own elaboration (2018)

Figure 3 shows the spatial differentiation of share of final consumption expenditures on recreation and culture in total final consumption expenditures ( $Y_2$ ). The highest value of this variable in 1999 is noted in Belgium, instead in 2015 in Sweden. In general, north-west part of Europe is dominated in both years of analysis by countries with the highest level of consumption expenditures on recreation and culture. The spatial distribution of this variable is compatible with the distribution characterising the level of disposable income per capita.

**Figure 3: Share of Final Consumption Expenditures on Recreation and Culture in Total Final Consumption Expenditures Across Europe in the Years 1999 (a) and 2015 (b)**

### 2.1.2 Methodology

The investigation starts with a research of trend-autoregressive structures of the analysed spatial processes for each year of study. The models of spatial trend are used (Schabenberger and Gotway 2005: 235) and the spatial autocorrelation is tested (Moran 1950, Schabenberger and Gotway 2005: 21). Spatial autocorrelation investigates whether the values of spatial process in neighbouring spatial units are similar or not. Statistically significant positive value of the Moran's  $I$  statistics says that the processes in the neighbouring spatial units are at the similar level. The negative value of this statistics says that the processes in the neighbouring spatial units are at the different level. Random position of the values of the considered process is verified when Moran's  $I$  statistics is statistically non-significant. It is a few possibilities to define neighbourhood. In this research the matrix of connections based on the common border criterion is used.

Then, the spatio-temporal tendencies in analysed variables are investigated using spatio-temporal model (Szulc 2007: 103).

For spatial and spatio-temporal models exhibiting the spatial autocorrelation spatial autoregressive models (Anselin et al. 2004: 34, Arbia 2006: 111) or spatial error models (Anselin et al. 2004: 34) with the influence of disposable income per capita are estimated and verified. Choice between SAR and SEM models is made using LM tests (Anselin et al. 2004: 37-39).

### 2.1.3 Model Calibration

In the first step of the research, spatial trend models are estimated and verified, and spatial autocorrelation is tested. Table 1 presents the results of its estimation and verification.

Source: author's calculations

The degree of the spatial trend for the variable  $Y_1$  is not fixed in all years of research. Only from 2014 the spatial autocorrelation is noted. In the whole period of analysis spatial differentiation of the variable  $Y_2$  is characterized by a second-degree spatial trend and the spatial autocorrelation is not observed. These processes are highly explained by the spatial position (coefficients of determination in spatial trend models for the variable  $Y_1$  are over 0.7 and for variable  $Y_2$  over 0.55).

Table 2 shows the influence of the disposable income on the final consumption expenditures on food and non-alcoholic beverages and recreation and culture. In most of the years, the analysed dependence is significant (adopted level of significance for analysis is 0.05) for variable  $Y_1$ . In the whole period, the sign of estimate of parameter is negative for both variables. Only in the years of 2008-2010 and 2014-2015 the disposable income has a significant influence on the final consumption expenditures on  $Y_2$ .

Source: author's calculations

Then, the spatio-temporal models for analysed variables are estimated and verified. The third-degree of spatio-temporal tendency for variable  $Y_1$  and second-degree of spatio-temporal tendency for variable  $Y_2$  are noted. In both cases, the spatial autocorrelation in model residuals

is observed. Wherefore the spatial dependences are included in models with influence of the disposable income on the share of consumption of chosen groups in total consumption. The spatial autoregressive model for variable  $Y_2$  and the spatial error model for variable  $Y_1$  are estimated. Also in models the following influences on  $Y_1$  and  $Y_2$  are considered: the disposable income per capita in countries (parameter  $\alpha$ ) and the disposable income per capita in neighbouring countries (parameter  $\beta$ ).

The models contain statistically significant parameters. The estimates of the parameters  $\alpha$  and  $\beta$  are negative and positive respectively. Then, the residuals from both models do not show spatial autocorrelation.

### 3. Conclusion

The analysis shows that the consumption of food and non-alcoholic beverages, as well as recreation and culture in Europe is spatially diversified. The countries with higher level of the disposable income consume less food and non-alcoholic beverages than the other ones. This dependence is verified with spatial error model, including also spatio-temporal trend. Dependence of the recreation and culture consumption from the level of disposable income is noted to the same degree as the previous group of consumption goods; although these groups represent goods with different character (necessity goods and luxury goods). The models for the consumption of recreation and culture, as well as food and non-alcoholic beverages require an extension with new processes, e.g. price level in European countries. This will be one of the next steps in the further research of this topic. Moreover the analysis will be extended by spatio-temporal modelling of food, culture, non-alcoholic beverages and recreation separately after the division of groups analysed in this paper.

## **Abstract**

*Fiscal policy has started to regain a lost attention in recent years, both in the academic research and in the government policy agendas. The reasons is obvious, primarily in the European context. Financial, economic and subsequent debt crises have hit the EU economies especially hard and their recovery seems to be rather gradual. The European economies still suffer from the problem of over-indebtedness and the problem of excessive budget deficits. Therefore, the aim of the paper is to evaluate basic economic, institutional and political determinants of budget deficits in the European Union countries. We use an unbalanced cross-country time series data set, comprising all 28 EU countries over the period 1995-2016. Fiscal policy seems to play a stabilizing role, but its counter-cyclical reactions are significantly stronger in recessions, while it does not react to current inflation and changes in the government bond yields. Moreover, some political and institutional variables play statistically significant role as well and appear to be important determinants of fiscal deficits.*

**Keywords:** budget deficit, fiscal policy, political budget cycle, political economy

**JEL Classification:** C26, D72, E62

## **1. Introduction**

Fiscal policy has gained increased attention in recent years, both in academic research and in governments' policy agendas. The reason is quite clear. Financial, economic and subsequent debt crises have hit the EU economies especially hard and their recovery seems to be rather gradual. Fiscal policy has started to play a more prominent role during the crisis and have aroused new questions about its further direction. Partial reassessment of fiscal policy is taking place, stressing its more important role in smoothing the economic cycle and ensuring sustainable economic growth.

On the contrary, the high increase in fiscal deficits during the crisis has reopened up the question of the public finance sustainability and the question of the future of the European welfare state. European fiscal policy thus must manage to sail between the Scylla and Charybdis, between the more active role in the stabilizing the economy and the task to stabilize public debts and budget balances. It is clearly the task of achieving better results in a more constrained environment. Political economy provides an explanation of why this task can be particularly difficult and why its difficulty may vary across EU countries.

Academic research evaluating fiscal policy can be divided into the two main directions. First direction solves the question how economic and social conditions affect fiscal positions. Second direction solves the opposite, how fiscal policy actions affects economic environment.

In this paper, we focus on the first question, assessing economic, institutional and political determinants of government budget deficits.

The aim of the paper is to evaluate fiscal policy reactions to the changes in the economic environment and to assess basic institutional and political determinants of the budget deficits in the European Union countries. The paper proceeds as follows. Section 2 is the literature review. Section 3 includes a description of the data, empirical strategy and underlying empirical model. In Section 4, we discuss the results of the analysis. Section 5 concludes.

## **2. Literature Review**

The paper is empirically oriented and therefore we offer only a survey of the empirical literature in this section. However, let us mention that a large body of literature is devoted to theoretical background of our topic. Leading studies in the political economy or “new political economy” (see especially Drazen (2002) and Persson and Tabellini (2000)) emphasize how private agents’ preferences influence public policies and how budget deficits are partly a reflection of opportunistic behavior of policymakers and changeable institutional design. These studies state that deficits can be explained by more factors (including institutional and political factors) than by economic variables only.

Barro (1979) set up an empirical model based on his equilibrium approach. Changes in the stock of nominal debt were explained mainly by average anticipated rate of inflation, changes in the real government expenditures, corporate bond rates and yields on 10 and 20-year bonds and trend value of real GNP. A central proposition of the model was that deficits are varied in order to maintain expected constancy in tax rates. The model is known as the equilibrium approach to fiscal policy, because it suggests keeping the tax rates constant over time, while deficit will emerge during recessions and surplus during expansions. Barro’s model was rather basic settings for subsequent research since persistent budget deficits during peacetime have increased attention in institutional and political determinants of the deficits.

Political determinants can substantially vary across countries and even within the same country in time. For example, it is usually supposed that left-wing governments are more willing to accept rising government deficits than right-wing governments. Theoretical explanation is mainly based on Hibbs (1977) and Frey and Schneider (1978) and some empirical evidence has been provided by Roubini and Sachs (1989a) or Perotti and Kontopoulos (2002).

Roubini and Sachs (1989b) offer another way in which the design of the political institutions can affect the fiscal outcome. They found out those coalition governments in the industrialized countries (OECD countries) experience higher budget deficits than one-party, majoritarian governments. It results from the difficulties of political management in coalition governments and it is worsened by the presence of many political parties in the ruling coalition.

Some studies suggest that instability and political polarization are negatively correlated with the public debt amount and budget deficits. Alesina and Tabellini (1990) observed that a public debt is positively affected by the degree of polarization between alternating governments. In the similar way, Grilli, Masciandaro and Tabellini (1991) measured a negative relationship between debt accumulation and the frequency of government changes in the OECD countries. Haan and Sturm (1994) have found the same results for countries of European Community in the 1980s.

A fairly wide stream of literature investigates situations, in which politicians attempt to ‘bribe’ voters in election years by extra government handouts. It is a theory of political budget cycle which states that we can expect higher budget deficits in the time of elections (see Person and

Tabellini (2002) and Shi and Svensson (2006)) especially for theory and Brender and Drazen (2005), Alt and Lassen (2006) or Hagen (2006) for empirical findings.

On the other hand, some studies focuses mainly on wider institutional determinants of budget deficits and debts. For example, Hagen (1992) argue that budgeting procedures and fiscal rules should have important consequences for the sustainability of fiscal policy. Hagen (1992) examines European Community (EC) countries using 1970s and 1980s fiscal data and expert characterizations of budgeting procedures. He observed that long-term fiscal constraints have positive role in achieving fiscal discipline, although the results were not sufficiently statistically significant. Significant effects of fiscal rules on fiscal discipline have been however found by many more recent studies (see e.g. Debrun et al. (2008) or Hagen (2006)).

### 3. Data and Methodology

This section will first describe the data used for the estimation, then postulate the empirical model and finally discuss the details of the estimation methodology.

#### 3.1 Data

We use an unbalanced cross-country time series data set, comprising all 28 EU countries over the period 1995-2016. Our final sample consists of 616 observations that almost all have data on government fiscal budget balance and elections, but may have missing values for other variables. An autoregressive (dynamic) panel model is employed, including a number of economic, social and political variables.

Data are obtained from the World Bank (WB), Eurostat and the International Monetary Fund (IMF) as well as from the Database of Political Institutions (see Cruz, Keefer and Scartascini, 2016), Comparative Political Data Set 1960-2014 (Armingeon et al., 2016) and Fiscal Rules database (European Commission, 2017).

#### 3.2 Regression Model

We use a dynamic panel data framework to test theoretical assumptions of determinants of government budget deficits. First, we use basic empirical model similar to that of Barro (1979) and then we modify it in line with the assumptions of the new political economy. We can specify our baseline model as follows:

$$DEF_{it} = \alpha DEF_{it-1} + \beta \Delta GDP_{it} + \gamma ASYM \Delta GDP_{it} + \delta X'_{it} + \mu_i + \varepsilon_{it} \quad (1)$$

where  $DEF_{it}$  is the dependent variable, the budget deficit to GDP ratio,  $\Delta GDP$  is percentage change in GDP,  $ASYM \Delta GDP_{it}$  is asymmetrical fiscal response to a negative output gap,  $X'_{it}$  is a row vector of economic control variables,  $\mu_i$  captures unobserved country-specific effects and  $\varepsilon_{it}$  is the error term. The vector of economic control variables contains  $X'_{it} = (\Delta YIELD_{it-1}, INFL_{it})$ , where  $\Delta YIELD_{it-1}$  is lagged change of government bond yields with 10 years' maturity and  $INFL_{it}$  is inflation rate for given year, defined as percentage change in the price level from the previous year.

A percentage change in GDP,  $\Delta GDP_{it}$ , measures the fiscal responsiveness to macroeconomic conditions. The variable operates mainly through automatic stabilizers. In a recession, a counter-cyclical fiscal policy is automatically performed through increasing unemployment-related expenditures and decreasing tax revenues (vice versa in a boom). However, the variable can capture additional effects that arise from discretionary fiscal policy as well. Tujula and

Wolswijk (2007) point out that literature considers possible asymmetries in fiscal responses to recessions and upturns (see e.g. Mayes and Virén, 2000). Governments often pursue expansionary policy in recessions, but in economic upswings, they use the cyclical budgetary surpluses for cutting taxes or increasing spending rather than for reducing deficits. For that reason we control asymmetrical fiscal response to a negative output gap by  $ASYM\Delta GDP_{it}$ .

A variable  $\Delta YIELD_{it-1}$  is included in the original paper by Barro (1979) and in many others (sometimes in various variations as the change in debt-servicing costs or spread of country's sovereign debt bonds), see e.g. Alessina and Hausmann et al. (1999) or Volkerink and Haan (2000). The variable is lagged change of government bond yields with 10 years' maturity and we expect that higher interest rates worsens fiscal stance of current government via increasing debt-servicing costs. On the contrary, higher interest rates on government bonds can lead to the signalling behaviour of the government in an effort to stabilize fiscal balance and to reduce yields from bonds. In conclusion, we are a priori unsure which of the effects prevails.

An expected inflation  $INFL_{it}$ , is another variable included by Barro (1979) and some of the recent studies (Maltritz and Wüste, 2015 or Tujula and Wolswijk, 2007). Tujula and Wolswijk (2007) state that inflation can have an automatic effect on government receipts and expenditures through nominal progression in tax rates and tax brackets as well as through price-devaluation of government expenditures. On the contrary, if we conclude about expected inflation, higher expected inflation erodes the real value of nominal government debt and it can lead to excessive government deficits in the present. Therefore, the overall effect of inflation on budget balance is not a priori clear.

Now, we can specify our enlarged model in line with the findings of the new political economy:

$$DEF_{it} = \alpha DEF_{it-1} + \beta \Delta GDP_{it} + \gamma ASYM\Delta GDP_{it} + \delta X'_{it} + \theta W'_{it} + \vartheta Z'_{it} + \mu_i + \varepsilon_{it} \quad (2)$$

where  $W'_{it}$  is a row vector of institutional and social variables defined as  $W'_{it} = (DEP_{it} RULE_{it})$  and  $Z'_{it}$  is a row vector of political variables  $Z'_{it} = (IDEO_{it} ELE_{it})$ .

A variable  $DEP_{it}$  denotes old-age-dependency ratio defined as number of persons aged 65 and over and the number of persons aged between 15 and 64. A higher  $DEP_{it}$  is expected to lead to a lower budget balance, i.e. a negative sign is predicted. It is largely used to control generational burden on public budgets (see Klomp and Haan, 2013 or Ademmer, Dreher, 2016).

Another explanatory variable,  $RULE_{it}$ , is included to control institutional constraints imposed on fiscal policy. It is Fiscal Rule Index published by European Commission and reflects the strength of the fiscal rules in the European countries. A higher index means better and stronger fiscal rules, so we expect positive relationship with the budget balance. The influence of fiscal rules on fiscal policy is a widely discussed and analyzed topic in political economy (see e.g. Debrun et al. (2008) or Hagen (2006)).

Variables  $IDEO_{it}$  and  $ELE_{it}$  are basic political variables which are commonly used in many studies on political determinants of fiscal policy (see e.g. Roubini and Sachs (1989a) or Shi and Svensson (2006) and discussion in Section 2). The variable  $IDEO_{it}$  denotes dummy variable, which equals 1 if the current government is left-wing and 0 otherwise. Finally, the variable  $ELE_{it}$  denotes the year in which the government gets elected. It equals 1 if an election takes place and 0 otherwise. We hypothesize that left-wing governments produce higher budget deficits (negative relationship) and that budget deficits are higher in the time of elections (negative relationship).

### 3.2 Methodology

We can expect that unobserved country-specific effects ( $\mu_i$ ) (see equations 1 and 2) are different across countries, meaning that the simple OLS estimator would be biased. This is the case because the vector of the lagged dependent variable  $Y_{i,t-1}$  is endogenous to these country-specific effects (violation of the assumption of orthogonality, for more see e.g. Roodman, 2006). Most empirical studies therefore employ Fixed Effects (FE) in order to allow for cross-country differences. However, the commonly used Within Groups (WG) estimator is problematic as well, especially if the number of periods is low. It is well documented that the WG estimator does not eliminate the dynamic panel bias that is in the order of  $1/T$  (Nickell, 1981; Kiviet, 1995).

For that reason we use Blundell and Bond (1998) estimator (or System GMM estimator), which is based on the Arellano and Bond (1991) estimator (or FD GMM estimator) and uses the Generalized Method of Moments (GMM) with Instrumental Variables (IV). The Arellano and Bond (1991) estimator uses the lagged levels of the dependent variable as instruments for equations in first differences. On the other hand, Blundell and Bond (1998) use a system of equations where lagged differences of dependent variable are instruments for the equation in levels, in addition to the lagged levels used as instruments for equations in first differences. It is important to note that the System GMM estimator does not magnifies gaps in unbalanced panels as FD GMM do. Moreover, it is asymptotically more efficient which is why the former is our preferred specification.

In order to alleviate some known problems within the GMM approach, we use a two-step GMM estimator, which is robust to panel-specific autocorrelation and heteroscedasticity. To avoid the fact that its standard errors are downward biased in small samples, we use Windmeijer (2005) finite-sample correction, which yields a finite-sample corrected two-step covariance matrix. A second common issue is a problem of too many instruments (see Roodman, 2009), which can make some asymptotic results of the GMM estimators and the related specification tests misleading. To mitigate this problem we use only a subset of the available instrument matrix.

We test the validity of the instrumental variables in two ways. First, we examine the second order serial correlation of differenced residuals (AR2), as proposed by Arellano and Bond (1991). If the null hypothesis of the test (no serial correlation) is not rejected, we can treat the instrumental variables as valid. Second, we test the validity of all orthogonality conditions for the overidentified model by the Hansen (1982) test. This test verifies the validity (exogeneity) of instruments' subsets and it is preferable for the two-step estimation. We test null hypothesis that residuals are uncorrelated with instruments. If the hypothesis is not rejected, we can treat the instruments as orthogonal.

## 4. Results and Discussion

This section presents our empirical results regarding determinants of the budget deficits in the EU countries in 1995-2016. We present and discuss results of the baseline model in the first part of this section. In the second part, we describe empirical findings on the empirical model of political economy, which includes political and institutional variables.

#### 4.1 Baseline Model

Table 1 in the Appendix reports the results of baseline model (tax smoothing model, M1) in the period 1995-2016 for 27 countries of the European Union.<sup>7</sup> The second column features results of our preferred specification, namely system GMM estimation (two-step Blundell-Bond procedure) using the Windmeijer (2005) finite-sample correction.

The coefficient of the lagged dependent variable,  $DEF_{it-1}$ , is relatively large and statistically significant in this specification (and in all others) indicating significant persistence over time. Most interesting of all are the fiscal policy responses to the business cycle. The coefficient on a variable  $\Delta GDP$  is an elasticity of the balance of the government budget. It is a percentage change in the budget balance GDP ratio in response to a one-percentage point increase in the GDP. Given that we control an asymmetrical fiscal response to a negative output gap by  $ASYM\Delta GDP_{it}$ , the coefficient on  $\Delta GDP$  is in fact a reaction of the budget balance to a positive output gap. Overall response of the budget balance to changes in GDP, regardless of the positive/negative output gap is therefore approximately 0.247. A statistically significant and positive response means that overall budget balances had a stabilizing role in the examined period. The overall elasticity reported is comparable with Virén (2000) study, which concludes values ranging 0.2-0.3 for EU countries. It is slightly higher than Tujula and Wolswijk (2007) measured in the 22 OECD countries in 1970-2002 (roughly 0.15) and almost the same as Alesina, Campante and Tabellini (2008) reported for OECD countries during 1960-1999 (0.261).

Large positive reaction displayed in the coefficient  $ASYM\Delta GDP_{it}$  (0.174) shows that deficit elasticity in recessions is considerably higher than in the economic upswings (these two elasticities significantly differ). The higher response reflects that automatic stabilizers play more important role in the time of recessions. If  $\Delta GDP$  decrease by 1 percentage point, budget balance decrease by 0.34 (0.17 + 0.17) in the case of recession and only about 0.17 in the case of economic upturn (positive output gap). A fiscal policy seems to be more counter-cyclical in the recession for that reason. On the contrary, there are probably more pro-cyclical policies in the economic upturns – the GDP is increasing and governments can spend more (they work against automatic stabilization) and it reduces the measured elasticity.

Fiscal policy in the European countries however reacts to a current inflation and lagged yields from government bonds as well. The coefficient on the  $INFL_{it}$  is negative which can signify that governments expect government debts to be eroded by higher inflation and therefore promote excessive deficits. On the other hand, we can observe stabilizing reactions to the increasing lagged change of government bond yields ( $\Delta YIELD_{it-1}$ ). A higher interest rate in the previous period seems to push governments to improve a fiscal position through the reducing deficits. Our findings on  $\Delta YIELD_{it-1}$  are in line with findings of Volkerink and Haan (2000) who found the stabilizing reaction of fiscal policy to the higher interest payments from the government debts. On the other hand, our results are inconsistent with studies Alessina and Hausmann et al. (1999) or Alesina, Campante and Tabellini (2008) which investigated similar debt-costs variables.

---

<sup>7</sup> Estonia is not included because it did not use an active monetary policy in the examined period (Estonia operated with the currency board system) which has resulted in modest issuance of government bonds. Estonian data on the long-term interest rates are therefore rather problematic. Estonia will be included in the adjusted political economy model in the next chapter.

The reported Hansen test of overidentifying restrictions and the Arellano-Bond test for second order serial correlation of the differenced residuals both have expected p-values (the null hypotheses are not rejected), see Table 1.

In sum, Barro's (1979) tax smoothing model does not seem to explain the behavior of fiscal policies in the EU quite well. Fiscal policy seems to play a stabilizing role, but the budget elasticity is much higher in the recessions. The question is, whether the results will hold even if we enlarge the baseline model by adding new "political-economy" variables.

#### 4.2 Political Economy Model

Table 2 in the Appendix reports the results of enlarged (political economy model, M2) in the period 1995-2016. We can observe that our results regarding the counter-cyclicality of the European fiscal policies remain quite stable, whereas the inflation and yields from the government bonds no longer seem to be significant factors of the budget deficits. These findings are consistent with the related literature on the political economy models of fiscal deficits (see e.g. Tujula and Wolswijk, 2007).

The coefficients on the political and institutional variables are in line with our expectations, although some of them are statistically insignificant. The levels of the government budget balances are negatively influenced by a higher old-age dependency ratio, whereas stronger fiscal rules have positive impact. Moreover, political variable  $IDEO_{it}$  shows that left-wing governments tend to record higher deficits. These results are generally consistent with studies cited above, although negative and statistically significant impact of left-wing governments to the budget balance is rather an exception in the related studies (see e.g. Alesina, Roubini and Cohen, 1997 or Perotti and Kontopoulos, 2002). On the other hand, elections do not seem to be a statistically significant determinant of the higher budget deficits (there is a correct sign at the coefficient  $ELE_{it}$ , but statistically insignificant).

In order to include all countries of the European Union we exclude variable  $\Delta YIELD_{it-1}$  from the regression in the third column (model M3). This variable showed to be statistically insignificant and prevented inclusion of Estonia. Moreover, it contains many gaps, which significantly reduces the number of observations. Generally, the results are not substantially different, except for dummy variable on elections,  $ELE_{it}$ , which is now statistically significant. The coefficient takes value -0.37 which is in line with previous studies on the political-budget cycle in the developed countries, see e.g. Mink and Haan (2006) for results from euro area.

Last column of Table 2 reports the results of the political economy model including the dummy for controlling recent economic crisis (model M4). The dummy takes 1 in the period 2008-2009 and 0 otherwise. Despite the fact that we control economic fluctuations via variables  $\Delta GDP_{it}$  and  $ASYM\Delta GDP_{it}$ , an adjustment for that specific period can give us additional insights. Again, the results only slightly differ from previous models (signs and statistical significance remain the same, although coefficients differ slightly in size), except asymmetrical fiscal response to a negative output gap,  $ASYM\Delta GDP_{it}$ . The coefficient is not statistically significant (although positive) which means that the fiscal policy reactions do not differ in the situation of the positive and negative output gap. These results are rather expectable and we will discuss them in the conclusions (Section 4).

Finally, let us add that the political-budget cycle dummy variable,  $ELE_{it}$ , is still statistically significant in our last specification (M4) which confirms the results of inclusion of all countries and the majority of observations in the model M3.

## 4. Conclusion

In order to answer the question of the role of the fiscal policy in the European Union, we tested panel data consisting from data on all 28 countries in the 1995-2006. Since the FD-GMM estimator has been found to have large finite sample bias and poor precisions when the time series are persistent, we employed the system GMM estimator by Blundell and Bond (1998) in our study.

First, we empirically tested the theoretical model which is based on the Barro (1979) approach. Results of this baseline regression gave us rather preliminary insight into the examined problem. We could observe asymmetric fiscal response to the negative output gap in the EU countries which is in contradiction with Barro's expectations. European fiscal policies seemed to play a stabilizing role, but especially in the recessions. Moreover, we found out stabilizing reactions of the fiscal policy to the increasing yields from government bonds. Second, political and institutional variables appeared to be important determinants of fiscal deficits in the enlarged political economy model.

What is interesting, statistical significance of the asymmetrical fiscal response disappeared after the inclusion of the dummy for crisis. It is probably due to the fact that we practically "excluded" 56 observations where the fiscal policy reacted the most counter-cyclically in the situation of the negative output gap across the European countries. For that reason, it seems to be crucial for the next analysis to divide examined period into the two – pre-crisis and post-crisis period. We can probably expect important variations in the fiscal policy reactions before crisis and after crisis. It regards even the included political variables. We can hypothesize that the political economy model could be more suitable for explaining fiscal policy reactions before GFC, whereas after the crisis the tax smoothing model could take its place. The after-crisis period is probably full of threats and sailing between the Scylla and Charybdis is probably more demanding. We can also hypothesize that political budget cycles differ across the countries and that they are probably more pronounced before crisis than after the crisis. Above-mentioned problems are probably the most serious limits of our analysis and should be solved in the forthcoming paper.

$\Delta$ GDP	0.174*** (3.67)
ASYM $\Delta$ GDP	0.171*** (3.12)
INFL	-0.207*** (-4.79)
$\Delta$ YIELD(-1)	0.177*** (3.5)
Hansen test	25,83 [0.934]
AB test	-0.10 [0.920]
No. observ.	457
No. countries	27

Columns report estimated coefficients with the z-statistics in brackets. \*\*\*, \*\*, \* denote significance at the 99%, 95%, and 90% levels, respectively. The instruments used in the system GMM regression are lagged levels (two periods) of the dependent variable for the differenced equation, and lagged difference (one period) for the level equation. The exogenous covariates and electoral dummies are instrumented by themselves in the differenced and level equations. This also applies to all other regressions.

### **Abstract**

*One of the security forces is the Fire Rescue Service of the Czech Republic. Its primary task is to protect lives and health of the population in particular from fires and other emergency and critical situations. FRS CR is involved in providing security of both the population of the Czech Republic, and of other countries of the European Union, in the form of special emergency response teams (Urban Search and Rescue - USAR) sent abroad. These USAR teams are registered in the CECIS (Common Emergency Communication and Information System) international database of the European Union. While performing these public services members of the FRS CR need special fire appliances. The first-response group of firefighting appliances is professionally denominated as firefighting vehicles. Traffic accidents occur occasionally while driving to emergency. Costs connected with these accidents adversely affect the economy of transport and, above all, threaten the operational capacity of fire units. The paper summarizes results of the analysis of the most numerous group of emergency vehicles – water tenders. One of the analysis objectives was to estimate the profile of the driver-fireman who caused the traffic accident.*

**Keywords:** estimation, EU civil protection, fire fighting vehicles, public services, traffic accident, transportation economic, Urban Search and Rescue teams - USAR

**JEL Classification:** C13, H41, R41

### **1. Introduction**

Contemporary human society is extremely interconnected, therefore natural disasters, fires or industrial accidents have an impact on much more people than in the past. The Fire Rescue Service of the Czech Republic (FRS CR) has the task to eliminate consequences of these incidents and help where necessary. As a member country of the European Union, the Czech Republic provides humanitarian assistance also to recipients abroad by sending abroad special emergency response teams - Urban Search and Rescue teams (USAR teams). As defined in Article 21, paragraph 2. g) of the Consolidated versions of the Treaty on European Union and the Treaty on the functioning of the European Union (European Union, 2010), “The Union

shall define and pursue common policies and actions, and shall work for a high degree of cooperation in all fields of international relations, in order to: ... assist populations, countries and regions confronting natural or man-made disasters.” The forms of humanitarian aid can be broadly divided into rescue, material, financial, advisory and combined assistance. The FRS CR has established special brigades - USAR teams - to provide rescue humanitarian assistance abroad. These USAR teams are registered in the CECIS - Common Emergency Communication and Information System international database of the European Union (USAR, 2017). USAR teams created within the FRS CR are prepared for search and rescue activity in collapsed buildings, managing fires, flood rescue work and interventions in chemical and environmental accidents. USAR teams and/or fire brigades need firefighting vehicles for providing this assistance.

Traffic accidents also occur while driving fire trucks, just as it happens to other road users. Dittmar (2005) stated that the traffic accidents while emergency driving were the second most frequent cause of firefighters’ tragic death in the USA. Čemerková et al. (2014) performed the analysis of traffic accidents in the Czech Republic and the Slovak Republic in the years 2001 - 2011. The most important factor in the road accidents with injuries and deaths in the Czech Republic was the length of motorways, according to their findings. The number of accidents declined with increasing length of motorways. Mesjasz-Lech (2016) described the sustainability of transport in Poland. The author established three kinds of indexes within this study, among which the social index was the first one. This index contained, among other factors, the number of persons killed in road accidents per 1,000,000 citizens. In 2013 within the EU-rated countries, Austria had the lowest index (1), the index for the Czech Republic was 7, while the Netherlands had the worst value of the index (14).

Because fatal accidents occur at FRS CR while emergency drives likewise (there were 1 firefighter’s death referred in FRS CR traffic accident statistics, both in 2015, and 2016, moreover 2 firefighters were killed during emergency rides in 2017), we decided to deal with the traffic accidents of firefighting vehicles, especially water tenders, while emergency driving.

## 2. Problem Formulation

The Police of the Czech Republic evaluate traffic accidents every year in their statistics. The latest published data evaluation is summarized in the document "Road Accident Report of the Czech Republic in 2016" (Police Presidium of the Czech Republic, 2017). The total number of investigated accidents was 98,864 and the material damage reached CZK 5,804 million in 2016. These numbers are high compared to some other EU countries.

For the comparison, there were 13,522 accidents in the Slovak Republic with a total damage of approximately CZK 1,110 million in the same period. Traffic accident statistics per capita are much worse in the Czech Republic. The number of accidents per 1 million inhabitants was 9,415 in the Czech Republic, while in the Slovak Republic it was 2,704 accidents, which is more than three times less.

We have focused on the following characteristics of traffic accidents in the CR when studying this document, and used them for our analysis.

*Main causes of traffic accidents.* Incorrect driving (54,961 traffic accidents), not giving way (14,771 traffic accidents) and speeding (14,283 traffic accidents) were the most common causes of traffic accidents caused by drivers.

*Length of driving experience.* The wrong way of driving (14,363 traffic accidents), speeding (7,170 traffic accidents), and not giving way (4,946 traffic accidents) were the main causes of traffic accidents caused by drivers with the experience up to 10 years. Traffic accidents mainly caused by the incorrect way of driving (16,286 traffic accidents), not giving way (5,971 traffic accidents) and speeding (4,860 traffic accidents) occurred in the group of drivers with the experience longer than 10 years.

*Age of the driver who committed the traffic accident.* The following numbers were recorded: 14,324 traffic accidents occurred in the age group of 21 - 29 years, drivers aged 30 - 39 caused 14,027 traffic accidents, drivers aged 40 - 49 caused 13,291 traffic accidents, and 8,968 traffic accidents occurred in the age group 50 - 59 years.

Two hypotheses have been formulated according to the above findings, before starting the accident analysis at FRS CR. The first hypothesis claims: Incorrect way of driving is the most common cause of traffic accidents. The second one predicts: Drivers under the age of 30 cause the majority of traffic accidents.

### 3. Methodology

Every year, the Ministry of the Interior - General Directorate of the Fire Rescue Service of the Czech Republic compiles traffic accident statistics. Results of this analysis are published by the Ministry in official documents, for example in Šnely (2011). The aim of the analysis is to compare the trend of traffic accidents at FRS CR units in the given year with previous years and to inform about the state of traffic accidents all units of fire protection. The statistics mentioned above evaluate and summarize overall results for the given year. However, these texts cannot capture all details on their approximately 30 pages. Our analysis is focused on these selected details. Individual reports of firefighting vehicles traffic accidents sent to the General Directorate of the FRS CR by mechanical service technicians from the regions, territorial departments and individual stations as required by the Machine Services Order (Fire Rescue Service of the Czech Republic, 2006) were a source of input data for our analysis. Before the beginning of the analysis, we decided to focus on the following criteria:

1. The traffic accident character – accident caused by firemen.
2. The purpose of the ride – emergency ride.
3. The type of fire appliance – water tender.

Primary records of traffic accidents from the "Fire Traffic Accident Report" form, which were collected centrally at the General Directorate of the FRS CR, were processed in MS Excel. These data were processed thereafter while using the same software by the authors. Elementary filtering functions in MS Excel were primarily used according to the above mentioned criteria. Specific traffic accidents records were studied in cases of unclear recorded data. The focus of the analysis on water tender vehicles was based on the following generally known facts. Water tenders are vehicles that run as the first-response vehicles in the emergency event. They are going to operate with the switched on warning lights as vehicles with the right of way. Thus, they do not have to follow certain traffic rules while emergency driving. Their drivers go on the edge of motor vehicle dynamics. These vehicles have the largest annual mileage of all types of firefighting vehicles. Acquisition value of water tenders always exceeds the purchase price of FRS CR other trucks. Solely special appliances are more expensive than water tenders, such as aerial ladders and hydraulic platforms. The frequency of accidents also corresponds to the fire vehicles structure. E.g., in 2015, the highest frequency of traffic accidents by the type of fire appliances was following: water tenders - 67 traffic accidents (41 %), passenger cars - 29 traffic accidents (18 %), command cars - 16 traffic accidents (10 %) of the total number

163 traffic accidents happened to all types of vehicles at FRS CR in the given year. Traffic accident analysis was carried out pursuant to statistics of 2011 to 2016. During this period, 58 traffic accidents were analyzed.

#### 4. Problem Solution

Results of the analysis of traffic accident statistics according to the above criteria are shown in the following tables. Causes of accidents, amounts of damages, the month in which an accident occurred, the driver's age and the driver's experience were evaluated for the recorded traffic accidents.

##### 4.1 Causes of Traffic Accidents

The initial steps in solving the task were focused on filtering traffic accidents by the cause. Table 1 summarizes all recorded causes of water tenders traffic accidents during emergency drives. Figure 1 shows the share of particular traffic accident cause over the period 2011 to 2016.

**Table 1: Causes of Traffic Accidents**

	2011	2012	2013	2014	2015	2016
<b>not keeping a safe distance</b>	4	6	5	2	3	3
<b>speeding</b>	5	3	8	9	6	4
<b>wrong bypassing</b>	5	6	11	13	10	10
<b>not giving way</b>	1	0	0	1	1	2
<b>dangerous reversing and turning</b>	9	8	11	6	6	8
<b>others</b>	2	0	3	5	1	1

**Figure 1: Shares of Particular Traffic Accident Cause, Years 2011 - 2016**

Source: own research based upon data from General Directorate of the FRS CR (2011-2016)

### 4.2 Damage Value at Traffic Accidents

The second step consisted in evaluating damages at firefighting vehicles. Table 2 summarizes the total damage on fire appliances and a surrounding area, i.e. on the roads and other traffic accident participants, during the given period.

Figure 2 shows the share of particular cause of the total damage value arising during the monitored period 2011 - 2016. The graph shows the cause of traffic accident, the value of the damage and its percentage of the total amount of damage for the 2011 - 2016 period. Speeding has proven to be the most serious cause of traffic accidents in terms of the damage value that resulted from this analysis.

**Table 2: Total Damage According to the Traffic Accident Cause**

	2011	2012	2013	2014	2015	2016
<b>not keeping a safe distance</b>	38 000	318 921	380 300	13 000	15 500	110 000
<b>speeding</b>	1 110 000	4 562 000	3 417 000	13 218 910	13 915 160	632 000
<b>wrong bypassing</b>	49 000	146 000	708 000	159 000	102 500	155 660
<b>not giving way</b>	100 000	0	0	320 000	190 000	62 800
<b>dangerous reversing and turning</b>	169 000	177 802	253 500	170 000	202 776	375 500
<b>other</b>	34 300	0	20 000	133 129	8 000	0

**Figure 2: Total Damage Value According to the Traffic Accident Cause**

Source: own research based upon data from General Directorate of the FRS CR (2011-2016)

Damage to the environment was filtered out from total damage in the subsequent evaluation, so that the amount of damage arising on fire vehicles could be obtained only. The total damage for each year is summarized in Table 3.

**Table 3: Damage to Firefighting Water Tenders by the Cause of Traffic Accident**

	2011	2012	2013	2014	2015	2016
not keeping a safe distance	38 000	278 921	315 300	0	5 000	50 000
speeding	1 110 000	4 500 000	3 266 000	12 703 910	13 458 160	440 000
wrong bypassing	49 000	28 000	650 000	20 000	34 000	80 660
not giving way	100 000	0	0	70 000	120 000	12 800
dangerous reversing and turning	169 000	59 802	68 500	25 000	77 776	275 500
others	34 300	0	0	43 129	0	0

Source: own research based upon data from General Directorate of the FRS CR (2011-2016)

In Figure 3, the overall share of individual causes of damage to firefighting vehicles is shown during the period 2011 - 2016. The damage to firefighting vehicles attained 92.3 %, while other environmental damage achieved only 7.7 %. Environmental damage was not recorded for its small share of total damage in the FRS CR statistics until 2011.

**Figure 3: Damage to Firefighting Vehicles by the Cause of Traffic Accident in 2011 – 2016**

Source: own research based upon data from General Directorate of the FRS CR (2011-2016)

**4.3 Frequency of Traffic Accidents in a Particular Month of the Year**

The third part of the analysis aimed to identify the frequency of traffic accidents for the water tender vehicles in the particular month of the calendar year and to compare it with the total statistics of the FRS CR. The result of our analysis is graphically illustrated in Figure 4.

**Figure 4: Frequency of Traffic Accidents (TA) in a Particular Month, 2011 – 2016**

Source: own research based upon data from General Directorate of the FRS CR (2011-2016)

Our results show a different fact compared to data in FRS CR statistics, see e.g. the 2015 report (Ministry of the Interior of the Czech Republic, 2016). According to the overall statistics for the years 2000 to 2015 the largest average number of traffic accidents occurred in December, February and June. The average number of traffic accidents over these 16 years ranges from 9 to 13 traffic accidents per month. Peaks and troughs occur identically three times a year and the average number is 11 traffic accidents per month. Our research showed that the highest frequency of the traffic accidents of the monitored vehicles was in January and February. On the other hand, our findings show significant extremes in the monthly accidents numbers that need to be concentrated on in the preventive educational activity at FRS CR units.

**4.4 Drivers' Age**

The fourth part of the analysis focused on the age structure of the drivers who caused the traffic accident, and the length of their driving experience. As for the year 2011 was unable to trace traffic accident reports (paper forms were shredded), the analysis was made for the period 2012 - 2016 only. The total number of evaluated drivers who caused a traffic accident was 49. The distribution of traffic accidents according to the age of drivers who caused a traffic accident is shown in Figure 5. The highest level of traffic accidents was found in the age group from 33 to 37 years (16 accidents) and in the age group from 43 to 46 years (12 accidents).

**Figure 5: Distribution of Traffic Accidents (TA) according to the Drivers' Age**

Source: own research based upon data from General Directorate of the FRS CR (2012-2016)

### 4.5 Length of Drivers' Experience

The last part of the analysis focused on the number of traffic accidents according to the length of the driving experience. The overall practice in driving was evaluated in these analyzes at first, the driving experience on firefighting vehicles at FRS CR was ascertained afterward. In Figure 6, the traffic accidents occurrence and the total length of the truck driver's practice are listed in the monitored period 2012-2016. Whereas two risky groups of drivers were profiled during the study of the drivers' age structure, the increase in traffic accidents number and a presumptive deterioration of driving skills was evident after 14 years of driving practice. The raise of accidents number continued until the 25th year of drivers' experience, thereafter numbers of traffic accidents diminished. The width of this interval (more than 11 years) could be the subject of further more detailed analysis.

**Figure 6: Number of Traffic Accidents (TA) in Relation to the Truck Driver's Practice**

Source: own research based upon data from General Directorate of the FRS CR (2012-2016)

During the second part of the analysis we focused on the distribution of traffic accidents according to the length of the driver's practice achieved in driving firefighting vehicles at FRS CR units. Results of the analysis for the period 2012 - 2016 are summarized in Figure 7. Most accidents occurred among drivers with the 4 - 6 years practice duration at FRS CR. The number of accidents does not decrease significantly even after acquiring further experience in the range of 7 to 19 years. The reduction occurs after 20 years of driving practice.

**Figure 7: Number of Traffic Accidents (TA) in Relation to the Driver's Practice Achieved at FRS CR**

Source: own research based upon data from General Directorate of the FRS CR (2012-2016)

## 5. Conclusion

The paper focused on the analysis of road traffic accidents in the CR which is considerably higher than in some EU Member States (e.g. in the Slovak Republic) according to police statistics. In the framework of the overall road accident survey, we mainly focused on traffic accidents of firefighters during the rides for intervention at FRS CR. We also dealt with the causes of accidents and the relationship between the number of accidents and the age of drivers who caused a traffic accident.

In the beginning of the analysis, two elementary hypotheses were stated based on the Road Accident Report (Police Presidium of the Czech Republic, 2017). After evaluating results of the presented analysis we had to state that these hypotheses have not been verified. The characteristics of firefighting vehicles traffic accidents, specifically of water tenders accidents, were different from the overall police statistics.

The first hypothesis declared: Wrong way of driving is the most common cause of traffic accidents. This hypothesis has not been verified. It was found that in the case of water tenders the most common cause of accidents was wrong bypassing (31 %) followed by dangerous reversing and turning (27 %) and speeding (19 %).

The second hypothesis stated: Drivers under the age of 30 cause the majority of traffic accidents. The hypothesis was not proved likewise. We divided the drivers into 10-years age groups. Drivers of the age 30 - 39 caused the most traffic accidents, according to our findings, see Figure 5. The group of the age 40 - 49 was another risky one in terms of traffic accidents.

### **Abstract**

*Organic farming and organic food are nowadays very important issues related to the health of modern society. The development of the organic food market in Poland is a problem that inspired the writing of this article. The aim of this article is to examine the role played by the subsidies granted by European funds for farmers in Poland and an attempt to assess the influence of these funds on the development of the organic food market. The article thus presents the topic of organic food in connection to European funding. The hypothesis advanced in the empirical part of the article has been confirmed by an appropriate analysis. The analysis of the Pearson correlation coefficient and linear regression coefficient was used in the work. Both indicators showed a relationship between the number of organic farms and the value of financial assistance provided by the European Union. The dynamics of the number of organic farms in Poland was also examined.*

**Keywords:** *European funds, European Union, organic agriculture, organic food, organic food market,*

**JEL Classification:** *Q11, Q13, H20*

### **1. Introduction**

The aim of this article is to examine the role played by the European funds in shaping the market of organic farming in Poland. At the onset of the 21st century a significant rise in consumers' interest in this market and this type of products was observed. Such a demand caused in turn an increase in the number of organic farms producing food according to the precepts of organic agriculture. With time, the production of organic food in Poland was given certificates and was standardized, so that consumers have now a ready access to such products in every supermarket.

Apart from a section devoted to theory containing a description of the organic food market, organic farming and the European funds supporting this area of agriculture, the article also includes an empirical section, which contains a statistical analysis of data pertaining to the amount of subsidies for agriculture and the number of organic food producers in Poland. The following hypothesis has been assumed: the overall value of the aid allotted by EU funds has an impact on the number of organic food producers in Poland. The article thus discusses existing literature on the subject as well as employs a statistical analysis.

### ***1.1 Organic Food***

Organic food is the product of organic agriculture which utilizes natural processes on the farm and links agricultural production with environmental protection. Therefore, the processes of plant and animal production excludes the use of synthetic substances such as synthetic fertilizers, chemical pesticides or growth hormones (Michalczyk, 2016). The production of such food should be done as close to nature as possible (Wojciechowska-Solis & Soroka, 2017).

The solutions introduced by the member states of the European Union exerted a significant influence on the shape of Polish law pertaining to the production of organic food. EU membership forced Poland to adjust Polish regulations to EU regulations. The first key EU document regulating the market for organic products was the Council of the European Communities regulation of 1991 on organic production of agricultural products and indications referring thereto on agricultural products and foodstuffs (Council Regulation (EEC) No 2092/91). Subsequent EU legislation brought the publication of further documents, of which the ones most important for the current discussion are: Council Regulation (EC) on organic production and labelling of organic products and repealing Regulation (EEC) of 1991 as well as two Commission Regulations (EC) of September and December 2008. They have established the rules for the implementation of the Council Regulation on organic production, labelling and inspection respectively, as well as rules for the import of organic products from non-member countries. Another regulation referring to more detailed aspects of the areas mentioned in the previous one, stipulates precisely the methods of production of agricultural products and foodstuffs which may be entitled to bear a logo of organic production. The right to labelling and advertising of foodstuffs as products made according to the standards of organic farming may be obtained if 95 % of the total components used in the production of such foodstuffs comes from agriculture using organic methods. The final step in obtaining the logo of EU organic product consists in undergoing assessment through the process of certification (Michalczyk, 2016).

### ***1.2 Organic Agriculture***

Unfortunately, intensive agricultural practices that yield a large number of produce exploit the soil excessively. This is the reason for the need to limit such soil exploitation and to resort to methods improving soil fertility. The use of pesticides and other substances harmful to the environment has led, among other reasons, to the rise of organic agriculture (Komorowska, 2014).

Improved animal welfare, environmental protection and potential beneficial effects on human health are some of the reasons for the increasing demand for organic products (Cubero-Leon, De Rudder, Maquet, 2018). The development of organic farming is the effect of changes in society, the environment, health care and economy, and, in particular, in the complex of agro-food production. Organic agriculture is a modern method of farming which ensures a continuous soil fertility, good health condition of animals, and a high biological quality of crops. Currently, it constitutes the fastest developing branch of agriculture in the world, which is especially evident in EU countries. Organic agriculture started rapidly developing in Western Europe in the 1980s, which was in part stimulated, among other factors, by the growing distrust towards foodstuffs produced with the use of intensive farming, by the fear of BSE and GMO, as well as by the EU funding. In Poland, a dynamic growth in the number of organic farms happened at the beginning of the 21<sup>st</sup> century. Undoubtedly, it was connected with the fact that Poland had joined the EU and the appearance of financial subsidies for the development of organic farms (Jeziarska-Thöle & Biczowski, 2017).

### **1.3 The Consumer in the Organic Food Market**

Similarly to other forms of activity, farming depends, to a great degree, on modern technology, which provides specific sources of information. In the case of organic agriculture these sources of information provide the profile of an organic foodstuffs consumer. The producer may also use the Internet for the purposes of organic product sale and distribution (Ciupiał Szelağ-Sikora Tabor, 2017).

The factor determining the further development of organic food market, especially on a local scale, is the positive attitude of buyers displaying an ethnocentric preference while shopping. Ethnocentrism means that the local product is preferred and the foreign product is rejected (Nestorowicz Rogala Jerzyk Pilarczyk, 2016). In the realities of highly developed food industry, customers are more and more aware of the dependence of good health on the quality of consumed foodstuffs, thus recognizing the importance of healthy products. Consumers expect the broadening of the range of organic food products (Grzybek Kawa, 2017). A higher level of education and a better economic situation in a substantial number of societies provided the impulse for a greater sense of responsibility for progressive degradation of the natural environment and for the disturbance of its balance (Michalczyk, 2016). Organic food consumers are characterised by a high level of wealth, the possession of an intermediate or a high level of education, and an increased awareness of the importance of healthy lifestyle as well as of the need for environmental protection for the sake of present and future generations. Therefore, the most common reason for purchasing organic foodstuffs is the care for one's and family members' well-being (Barłowska & Wolanciuk & Idec, 2017).

## **2. The Role of EU Funds in the Development of Organic Agriculture in Poland**

With the creation of a European space was needed to solve the differences between member countries. One of the objectives of the EU is its balanced development that is connected with a reduction of a structural differences between the regions known as cohesion (Kyjonkova, 2016). In the last decade, rural areas have substantially benefited from the opportunities of development given by foreign subsidies such as EU funding, at the same time building up their own endogenic potential. It is worth remembering that for whole decadesthe Polish countryside remained on the margins of the major developmental processes, which contributed to its general civilizational backwardness on many levels, such as the following elements: the underdeveloped social and technical infrastructure, the low level of education in rural population, the lack of investments in the visual outlook and structural character of the rural areas, the disorder in the distribution of public spaces and the dominance of small farms (Biczkowski, 2016).

Taking into consideration the fiscal effects of EU membership, the EU states may be divided into two groups: the net payers (countries which contribute more to EU budget than receive from it) and the nett receivers (countries which receive more funds from the budget than contribute to it). Since the first year of its EU membership, Poland has been a net receiver of the EU budget. What is more, currently Poland is the largest net receiver. The fiscal net effect of EU membership for Poland is the following (Pawlas, 2016):

1. In the years 2004-2006 Poland received 6.3 billion euros, that is about 2.1 billion euros a year.
2. In the years 2007-2013 Poland received 65 billion euros, that is about 9.2 billion euros a year.

3. In the years 2014-2020 Poland is due to receive 75.9 billion euros that is 10.83 billion euros a year.

Local governments constitute a very important group of beneficiaries of EU funding which in the years 2007-2013 received about 25% of total subsidies Poland received, and in the years 2014-2020 this sum will be increased to 40% of total subsidies (Czudec, 2017). It is possible to say that the EU funds have been successfully used, which seems to be confirmed by the following numbers: there were 301.7 thousand applications for the total funds awarded of 613.3 billion PLN. The effect of the use of the EU funds are noticeable in Poland, which is confirmed by the advertisement slogan: "Used by all – seen by few" (Sorychta-Wojczyk & Musioł-Urbańczyk, 2016).

With high expectations the European Union Member States were watching the development of ongoing discussions, intensive negotiations and subsequent final shape of so called the new Common Agricultural Policy of the European Union, which lasted almost three years (Harakal'ová, 2016). Recently, there have been more and more discussions taking place in the professional and lay public concerning the problems associated with utilising funds from EU structural funds (Beck, 2012). One of the most important economic issues are still the problems resulting from the division of resources and the lack of an answer to the question why different economies develop at different paces. This issue has been raised more and more often in the light of a growing critique of the European integrity politics, one of the basic tools of which are EU funds received from the common EU budget. The assumed realignment of the social and economic conditions of EU regions falls further and further short from the empirical experience of the state of affairs. The major problem consists in the fact that the regions labelled as least developed far too often resign from the use of the available aid or they do not take appropriate measures to secure contracts, specifically those intended for the development of infrastructure and innovation. They are however leaders in projects aimed at the human resources programmes (Jęgorow, Regional..., 2017).

Cohesion policy formed the foundations for the designing of the EU funds for the years 2014-2020 with the assumption that the major part of activities it consists of will be financed by EU funds available in the current fiscal perspective (Pondel, 2017). The EU cohesion policy has become a fixed element in the functioning of numerous sectors of Polish economy. As much as entrepreneurs with a realistic approach to business have not been affected by the unique phenomenon of EU funds, the contribution of EU subsidies in the public sphere has become almost a given in the current activities of a huge number of entities supported by public funding, including local government units (Jęgorow, Jednostki..., 2017). The system of funding local governments seems to be inadequate as far as their tasks are concerned, which forces them to pursue external sources of funding, and in particular, investments. Because of the non-repayable character, local governments focus their efforts on the available financial means from EU budget. The level of active effort in applying for these funds depends on institutional and programmatic preparation as well as on the condition of their budgets which guarantee the availability of their own necessary contribution (Wojarska, 2017).

### **3. The Analysis of the Rates of EU-Funded Aid for Polish Agriculture**

This article opened with a discussion of numerical data concerning the size of the organic food market in Europe and in the European Union. Table 1 presents this data in detail. The final verse of the Table shows the indicator of the growth dynamic of the organic food market in EU in comparison to previous years. From the presented numbers it unequivocally follows that the organic food market has been growing consistently.

**Table 1: Development of Organic Food Market in Europe in 2004-2012**

	2004	2005	2006	2007	2008	2009	2010	2011	2012
<b>Europe</b>	10.8	12.1	13.5	15.2	17.1	18.2	19.7	21.5	22.8
<b>European Union</b>	10.0	11.2	12.6	14.3	15.9	17.0	18.2	19.7	20.9
<b>The EU dynamics indicator</b>	-	112	112.5	113	111	107	107	108	106

Source: Komorowska, 2017

This section of the article in major part focuses on the question of organic market development in Poland in correlation with the size of aid allocated from European funds.

**Table 2: The Number of Organic Producers in Poland and the Yearly Aid from the European Agricultural Fund for Rural Development (EAFRD)**

Years	The number of organic producers in Poland	The dynamics of the number of producers in Poland	EAFRD aid in a given year in Euro
<b>2007</b>	12121	-	1989717841
<b>2008</b>	15206	125	1932933351
<b>2009</b>	17423	114	1971439817
<b>2010</b>	20956	120	1935872838
<b>2011</b>	23847	114	1860573543
<b>2012</b>	26376	111	1857244519
<b>2013</b>	27093	103	1851146247
<b>2014</b>	24829	92	1569517638
<b>2015</b>	22991	93	1175590560

Source: EPROW 2007-2013, EPROW 2014-2020 [www.minrol.gov.pl], Raport o stanie rolnictwa ekologicznego w latach 2013-2014 [www.ijhar-s.gov.pl], Rocznik statystyczny rolnictwa, 2016

Table 2 shows the number of organic producers in Poland and the yearly contributions of EAFRD in the period of 2007-2015. The data from this period have been selected because during those years one of the largest aid programmes for Polish enterprises was implemented. For the data in Table 2, Pearson's correlation coefficient (R) has been calculated and its value was -0,381679144. The approximate value of the correlation coefficient was -0,40. It means that the number of organic producers in Poland and the yearly rate of EU aid for all farmers are on average negatively correlated. The linear regression coefficient for the given data is 0,11450442. This means that if the value of one variable increases, the value of the second variable also increases. Additionally, the analysis of the dynamics of the number of organic producers in Poland has been prepared, and its indicator has been calculated in comparison to the preceding years. As it follows from Table 2, a definitive rise in the number of organic producers from 2004 to 2013 may be observed. The years of 2014 and 2015 show a minimal collapse of the trend and a slight drop in this number. Table 3, in turn, shows allotted aid by EU funds and Poland's own contribution in the respective programmes.

**Table 3: The Comparison of Poland's Fiscal Contribution and EU Aid in Rural Development Programmes (RDP)**

Programmes	EAFRD aid	Poland's contribution	Total	EAFRD aid in %
<b>RDP 2004-2006</b>		72600000	3592400000	79,8%
<b>RDP 2007-2013</b>	13398928156	4013750110	17412678266	76,9%
<b>RDP 2014-2020</b>	8697556814	4914654614	13612211428	63,9%

Source: <http://www.minrol.gov.pl/Wsparcie-rolnictwa/Program-Rozwoju-Obszarow-Wiejskich-2007-2013>

As it follows from Table 3, the value of aid allotted by EU funds is multiple times greater than Poland's own contribution to both of the programmes mentioned earlier in the theoretical section of this article. The first programme active short after Poland's EU access was short, but the value of the EU aid allotted was 79.8% of the total value of the programme. In the period of 2007-2013, the value of EU contribution to the total value of aid given to Polish farmers was 76.9%. Yet, in the years 2014-2020 this contribution has dropped to the level of 63.9%, but the total value of aid given has also decreased. It very well may be that the drop in the number of organic producers in Poland is connected to the decrease in the aid allotted in the year 2014. In order to prepare a thorough analysis it would be necessary to calculate the percentage of aid allotted only to organic agriculture and to compare it with the number of organic farms. Nevertheless, given the limited scope of this article, its analysis will not proceed further.

**Table 4: The Aid Allotted to Polish Organic Farmers in Rural Development Programme in 2014-2020**

Aid	In the period of conversion	After the period of conversion
<b>Plant cultivation</b>	966 PLN/ha	792 PLN/ha
<b>Vegetable cultivation</b>	1557 PLN/ha	1310 PLN/ha
<b>Basic orchard cultivation</b>	1882 PLN/ha	1501 PLN/ha
<b>Forage cultivation</b>	787 PLN/ha	559 PLN/ha

Source: <http://www.farmer.pl/finanse/dotacje-i-doplaty/rolnictwo-ekologiczne-w-prow-2014-2020,54837.html>

Table 4 only signals the real value of the aid for Polish organic farmers according to the RDP for the years 2014-2020. As it is visible above, the European organic farmers are not left without support in their enterprises due to the aid from the EU.

#### 4. Conclusion

The hypothesis ventured in this article has been demonstrated as correct, because the correlation between the value of the allotted aid from EU funds and the number of organic farmers in Poland has been revealed. Since the beginning of the functioning of the EU aid programme, the number of the organic farmers has been growing. It is interesting to notice

that since the introduction of the new programme in 2014, a slight drop in the number of organic farms has been observed. The average correlation between these data seems to be suggesting such a dependence. A special attention needs to be paid to the issue of the stable, regular increase in the number of organic producers since Poland's access to the European Union. The data from the years 2004-2006 have been omitted in the analysis due to their impossibility of reference to the data from the particular years of the programmes discussed. According to the data of the Agricultural and Food Quality Inspection, in 2004 there were only 3760 organic producers, in 2005 –7182, and in 2006 as many as 9194 (Raport o stanie rolnictwa ekologicznego w latach 2013-2014 [www.ijhar-s.gov.pl] [A Report on the State of Organic Farming in the Years 2013-2014]). Having now a broad outlook on the issue, it is possible to state unequivocally that the EU fiscal aid has substantially supported the development of organic food market in Poland, and it is so not only because of the rise in the number of organic producers, but also because of the process of certification and labelling. The introduction of one common logo in the whole of European Union has certainly built up trust of Polish consumers in this type of foodstuffs. It is possible to say with a degree of certainty that the organic food market in Poland is not as developed as the one in Germany or in other leading countries, but due to further EU subsidies this state of affairs has been constantly improving.

### **Abstract**

*Organic production is an overall system of farm management, food production and its impact on the environment. The challenge for the organic sector is to ensure a steady increase in supply and demand for organic foods and consumer confidence in these products. In recent years, organic foods have been highly preferred by European consumers, who no longer buy processed food products produced by large multinational enterprises that contain large amounts of additives. The aim of the article is to characterize selected European associations promoting organic farming practices, organic food production, organizing: control bodies, authorities, small, medium-sized and large-scale enterprises, research units and consumers in order to identify the research needs of the organic farming sector and provide them with European legislation.*

**Keywords:** EU legislation, EU units promoting and supporting organic farming, organic food control in EU

**JEL Classification:** Q13, Q18, M30

### **1. Introduction**

Organic production is a complex system of management of agricultural farms and food production, which is a combination of best environmental practices, a high level of biodiversity, the protection of natural resources, the application of stringent animal welfare and production standards, in accordance with the preference of consumers for organic food products produced using natural substances and processes (Council Regulation (EC) (No 834, 2007). The Regulation (EC) No 834 contains the basic principles of organic farming and labelling of organic products in line with the 2004 European Action Plan on Organic Food and Agriculture. This regulation applies as of 1 January 2009 in the same way in all EU Member States (Schlosserová, 2012).

The production system of organic farming is based on the preference of quality over quantity, which distinguishes it from conventional farming. Organic farming combines traditional practices and modern scientific and technical knowledge in an integrated, primarily extensive

system that, by its very nature, differs from intensive conventional farming (Kozáková et al., 2015).

To achieve the positive effects of organic farming and organic production with minimal impact on the environment, The EU has introduced several binding regulations directly applicable in all EU Member States on the protection of natural resources, the use of chemicals (pesticides, industrial fertilizers, etc.) and genetically modified organisms (GMOs) in agriculture (EU Agricultural Markets Briefs, 2014).

The European Commission adopted the first European Action Plan on Organic Food and Agriculture in 2004 to support and strengthen this sector. Most of the 21 measures from the first plan were achieved, in particular the creation of a new logo of the European Union's organic production. Since then, the European Council has been examining legislation on organic farming in 2007 and the European Commission has adopted a proposal for a new regulation of the European Parliament and of the Council on organic production and labelling of organic products and repealing Council Regulation (EC) 834/2007.

In March 2014, the European Commission presented a Second Action Plan For The Future of Organic Farming in the European Union, targeting three priorities by 2020 (European Commission, 2014):

1. Enhancing the competitiveness of organic producers from EU member states:
  - raising awareness of EU instruments for organic production and their synergies,
  - addressing technical deficiencies in organic production through research, innovation and dissemination of knowledge,
  - raising awareness of the organic production sector as well as of the market and trade,
2. Strengthening consumer confidence in the European system for organic food and agriculture.
3. Strengthening the external dimension of the EU's organic production system.

The action plan is aimed at legislative changes resulting in the growth of organic production, especially in the area of supply and demand. This action plan also offers a contribution to the objectives set out in the Europe 2020 strategy (European Commission, 2014).

Food quality and food safety are strongly discussed topics in the last years. Consumers have become more critical in their food choice, they are getting interested in origin, composition, methods of production, and other quality attributes of food products. The effort to provide consumers a higher food quality and guarantees that product quality stands up to given standards has led to a number of quality assurance schemes in an international, European Union (EU) and national levels (Velčovská, Sadílek, 2015; Velčovská, 2016). A lot of factors are influencing consumer's purchasing decision related to food products. These factors are e.g. quality, cost, lifestyle, motivation to support local producers, local economic growth, labelling (e.g. organic food, PDO, PGI, TSG) (Arsil et al., 2011).

In the case of organic food, the most important factor which influences consumer's shopping behaviour is health benefits, but the main barrier is high price, the same as in case of sustainable products (Rööös, Tjärnemo, 2011; Grunert, 2011). As have shown results of other research (Jarossová, Pazúriková, 2014; Velčovská, Sadílek, 2014; Jarossová, 2016), the main barrier in purchasing this kind of certified food is a low familiarity with these quality labels. This situation is caused by shortage of information or inadequate presentation of that information on these labels. They should be supported and their promotion should be

implemented into producers' marketing strategy in order to increase the consumers' awareness and perceived credibility of quality labels (Velčovská, Sadílek, 2014).

People realize more and more the importance of ecological agriculture and many different organizations and institutions focuses on supporting them (Lacková, Karkáliková, 2014).

### ***1.1 Control Bodies and Control Authorities in the Organic Sector in the EU***

In recent years, many of private and state quality schemes for food products had been created. These systems are a guarantee to consumers that what is stated on the product label is consistent with a particular food production system. On the other hand, they are a guarantee of effective consumer information and require certain certification costs. The European dimension of certification systems begins with compliance with mandatory production standards and ends with additional requirements relating to environmental protection, animal life, business ethics, justice, and so on. To enable farmers, processors and traders to use the EU organic logo (Fig. 1) and labelling it on products, they must meet EU requirements in this area.

**Figure 1: EU Organic Logo**

Source: EU Commission [online], 2010

EU Member States, when setting up an organic farming control system, can choose between a public, private and mixed system, designate one or more competent authorities responsible for the control of these entities. The competent control authorities are obliged to organize audits or inspections of control bodies and, in case of non-compliance, withdraw their accreditation. Controls are carried out at each stage of the “ecological chain”. Every operator - farmer, processor, trader, importer or exporter, excluding wholesalers who handle packaged organic food - is checked at least once a year or more frequently, based on risk assessments. Each certified organic farmer in EU countries is regularly inspected for compliance with the rules of the production system. Inspections are carried out by designated inspection organizations, which we divide into three groups (Schlosserová, 2012):

- **Private inspection organizations (type A)** - the State shall designate an official control body, which delegates the execution of official controls in the system of organic farming to private inspection organizations. These organisations have the appropriate accreditation for conducting inspections and meet certain criteria defined by governmental authorities. This type of control is applied in most EU countries, including Slovakia, the Czech Republic and Austria.
- **State inspection organizations (type B)** - official control of organic farming operators is carried out only by the state (e.g. Denmark, Estonia, Finland, Lithuania, Malta).
- **System of mixing private and state inspection organizations (type C)**, which is successfully operating for example in Spain, Luxemburg, Poland.

Inspectors are required to oversee compliance with all statutory rules for production, processing, packaging, storage, labelling and the sale of bio production, including conducting accurate documentation of all operations carried out.

## 2. Problem Formulation and Methodology

Continuous pollution of the environment, biodiversity loss, increase in allergic and oncological diseases lead to that people are becoming more and more aware of the importance of organic farming, which is exploiting resources and landscapes in a sustainable manner. This is a prospective way of managing, which is being developed in all EU countries. The share of agricultural land managed environmentally is steadily growing. This is evidenced by the fact, that to promote and support organic farming, different associations and institutions are being created within the EU, an overview of which is addressed in the article.

The methods of analysis and synthesis were applied to obtain theoretical backgrounds on this issue. The analysis method is the process of breaking a concept down into more simple parts, so that its logical structure is displayed (Blackburn, 2008). The research synthesis is defined as the conjunction of a particular set of literature review characteristics. Research syntheses attempts to integrate empirical research for the purpose of creating generalizations (Cooper, Hedges, 1994). Using these methods, we analysed information gained from domestic and foreign scientific and specific sources, e.g. the information provided on the websites of the European Commission. Research was conducted from February 12<sup>th</sup> to February 28<sup>th</sup> 2018.

## 3. Problem Solution

There are many organizations in Europe and around the world promoting the principles of organic farming and its positive impact on the environment. The first one is the IFOAM EU Group (Fig. 2) - an independent regional group that belongs to The International Federation of Organic Agriculture Movements – IFOAM) which was established in 1972. The IFOAM EU Group was established as a regional group within the IFOAM in 2000 and in presently representing more than 300 IFOAM member organizations operating in 27 EU countries, candidate countries and Member States within EFTA. Member organisations represent many professionals from different areas, e.g. consumers, farmers and processors, researchers, education and advisory organisations, certification bodies and commercial organic companies (IFOAM Organics International [online], 2018a).

**Figure 2: Logo of the Regional European Group Belonging to the IFOAM**

Source: IFOAM EU GROUP [online], 2018

The **IFOAM EU Group** promotes the development and integrity of organic food and organic farming in Europe. It is a forum for negotiating common interests, important for the exchange of information and work on the preparation of EU policies. According to the Statute, it is possible to summarize the main objectives of this organization:

- promoting the principles and practices of organic farming and food production in the EU, as defined by IFOAM standards,

- coordination of activities and representation of IFOAM EU countries in EU and outside of Europe,
- exchange of information between IFOAM members in EU countries and other entities around the world,
- assistance in coordinating research on organic food production throughout the European Union and disseminating its results,
- execute measures to establish a common policy of the Group in relation to the objectives pursued.

Representatives of the IFOAM EU Group take part in many of the European Commission's committees, including advisory groups: quality of organic farming and health, rural development and others. The Group has observer status in the Agriculture and Environment Advisory Group. It is also represented in the DG Sante Advisory Group on the Food Chain and Animal and Plant Health.

IFOAM currently has over 800 branches in more than 100 countries worldwide (IFOAM EU [online], 2016b). It is the largest international organization in the world in the field of organic farming. IFOAM has developed the principles and guidelines that have been considered as the basis for organic farming. They have become the basis for the first international regulation on organic farming and the labelling of its products.

It is well known that the basic objectives of organic farming are of a complex nature and concern, among other things, the production of high-quality food, activities supporting and preserving the biological effectiveness of the soil, maintaining the genetic diversity of ecosystems, the use of renewable raw materials and promoting local and regional production and distribution (Kreisberg, 2006). The IFOAM vision is the worldwide adoption of ecological, social and economic systems that are based on the principles of organic farming (Fig. 3). The IFOAM organic farming principles are: health, ecology, fairness (decency, fairness and care).

**Figure 3: Principles of Organic Agriculture Farming According to IFOAM**

Source: IFOAM Organics International [online], 2018

**The European Organic Certifiers Council – EOCC** is an international non-profit organization connecting the inspection bodies and authorities operating in the field of certification of organic farming. The organization was founded in 2010 and currently has 51 members from around the world. The organization aims to increase the reliability of control and certification activities and decisions by the authorities in relation to European organic farming, exchange important information for control bodies, such as fraud cases, harmonising of interpretations of the European organic legislation by its members especially on inspecting ability of organic agriculture, processing and trade, sharing services and developing common methodologies and tools. The EOCC is considered to be a valuable EU partner, contributing expertise to improving the EU organic farming legislation (EOCC [online], 2018a). Logo of the organization is shown in Fig. 4.

**Figure 4: Logo of the European Organic Certifiers Council: EOCC**

Source: The European Organic Certifiers Council, [online], 2018b

Another important subject is the TP organics, European Technology Platform for Organic Food and Organic Farming. The Platform is one of the 40 European Technology Platforms officially recognized by the European Commission (Fig. 5). Its aim is to strengthen research and innovation for organic farming and other agroecological approaches that contribute to sustainable food and farming systems. The platform identifies the research needs of the organic sector and then relays research priorities to the policy-makers in Europe and beyond.

**Figure 5: Logo of the TP Organics European Technology Platform**

Source: TP Organics European Technology Platform [online], 2018b

TP Organics also informs its members about funding opportunities for research & innovation and promotes knowledge exchange between farmers, companies, and researchers. The Platform has 87 members and seven national platforms reaching 5.8 million farmers; 5,000 companies, 2,500 researchers and farm advisers and 20 million citizens (TP Organics [online], 2018a). TP Organics brings together small, medium and large businesses, researchers, farmers, consumers and civic associations operating in the eco-chain from production, supply, processing, marketing to consumption. The platform identifies the research needs of the organic farming industry, and then provides these findings to creators of European legislation. TP Organics also informs its members about the possibilities of funding research and innovation and supports the exchange of knowledge between farmers, society and researchers.

The last of the described organizations, **The European Consortium for Organic plant breeding – ECO-PB** deals with organic plant growing (Fig. 6). Consortium was established in 2001 to promote organic plant growing and build independent centres of expertise. The association is based in Freiburg, Germany.

**Figure 6: Logo of the European Consortium for Organic Plant Breeding (ECO-PB)**

Source: European Consortium for Organic plant breeding, [online], 2018

The main objective of the consortium is to promote organic farming, protect the environment and save agrobiodiversity through plant breeding programs intended specifically for the needs of organic farming. Therefore, the main activities of the consortium concern (ECO-PB [online], 2016) are:

- initiating, supporting and maintaining programs for environmental breeding of plants,
- the development of scientific concepts relating to organic plant breeding,
- the development and promotion of appropriate standards, procedures and legal frameworks for organic plant production,
- discussions and exchanges of knowledge and experience,
- providing independent, competent expertise to develop standards regarding organic plant growing,
- organizing meetings and seminars on organic seeds and environmental issues.
- set up organic variety trials on cereal and vegetable crops in different countries in Europe to study how they perform under different conditions.

#### 4. Conclusion

The aim of the article was to characterize selected European associations promoting organic farming practices, organic food production, organizing control bodies, authorities, small, medium-sized and large-scale enterprises, research units and consumers in order to identify the research needs of the organic farming sector and provide them with the creation of European legislation. There are many European associations, organizations promoting the principles of organic farming and its positive impact on the environment. They conduct a lot of activities concerning the promotion of organic farming, organic food, and organic plant breeding. They gather opinions and promote exchange of information between producers, farmers, consumers and other entities in order to improve regulations in this field in Europe. Some organizations also mediate in business contacts between various entities enabling them to obtain the necessary information and establish business cooperation.

The limitations of the research were related to the selection of described associations. The most-known organizations in the opinion of the authors of this article were selected for the analysis (IFOAM EU Group, the European Organic Certifiers Council, The European Consortium for Organic plant breeding) and TP Organics European Technology Platform.

At present, organic farming is on a global scale a continuously growing and evolving industry, which helps to protect biodiversity and preserve the principles of sustainable development. The rural development, resulting in increasing job opportunities, can be observed from the economic point of view. Organic farming contributes not only to job creation, but also to GDP growth. It is also involved in improving the country's trade balance. Organic farming is an area that the European Union supports and its aim is to continue this support. Most countries have organic farming systems including 5-12% of agricultural land and the number of subjects and farms are counted from hundreds to thousands. Organic farming is currently being practiced in more than 120 countries around the world and the total area of ecologically managed land is 22 million ha. From this point of view, close cooperation between institutions in the organic farming sector, producers and the exchange of information on organic food between the Member States and the European Commission is of great importance as well as the provision of up-to-date information through various organizations and associations focusing on organic food for the general public.

### **Abstract**

*Competitiveness is the ability of market participants to present potential buyers with such an enticing offer, that will boost their sales and increase market share. Considering this issue, the immediate result of gaining competitive advantage is the growing exports, improvement of the current account balance. After joining the euro area member countries have lost the opportunity of improving their competitive position by using exchange rate and they have to compete with unit labor cost and labor productivity. The main aim of the paper is to analyze and evaluate, how the position in current account balance of the euro area and individual member states after joining the EMU has changed and what were the factors determining this position, with special attention to interpreting the changes in labor productivity. The results of the analysis show that there is some correlation between changes in labor productivity and current account balance.*

**Keywords:** *Current Account Balance, Economic and Monetary Union (EMU), International Competitiveness*

**JEL Classification:** *F10, F14*

### **1. Introduction**

In the context of the previous achievements in the field of the theory of foreign trade, competition at the international level consists primarily of the effective use of natural comparative advantages in particular countries and of the appropriate shaping of the related competitive advantages by implementing a suitable economic policy at the national and international level. Competitiveness is a multidimensional notion; a distinction should be drawn between international competitiveness, often referred to as competitive advantage, international competitive capability and competitive position. As stated by Bossak (1984) international competitive capability can be defined as an ability to struggle and compete and the benefits associated with a country's share in the international division of labour. From the point of view of developing international competitive capability, the crucial factors are the ability and inclination towards saving money, the tendency to take initiative and innovate, and self-organisation abilities. International competitiveness is related to the current status and directions of changes of the real and institutional component of international competitive capability of a given country in competing for the benefits from participation in the international division of labour (Misala, 2011). Contrary to competitive capability and competitive advantage, which are dynamic in nature, competitive position is a static notion. The term denotes the status and changes in the share of a specific country in the generally understood international trade, i.e. in the international trade of goods and services and the international flows of production factors, and also the evolution of the structure of this type of

trade, including the respective quality changes. It should also be mentioned that all the above concepts of competitiveness and their shaping factors are closely interrelated. An improvement of competitive capability and competitive advantage translates into an enhanced competitive position.

Bossak (1987; as cited in: Pawlak and Poczta 2011) among factors determining international competitive capability of a country mentions external and internal factors; internal factors include changes in economic potential, changes in management effectiveness and the innovativeness of the economy. The sources of competitive advantage enumerated by Bossak include relatively low production costs, high degree of processing, high quality, brand, high innovativeness, management quality and flexibility, and strong network connections. Tesch (1980; as cited in: Bossak 1987, Pawlak and Poczta, 2011) points to several supply factors, among which advantages related to the use of economies of scale. Economies of scale occur when, as a result of trade specialisation and trade development, production series increase, which leads to lowering the unit costs of production thanks to reducing the frequency of adjusting the production model, increasing the labour productivity of employees and distributing fixed costs into more units. The factors determining the production capacity of an economy according to Bienkowski (2008), Kasztelan (2015, 2016), Nowak and Kaminska (2016) are the volume of natural resources, inherited assets and the level and efficiency of economic infrastructure, the effectiveness of the labour force and the capital, and the level of technology. In its report, the European Commission (1996) put forward a pyramid of international competitive capability and international competitiveness factors. Labour productivity is almost at the top of the pyramid, at the same level as the employment rate, with the living standard occupying the top.

In strictly theoretical terms, there are four types of competitive advantage sources (Misala, 2011): 1) the degree of technological advancement – creating conditions for business entities in a given country at a particular development level to specialise in the production and exports of products that can be used at a relatively lower cost than partners from other countries; 2) using the advantage of having in place the basic production factors by creating conditions for various entities to use the varying resource-intensiveness of these factors to their benefit; 3) the use by primary business entities of the diverse preferences of domestic and foreign business entities (consumers and investors) and creating favourable conditions therefor; 4) the obtaining by primary business entities of various economies of scale in the area of production and sales.

In the literature on the subject, the issue of selecting appropriate measures to assess international competitiveness is being widely discussed. Taking the competition method criterion as the starting point, it is possible to distinguish the following measurement methods: quantitative and cost-price measures, price and non-price competitiveness measures, measures considering only the effects of price and non-price competitiveness from the perspective of the current account balance, traditional economy competitiveness measures and the technological and innovativeness measures of the so-called new economy (Bombińska, 2002; Jagiełło, 2003; Pawlak, Poczta, 2011). Developing the current account balance is an important measure assessing international competitiveness, which can also be applied to measuring the competitive position. The current account balance can be affected by saving rates, capital flows from abroad, relative economic growth, consumer import spending, exchange rate, relative inflation rate and productivity (Gossé et al., 2014; Gourdon, 2009; Kennedy et al., 2005; Mocossi, 2016; Navrátil, 2016). Productivity and labour productivity are becoming particularly important factors of international competitiveness and international competitive position measures with the current account balance in the event when a given country loses its influence on competitiveness with the use of exchange rate changes, which is the case for euro-area countries which adopted the common currency, with the exchange rate of euro being

determined by the European Central Bank. The above is confirmed by the assumptions of classical and neoclassical theories (David Ricardo's theory of comparative costs, Heckscher-Ohlin's factor endowments theorem) and neotechnology theories (the economies of scale of production and sales theory), on the basis of which labour productivity can be considered as an important factor determining competitive position measured with the current account balance.

It should be emphasised that numerous authors define international competitiveness using the notion of productivity. For instance Porter (1990) claims that the only possible concept for a country's competitiveness is developing national productivity. Oughton and Whittam (1996) define international competitiveness as "long run growth in productivity and hence rising living standards, consistent with increasing employment or the maintenance of near full employment, while Pajarinen, Rouvinen, Ylä-Antilla (1998) describe international competitiveness as the ability of a nation state to continuously attract high value-added activities of private enterprises world-wide in such a way that all factors of production are fully employed and earn high returns, and the long-term external balance of payments of the country is maintained. Aiginger and Landesman (2002) distinguish four levels of international competitiveness: the first level denotes a country's ability to increase per capita income in a given period by increasing productivity and labour force. Higher competitiveness levels are associated with the permanence of the process, the provision of a social security system for citizens, environmental protection, sustainable growth and economic development and the appropriate level of the citizens' quality of life and lifespan (as cited in: Misala, 2011).

According to Glick and Rogoff (1995) and Bussière et al. (2010) productivity shocks specific for a given country are one of the major factors impacting the current account balance. A temporary productivity shock boosts production and has a positive impact on the current account balance. The expected outcome of a permanent, long-term increase in productivity is a decrease of the balance on the current account because: 1) higher return on investment increases the capital; and 2) projecting higher future profits decreases savings. Although productivity shocks may potentially improve the current account balance, as pointed out by Bagnai and Manzonchi (1999), the general impact will be generally negative (Gossé et al., 2014). Dependencies between changes in the current account balance and labour productivity were also noticed by Mucha-Leszko and Twarowska (2015), who pointed to the special significance of achieving international competitiveness using labour productivity and unit labour costs in the absence of the possibility of taking advantage of exchange rates by euro-area countries.

## **2. Problem Formulation and Methodology**

The objective of the study is to analyse correlations between changes in the current turnover account balance and labour productivity in European Union countries after introducing euro in 1999, with a particular consideration of the 2008 – 2009 economic crisis, and to evaluate these two economic variables in euro zone countries in comparison to non-euro-area countries. The following research hypothesis was investigated in the study: changes in labour productivity correlate with changes in the current account balance.

The analysis employs variables calculated on the basis of data from the Eurostat database: real labour productivity per person employed – percentage change on previous year and current account balance calculated as percentage of Gross Domestic Product (GDP) (Appendix). The analysis covered the years 1999-2016.

In order to identify the correlations and dependencies between changes in the share of the current account balance in the GDP and the labour productivity change rate, the correlation analysis and the cluster analysis based on the k-means method were applied. The calculations were carried out with the use of the STATISTICA software.

### 3. Problem Solution

The correlation result between the current account balance as percentage of GDP and real labour productivity as percentage change on previous year were presented in Table 1. A positive correlation, where the increase in the value of one characteristic is accompanied by an increase in the mean value of the other characteristic was observed for Italy (IT), Spain (ES), France (FR), Luxembourg (LU), the Netherlands (NL), Finland (FI), Denmark (DK), Malta (MT), the United Kingdom (GB), Belgium (BE) and Ireland (IE). A negative correlation, where an increase in the value of one characteristic occurs with a drop in the mean value of the other characteristic was recorded for Lithuania (LT), Hungary (HU), Estonia (EE), Latvia (LV), Slovakia (SK), the Czech Republic (CZ), Portugal (PT), Romania (RO), Slovenia (SI), Austria (AT), Bulgaria (BG), Greece (GR), Poland (PL), Croatia (HR), Cyprus (CY), Sweden (SE) and Germany (DE). Table 1 presents countries grouped by the strength of correlations.

**Table 1: Correlation Coefficients Between Current Account Balance (%GDP) and Labour Productivity per Person Employed (% change on previous year) in 1999-2016**

Strength of the correlation		Countries and correlation coefficients	
Range of correlation coefficient	Interpretation of correlation coefficient	1999-2016	1999-2016 (except 2008, 2009)
-1 to -0.6	significant relationship (high)	LT (-0.65), HU (-0.62)	EE (-0.62), LT (-0.78), HU (-0.68), SI (-0.65), SK (-0.67)
-0.6 to -0.4	important relationship (moderate)	EE (-0.47), LV (-0.4), SK (-0.53)	HR (-0.45), LV (-0.52), NL (-0.58), PL (-0.58), PT (-0.47),
-0.4 to -0.2	explicit relationship (low)	CZ (-0.34), PL (-0.3), PT (-0.28), RO (-0.23), SI (-0.26), AT (-0.27),	CZ (-0.39), IT (-0.25), CY (-0.31),
-0.2 to 0	no relationship	BG (-0.07), DE (-0.05), GR (-0.03), HR (-0.02), CY (-0.08), SE (-0.07)	BG (-0.14), AT (-0.15), RO (-0.19)
0 to 0.2	no relationship	IT (0.04)	DE (0.06), FR (0.14), SE (0.16)
0.2 to 0.4	explicit relationship (low)	ES (0.2), FR (0.27), LU (0.21), NL (0.24), FI (0.36)	DK (0.24), GR (0.3), ES (0.39), LU (0.24), MT (0.3)
0.4 to 0.6	important relationship (moderate)	DK (0.46), MT (0.44), GB (0.52)	FI (0.51)
0.6 to 1	significant relationship (high)	BE (0.71), IE (0.74)	BE (0.66), IE (0.74), GB (0.78)

Source: author's calculations

It is worth considering the change in the strength of correlations between the analysed variables when excluding the economic crisis years (2008 and 2009) from the analysis. The strength of the correlations changes significantly for 18 out of 28 EU Member States. The negative correlation increased for Estonia, Slovenia, Slovakia, Croatia, the Netherlands, Poland, Portugal and Italy, and dropped for Romania and Austria. In the case of countries which recorded a positive correlation, the exclusion of the years of the economic crisis had a varying impact on the strength of correlations between the analysed variables. The correlation coefficient grew for the United Kingdom, Finland, Spain, and Greece, and also for Germany and Sweden; however, for the latter two the correlation was insignificant. In turn, in the case of Denmark, Malta and France the strength of correlations weakened. In the period of the economic crisis, non-euro-area countries could improve their international competitiveness through exchange rate changes. Such an option was not available for euro-area countries, which needed to improve the competitiveness of their exports by increasing labour productivity and/or reducing unit labour costs. The strategy was applied in particular by Southern European countries such as Spain, Italy and France, and the Baltic Sea countries: Latvia, Estonia and Lithuania.

**Table 2: Elements of Clusters and Distance from the Centre of the Clusters**

Source: author's calculations

Using the k-means method made it possible to group the countries into four clusters on the basis of the ratio for the share of the current account balance in GDP and the labour productivity change rate. The elements of particular clusters and distance from the centre of the respective clusters are presented in detail in Table 2. The descriptive statistics for particular clusters are included in Table 3.

**Table 3: Descriptive Statistics of Individual Clusters**

Variable	Average				Standard deviation				Variance			
	1	2	3	4	1	2	3	4	1	2	3	4
Number of cluster	1	2	3	4	1	2	3	4	1	2	3	4
Current account 2016	6.09	-0.78	-0.72	2.17	2.42	3.74	2.93	2.36	5.86	13.97	8.60	5.57
Labour productivity 2016	0.77	1.70	0.58	1.40	0.67	2.65	0.66	1.12	0.45	7.01	0.43	1.26
Current account 2008	4.61	-15.60	-1.52	-8.38	3.05	3.86	2.26	2.37	9.30	14.92	5.13	5.61
Labour productivity 2008	-1.23	2.94	-0.82	0.43	2.19	3.84	0.77	2.55	4.80	14.74	0.59	6.51
Current account 1999	0.58	-2.58	0.57	-3.30	3.87	1.67	3.22	2.99	14.95	2.77	10.36	8.96
Labour productivity 1999	2.07	1.20	1.85	2.49	0.91	1.96	1.10	1.52	0.83	3.83	1.22	2.31

Source: author’s calculations

Figure 1 shows that the variable determined by the share of the current turnover account balance in GDP in 2016 contributes to the differences between countries, which means that in particular groups of countries it was at varying levels, with the highest value recorded for countries in cluster 1 – approx. 6.09; for cluster 4 the value of this variable was 2.17, and for clusters 2 and 3 the value was at a similar level. The labour productivity change rate in 2016 does not seem to be significant in the respective clusters. The figure demonstrates that its value is at a similar level in all clusters, i.e. 0 or slightly above 0.

The current account value in 1999 is similar in clusters 1 and 3 (amounting to, respectively, 0.58 and 0.57) and in clusters 2 and 4 (equalling, respectively, -2.58 and -3.29). The current account value in 1999 would divide countries into two clusters if other variables were disregarded, i.e. clusters 1 and 3 and 2 and 4 were each combined into one cluster Labour productivity in 1999 was at a very similar level in all clusters, and its overall level was slightly above zero, oscillating from 1.2 to 2.49. The variable also seems insignificant, i.e. on its basis it is not possible to divide the analysed countries into clusters.

**Figure 1: The Average Current Account Balance and Labour Productivity of each Cluster**

Source: own elaboration, basing on Table 3.

Figure 1 demonstrates that the highest cluster variability was observed for the current account from 2008, with the highest value (4.61) for countries in cluster 1, followed by -1.52 for cluster 3 and -8.38 for cluster 4, and the lowest value of the variable was recorded for cluster 2 (approx. -15.6). Labour productivity in 2008 was the highest for cluster 2 and equalled approx. 2.94, which clearly distinguishes the cluster from other clusters, where it is at a comparable level, with values from -1.23 to -0.43.

#### 4. Conclusion

The most stable cluster with the lowest fluctuations of the analysed variables of the share of the current account balance in GDP and the labour productivity change rate is cluster 3, which includes the following EMU countries: Belgium, France, Italy and Finland, and non-euro-area countries: the United Kingdom and the Czech Republic. The most diverging values of the analysed variables were observed in cluster 2, to which the following countries were assigned: Bulgaria, Greece, Cyprus, Lithuania and Romania. In these countries labour productivity is increasing and the current account rate is dropping, which may be associated with an influx of foreign capital and the exports growth rate being not as dynamic as the production increase, possibly resulting from a failure to adjust the sales package of these countries to international market needs. An opposite tendency can be observed for cluster 1, which included Denmark, Germany, Luxembourg, Malta, the Netherlands, Austria and Sweden, with a slight decrease of the labour productivity index and a rise of the current account rate. These countries experienced the lowest decline of their international competitiveness measured with the current account rate during the economic crisis, which can be explained with generally high labour productivity levels in these countries, where even a slight decrease of the rate does not lead to losing international competitiveness. In cluster 4, including Poland and Central and Southern European countries, the labour productivity index decreased slightly between 1999 and 2008, and rose slightly in average terms in the following time period. International competitiveness for countries from cluster 4 measured with the current account rate dropped in the year of the economic crisis, and increased significantly after 2008. This group of countries encompasses such euro-area countries as Ireland, Slovenia, Portugal, Spain, and Latvia and Estonia. Poland is among the countries which raise their international competitiveness through labour productivity, which can be viewed positively in the context of preparations to accession to the Economic and Monetary Union. The specified groups of countries and the correlation analysis show that the correlation between changes in the labour productivity index and the current account balance is not equal for all the analysed countries. On the basis of the analysis it is not possible to conclude that the EMU countries are a separate group in terms of the directions and degree of changes and the correlations between the analysed variables as compared to non-euro-area countries.

### **Abstract**

*The aim of this paper is to investigate possibilities for closer EU–Faroe Islands trade relations. The Faroe Islands are an autonomous part of the Danish Kingdom which, due to a number of reasons, chose to remain outside of the European integration project when Denmark sought full membership in the 1960s–70s. Today, the Faroes remain outside of the EU Single Market, as well as the Customs Union, trade relations with the EU being governed by a decades-old Free Trade Agreement. This poses significant impediments to the small and undiversified Faroese economy (though the structure of the economy evolves) and causes the Faroese to look for markets elsewhere – including, perhaps unexpectedly, in Russia. Possibilities for closer trade relations with the EU include a modernized FTA, EFTA/EEA membership and full EU membership. Economic, legal and political aspects are taken into account using SWOT analysis. It is argued that enhanced bilateral or multilateral preferential trade regime (free trade agreement) better corresponds to the Faroese specificity of size and political status, while EFTA membership provides added value mainly in symbolic terms.*

**Keywords:** *European Free Trade Association, European Union, Faroe Islands, trade relations*

**JEL Classification:** *F13, F15, H77*

### **1. Introduction**

The Faroe Islands have been, and still are, an intriguing territory for an academic, many definitions in all sorts of areas falling short of describing its status. For instance, they are considered to be part of Europe politically, but they are far from its physical shores. They are part of the Danish Kingdom, but in fact not entirely due to a specific autonomous status. They are part of an EU member state, but they are not part of the EU themselves. And many similar irregularities may be identified.

At the same time, these 18 islands and rocks inhabited by some 50 thousand Faroese attract only limited attention outside the Nordic region. It could be argued that this situation is unjustified and more interest is warranted – both for economic and political reasons. From the economic perspective, a booming (even though small) economy, overlooked by many, could be of interest to many Central European actors - the presence of Polish construction companies, witnessed on site by the author during his field trip in 2017, as well as the historical Faroese-Polish free trade agreement (Government of the Faroe Islands [online], 2018b) prove, that there might be interesting economic perspective in Faroese-Central European relations. Some economic developments in the Faroese context could even have unexpected political connotations. When the European Union approved restrictive measures against Russia in 2012

after the Crimean and Donbas crises, the Faroe Islands as a non-EU country, unrestricted in its trade relations, profited. The Faroese export to Russia tripled in terms of percentage of exports and reached some 24% in 2017 (compared to 44% in case of exports destined to the EU-28 countries!) (Statistics Faroe Islands [online], 2018). Political consequences might not be self-evident, but should not be easily dismissed in times of social media and political instability in the West. Especially if one considers the difficult relations between the autonomous Faroe Islands and its sovereign state Denmark (Hořejšová, 2006, p. 12), an EU and NATO member (plus the interesting geographical position of the Faroes in Northern Atlantic Ocean).

The above-outlined justifies a closer look on Faroese-EU trade relations. As stated above, the situation of the Faroe Islands is far from simple and schematic, therefore, after a short theoretical overview, the third chapter will provide a short summary of the status quo and a brief historical perspective. Then, possibilities for the future will be considered, ranging from an enhanced free trade agreement regime, through EFTA and EEA membership, all the way to full EU membership. These possibilities will be analysed using SWOT analysis, with economic, legal and political aspects being taken into account. The paper is based on Faroese sources, which include interviews with local administration and scholars, and international secondary literature.

## 2. Theoretical Approaches to Small Entities in the International Arena

The performance and even the existence itself of small entities in the international arena attracts academic attention. This is true mainly for small *states*, however, in the context of this paper, the Faroe Islands can be treated as such, even though they lack full sovereignty, since they enjoy an almost all-encompassing autonomous status in economy issues (except perhaps for the annual block grant from Denmark, which gets smaller every year (Hořejšová, 2006, p. 13)). Several authors looked at their specific problems that are derived from their small size - such as undiversified economy, small home market or inability to attain efficient scale of output (Kuznets, 1960; Tarshis, 1960). Some argued, though, that international trade relations, if arranged properly, are able to tackle these issues and provide a way for sustainable economic development of small states (Marcy, 1960; Scitovsky, 1960; Triffin, 1960). Clive Archer and Neill Nugent (2002) then looked at the specificity of small states' relationship with the EU, though it is important to say, that they focused mostly on bigger entities, than the likes of the Faroe Islands (especially the Benelux states). In any case, the small state specificity is being studied also in the context of the EU.

Perhaps most importantly, in the context of this paper, is Harvey Armstrong and Robert Read's (1995) study on the economic performance of micro-states (a specific sub-category of small states, in their article mainly Andorra, San Marino and Monaco, which are similar in size to the Faroe Islands). They compared the performance of these micro-states and of similarly big autonomous entities (Gibraltar, the Channel Islands, and also the Faroe Islands), which all have in common that they are not (fully) part of the EU, with the economic performance of neighbouring regions of EU member states. Armstrong and Read argue, that micro-states and non-EU autonomous regions (such as the Faroes) do better in GDP growth and unemployment terms, than neighbouring EU regions. However, they do not provide a conclusive answer to what the reasons are. In any case, though, their non-EU membership, combined with a favourable trade regime seem to play an important role (Armstrong and Read, 1995, p. 1239).

### 3. Faroe-EU Relations Before and Nowadays

As indicated above, the Faroe-EU relations are far from simple in terms of structure. This stems primarily from the Faroese status within the Danish realm, as well as from the Faroese economy structure. The Faroe Islands have been part of Denmark for centuries, though a specific culture, distant from the Danish one, developed in the course of the 19<sup>th</sup> century (Solvará, 2016, pp. 9–25). This led to calls for greater autonomy, which culminated during the Second World War, when Denmark was occupied by Nazi Germany and the Faroe Islands, due to an extremely important geographical position, by Great Britain – as part of what is sometimes called “friendly occupation” (Solvará, 2016, p. 141). The Brits allowed the Faroese to govern themselves freely (Ackrén and Lindström, 2012, p. 500), which led to even greater sense of distinctiveness and, after the War, referendum on independence. In the referendum in 1946, a slight majority voted for independence, though Denmark was not in position to grant it and the results were overruled by Danish legislation on autonomy (Arter, 2008, p. 41). Since then, a sensitive relationship exists between Denmark and the Faroe Islands, characterized by an ever increasing level of autonomy, without openly disputing the sovereignty issue (Hořejšová, 2006, pp. 12–15). The sovereignty issue is, however, present in Faroese politics as one of the political dividing lines (Adler-Nissen and Gad, 2014, p. 13) and enters into many issues, including the trade agenda where the Faroese authorities have wide autonomy.

The Faroe Islands became part of EFTA in the 1960s, together with Denmark. In 1973, though, when Denmark opted for EEC membership, the Faroe Islands followed Denmark out of EFTA, but chose not to enter the EEC. Since then the islands remain outside the European integration project that is today the European Union, while Denmark is a full member (although with some opt-outs). This step was motivated mainly by economic reasons – the Faroese economy is very dependent on fisheries and fish and fish products account for over 90% of Faroese exports. Thus, the Common Fisheries Policy of the EU would have catastrophic consequences for the island nation (Brunclík et al., 2011, p. 231).

Since mid-1970s until 1991, trade relations between the EEC and the Faroe Islands were governed by various transitional and unilateral measures, the main idea of which was, on the one hand, to provide legal framework for the specific situation (Denmark was in the EEC, thus the Faroese-Danish trade was in fact Faroese-EEC trade), while on the other hand, to allow Faroese fish and fish products exports without which the Faroese economy would collapse. In 1991, a Free Trade Agreement came into force between the EC and the Faroe Islands. The FTA covered exports of industrial goods and fish and fish products to the EEC. This treaty was replaced by a new one from 1998 and was last amended in 2008. The main concept of Faroese-EU trade remains, although restrictions and tariffs were further cut (Faroese Ministry of Foreign Affairs, 2010, pp. 21–24). For several decades, then, the Faroe Islands are able to export products listed on a “positive list” of the FTA, such as fish, some fish products and industrial goods, largely duty- and quota-free to the EU market. EU goods are allowed to enter virtually freely to the Faroese market, with some specific protective measures existing in sectors sensitive for the Faroese economy. Other segments of trade (mainly services, but also capital) are not covered (Government of the Faroe Islands [online], 2018a).

For a complete overview, it can be added that beyond FTA, the Faroe Islands have a specific fisheries agreement with the EU, a veterinary protocol allowing for harmonisation and mutual recognition of phytosanitary standards and an agreement covering cooperation in research (providing access to FP7/Horizon 2020) (Government of the Faroe Islands [online], 2018b). The Faroese-EU relationship thus remains on an ad hoc basis both in legal and political, as well as in practical terms – there is no structured all-encompassing Faroese-EU dialogue, as a

desk officer at the Faroese Ministry of Foreign Affairs and Trade confirmed to the author during an interview. Possibilities for the future are nevertheless being considered in Torshavn (some have been discussed in (Faroese Ministry of Foreign Affairs, 2010)).

#### **4. Possibilities for Faroe-EU Trade Relations in the Future**

The existing Free Trade Agreement of 1998 (amended in 2008) governs trade in goods, mainly the ones crucial for the Faroese economy. The logic of the agreement, though, based on a fixed positive list of products covered, is very rigid and slowly reaching its limits. From a Faroese perspective it conserves the undiversified structure of the economy or, from a different perspective, fails to include growing sectors of the economy, such as services. From the EU perspective, the Faroe Islands might be forced to look elsewhere for markets, which may not be dangerous in narrow economic terms (the Faroese economy and exports are relatively small), but may be unfortunate in political consequences – the above-outlined steep growth of Russia-destined exports are an obvious example.

For the Faroese, at the same time, the issue of foreign (trade) relations is part of the larger picture of Danish-Faroese dynamic, with the Faroese trying to emancipate themselves and establish themselves as part of the international (trade) community (Adler-Nissen, 2014, p. 57). Economic factors thus cannot fully grasp the complexity and political factors need to be taken into consideration. This must be done in two ways. One needs to look at the political “inputs” – the political and legal possibilities of the Faroese to upgrade their trade relations in their current status within Denmark; as well as the “outputs” – how politically meaningful a future trade solution is in the wider process of the Faroese emancipation (both vis-a-vis Denmark and in terms of the international community).

Since the Faroe Islands are a rather small economy, it is difficult to imagine that a specific ad hoc type of trade regime would be introduced. It is more likely that existing structures would be considered. In this logic, possible future trade regimes, ranging from less to more ambitious are: 1) an enhanced bilateral free trade agreement, 2) entering into EFTA and/or EEA, 3) becoming a member of the EU.

##### ***4.1 Enhanced Free Trade Agreement***

Under enhanced FTA regime fall many possibilities of bilateral trade regimes having many possible levels of ambition. One can imagine a “classic” free trade agreement, only covering a wider range of exports in goods (longer “positive list”, alternatively an FTA covering “all but several products”, or even a customs union-type agreement) or a new-generation deep and comprehensive FTA covering goods (including regulatory issues), as well as services and capital (such as CETA).

The main strength of the enhanced FTA regime in the above-outlined mutations, is that it is relatively easy to negotiate in terms of administrative and expert capacity (which is an issue in terms of a 50 thousand-strong population, see e.g. (European Commission [online], 2012), while providing an important gain in economic terms (the more ambitious the treaty, the bigger the potential gains) and respecting the specificity of Faroese needs in the fishing sector. At the same time, the possibility is virtually non-problematic from the legal perspective – the Faroe Islands have the constitutional and legal authority (under the autonomy regime) to conclude trade agreements (Government of the Faroe Islands [online], 2005). On the other hand, regarding the weaknesses, it would be only minor change in terms of the Faroese emancipation.

Also, the regime would continue to be solely focused on trade and other areas of interest for the Faroese (such as research cooperation) would still need to be specially negotiated.

From the external point of view, Denmark would likely be in a position to support the Faroese claim for an enhanced FTA, and in principle it should not be difficult for the EU to negotiate and approve deeper trade relations with a European territory. At the same time, though, the risk persists, that the EU would not be willing to liberalize mutual trade in sectors that some EU member states regard as sensitive. Also, given the natural asymmetry of Faroese-EU relationship, it is likely that more liberal trade rules from the EU side would only be granted in exchange for enhanced access of EU fishing vessels into the Faroese waters.

To provide a comprehensive picture, a specific trade regime should also be mentioned. The EU is in the process of negotiating one or more association agreements with European micro-states of Andorra, Monaco and San Marino (Council of the European Union [online], 2014). These specifically-tailored association agreements are to have an ambitious trade component. Such regime would likely encompass all the above-mentioned strengths, while adding another – a very important symbolic one. If the Faroe Islands were included in talks in this structured format, it would be a huge symbolical step in emancipation – the Faroe Islands would be seen as being on equal footing with other small, but by-all-means sovereign states. Plus, as Armstrong and Read (1995, p. 1239) have shown, an association to the EU in case of these micro-states often correlates with above-average macro-economic performance. Also, the association agreement would surely cover more than only trade, which is both a strength (as seen above) and a weakness. The Faroese authorities might not have all the competences they would need to conclude such an agreement. Also, Denmark might not be willing to see its autonomous territory being treated alongside sovereign micro-states, which is an obvious threat tied to this scenario. Given that the talks are on-going, it is also unlikely that there would be an easy way for the Faroe Islands to enter them. In a longer-term perspective, though, a given structure for relations between the EU and micro-states (if there is one), might further reduce potential administrative “costs” of the Faroese, if they decided to adopt a similar agreement later.

#### **4.2 EFTA/EEA Membership**

Another possibility for the Faroe Islands to integrate closer with the EU, than through an FTA, but short of full membership, is the model two other Nordic countries chose – the membership of the European Economic Area. Historically, the EEA was conceived as a way to integrate EFTA countries with EC/EU countries (Brunclík et al., 2011, p. 227). To be part of the EEA, one needs to be either part of the EU, or a member of EFTA (EFTA [online], 2016). That is why this possibility will be taken as a combined possibility of EFTA and EEA.

The EEA is in fact a solution for countries wishing to enjoy the benefits of the EU Single Market, without committing to all (non-Single Market) aspects of the EU. That is why it often shows up also with regard to post-Brexit UK (Ševčíková, 2016, p. 962) For the Faroe Islands, EEA membership would mean a vast widening of commercial relations, since the EEA countries enjoy rights of free movement of goods, services, capital and people (EFTA [online], 2016). This would be a big impetus for the Faroese economy. Also, the Faroese would become part of a multilateral economic integration organisation, which would be an important step in their emancipation. At the same time, the crucial economic sector of fishing would be unaffected, since the EEA does not entail participating in the EU Common Fisheries Policy. An obvious weakness of EEA membership is the generally acknowledged disadvantage of EFTA EEA members, who need to adopt EU legislation without the possibility of forming it (Brunclík et al., 2011, p. 227). Also, specifically for the Faroes, EEA membership would mean

a significant increase in administrative capacity needs. And last but not least, EEA is again mainly an economic organisation and the Faroe Islands have interest in deeper cooperation in other areas as well – which EEA membership would not entail automatically.

From the external perspective, the stance of Denmark would likely be ambivalent. On the one hand, under the current Home Rule Act, the Faroe Islands would be able to become member of EFTA. This is true even given that only states can become members of EFTA – the Faroe Islands could become a member without needing to open the sensitive sovereignty question (i.e. without becoming an independent state per se). A specific formula of “Denmark in respect of the Faroe Islands” could in principle be utilized (Faroese Ministry of Foreign Affairs, 2010, p. 27). However, in the current legal situation, the Faroes could not become party to the EEA Agreement, since Denmark already is and, as postulated by the Home Rule Act, the Faroe Islands cannot become member of an organisation of which Denmark already is member (Government of the Faroe Islands [online], 2005). Thus EFTA membership could be possible, but EEA membership not.

EFTA membership in itself cannot be seen as a way for the Faroe Islands to integrate more closely with the European Union. But this eventuality should not be easily dismissed. EFTA is a multilateral free trade regime with free movements of goods, services, capital and people among its members. Moreover, two out of its four current members – Norway and Iceland, are close trade partners of the Faroe Islands. Currently, the Faroese have an FTA with Norway and a comprehensive economic partnership agreement with Iceland (Government of the Faroe Islands [online], 2018a). Membership in this organisation would make economic sense. Also, EFTA groups smaller countries with relatively small administrations and thus this aspect need not be entirely problematic for the Faroese. One should also not forget the free trade agreements that EFTA as an organisation has concluded with third countries – this could be a big impetus for the Faroese economy. And EFTA membership might serve as a good capacity-building exercise for the inexperienced Faroese foreign and trade office, which in itself might open new ways for closer EU-Faroese relations in the future.

The threat in this relatively optimistic assessment may be the stance of other EFTA members, who might not be willing to let another member in, as was illustrated in a different context when possibilities for the UK after Brexit were discussed (Dagenborg, 2017).

### ***4.3 EU Membership***

To benefit the most from EU membership advantages, the Faroe Islands may consider the possibility of entering the EU. Due to a specific status of the Faroes, two modalities exist. The Faroese could either declare that they wished to become part of the EU under the Danish EU membership. In contrast, the Faroes could seek independent Faroese EU membership. These two options need to be analysed separately.

#### ***4.3.1 Faroes as Part of Danish EU Membership***

The option of EU membership via Denmark is, in practical terms, the simplest possibility to achieve. A deal would need to be made with Denmark on the practical matters and then Denmark would need to negotiate with the EU a ways to include the territory of the Faroe Islands under the regime of the EU treaties. This is a relatively easy solution, where the majority of administrative work would be carried out by the Danish authorities. It would mean full economic integration within the EU, also with access to non-economic programmes, which

are of interest for the Faroese. Externally, one could imagine that both Denmark and the EU would be willing to support the Faroese in this matter.

However, there are several weaknesses of this solution. First and foremost, the Faroe Islands would be participating in the Common Fisheries Policy, which is perceived as potentially disastrous for the Faroese fishing industry. Also, in symbolic terms, this would be regarded as a huge step back in the Faroese emancipation project – having been making gradual steps towards self-rule, the Faroes would in an instant become very much closer to Denmark (Faroese Ministry of Foreign Affairs, 2010, pp. 41–42).

#### *4.3.2 Independent Faroese EU Membership*

This solution would be more complicated than the one discussed above, but other than that, it would bring similar benefits of full EU integration. Also, it can be imagined that the Faroese would be able to ask for specific opt-outs of some EU policies, thus assuring the best membership regime.

From the perspective of both weaknesses and threats, though, this solution is very problematic. Administrative capacity is an obvious weakness that could only hardly be tackled. The Faroese autonomous administration comes nowhere near the theoretical needs of an EU member. Equally importantly, the EU or some of its member states might not be willing to support the Faroese claim for EU membership.

Most importantly, since only states may apply for EU membership (and having in mind that under the current Home Rule Act, the Faroes cannot enter an organisation where Denmark is member), the sovereignty issue in the Danish-Faroese relationship would need to be solved first. It is needless to say, that this is an extremely sensitive issue, which is present in the Faroese political life, as well as in Danish-Faroese relations, for decades and no quick solution is foreseen (Hořejšová, 2006, pp. 12–15).

## **5. Conclusion**

On the lines above, we have tried to provide an overview of the Faroese possibilities to gain a closer trade relationship with the European Union. Typologically, the following possibilities were considered: an enhanced bilateral preferential trade regime, membership in a multilateral organisation with access to the EU market and full EU membership. Each of these possible solutions, furthermore, showed a level of complexity. Enhanced bilateral preferential trade regime could also be part of a more comprehensive solution that the EU is currently seeking with the European micro-states. The multilateral solution, that was investigated (the EEA) provided an interesting possible “by-product” (EFTA membership without accession to the EEA) that on the one hand does not answer the need for closer trade relations with the EU, but at the same time could serve as a meaningful first step in that direction. Paradoxically, full EU membership still appears to be the least complicated solution, when considered as part of the Danish EU membership.

It must be accentuated, however, that the Faroese situation goes beyond simple economic terms. The Faroese political and public discourse has for decades been characterized by the sensitive issue of Faroese-Danish relationship. The Faroe Islands are an autonomous region, the current legal framework provides for possibilities to acquire ever more powers and the eventuality of full secession from Denmark is actually quite realistic. Even more so in good economic times, such as is the case nowadays. This topic inevitably enters into the seemingly economic debate of Faroese-EU trade relations, and not only at the academic level.

The issue of eventual secession is a political divide cutting across the political arena, as well as the society (Adler-Nissen, 2014, p. 56). One could argue, that ever since the Second World War, the topic is present and it periodically resurfaces with renewed strength. This was the case in 1999 when the Republican Party government commissioned a draft constitution for the Faroe Islands that is today still under consideration and the most recent government plans to submit the draft to the people in a referendum in April 2018 (Posaner, 2017). As Joan-Pauli Joensen, chair of the committee tasked to draft the constitution in 1999, confirmed to the author during an interview, the draft is a compromise between the pro-secession and pro-union halves of the political and societal spectrum, but goes too far according to Denmark. Denmark is willing to “let the Faroes go”, but their economic sustainability is questionable, considering the annual Danish grant to the Faroese budget (Hořejšová, 2006, p. 14).

This is where the topic of Faroese external trade relations resurfaces. Closer trade ties with the EU, followed by an increase in mutual trade, i.e. increased economic growth, could be a solution for the substitution of the ever-diminishing Danish grant (even though the public discourse does not regard these things as connected, as civil servants of the Faroese authorities confirmed to the author during interviews). This would be in line with the theoretical assumptions, with a number of authors arguing that in fact integration into a wider economic bloc could be a way to ensure sustainable development of such small entity (see Marcy, 1960; Scitovsky, 1960; or Triffin, 1960). At the same time, though, one should keep in mind Armstrong and Read’s (1995, p. 1239) finding that micro-entities on the outskirts of the EU are empirically better off, than their counterparts inside the EU. One could argue, then, that closer economic ties with the EU in the form of an enhanced bilateral or multilateral (together with other European micro-states) trade regime is in fact preferable to EU membership in the case of the Faroe Islands. Though this issue has not been strongly supported by empirical analysis and requires further research.

From the EU perspective, enhanced preferential trade regime for the Faroe Islands does not seem controversial. This is mainly due to the small scale of the Faroese exports in absolute terms, when compared to the EU market. On the other hand, the EU would perhaps avoid the possible future political (and even security) repercussions brought about by the recent partial reorientation of the Faroese exports to Russia. Moreover, the integration into the eventual multilateral regime (together with the other European micro-states) would bring more coherence into EU trade relations. And not least, free trade promotion and lifting of barriers on the market is part of the EU “DNA” and the EU proposes to do so even in case of such micro-entities (European Commission [online], 2012). Despite the seemingly modest consequences in the EU.

At the same time, the interesting “by-products” of EFTA membership bring also this possibility into the equation. True, EFTA is probably not strong enough economic bloc, as to ensure the sustainability of the Faroese economy (even though this is purely an intuitive assumption and future research could suggest otherwise). However, EFTA membership would be a symbolic step in the Faroese pursuit of sovereignty and would serve as a school for the so far inexperienced local civil servants. It comes as no surprise, then, that EFTA membership is being seriously considered by the new Faroese government (Government of the Faroe Islands [online], 2015).

### Abstract

*Sustainable development is today a non-separate element of environmental policy, socio-economic policy and various socio-economic strategies of the European Union. At a time when the majority of citizens live in cities or urban areas sustainable development is a fundamental principle that should accompany assumptions of smart cities. The URBAN Program supports this activity through the social and economic development of cities, districts and urban areas in crisis. The Europe 2020 strategy intensifies the implementation of activities in the long term, to make it possible, an action plan must be based on a thorough analysis of the needs of residents and the possibilities of the ecosystem. The current European Union policy has a certain collegial elements that connect protective environments, management of non-renewable natural resources or aimed to keep forethought. However some extent these aspects still remain a challenge for the future.*

**Keywords:** *environmental problems of cities, Raport Brundtland, sustainable development, the Europe 2020 strategy, the URBAN Program*

**JEL Classification:** *Q57, P20, R11*

### 1. Introduction

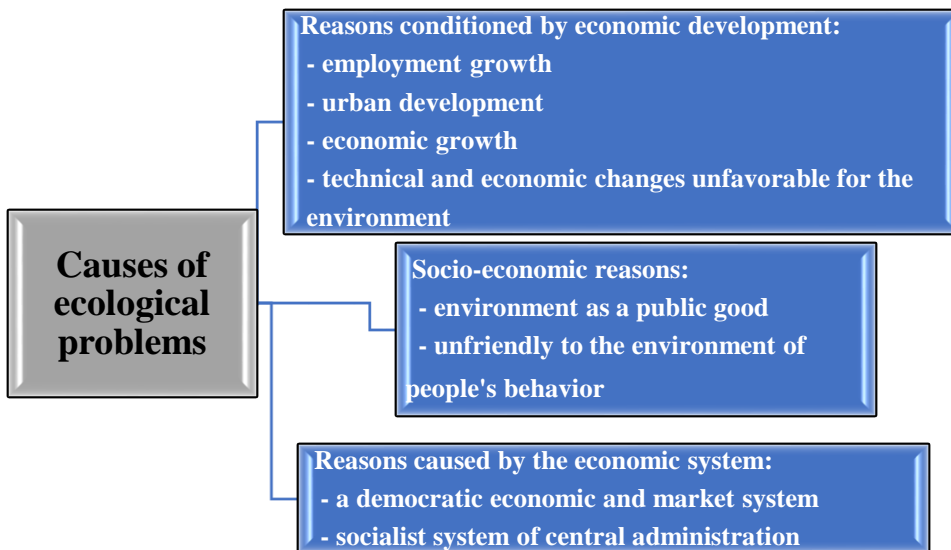

Sustainable development is today a non-separate element of environmental policy, socio-economic policy and various socio-economic strategies. The precursors of the concept of sustainable development are derived from classical economics: D. Ricardo, T.Malthus, J.S. Mill. However, the original definition was formulated in 1987 in the report: *Our Common Future* (cited Brundtland's report): "Sustainable development is a development aimed at satisfying the developmental aspirations of the present generation in a way that allows the same aspirations to be pursued by future generations" (Kramer M., Urbaniec M., Kryński A., 2004). These aspirations, however, must take into account many aspects of development. In the modern sense, sustainable development is particular interest of: ecological economics, environmental economics or other related disciplines. However, considering the approach to sustainable development in relation to the Brundtland report, it raises some doubts (Jeżowski, 2007). In particular in the aspect of perceiving needs, social justice or limitations imposed by the natural environment of the city. Europe, in its geographic and political diversity, provides

us with numerous examples of cities that can be put forward as models for managing sustainable development. The study analyzed the current practice of managing the sustainable development of the city Gdańsk, located in the north of Poland and Copenhagen, the capital of Denmark, which is a precursor of the model use of environmental assets. The aim of this study is to present ecological problems of European cities on the example of Gdańsk and Copenhagen and their action strategy for smart and sustainable development in accordance with the European Union policy for environmental protection.

### 1.1 Environmental Problems of Cities

The quality of the natural environment in large cities, and thus the living conditions since the late 1960s, became the subject of public discussion. Every day, each of us encounters ecological problems, it is no novelty. However, news are the more and more serious threats to human existence. They result from ecological problems of global reach, they are mainly: acid rain, ozone hole, greenhouse effect, soil and water contamination by various metals, salts or insects. In principle, three categories can be distinguished that have a causal relationship with an impact on the natural environment.

**Figure 1: Causes of Ecological Problems**

Source: Own elaboration based on: Meffert H., Kirchgeorg M.(2001): *Marktorientiertes Umweltmanagement*, Stuttgart 1998 s.10, Graap T.: *Nachhaltigkeit und Kooperation: zum Verständnis eines Leitbildes und Handlungstyps in einer komplexen Welt*, Berlin 2001 p.30.

The first of the reasons is conditioned by the development indispensably linked to population growth. In 1950, the number of individuals in the world from the homo sapiens species was 2 billion, in 1980 it doubled to 4 billion (Koch, Czogal 1999), while in 2014 their sum was 7 billion 137 million 577 thousand 750 people, increasing by 77 million compared to 2013 (Changes on Earth online). The population is growing rapidly and is becoming a problem of developing countries, as a result of which cities are undergoing intensive transformation. This state of affairs is reflected in the number of urban residents in the world since the beginning of the 19th century, where the world's population accounted for 2.5%, rises to around 25% in

1960, to reach 51% of the Earth's population in 2006. However, this situation is constantly changing and as the forecasts indicate, the share of urban residents in 2030 will exceed 60% of the world's population. However, the population growth increases the problems. They are manifested by the use of soil during the production of food, resulting in expansion of arable land, increased energy consumption and ultimately the emergence of an increased amount of municipal waste. This increase reveals the destruction of the environment, so how to solve environmental problems arising through the quantitative effect of population growth and economic progress? By reducing the consumption of raw materials and the decrease in pollution generated as a result of production and consumption (Koch, Czogal 1999). The second problem resulting from the causes of ecological problems are socio-economic reasons. Their character results from the disposition of environmental goods and their use in production processes or consumption for free, the emergence of external effects (negative effects) and the maintenance of economic entities to the environment (Schmid, 1996). The last reason for ecological problems is the so-called causes conditioned by the economic system. Their germ lies in market-democratic economy systems, where the maximization of income by enterprises leads to negligence in favor of environmental protection. Therefore, one should look carefully at the aspects of ecological problems, paying attention to the obligation of sustainable development by taking into account the necessary environmental protection requirements in enterprises.

## **2. Problem Formulation and Methodology**

This research attempts to analyze the significance of European Union activities in the field of social development of cities, urban areas and urban districts in accordance with the concept of sustainable development. Global ecological problems faced by contemporary European cities are discussed in detail. An analysis of the sustainability management strategy practiced by these agglomerations was conducted on the example of Gdańsk and Copenhagen.

The aim of this study is to present ecological problems of European cities on the example of Gdańsk and Copenhagen and their action strategy for smart and sustainable development in accordance with the European Union policy for environmental protection. In order to present the problem, a monographic method was selected that primarily considers information in the form of a qualitative and descriptive form and serves to illustrate the effectiveness / improvement / innovation or development forecasts of a specific entity (urban agglomerations here). The article has a theoretical and research character. In the first part of the article, the authors identify the concept of sustainable development and present environmental problems arising through the quantitative effect of population growth and economic progress. The importance of EU actions to protect the environment by promoting ecological and sustainable development of cities are emphasized. The second part justifies the issue, comparing the ecology management policy in Gdańsk and Copenhagen. The article is based on Polish and foreign language literature in the field of sustainable development management and the analysis of national and European documents in this thematic scope.

## **3. EU Cooperation in the Field of Sustainable Urban Development**

The importance of the European Union in terms of finance, economy and business is unquestionable and definitely places EU among the power of the world (Kana, Mynarzova, 2015). One of the Community Initiatives of the European Union aimed at the social development of cities, districts and urban areas that may be in a crisis or reducing negligence for environmental protection has become the URBAN program. As part of the program,

activities aimed at innovation and social development of cities were proposed. During the implementation of the two editions of the program, funding was achieved at the level of 1 billion 703 million euro. On the other hand, the priorities set for the European Regional Development Fund under the second objective were: "environmental protection measures, including reclamation of contaminated sites, stimulation of energy efficiency, promotion of ecological and sustainable urban public transport". The ERDF program solved numerous economic and environmental problems with which societies struggled every day.

Another strategy for smart and sustainable development is the Europe 2020 strategy, which includes three interrelated priorities:

- a. Intelligent development: development of a knowledge-based economy and innovation;
- b. Sustainable development: supporting a more resource efficient, more environmentally friendly and more competitive economy;
- c. Inclusive growth: supporting a high-employment economy that ensures social and territorial cohesion (Communication from the commission EUROPE 2020).

The above goals have become interlocked, thanks to which the effectiveness of one of them translates into an increase in the chances of others. Of course, it raises many questions, both from political, military or economic areas on which the EU can focus in the near future (Kana, Mynarzova, 2012).

#### **4. Implementation of the Sustainable Development Policy**

Environmental pollution, climate change, the fuel or energy crisis, as well as the resulting losses in biodiversity contribute to the search for new global solutions that will contribute to the possibilities of sustainable development. They are an indispensable challenge for citizens and policy-makers who, at various levels from international, through national, regional and local, endeavor to solve problems: ecological, economic and social. The concept of sustainable development in Poland was introduced in 1991 by setting the most important goals of sustainable development. However, it was not until 1995 that a resolution on the policy of sustainable development was adopted (Kramer M., Urbaniec M., Kryński A, 2004). The principle of sustainable development itself has been included in the Constitution of the Republic of Poland in 1997, in art. 5 together with other important state issues including: independence and inviolability of the territory, freedom and rights of man and citizen (Constitution of the Republic of Poland). The Brundtland report was therefore the beginning of the implementation of the concept of "sustainable development" in line with the principle of global environmental policy and development (Wagner, 1997).

The most important point of the conference was the implementation of the Agenda 21 document. Under which, in many European cities, sustainable development began to be implemented through activities supported by the public, non-governmental organizations and other pressure groups. Due to local activities related to Agenda 21, many Polish cities begun work on introducing sustainable development, including in the city of Gdańsk. The city is located in the north of Poland, by the Baltic Sea. It is ranked sixth in Poland in terms of population (456,977 inhabitants) and also sixth in terms of size - 261.96 km<sup>2</sup> (The number of city dwellers is decreasing [online]). It enjoys prosperous maritime trade, productive industry and well-developed tourism. Implementation of Agenda 21 was initiated in Gdańsk in 1990 by adopting: "Equal development policy for the city". Gdańsk initiated the implementation of Agenda 21 at the local level through activities aimed at short, medium and long-term goals, each of them being fully implemented. The first of them were already achieved within 5 years - until 1995 as a result of which the quality of drinking water was improved, sewage treatment plants were built, emissions from refineries were monitored or waste and ash were removed

from the power plant. The medium-term goals were achieved within 8 years - until 1998 through further activities for the disposal of sewage and waste, improvement of the status of surface water together with the water protection areas, as well as ensuring sufficient capacity of landfills. As a result, the "mountain of waste" in the city of Gdansk has been reduced by 30%. The implementation of long-term goals was profiled for actions spread over a longer period of time, however, not exceeding 12 years - until 2002. These included the reduction of the greenhouse effect by 20% compared to 1990, the co-creation of green areas, the supervision of the groundwater level, and the project to protect species diversity on Sobieszewska Island. Cooperation with the industry also brought measurable benefits in the form of reduction of dust emissions (nitrogen oxide and sulfur to air). However, planted trees and isolated green areas are still enjoying the eye of the inhabitants of the city of Gdańsk (Lokale Agenda 21[online]). Also, current reports on sustainable urban development show the prestigious success of the city of Gdańsk, which is increasingly compared to the Danish city of Copenhagen. The Polish city ranked fourth in the "Policy Insight" ranking in 2016 in terms of: quality of the environment, economic development, society and politics. The report has been prepared for the Polish Foundation of Robert Schuman and the Konrad Adenauer Foundation in Poland. It shows the main advantages of Gdańsk, which include: limited car traffic, including the extension of the zone of slowed traffic to 30 km / h that already exceeds 50% of the city's road network. Environmental quality expressed in the form of lower emission of carbon dioxide (116 tons / ha) with average cities with district rights defined at the level of 118 tons / ha, as well as less gas and dust pollutants below the national average. Other advantages include reduced waste amounting to 186 kg per capita with a national average of 215 kg. However, the minuses of the city of Gdańsk include above-average consumption of electricity - 888 kWh with the national average less by 111 kWh. A good economy is also an advantage of this coastal city, for 10,000. There are 120 new entrepreneurs, which in the final analysis creates 130% of the national average. In terms of road hardening, the city looks quite weak because for 100 km there are only 193 km. However, their condition is constantly being improved and the city budget for the implementation of road investments has allocated as much as 22% of the city budget with the national average of 10%.

The authors of the ranking also appreciate the innovativeness of Gdańsk in terms of building a network of roads and bicycle paths, while giving Gdańsk the nickname of the "cycling capital of Poland". Currently, work is underway on a bicycle rental project that includes leaving the bike at any point in the urban agglomeration, the implementation of which is scheduled for 2018. Currently the city has an impressive network of roads and cycle routes, which total length is 586 km (*Gdańsk how Copenhagen* [online]). In the final analysis, showing the authority of the Polish city compared more and more to a sustainable city like Copenhagen. The capital of Denmark is the most beautiful city on the east of Zealand and Amager. We owe its prestige among many European cities to being one of the most sustainable cities in the world. The capital of Denmark has been fond of the idea of being a city of economically sustainable development that will resolve environmental, economic and social issues. Copenhagen is seen as the "greenest city in the world" according to the Global Green Economy Index (GGEI) published in 2013 (Sustainable Cities: Copenhagen [online]). Its uniqueness is evident in all aspects of life ranging from the environment, the quality of life of residents, and ending with the economic situation of the city. This Danish capital at the heart of its activities has focused on eco-innovation and sustainable development with companies, universities and organizations to develop and implement green development [Laconte, 2012]. Copenhagen is environmentally friendly in many respects, one of its assets should be recycling covering about 90% of all waste, also household waste is re-used because as much as 75% of them are used for heating flats. From 2010 in Denmark, all roofs are inclined at an angle below 30% and must be covered with vegetation. The government apparatus also puts on wind power, until

2020 the city is to produce so much energy that it will be supplied with 50% of its use, creating a self-sufficiency factor of 156% (Sustainable Cities: Copenhagen [online]). The capital of Denmark, just like the city of Gdansk, is leading the way in supporting cyclists. There are over 300 km of bicycle paths in the city, of which every statistical day is over 3 km by bicycle. The implemented model in the field of urban planning shows the effective implementation of bicycle transport goals, which within 5 years from 35%, increased to 50% of people riding a bicycle to work or school. The Danish capital also places restrictions on car traffic in the city center and in designated areas. The capital of this European city can also boast excellent communication in the form of a metro network, city trains, as well as buses powered by electricity. All these activities aim to achieve a neutral state in the balance of CO<sub>2</sub> emissions in 2025 (emission = absorption), (Laconte, 2012).

## 5. Conclusion

Sustainable development has become a global concept staged for the needs and challenges of the developing economies and societies of the nineteenth century. It is not a single and strictly defined category based on ecological and socio-economic activities. However, it is a concept that develops in time and space through differences in value systems. Moreover, it should have certain collegial elements that connect protective environments, management of non-renewable natural resources or activities aimed at preserving foresight. The current European Union policy consolidates to a small extent the actions of sustainable development of cities and villages, to some extent these aspects still remain a challenge for the future.

### **Abstract**

*The European Union regulations develop the Rural Development Program for 2014 - 2020+ (PROW 2014-2020 +) and by the year 2030 of the Silesian Voivodeship. In particular, by the Regulation (EU) No 1305/2013 of the European Parliament and of the Council of December 17, 2013, on support for rural development by the European Agricultural Fund for Rural Development (EAFRD). And repealing Council Regulation (EC) No 1698/2005, as well as delegated and implementing acts of the European Commission. This article aims to present a rural management process on the example of innovative activities of the Silesian Voivodeship with the use of EU funds. The authors discuss the implementation of common EU objectives defined in the EU growth strategy "Europe 2020 - a strategy for smart and sustainable development inclusive of social inclusion" taking into account the development needs of the Member State concerned.*

**Keywords:** EAFRD, EU funds, EU growth strategy, management, Silesian Voivodeship

**JEL Classification:** H11, H75, P21

### **1. Introduction**

The development strategy is the process by which the organization focuses on the implementation of the main objectives of survival, development, improvement of living conditions and strengthening of the market position (Skowron-Grabowska, Nowakowska-Grunt, 2017). It is a tool for efficient resolution of economic, social, ecological and spatial problems. It is an instrument supporting the ongoing work of local governments, such as promotion, development of socio-economic plans or investment offers. Having a strategy is a prerequisite for the mobilization of external funds, in particular funds from the European Union (Lokalna Strategia Rozwoju [online], 2018). The development strategy covers all activities aimed at achieving the strategic objectives of the organization in a long-term action.

The development strategy takes into account each of the functions of the management process (planning, organizing, coordinating and controlling) (Fojtíková, Vahalík, and Staníčková, 2016), which focus on tangible, human and financial resources (Porter, 1991). The

development strategy assumes realizing innovative solutions, with a particular precise plan, optimally exploiting the potential of the area and ensuring a balance in all aspects of life (Romanowska, 2015).

The objective of developing a rural development strategy for the Silesian Region of Silesia in the Silesian region by 2020 + was to draw new strategic orientations for the development of rural areas. Municipalities of Silesian Voivodeship in "Development strategies of the Silesian Region 2020 +" (Dahme, Wohlfahrt, 2001) particularly emphasize the dynamic and harmonious development of rural areas, which remain in symbiosis with the environment while maintaining the values Landscape and cultural regions (Krawczyk-Sokołowska, Mesjasz-Lech, Nowicka-Skowron, 2017). The Rural Renewal Program refers to problems that have existed in the region for several years as a result of the economic, cultural and societal revalues of reality (EUROPA 2020 [online], 2018). The regional development strategy is a specific document, especially in the context of the internal diversity of the province, multifunctional and sustainable development of rural areas and the multi-entity shaping of development processes for Rural areas (EUROPA 2020 [online], 2018). On the background of the country, it is a pioneering document defining the operational objectives of the Strategic and key rural development guidelines of the Silesian Region and the project in the perspective of 2030.

This document is overarching with other rural development studies and programs prepared in the Silesian region after 2015 in the following years (PROW 2014-2020 [online], 2018).

The rural development strategy takes into account the working conditions and rural development forecasts of the entire Silesian Voivodeship.

The regional government of Silesia, during the work on the formulation of the Rural Development Program for the period 2014-2020 (RDPS 2014-2020 +) and by 2030 (Rural Development Strategy for the Silesian Province by the year 2030) referred to the regulations of European Union. The program refers to the regulation (EU) No 1305/2013 and of the EU Council's (December 2013) on support for rural development by the European Agricultural Fund for Rural Development (EAFRD) and the repealing of Council Regulation (EC) No 1698/2005). Additionally, it includes the regulations from the delegated and executive acts of the European Commission (PROW 2014-2020 [online], 2018).

## **2. Problem Formulation and Methodology**

The paper presents a process for managing rural areas, on the example of innovative activities of the Silesian Voivodeship. It discusses the use of the EU funds to achieve the common EU objectives set out in EU development Strategy "Europe 2020 - a strategy for smart, sustainable development, including social inclusion", taking into account the development needs of the Member State concerned.

The authorities of the Silesian Voivodeship propose in particular the development of awareness of local rural leaders, supporting the strategy of "Investing in people" and promoting actions complementary to other projects of self-government Silesian Voivodeships and national programs.

The authors have used the monographic method to explore the characteristics and elements of a specific structure/system/process (the process of managing the relocation of the countryside) and to identify their nature, functioning, and development. The paper presents the cognitive problem of classification type and explication type. Accordingly, the authors are looking for answers to questions: What direction of changes in the rural management strategy was made

by the regional government of Silesia? What innovative actions do the Silesian authorities take in finding new quality in rural development? The first part of the work presents the literature of the subject, acquainted with the problem in purely theoretical terms. The literature analysis served to determine the facts in the context of the phenomenon. The second part of the work is the empirical part, which presents the results of the study.

The article was written on the canvas of literature studies on the management, organization, and planning of the renewal of the countryside, national and European documents from this thematic scope, analysis of surveys and statistical data collected by the Voivodeship.

### **3. Socio-economic Determinants of the Silesian Voivodeship Including Rural Areas**

Silesian Voivodeship is a region located in the southern part of Poland covering 12 333 km<sup>2</sup> (cities: 3 790km<sup>2</sup>, villages: 8 543 km<sup>2</sup>). The region represents as much as 4% of the country's area. The administrative structure of the Silesian Region consists of 167 municipalities, grouped in 36 counties. Regarding population, the province occupies the second position in Poland (4615.9 thousand people) reaching the highest population rate – for 1km<sup>2</sup> there are 374 people (Lokalna Strategia Rozwoju [online], 2018).

According to the population forecast for 2035 by the Central Statistical Office, the population in the described province is steadily decreasing. The projected decline is highest in Poland and is approximately 482 thousand for years 2015-2035. The data applies to both urban and rural areas.

In Silesian Voivodeship, most of the unemployed are city dwellers (78.0%), in 2012 only five unemployed people resided in rural areas (22.0%). As many as 56% of the unemployed in the countryside holds a professional, secondary and fundamental education (PROW 2014-2020 [online], 2018).

The Silesian Voivodeship embodies the highest density of roads, including highways and expressways in the country, as well as the largest length of the urban transport lines (about 20% of the length of all city lines in Poland) (PROW 2014-2020 [online], 2018).

The province in question is the largest in the country, evenly spread over the rail network, comparable to the European regions. However, its technical condition is disappointing (Porter, 1991). In particular, in the areas of mining exploitation, Silesian Railway infrastructure does not meet any operational standards.

The standard of living for the inhabitants of Silesia, between 2007 and 2012 in the country improved. The number of people in households benefited from environmental; social assistance fell by 14.7% and 20.4% respectively (EFRROW [online], 2018). The share of people using social assistance in the total population in the region (5.4%) was lower than in the country (8.1%). During the same period, there was also a downward trend in the number of families receiving family allowances for children. Social and cultural activity is constantly evolving. Cultural houses, clubs, and dayrooms have been improved, and they are now wheelchair-accessible. Currently, as many as 57.7% of facilities are available for people with mobility impairments. Cultural and entertainment institutions belong to the public organization of culture, which, especially in rural areas, often functions as the only significant organizer of cultural and social life [Lokalna Strategia Rozwoju [online], 2018).

Farmers in the Silesian Voivodeship, in different parts of the region, practice different cultural patterns and ways of management, due to the former administrative divisions of the country

and different historical circumstances. Farms are chipped, not adapted to current market conditions; they indicate very low production space (PROW 2014-2020 [online], 2018). Only 1/5 of the farms produce on the market using significant consumer opportunities in the Silesian agglomeration (Lokalna Strategia Rozwoju [online] 2018).

Due to the absence of professional logistics centers dealing with an agricultural turnover or the trade in breeding material, Silesian farms show very low income. Such situation, in turn, translates into a lack of ability/capital to expand directions of production, change the traditional land use or rebuild and maintain agricultural equipment (Krawczyk-Sokołowska, Mesjasz-Lech, Nowicka-Skowron, 2017).

According to the agricultural census of 2010 in Silesian Voivodeship, there were 163.3 thousand farms. There were 77.6 thousand farms with an area of more than 1 ha of farmland. The Silesian Region, due to its high industrialization, indicates the lowest proportion of agriculture in creating gross value added (Okręglicka, Mynarzová, Kaňa, 2015). Despite the high fragmentation, the number of large farms with an area of 20 – 50 ha (about 21.8%) and the largest farms with 50 hectares and more (41.8%) increased (PROW 2014-2020 [online], 2018). The situation forces the provincial authorities to seek solutions conducive to the economic exploitation of land, i.e., its destination for afforestation purposes, temporary exemptions, the holding of agricultural activities in areas of fragmented agriculture and the preservation of the land in good agricultural culture. The Silesian local government predicts that farms will be less in number, but they will be modern, more automated and with a larger total area. Agriculture in Silesian Voivodeship mainly specializes in the cultivation of vegetables, fruit, poultry and cattle breeding and mushrooms production. The processing sector in the dairy and meat processing industry is also developing.

Although the environmental conditions of rural areas remain with a lot to be desired, due to the poor air quality and the pollution of surface water and groundwater, they still have favorable agri-nature conditions, including favorable agri-climate, the region's potential for energy production from renewable sources in biomass, high biodiversity, and geodiversity.

#### **4. Sources of Aid for the Restoration of Rural Areas in Silesian Voivodeship**

Modernizing and developing rural areas would not be possible without the support of funding from the European Union. The effectiveness of the changes planned in the rural development strategy of the Silesian Voivodeship depends on ensuring adequate sources of funding. The activities of the Silesian Government under the renewal of rural areas pursue two policies: cohesion policy also called regional policy and the common agricultural policy (Kaňa a Mynarzová, 2012). In the years up to 2018, the source of cohesion policy funding was: the Cohesion Fund (CF), the European Regional Development Fund (ERDF) and the European Social Fund (ESF). The implementation of activities under the common agricultural policy was based on aid measures obtained from the European Agricultural Guarantee Fund, the European Agriculture Fund for Rural Development and the European Social Fund Fishing (EFRROW [online], 2018).

Co-financing of the Silesian Rural Renewal Program was also implemented through operational programs managed by the Ministry of Development and the management boards of the voivodeships: Infrastructure and Environment-ERDF Program; Innovative Economy Program - ERDF; Human Capital - ESF Program; 16 regional programs - ERDF; Program Development of Eastern Poland - ERDF; Technical Assistance Program - EFRR; Programs of European Territorial Cooperation – ERDF.

From the comparative analysis of the 2007-2013 funding period on a country-wide basis, the Silesian Voivodeship ranked below the national average regarding aid pool.

The current programming period is covering the years 2014-2020 (RDP 2014-2020) is also co-financed by the foreseen EU funding. The EU budget for aid is an essential source of rural development funding (Melecký, Staníčková, 2014). The RDP 2014-2020 was developed on the basis of the European Union rules – mainly, the regulation (EU) No 305/2013 of the European Parliament and of the Council of 17 December 2013 on support for rural development by the European Agricultural Fund for Rural Development (EAFRD) (PROW 2014-2020 [online], 2018).

At present, the EU budget (EAFRD) provides funding the renewal of rural areas in Silesia of 8598280814 euros. The national contribution was estimated at 4 915 014 186 euros (PROW 2014-2020 [online], 2018).

The strategy is financed by the funds from loans or other return and non-refundable instruments. For example, money is obtained via the European Investment Bank or the World Bank. Some tasks may also be financed by private funds using public-private partnerships. Today, such solutions can be used to implement public investment, which is strongly supported by the Union (Fojtíková, Vahalík a Staníčková, 2015).

## **5. Pioneering Solutions to the Rural Renewal Strategy in Silesian Voivodeship**

The rural development strategy in the Silesian Voivodeship, developed by the provincial government for the period 2014-2020 and by 2030, is based on 15 main activities that have been adapted to the six priorities of EU policy (PROW 2014-2020 [online], 2018). Priorities are (Lokalna Strategia Rozwoju [online], 2018):

- a. Simplification of knowledge transfer and innovation in agriculture, forestry, and rural areas,
- b. Improving the competitiveness of all types of farming and increasing the profitability of farms,
- c. Improving the organization of the food chain and promoting risk management in agriculture,
- d. Restoring, protecting and strengthening ecosystems dependent on agriculture and forestry,
- e. Promoting resource efficiency and shifting to a low-carbon and climate-resilient economy in the agricultural, food and forestry sectors,
- f. Enhancing social inclusion, reducing poverty and promoting economic development in rural areas.

As it has been already mentioned, together 13 513 295 000 euros of public funds, have been earmarked for the implementation of the intended tasks (PROW 2014-2020 [online], 2018).

In the framework of the RDPs for 2014-2020 realized by the Silesian governments out of 15 activities, three major have been specified (Lokalna Strategia Rozwoju [online], 2018):

- a. Support for investments related to the development, modernization and adaptation of agriculture and forestry (land consolidation) – 24 152 381 euros,
- b. Basic services and village renewal in rural areas (among others for local roads, water and wastewater management and markets) – 33 849 751 euros,

- c. Support for local development within the LEADER initiative, for preparatory actions, for cooperation with the local action group and running costs and activation, as well as the implementation of the local development strategy - 40 929 190 euros.

All the activities undertaken in the field of renewal of the countryside are intended to serve sustainable development, to meet the needs of modern residents without diminishing the opportunities for future generations. The process of change in Silesian Voivodeship should ensure social, economic and environmental sustainability. Sustainable development projects are a reflection of the policies and strategies of continuous economic and social development without compromising on the environment and natural resources, the quality of which depends on the continuation of the activity and further development (Nowicka-Skowron, Krawczyk-Sokołowska, Mesjasz-Lech, 2017).

Aid funding for the 2014-2020 period and 2030 will mainly aim at modernizing and restructuring the Polish agricultural sector in the whole of Silesia. The Silesian authorities have continued to support the reconstruction of agricultural production potential, damaged by natural disasters and disasters, as well as regulating the protection of farms against these types of events. Financial instruments, during the described period, will be allocated in addition to modernizing the agricultural sector, to support young farmers and payments to farmers who decide to transfer small farms to merge fragmented holdings. Projects to be implemented in the framework of land consolidation are designed to improve the area structure of agricultural holdings. Particular emphasis is on diversifying agricultural production and adapting it to market needs as well as regionalization of products. To increase the competitiveness of agricultural areas in the province, it also puts knowledge transfer and advice on every level of agricultural activity. Co-operation will be a pioneer edition instrument in support of the implementation of innovation in the agri-food sector. Support is envisaged to improve the organization of the food chain by investing in the processing and marketing of agricultural goods (Lokalna Strategia Rozwoju [online], 2018). The local government is setting further development of producer groups and organizations and quality schemes for agricultural products and foodstuffs. For the facilitation of direct selling of agricultural goods, it is planned to invest in the construction and modernization of the markets.

The operation of "basic services and rural renewal in the countryside" carries out investments related to the development of technical infrastructure. The result of this type of operation is the construction or modernization of local roads.

Sustainable development is the cohesion of rural areas in economic, social and environmental terms and will, therefore, continue the activities begun in the earlier programming period (2007-2013) contributing to the development Entrepreneurship, the rural development also in the field of technical infrastructure (PROW 2014-2020 [online], 2018). The actions will be implemented both within separate actions and through the action of local development strategies (Leader). Leader aims to strengthen grassroots initiatives in local communities (Lokalna Strategia Rozwoju [online], 2018).

This sector is particularly important regarding sustainable rural development and, therefore, innovative action will be an increase in the market for organic production. The agri-environmental climate action will support environmental measures (including water, soil, landscape) and biodiversity conservation. The aid will be able to benefit farmers using the land in less-favored areas. Investment support for the achievement of environmental objectives shall be granted to farms located in Natura 2000 areas and areas prone to pollution by nitrates from agricultural sources.

The Silesian Voivodeship also struggles with the problem of high pollutant emissions. The work of the local authorities will be directed towards the fight against smog, which is why the ANTISMOG resolution has been implemented (Lokalna Strategia Rozwoju [online], 2018). It is planned through a series of information platforms, conference organizations, developing educational materials to inform locals as smog enters the atmosphere and how it affects our health. Therefore, it is important to use the appropriate fuels, using heating devices that meet the highest standards (Lokalna Strategia Rozwoju [online], 2018).

## 6. Conclusion

Rural areas are an important part of the economy of the Silesian region. They are characterized by a large variety of functional and spatial systems, and their status is important for the living conditions of the population and the possibility of farming and therefore also for the direction and pace of development.

EU agricultural policy 2014-2020 is crucial for ensuring the competitiveness of European agriculture, food security, the sustainable development of agriculture and rural areas and the management of natural resources.

The Strategy for the Development of Rural Areas in the Silesian Voivodeship emphasizes sustainable management methods; sustainable agriculture, organic farming, ecological products. Improving practices, processes, technologies, organization or marketing methods related to production and processing should facilitate the marketing of organic and local products.

Innovation in undertaking actions in the field of rural renewal is to concern all areas of life. These areas will be developed simultaneously by strengthening links between agriculture, food production, and forestry, research and innovation, optimizing environmental management methods. Also, by ensuring the sustainability of agriculture in the face of climate change and natural limitations, improving the sale of agricultural products and strengthening the position of farmers in the food chain. And by improving the quality of agricultural and food products or restoration and preservation of biodiversity and development of technical and social infrastructure in rural areas.

The new instrument for managing the renewal of rural areas is to support innovation, cooperation and the development of knowledge base in rural areas. In the context of knowledge transfer, it is necessary to assign an appropriate role to state higher education institutions. The document shows that the process of knowledge transfer, specific in R & D and innovation is important and must get the support from the public universities and research institutes. The authorities of the Silesian Voivodeship, in a newly developed strategy, take account of the challenges of the modern agricultural policy by engaging in their implementation all the instruments and resources they have. The resources and instruments should improve the competitiveness and efficiency of micro-and agricultural holdings, thereby advance the standard of living for the inhabitants of the region.

In the authors' opinion, a similar strategy should be developed for the remaining Voivodeships in Poland due to its multidimensionality, including strong social activation, knowledge transfer and the development of organic farming.

### **Abstract**

*One of the most visible indicators of entrepreneurship of farmers in Poland, due to the support from the State and the European Union, is currently the use of available economic resources and the necessity to improve agricultural holdings. Many features providing the quintessence of entrepreneurial management in rural regions cause the sphere has become an identified field of scientific research. The aim of the paper is the recognition of the significance of rural entrepreneurial management in the context of European Union support on the example of the selected local territorial unit, i.e. Częstochowa County in southern Poland. The author has aimed at presenting entrepreneurial management and European Union support as the determinants of development of rural areas. The applied research method was the survey carried out on a sample of 135 farmers of the selected county.*

**Keywords:** *European Union, entrepreneurial management, management, rural entrepreneurship*

**JEL Classification:** *F50, Q13, R10*

### **1. Introduction**

Entrepreneurship is an economic and social occurrence the advance of which is noticeable all over the world. Also in Poland, the growth in the area of entrepreneurship occurred in the nineties of the XX century in reference to the succession of economic liberalization assumptions. The transformation in the economic principles of the country contributed to the entrepreneurship perception as one of the major elements determining structural, economic and social shifts occurring at once (Stachowicz et al., 2014).

The aim of the paper is the recognition of rural entrepreneurial management in the context of European Union support on the example of the selected local territorial unit, i.e. Częstochowa County. The author has aimed at presenting entrepreneurial management and European Union support as the determinants of development of rural areas.

The selected research area, Częstochowa County, is the county located in southern Poland, in the Silesian Voivodeship. It covers an area of approximately 1519 km<sup>2</sup>, and the population is nearly 135.5 thousand people. It is based in the city of Częstochowa, which is located outside its territory. It consists of two urban and rural municipalities: Blachownia and Koniecpol and 14 rural ones.

## 2. Rural Entrepreneurial Management and its Specificity

Entrepreneurial management is an inconclusive and comprehensive term, as a result there are numerous interpretations of this idea. It is multidisciplinary in its framework, and this is the crucial motive for Wiklund (et al., 2011) to highlight that entrepreneurial management scholars have yet to accomplish a universal definition of the concept (Bojar and Mieszajkina, 2014; Gierszewska and Romanowska, 2016). Counting on the objectives on the research realized, a variety of descriptions are used by the theorists and professionals (Jędralska and Dyduch, 2017; Lichtarski, 2015). In literature, many interpretations of entrepreneurial management correspond with the indications of the process aimed at opportunities and probabilities (Castano et al.; 2015, Faggio and Silva, 2014; Gregorczyk et al., 2010; Kościelniak, 2013; Williams and Nadin, 2010). Explanations and interpretations of entrepreneurial management frequently involve such elements as: novelty, creativeness, adaptability and readiness to compromise (Bratnicki, 2002; Ochojski et al., 2006). For that reason, the basis of entrepreneurial management is to look for, explore and use the chances for a new advantage (profits, growth in value) through a exceptional consolidation of different means (Barczyk, 2004; Prusak et al., 2012). Drucker (2006) characterizes entrepreneurial management as the aptitude to form something original and diverse. Correspondingly in Darmadji (2016) perspective the entrepreneurial management is capability in inventive thinking and creative performance as essential, assets, propulsion, objectives, strategy and instructions in the life's challenges. Also Suryana (2006) points out that entrepreneurial management include all objectives, and activities connected with achieving the opportunities and establishing of business (Kadłubek, 2016).

Rural areas are defined differently, therefore one may come across various interpretations of this concept. In Poland, rural areas include an area of the country outside administrative borders of cities, i.e. built-up areas, agricultural areas (arable lands, meadows, pastures and orchards), forests, waters (including inland waters), wasteland (Wyszkowska, 2006). Typically rural spatial arrangements (Kiausiene and Vazoniune, 2016) perform the function stimulating local economic development by means of the activities typical of them in the field of agriculture, agro-food industry, tourism, recreation and forestry. In the conditions of Poland, countryside is still identified with agriculture since the basic determinant of its economy is agricultural production.

The phenomenon of rural entrepreneurial management is the result of taking an initiative by rural population in search of "niche" suitable for their own predispositions. Entrepreneurial management in the country is characterized by the variety of the form and number of rural businesses, which are mainly small and medium companies, whose activity is becoming increasingly important in the development of many rural areas of the country (Adamowicz, 2004). The basic component of entrepreneurial management in rural areas is therefore small business.

One of the most visible indicators of entrepreneurial management of farmers in Poland, on the grounds of the support from the State and the European Union, is currently the use of available economic resources and the need to improve agricultural holdings (Barcik and Barcik, 2006) .

Rural entrepreneurial management basically does not differ much from the essence of generally understood entrepreneurial management. The differences between entrepreneurial management in urban areas and rural areas are mainly due to the mentality of the rural community, which is characterized by low susceptibility to changes, unwillingness to take risk and lack of ability to adapt to changes occurring in the socio-economic system. The specificity of the rural environment brings about that the conditions of conducting business in this area are tougher than in the city. However, business in the country has its advantages

(among others, cheaper labor and lower cost of land), which determine that many entrepreneurs become interested in rural areas.

Many features providing the quintessence of entrepreneurial occurrence cause entrepreneurial management in broad-spectrum, but also entrepreneurial management in rural regions has become an identified field of scientific research. The perspective of further deliberation within this area causes there has been chosen the description integrating these two occurrences, which describes entrepreneurial management as an activity intended at looking for innovative solutions, developing emerging conveniences, instigating modifications in activities and also creating source of profits.

### **3. Description of the Course of the Survey**

The survey was carried out in spring 2017. The work on the preparation of the research began with the development of the survey. The summary of the components of the research was made on 29 May - 3 June. On the last day of the research there were ordered the collected data and presented in the form referring to the methodological assumptions.

The spatial scope of the research included the area of some of Częstochowa County, i.e. two types of municipalities: two urban and rural municipalities (Blachownia and Konięcpol) and four rural municipalities (Mykanów, Kłomnice, Poczesna and Konopiska).

The empirical inquiry presented in the subsequent part of the paper is realized on the basement of primary data since the major source of the data presented is the questionnaires amounting to 135 items addressed to the farmers of the county. The survey was conducted through direct personal contact with the respondents. The questionnaires were handed in only to those who expressed the will to take part in the research. Only 35 of 170 questionnaires were not returned.

### **4. Analysis of the Survey Results**

The survey involved 135 villagers from the area of Częstochowa County. In each of the municipalities, there were tested respectively 0.5% people of working age population (18-64), being the owners or co-owners of agricultural holdings.

When summarizing the results of the analysis of the survey demographics, in the study population, there were mostly the residents of two largest municipalities in the county: Blachownia and Konięcpol. The most numerous group was people aged 35-44. The respondents generally had basic vocational education. The majority of the farm representatives was the ones of the farms of 3-10ha. Among the respondents there were mostly men.

Entrepreneurship of farmers is proved, among others, by whether and to what extent they benefit from the possibility of institutional support. The data concerning this issue are included in Figure 1.

Among the most frequently indicated responses there were: the Agency for Restructuring and Modernization of Agriculture (ARMA), Bank and Municipal Office (MO) and County Office (CO). The institutions were indicated respectively by: 78.5%, 53.3% and 33.3% of all the respondents. The advice of Agricultural Counselling Center (ACC) was requested by only 14.8% of the respondents, i.e. on average every sixth resident of Częstochowa County who agreed to take part in the survey. While detailing, the following number of agricultural holdings applied for support of this institution: one of under 1ha, four of 1-2ha, 13 of 3-10ha and 12 of over 10ha. Only one person dealt with Cooperation Fund, appointed to handle funds from the EU and other international institutions. None of those questioned ever used the

opportunities provided by Polish Agency for Enterprise Development (PARP). After the analysis of the respondents' responses concerning this issue, it can be concluded that the larger the agricultural holding the more frequently its owners used the services of the listed institutions.

**Figure 1: Popularity of Business Environment Institutions in the Country**

Source: Own elaboration (2017)

The cooperation with the organizations mentioned above was very often associated with the type of EU funds used in the specific farm. Therefore, the farmers were also asked to express their opinion on what specific forms of EU support they benefited from. In that question, the respondents could indicate any number of responses. After calculating the amount of the indicated responses in each of the municipalities and comparing them with the number of the population taking part in the research, the analyzed units were ordered by the scale of EU support used. In terms of municipalities, the residents of Konięcpol benefited from EU funds the most and the most frequently. Due to the fact that an entrepreneurial farmer is a person that is able to exploit an opportunity to gain funds, the respondents of this municipality can be found the most entrepreneurial land owners. Further positions were subsequently occupied by the areas of: Mykanów, Blachownia, Kłomnice, Poczesna and Konopiska. In Figure 2, there is presented the information on the number of agricultural holdings supported by specific forms of aid from the EU.

**Figure 2: Types of Financial Aid from the European Union and its Use**

Source: Own elaboration (2017)

Exactly 80.0% of the respondents were the beneficiaries of area payments. Only payments are taken by about 43% of the farmers. Among the most often indicated options, the second position was taken by premium for afforestation of agricultural land (32 people – 23.7%). On

average, every fourth respondent exploited the opportunities of funding forest plantations. In the tested sample, not more than 14.0% of the respondents are supported only by grants and premium. In total, 20.8% of all the agricultural holdings were those that made attempts to obtain grants to young farmers and funds to improve infrastructure associated with agriculture. A little over 5.0% of the farmers switched to structural pension (21 people). In turn, 15.6% of the respondents added their answer to the item of “others, what type ...?”. Among those people two wrote: “adaptation of farms to EU standards” and “reimbursement of fuel costs”. The other 19 respondents stated that they did not use a single form of EU support. The greatest involvement in acquiring European Union support was characteristic of the members of peasant families representing medium and large farms.

Subsequently, the people who declared that they were investing in their farms or were going to invest (53.3% of the respondents) were asked to express their opinion on the sources of funds to carry out the accomplished or planned investments. The results of the research in this field are presented in Figure 3.

**Figure 3: Sources of Funds for Development of Agricultural Holdings**

Source: Own elaboration (2017)

In the analyzed group of rural households, the most frequently used source of funding development activities were: EU funds, credits and loans, long-term savings, capital earned abroad and donation from a family or friends. After Poland's accession to the European Union, the situation in agriculture began to change. Before 2004, in order to finance their ventures, farmers mainly use credits and loans. As the research has shown, at present this source is also important but no longer the most significant one. According to the respondents EU funds occupy the first position nowadays. 37.2% of the responses indicated exactly this option of financing. It was the most frequently indicated by both the people who had already managed to make some investment expenditure and the ones who were just planning to invest. EU funds were the main source of funding investments in the largest farms. Credit and loans mentioned above amounted to 32.7% of the identified sources. 22.1% of the farmers funded investments with their own funds whereas 7.1% amounts to expenditure covered with funds earned abroad. Those two options dominated among the owners of agricultural holdings of 3-10ha. Only one person benefited from the funds donated by the family or friends.

The European Union has provided farmers with a lot of opportunities. Unfortunately, as the results indicate, only some of them are able to exploit them (37.2%). Relatively low absorption of EU funds is another argument determining low assessment of the level of entrepreneurship of farmers.

At this point, it is worth referring to the farmers' opinion on the changes which took place in their living conditions after Poland's accession to the European Union (Figure 4).

**Figure 4: Farmers' Opinion on the Living Conditions in the Country after Accession to the European Union**

Source: Own elaboration (2017)

Against this background, it seems optimistic that the membership of the European Union is assessed as beneficial by 77.0% of the respondents due to an improvement (greater or less) in the social situation of rural families. The survey declarations indicate that 62.2% of the farmers, i.e. on average every second person, express an opinion that the living conditions in rural agricultural holdings "have improved". Significant improvement has occurred in the opinion of 14.8% of the residents of the examined municipalities. In 26 farms, significant changes in this field have not been observed. As the data indicate, only few respondents (3.7%) are not satisfied with the results of the membership of the structures of the European Union. Five people confirmed that the realities of broadly understood existence in the country have deteriorated. The data mentioned, in combination with individual categories of size of farms, inform that along with an increase in the area used for agriculture there was also an increase in the share of the farmers positively assessing the transformations associated with the membership (from 54.5% in the smallest farms to as much as 75.9% in the largest ones). Common Agricultural Policy, which has the largest impact on the situation of Polish agriculture, is most favored by young people (74.2% of them are under 34). The largest distance in diagnosing changes could be noticeable in reactions of people aged 45-54. Just over half of them noticed an improvement. In this age group, 7.5% assessed the present living conditions as worse than those dating back more than 6 years. Disapproval was particularly found among people from families with agricultural holdings of 1-2 ha.

As it can be seen, the farmers in Częstochowa County are not unanimous, however, as the research has proved, they mostly agree that Poland's accession resulted in an improvement in the situation of agricultural holdings.

## 5. Conclusion

The considerations taken in the paper have been an attempt to draw attention to the phenomenon of rural entrepreneurial management. The presented results of the survey have been aimed at presenting the significance of rural entrepreneurial management in the context of European Union support on the example of the selected local territorial unit, i.e. Częstochowa County.

The vast majority of the survey population was men. The most numerous group was people aged 35-44. The vast majority was the representatives of agricultural holdings of 3-10ha. The main source of income for the farmers was work on the farm and wage labor.

An agricultural activity for the majority of the respondents was not profitable. Poland's accession to the European Union, in the opinion of the farmers, has improved the living conditions of farms. From among the wide range of opportunities offered by the EU, the farmers of the analyzed area most frequently benefited from direct payments and premiums for afforestation. EU funds were the main source of financing investments in agricultural holdings. Nearly half of the farmers invested in their farms. However, it is important that they expressed the intention to modernize their farms. In their opinion, agriculture should be the main direction of economic development of the county.

The entrepreneurs from the rural areas of Częstochowa County, from the point of view of the activity in undertaking ventures, were found not a very entrepreneurial group. It must be acknowledged that they could not effectively benefit from European Union support. It can be stated that these are not own companies but agricultural holdings increasingly modern due to EU funds that are the greatest manifestation of entrepreneurship among farmers. In this situation, it should be indicated that farmers cannot effectively benefit from European Union support. The level of the use of services of other institutions supporting entrepreneurial management is also still unsatisfactory.

The conclusions from the conducted research can probably refer to most rural areas in Poland. An innovative entrepreneurial way of thinking and procedure of the inhabitants of rural areas is an excellent occasion not only for the implementation of the postulations of multi-functional growth of rural regions but also the formation of the foundation for dynamic and sustainable development in rural regions. Recognition of the significance of the occurrence of entrepreneurship can turn into an encouragement for the improvement of entrepreneurial performance. The conducted analysis can be a starting point for further research in the field specified in the subject of the paper.

## Poland's Competitiveness in Services Trade on the European Union Internal Market

**Magdalena Kałol**

Maria Curie-Skłodowska University

Faculty of Economics, Chair of World Economy and European Integration

Pl. Słodowskiej 5, Lublin, 20-031

Poland

e-mail: mkakol@hektor.umcs.lublin.pl

### **Abstract**

*In recent decades services play an increasingly significant role in international trade and contribute to building comparative advantage of enterprises, sectors and countries. Accession to the European Union has created opportunities to enhance the degree of internationalisation of services in the Polish economy. The aim of this study is to examine Poland's competitive position and capacity in intra-EU28 trade in services in 2008-2016. The analysis was carried out based on cost-price and productivity indicators as well as the Revealed Symmetric Comparative Advantage (RSCA) index. It disclosed that, compared to other EU members, Poland had a comparative advantage in: construction; manufacturing services; transport; maintenance and repair services as well as such high-tech KIS sub-sectors as information and computer services. Poland based its competitiveness in intra-EU28 trade in services primarily on price and cost advantages whereas in terms of labour productivity and technological measures the EU28 revealed better results.*

**Keywords:** EU internal market, international competitiveness, international trade, Poland, services

**JEL Classification:** F14, F15, F16, F41

### **1. Introduction**

Increasing role of services in economies and international trade contributes to the growing interest in research on the competitive position of particular countries in the global services market as well as regional markets. Poland joined the European Union in 2004, after only 15 years of building a market economy, with a relatively low level of competitiveness (taking into account efficiency measures). However, accession to the EU and the common market resulted in adjustment processes of Polish enterprises and stimulated competitive development of the entire economy. Due to the fact that marketization process coincided with a considerable growth in the significance of the services sector in Poland's economy - in 1990-2002 the share of services in the creation of value added increased by 27.2 pp and in employment by 16.2 pp (Białowąs, 2014, p.49) - examining and assessing Poland's competitive position in trade in services on the EU internal market seems to be an important issue. The more so because the share of intra-EU trade in services (exports plus imports) is large and amounted to about 73% for Poland, and about 57% for the EU28 in 2016 (Eurostat [online], 2018). Despite the downward trend in shares of intra-EU flows in total trade in services of Poland and the EU28, shares of intra-EU services trade in GDP of these economies are growing (Kałol, 2015, pp.76-77). For many years, the European Union was the most important player on the global market for services with increasing trade surplus and Poland (though having a small share in the EU

and world services flows) stood out with a growing surplus both in international trade in services and that with the EU28.

The aim of this study is to assess changes in Poland's competitive position in trade in services within the EU28 internal market in 2008-2016 (or earlier starting from 2004, depending on the availability of data) as well as to examine the country's competitive capacity, compared to the EU28, in order to indicate main factors that determine its export specialization and competitiveness on the internal market for services.

## 2. Problem Formulation and Methodology

Competitiveness is a relative, multidimensional and dependent on the analysed economic context concept. It can be considered from three various perspectives: microeconomic (individual company), industrial (branch) or macroeconomic (the whole economy). According to the World Trade Organization (Goode, 2003, p. 75) competitiveness means the ability of a firm, a production sector or even a country to hold its own in terms of economic efficiency against other firms, sectors or countries. As emphasised by Porter (1990, p.76), the only possible concept of international competitiveness of a country is the formation of national productivity and the main national goal to produce high and rising standard of living for its citizens. Radło (2008, p.4) defines a competitive economy as such which in the conditions of free trade and free flows of factors of production is able to grow relatively quickly and develop in the long term. In this approach, the competitiveness of the economy includes both the assessment of the resulting competitiveness (competitive position) and factor competitiveness (competitive capacity). The competitive position is reflected in the level of national income, the effectiveness of the use of production factors and the position in foreign trade. On the other hand, competitive capacity is the ability of a given economy to maintain its long-term, profitable development that results in such a structure of the economy - and consequently export structure - which corresponds to long-term changes in the structure of global demand; and in the case of developed countries also the ability to create and co-create new supply and demand structures (Bieńkowski, 1995). For Varblane (2006) competitiveness consists of the following elements: the ability to sell goods and services internationally; the ability to adjust to market changes; the ability to attract factors of production; and finally as a consequence of the previous features the ability to earn which can be measured by GDP per capita. In the context of international trade the ability to sell seems to be most important to examine. According to OECD ([online], 2014) competitiveness in international trade is a measure of country's advantage or disadvantage in selling its products in international markets. Governments sometimes try to improve competitiveness of a sector through the use of export targeting, subsidies, protection or other measures what can only be done at the expense of the remainder of the economy and leads to reduced overall competitiveness in the longer-term (Goode, 2003).

Indicators of competitiveness in international trade can measure the size or increase in market shares, export performance, price ratios, cost competitiveness, or more complex dimensions (Wyszkowska-Kuna, 2014). Some of them are supposed to measure benefits from international trade (e.g. labour and capital productivity, sector's share in country's total exports) and other market domination (export performance, market share or revealed comparative advantage) (Wyszkowska-Kuna, 2014). It is also necessary to distinguish between the different stages in the measurement of competitiveness in order to reflect the process of transferring competitive potential into competitiveness (competitive position) (Viira et. al, 2015). There are input and output measures of competitiveness. Input measures concern factors that determine competitiveness, including cost and price indicators (based on wages, unit labour costs, export

unit values) whereas output measures examine a country's performance on export markets (measured either by revealed comparative advantages or market shares and their evolution over time) as well as output performance (measured by labour and capital productivity) (Wörz, 2008). As emphasised by Radło (2008), single-factor productivity measures are used to assess the competitive position while multifactor productivity (MFP) or total factor productivity (TFP) indicators to appraise the rate of technological and organizational changes in an economy that determine the competitive capacity. Viira et. al. (2015) stress that productivity is a parameter characterising efficiency of an economy and measuring the conversion of inputs into outputs. Nevertheless, without taking into account production costs and profitability indicators, a low partial productivity does not necessarily indicate low competitiveness potential, as low production costs can compensate for low partial productivity. And vice versa, high labour productivity may reflect high efficiency resulting from the use of more advanced technologies but it may also be caused by substituting inefficient capital for labour. Therefore, the authors suggest applying TFP indicator (combining all inputs and outputs used in production) rather than partial productivity indicators to characterise competitiveness.

In this paper, the "ability to sell" aspect of competitiveness in services was mainly analysed concerning Poland's performance only on the EU internal market.

To assess Poland's competitive position in intra-EU28 trade in services the following output measures were used: market shares in exports of services (in total intra-EU28 trade in services and at sectoral level) and their changes, trade balance, the Revealed Symmetric Comparative Advantage (RSCA) indicator as well as labour productivity measures (such as gross value added per hour worked, apparent labour productivity and wage adjusted labour productivity) as well as some profitability indicators (like gross operating rate) presented by certain services sectors.

Due to the lack of data on multifactor productivity or total factor productivity for services at sectoral level, evaluation of Poland's competitive capacity was conducted to a great extent based on cost and price indexes and their changes (e.g. unit labour costs, wages and salaries or labour compensations per hour worked as well as price level indices in relation to the EU28). Other input measures used in this study included: share of personnel costs in production, personnel costs per employee, investment rate, employment in technology and knowledge-intensive sectors by persons with tertiary education as percentage of total employment and enterprises in services sectors that provided training to develop ICT skills of their personnel as percentage of all enterprises in a given sector. Especially these latest indicators let to assess a country's abilities to enhance its potential in high-tech knowledge-intensive services (KIS).

The time scope of analysis covers the years 2008-2016 for main categories of services (except for government services) and, due to the lack of previous data, 2010-2016 for high-tech KIS sub-sectors as regards measuring of export performance. The research was based on the balance of payments statistics provided by the International Trade Centre (ITC), the United Nations Conference on Trade and Development (UNCTAD) and the World Trade Organization (WTO) as well as the Organisation for Economic Co-operation and Development (OECD) in accordance with BPM6 methodology (IMF 2009; United Nations 2012).

To measure Poland's comparative advantage in intra-EU28 trade in services the Revealed Symmetric Comparative Advantage Index (RSCA) is used with the following formula:

$$RSCA_{ij} = (RCA_{ij} - 1) / (RCA_{ij} + 1) \quad (1)$$

where  $RCA_{ij}$  is the original Balassa index (1965) that can be calculated as follows:

$$RCA_{ij} = (X_{ij} / X_j) / (X_{iEU} / X_{EU}) \quad (2)$$

where  $X_{ij}$  denotes country  $j$ 's intra-EU exports of service sector  $i$ ,  $X_j$  means country  $j$ 's intra-EU exports in all services sectors,  $X_{iEU}$  represents exports of all EU28 countries in services sector  $i$  and  $X_{EU}$  stands for total intra-EU28 exports in services.

Owing to the fact that  $RCA_{ij}$  results range from zero to infinity ( $0 \leq RCA_{ij} \leq \infty$ ) - with values greater than one indicating that country  $j$  has a comparative advantage in product  $i$  and values lower than one meaning a comparative disadvantage - this measure is asymmetric. To avoid this asymmetry Dalum et al. (1998) and Laursen (2015) suggest using the  $RSCA_{ij}$  indicator which allows to attribute changes below zero the same weight as changes above zero. The  $RSCA_{ij}$  index falls between -1 and +1 ( $-1 \leq RSCA_{ij} \leq 1$ ) where value greater than zero implies that country  $j$  has a comparative advantage in service sector  $i$ . In contrast, its value below zero implies a comparative disadvantage.

Other input and output measures (not connected with export performance) were gathered or calculated based on Eurostat or OECD data and concern selected years from the period 2004-2016 according to the availability of data.

### 3. Empirical Research

#### 3.1 Significance of Services Sector and Services Trade in Economies of Poland and EU28

Services constitute the most important sector both in Poland's and the EU's economies (tab. 1). In 2004-2016 shares of services (including construction) in value added amounted to, on average, 71,6% in Poland and 78,9% in the EU28 whereas in employment they accounted for 63,5% and 77,0%, respectively. Among the largest sectors in terms of value added and employment were wholesale and retail trade, transport, accommodation and food service activities as well as non-market services. In the EU28 professional, scientific and technical activities; administrative and support service activities seem to be greater in both terms whereas real estate activities create twice as much value added as in Poland.

Trade in services has also been increasing if we express it as percentage of GDP (Kąkol, 2015), though its role is less considerable compared to trade in goods. In 2016 exports of services amounted to 10,6% of GDP in Poland and 12,4% of GDP in the EU28 (7,3% and 11,1% of GDP in imports of services, respectively). In comparison, exports of goods as percentage of GDP accounted for 41,7% in Poland and 31,5% in the EU28 (41,0% and 29,5% in imports of goods) at the same time (Eurostat [online], 2018). Lower intensity of trade in services in Poland compared to the EU28 and to trade in goods may indicate still unused potential in this field, although due to the specificity of services, this potential will never be as large as in the case of goods.

Poland stood out against the background of the European Union with relatively high shares of intra-EU28 trade in services in total services trade. However, Poland's share of intra-EU exports in the country's total services exports decreased from 75,1% in 2005, through 73,5% in 2008, to 68,9% in 2016. The similar trend occurred in the EU28, where the share of intra-EU exports in total EU28 exports in services declined from 62,4% in 2008 to 56,8% in 2016. This is undoubtedly related to the very good and still unchallenged position of the EU28 in international trade in services and the rapid growth of extra-EU exports of services.

**Table 1: Gross Value Added and Employment (Based on Hours Worked) in Poland and the EU28 by Industry Breakdowns in 2004-2016 on Average in Percentage of Total**

Sector/TIME	Gross value added		Employment	
	Poland	EU28	Poland	EU28
<b>Total - all NACE activities</b>	100.0	100	100.0	100

Source: Own elaboration based on: Eurostat [online], 2018

Poland's services sectors shares in intra-EU28 exports and their changes in 2008/2010-2016 were presented in table 2 as well as trade balance in 2008 and 2016. In 2008-2016, Poland increased its share in intra-EU28 exports of services from 2,56% to 2,88%. In 2016, the highest shares - larger than the average for all services - Poland revealed in: construction; manufacturing services on physical inputs owned by others; transport; and maintenance and repair services n.i.e. (as regards categories of services at level 1 of BPM classification) as well as in: information, computer and R&D services (within high-tech KIS sectors at BPM level 2 of services classification). However, in this latter case (R&D services) such good performance was noted only for the year 2016, so it is too early to prejudge the good position of this sector in Polish exports. Corresponding shares of other services sectors were lower than Poland's average share for all services, with the lowest shares of such sectors as: charges for the use of intellectual property n.i.e.; financial services; and insurance and pension services.

In 2008/2010-2016, the largest increase in the share in intra-EU28 exports of services occurred in Poland in high-tech KIS sub-sectors (especially in audiovisual, computer and information services) and at a more aggregated level in: telecommunications, computer, and information services; personal, cultural, and recreational services; manufacturing services on physical inputs owned by others; and financial services. Insurance and pension services; transport; and other business services also stood out with a slight share in intra-EU28 exports. In four groups of services a decline in shares of intra-EU exports of services in total services exports appeared. They included: construction; maintenance and repair services n.i.e.; travel as well as charges for the use of intellectual property n.i.e.

For many years Poland has had a positive trade balance with the EU28 countries for the whole services sector. However, the situation as regards trade balance in various categories of services is very diverse. In 2016, the largest trade surplus in Poland occurred in: transport; computer services; and manufacturing services on physical inputs owned by others whereas the biggest trade deficit in: charges for the use of intellectual property n.i.e.; audiovisual and related services as well as insurance and pension services.

**Table 2: Poland's Services Sectors Shares in Intra-EU28 Exports (in Percent) and Their Percentage Change in 2008/2010-2016, and Trade Balance in Mln USD in 2008/2010 and 2016**

### ***3.2 Poland's Revealed Symmetric Comparative Advantage in Trade in Services on the EU28 Internal Market***

In this section an analysis of Poland's competitive position in the EU28 internal market as revealed by services trade flows was conducted. In table 3 values of RSCA index were presented. They were calculated for Poland versus the EU28 considering intra-EU trade flows in services for the period 2008-2016. Due to no availability of earlier data for services at BPM level 2 of classification, indexes for high-tech KIS sectors cover the years 2010-2016.

In 2004, Poland revealed a comparative advantage in intra-EU28 exports in the following main categories of services (from the highest to the lowest advantage): 1) construction; 2) maintenance and repair services n.i.e.; 3) manufacturing services on physical inputs owned by others; 4) transport; as well as 5) travel (however with low RSCA value). In 2008-2016, this comparative advantage increased in two sectors (manufacturing services and transport); declined also in two categories of services and in one case (travel) it changed into a comparative disadvantage. As a result, in 2016 Poland recorded a comparative advantage only in four main services sectors, in the following competitive order: 1) construction; 2) manufacturing services on physical inputs owned by others; 3) transport; 4) maintenance and repair services n.i.e.

**Table 3: Poland's Revealed Symmetric Comparative Advantage in Intra-EU28 Trade in Services**

Source: As in Table 2.

In the entire period considered, Poland revealed comparative disadvantages on the EU internal market in other categories of services (at BPM level 1) with the greatest disadvantage in: 1) charges for the use of intellectual property n.i.e.; 2) financial services; and 3) insurance and pension services. While in the two latter sectors a slight improvement as regards the reduction of disadvantage appeared in 2016, in the first category of services this disadvantage even increased. In 2016, Poland had small comparative disadvantages in: other business services; personal, cultural, and recreational services; travel; telecommunications, computer, and information services. Among these sectors, disadvantages were getting smaller throughout 2008-2016 in: telecommunications, computer, and information services as well as personal, cultural, and recreational services whereas in other business services RSCA results oscillated around zero (adopting negative values only in 2008 and from 2014 onwards).

As for high-tech KIS sub-sectors (at the level 2 of BPM services classification), their competitive position generally improved in 2010-2016 as at the beginning of this period all these sub-sectors in Poland revealed comparative disadvantages in intra-EU28 exports in services whereas in 2016 only two of them. From 2011 Poland recorded a rising comparative advantage in information services (with RSCA equalling 0,43 in 2016). In two other high-tech KIS sub-sectors - computer and R&D services - the country recorded comparative advantages versus the EU28 countries only in 2016. While in the case of computer services this is understandable, because Poland has been characterized by a growing comparative advantage in this sector in international trade for a few years, it is too early to draw conclusions about positive changes in trade in R&D services, in which Poland has stood out with a comparative disadvantage for a long time.

### ***3.3 Poland's Competitive Position and Competitive Capacity in Trade in Services on the EU28 Internal Market Based on Price, Cost and Productivity Measures***

Increased competition within the single market and opening of the service market should lead, according to the law of one price, to price equalization between member states. Indeed, the

price convergence in the EU accelerated significantly from 1993 and in 2008 was the greatest in history (both for services and goods), and then prices started to rise again at more differentiated pace in member countries (Kačol, 2017). Noteworthy, the price divergence on the internal market for services is over twice as large as in the case of goods and this situation persisted for many years. A decline in prices of services is hampered by relatively lower productivity of the sector and the pursuit of employed in services to earn as much as the more productive workers in the manufacturing sector as well as specific characteristics of many types of services and the inability to transport them over long distances (Kačol, 2017). Table 4 presents a comparison of price level indices in selected member states (mainly the Central and East European countries) in relation to the EU28 in 2004-2016.

**Table 4: Services Price Level Indices in Selected Member Countries (EU28=100)**

GEO/ TIME	Total services			Selected services sectors in 2016						
	2004	2008	2016	Transport	Communication	Recreation and culture	Restaurants and hotels	Education	Hospital Services	Construction

Source: Own elaboration based on: (Eurostat [online], 2018)

Due to the convergence process of the CEE countries one should expect a rise in levels of their services' prices after joining the EU with a possible decrease in relative services' price levels of more advanced EU economies at the same time. This phenomenon indeed occurred in 2004-2008. However, during the next period (2008-2016) prices of services in the EU15 and Germany increased, and in most CEE countries - including Poland - they were usually falling. For more wealthy EU countries, this could be the result of economic recovery after the crisis years, while in the CEE countries this was probably the effect of adjustment processes as a consequence of the Service Directive (adopted in 2006) entry into force in 2009 which created new opportunities for this latter group of member states to increase their activities on the EU internal market for services. The deregulation of some network sectors (such as telecommunications) has also contributed to the drop in prices of services.

Considering the situation in Poland in 2004-2016, the highest decline in prices appeared in transport and communication sectors (especially in telecommunications prices were close to the EU28 average in 2004) whereas in education services prices clearly increased. In 2016, Poland stood out against the background of other EU countries with relative price competitiveness in the following services sectors: communication (with the lowest price level in the whole EU); education services (in third place of this ranking, after Bulgaria and Romania); transport (after Bulgaria and Czech Republic) as well as recreation and culture services (after Bulgaria). However, in other sectors (construction; restaurants and hotels and hospital services) Poland also ranked quite well (from the 4th to the 6th position in the price level ranking).

In tables 5 and 6 total labour costs, wages and salaries and gross value added per hour worked in absolute values in Poland and EU28 were compared for different services sectors in 2004-2016.

**Table 5: Labour Costs per Hour Worked in Poland and the EU28 by Services Sectors in 2004 and 2016 in Euro**

Sector/TIME	Total labour costs				Wages and salaries

Note: \*Data for Germany due to no availability for the EU28.

Source: Own elaboration and calculations based on: (Eurostat [online], 2018)

In 2004, total labour costs per hour worked (in absolute terms) in services of the business economy were four times lower in Poland than in the EU28 whereas in 2016 this difference was only threefold. If we look into all particular categories of services in respect of both total labour costs and wages and salaries (in euro) this relation is similar.

**Table 6: Gross Value Added per Hour Worked in Poland and the EU28 by Services Sectors in 2004, 2008 and 2016 in Euro**

Sector/TIME	Poland			EU28		
	2004	2008	2016	2004	2008	2016

Source: As in Table 5

Comparing gross value added per hour worked (in absolute terms) in Poland and the EU28 gives much more differentiated picture. There was an increase in labour productivity in all services sectors in 2004-2016, both in Poland and the EU28. However, in Poland the rate of productivity growth was relatively higher in 2004-2008 compared to 2008-2016 while in the EU28 it was comparable in the two analysed periods, and for some sectors (like construction

or real estate activities) this rate was even larger in 2008-2016. The only exception in the growing trend of labour productivity occurred in Poland in information and communication services where productivity decreased in 2008-2016. In 2016, labour productivity values for certain services categories in Poland were from two to six times lower than in the EU28 with the biggest differences in the following sectors: real estate activities; non-market services as well as financial and insurance activities.

Data in table 7 illustrate annual average growth rates of unit labour costs (ULC), labour compensation per hour worked (LC) and gross value added per hour worked (GVA) by services sectors in Poland and the EU28 in 2005-2016. In the period considered ULC in Poland compared to the EU28 rose (predominantly from 1,5 to 2,5 times) faster in all services categories, except for financial and insurance activities as well as information and communication services (in the latter case a considerable decline on average in ULC growth rate in the EU28 occurred whereas in Poland an increase in ULC in this sector amounted to almost 2,5%).

**Table 7: Annual Average Growth Rates of Unit Labour Costs (ULC), Labour Compensation per Hour Worked (LC) and Gross Value Added per Hour Worked (GVA) by Services Sectors in Poland and the EU28 in 2005-2016 in Percentage**

Sector/TIME	ULC		LC		GVA

<b>Information and communication</b>	2.46	-0.81	4.62	1.45	2.02	2.27
<b>Financial and insurance activities</b>	0.71	0.95	2.95	2.04	3.23	1.07
<b>Professional, scientific and technical activities. Administrative and support service activities</b>	4.14	1.74	6.04	1.60	1.89	-0.13

Source: Own elaboration and calculations based on: (OECD [online], 2018b)

The situation was similar as regards annual average growth rates of labour compensation per hour worked by certain services sectors that were from 1,5 to almost 4 times higher in Poland than in the EU28. This difference was the biggest in the case of professional, scientific and technical activities, and administrative and support service activities while compensations in business sector services (excluding real estate) rose in Poland 2,6 times faster than in the EU28.

In 2005-2016, annual average growth rates of gross value added per hour worked by services sectors in Poland compared to the EU28 were larger in all services categories with the exception of information and communication services. The EU28 noted a negative change in GVA in the following sectors: construction as well as professional, scientific and technical activities, and administrative and support service activities.

The changes of ULC, LC and GVA for Poland are in general consistent with the assumptions of the convergence process. Nevertheless, the absolute values of these economic indicators disclose still much lower levels for Poland compared to the EU28 which means being more competitive as regards labour costs (including compensations) and less competitive as for labour productivity.

Tables 8 and 9 contain selected economic indicators reported by enterprises for different categories of services in Poland and the EU28 in 2015. Some of them characterise a country's

competitive position (such as turnover per person employed; apparent labour productivity - i.e. gross value added per person employed or gross operating rate - i.e. gross operating surplus/turnover) while others are supposed to measure economy's competitive capacity (like share of personnel costs in production; average personnel costs - i.e. personnel costs per employee; investment rate - i.e. investment/value added at factors cost). There is also a combined indicator measuring output in relation to input - wage adjusted labour productivity (apparent labour productivity by average personnel costs) - focusing on the effectiveness of the competitive process in a given sector of economy. Analysis of output measures leads to the following conclusions: 1) turnover per person employed in the EU28 was on average slightly above twice as large as in Poland in most service sectors covered in tables 8 and 9 (and almost twice as large in accommodation and food service activities); 2) apparent labour productivity in the Polish services sectors was around 2,5-3 times lower than the EU28 average (and for real estate activities over 3,5 times smaller); 3) gross operating rates in Poland were somewhat higher than in the EU28 in all services categories except for real estate activities as well as administrative and support activities.

**Table 8: Selected Enterprise Statistics for Services in Poland in 2015**

Sector/TIME	T	AC	I	R	P	AD
Turnover per person employed - thousand euro	63.0	31.7	94.7	90.2	49.2	33.5

**Table 9: Selected Enterprise Statistics for Services in EU28 in 2015**

Sector/TIME	T	AC	I	R	P	AD
Turnover per person employed - thousand euro	138	52	208	185	114	71
Apparent labour productivity - thousand euro	51	23	92	103	57	36
Wage adjusted labour productivity - percentage	147	127	167	290	121	146
Share of personnel costs in production - percentage	25.3	29.7	26.3	12.1	31.8	35.0
Average personnel costs - thousand euro	35.0	17.9	54.9	35.5	46.9	24.7
Gross operating rate - percentage	14.1	14.7	20.5	42.8	19.4	18.4
Investment rate - percentage	24.6	16.0	14.3	55.3	7.6	19.1

Note: As in Table 8

Source: As in Table 8

Examination of input measures let to indicate the following relationships: 1) lower shares of personnel costs in production in Poland compared to the EU28, usually by 20-30% (besides administration where the difference did not exceed 10%); 2) 2,5-3 times larger average personnel costs in the EU28 than in Poland in all services sectors; 3) much greater investment rate in Poland in: transportation and storage; accommodation and food service activities; professional, scientific and technical activities; and only slightly bigger in information and communication whereas the EU28 invested relatively more in real estate activities and administration. Considering effectiveness of transferring inputs into outputs based on wage

adjusted labour productivity it is worth noting that Poland recorded better results in this respect in three sectors: transportation and storage; accommodation and food service activities as well as information and communication while in other services, the EU28 had an advantage.

### 3.4 Poland's Competitive Capacity to Develop Trade in High-tech KIS

Poland's potential to enhance trade in high-tech KIS can be partly assessed based on employment structure and ICT training measures. Table 10 includes data on employment in technology and knowledge-intensive sectors by persons with tertiary education in 2016. They confirm good employment structure in the Polish services sector as a whole as well as in presented certain groups of knowledge-intensive services apart from: electricity, gas, steam and air conditioning supply; water supply and construction (where the EU28 stood out with a bit better employment structure).

**Table 10: Employment in Technology and Knowledge-Intensive Sectors by Persons with Tertiary Education (Levels 5-8) in Poland and the EU28 in 2016 as Percentage of Total Employment**

Sector/TIME	Poland	EU28
<b>Total - all NACE activities</b>	33.6	33.9
<b>Services</b>	45.9	39.3
<b>Electricity, gas, steam and air conditioning supply; water supply and construction</b>	18.6	19.5
<b>Wholesale and retail trade; accommodation and food service activities; activities of households as employers</b>	25.1	19.7
<b>Total knowledge-intensive services</b>	64.5	53.8
<b>Knowledge-intensive high-technology services</b>	76.6	65.8
<b>Knowledge-intensive market services (except financial intermediation and high-technology services)</b>	59.9	58.0
<b>Other knowledge-intensive services</b>	63.6	51.4
<b>Total less knowledge-intensive services</b>	24.3	20.7

Source: As in Table 9

According to Wyszowska-Kuna who investigated HRST- core employment (i.e. persons who have a university-level degree and are working in science and technology occupations) in services sectors (including KIS) in 2004-2010 Poland enjoyed a growing advantage over the European Union (whereas in manufacturing the situation was reversed). Nevertheless, if we look at the absolute number of researchers employed in services of the business economy, it is moderate compared to the most of EU28 countries (of course, taking into account the size and population of these economies). In 2014, this number amounted to 13497 (full-time equivalent) in Poland; 81665 in France (2013); 58303 in the United Kingdom; 29345 in Germany; 25612 in Spain; 24213 in Netherlands; 8812 in Hungary; 7988 in Czech Republic; and only 14 905 in Italy (as for such a big country); 3204 in Romania; and 1051 in Slovakia (Eurostat [online], 2018). We will reach a similar conclusion if we consider participation of Polish companies offering ICT training to their employees (table 11) which is significantly smaller compared to the EU28 average in all categories of services.

**Table 11: Enterprises (10 Persons Employed or More) in Services Sectors that Provided Training to Develop/Upgrade ICT Skills of Their Personnel in Poland and the EU28 in 2017 as Percentage of Enterprises**

Sector/TIME	Poland	EU28
Construction	7	14
Wholesale and retail trade; repair of motor vehicles and motorcycles	11	21
Transportation and storage	8	16
Accommodation	10	19
Information and communication	46	59
Real estate activities	17	28
Professional, scientific and technical activities	21	34
Administrative and support service activities	13	19
ICT sector	48	63
Financial and insurance activities (2012)	50	79*
Retail trade, except of motor vehicles and motorcycles	8	16

Note: \*Data for Germany due to no availability for the EU28.

Source: As in Table 10

In 2014, business enterprise R&D expenditure in high-tech KIS sectors accounted for 891 mln euro in Poland; 14296 mln euro in the United Kingdom; 14138 mln euro in France (2013); 7061 mln euro in Germany; 3212 mln euro in Spain; 3163 mln euro in Italy; 2627 mln euro in Netherlands; 2504 mln euro in Austria (2013); 1985 mln euro in Denmark; 1133 mln euro in Finland; 688 mln euro in Czech Republic; 435 mln euro in Hungary; and barely 181 mln euro in Bulgaria; 104 mln euro in Romania; 79 mln euro in Slovakia; 73 mln euro in Croatia; and 64 mln euro Lithuania (Eurostat [online], 2018). Against this background, the expenses of enterprises on R&D in high-tech KIS sectors in Poland should be assessed rather modestly. These results are part of the overall picture of the entire Polish economy as regards R&D activities. The research conducted by Halásková et.al. (2016) based on selected R&D indicators through cluster analysis in years 2004 and 2013 indicated relatively marked differences in the position and development of scientific and research activities between the EU28 countries. Bulgaria, Lithuania, Latvia, Slovakia and Poland were recognized as countries lagging behind the other EU countries in the development of R&D, innovation and knowledge economy.

Summing up, the analysis of Poland's relative technological capabilities (besides good employment structure as regards personnel with tertiary education) in services sectors did not reveal a high potential in this field which is still rather moderate. Without considerable changes in Poland's economic policy aimed at lowering the technological gap between this country and better developed EU countries (see Mucha-Leszko, 2014; Wojtas, 2014) major changes in the competitiveness of the Polish economy, including the services sector, should not be expected. As emphasised by Dosi et.al. (2015), at the present time low factor costs cannot guarantee the success of firms on international markets, technological capabilities are of key importance.

#### 4. Conclusion

On the basis of the analysis conducted in this paper one can try to determine Poland's competitive position in trade in services within the EU28 internal market as well as main factors that affect the country's competitive or non-competitive results. Considering RSCA values for Poland and the country's shares in intra-EU28 exports in services (with their changes) it can be confirmed that in 2016 Poland revealed comparative advantages and developed export specialization mainly in: 1) construction; 2) manufacturing services on physical inputs owned by others; 3) transport; 4) maintenance and repair services n.i.e.; i.e. in

labour-intensive and to a lesser extent capital-intensive services. Among the high-tech KIS sub-sectors the best competitive positions occurred in information and computer services whereas it is too early to prejudge maintaining positive results from 2016 by R&D sector. The largest comparative disadvantages versus the EU countries have been kept for years in: charges for the use of intellectual property n.i.e.; financial services; and insurance and pension services that in Poland had a very small combined share in intra-EU28 services exports. Looking into different labour productivity measures of competitive position it should be noted that although its level in Poland has been increasing (along with the processes of economic convergence) gross value added per hour worked in absolute terms was from two to six times lower in certain services sectors than in the EU-28 in 2016, with the biggest differences in: real estate activities; non-market services as well as financial and insurance activities.

Examination of competitive capacity based on price and labour costs disclosed Poland's advantages in relation to the EU28 generally in all services sectors. As for price indices, in 2016 this predominance was the greatest in: communication (the lowest price level in the whole EU); education; transport as well as recreation and culture services. Despite rising labour costs and compensations per employee in all services sectors their absolute levels in Poland are still three times lower on average than in the EU28. However, research on Poland's potential to enhance trade in high-tech KIS based on technology and human resources measures gave an ambiguous picture. Apart from relatively good assessment of Polish employment structure compared to the EU28 as regards persons with higher education employed in knowledge-intensive sectors, the degree of ICT training for personnel in all categories of services as well as the relatively low level of R&D expenditure by enterprises in high-tech KIS do not indicate a significant potential in this area. If Poland wants to gain and maintain firm competitive advantages in trade in services in both the single market and the global market, in the long term it should primarily focus on its technological capabilities as low labor costs will not ensure a lasting competitive advantage forever, especially in conditions of economic convergence and growing level of GDP per capita. Therefore, further research is needed, contingent on the availability of sectoral data, incorporating such efficiency indicators as total factor productivity or multifactor productivity as well as a more detailed analysis of factors affecting labour productivity level.

### **Abstract**

*The growing power of the European Union after establishment of the Common Foreign and Security Policy (CFSP) and, in particular, after the formation of a Common Security and Defence Policy (CSDP) as a major part of CFSP has led to the EU's gradual creation of defence and crisis management structures and capabilities. The Lisbon Treaty brought the necessary impetus to this area. In 2010, the European External Action Service, based just on the Lisbon Treaty, has enabled far better and more effective coordination of the main processes. The aim of this article is, by the use of mainly qualitative research, to analyze key initiatives, events and the roles of the bodies and institutions of the European Union within the framework of relevant development steps of the Common Security and Defence Policy in order to characterize and identify their importance in the future development of the European defence.*

**Keywords:** *Common Security and Defence Policy, crisis management, EU missions and operations, European External Action Service European Union*

**JEL Classification:** *F15, F51, F52, F53*

### **1. Introduction**

After the key political changes (in the early 1990s), only the United States appeared to meet the criteria of being a world superpower. Although fast downfall of the bipolar power division of the world significantly decreased the probability of a global military conflict, is not possible to consider the present security situation as free of safety threats (Kaňa and Mynarzová, 2016). Especially regional conflicts stand out from the common understanding and command of armed conflict and bring relatively new situations described as asymmetric and, more recently, the hybrid warfare (Kofman, Migacheva, et al., 2017).

Common Foreign and Security Policy is a very specific and original area due to the national sovereignty of EU Member States, which remains under state control (Kabus, 2017). CFSP is formulated in the Treaty of Lisbon (Treaty on European Union-TEU, Article 21). CFSP covers a whole range of EU security issues, which are also set out in a number of other documents. It should be noted that, unlike foreign policy (diplomatic activities), emphasis is placed on the security aspect. An integral part of the CFSP is the Common Security and Defence Policy, which provides operational capacity through EU civilian and military resources (Kaňa and Mynarzová, 2014b; Weiss, 2014).

Development in the field of CSDP has been rising in recent years. The activities of the European Council, the European External Action Service and the Commission's initiatives show a common interest in improving cooperation in this area and to continue in the coming

years in the gradual building of a common European defense. The article will not only focus on the characteristics of key events, but will also analyze important legislative initiatives, including the roles of individual EU institutions.

## 2. The Most Important Steps in Forming the CSDP

The origins of the present European Union's security and defence architecture can be traced back to the years following World War II, but real the foundation of the Common Foreign and Security Policy has been introduced in the Maastricht Treaty. With its entry into force on 1<sup>st</sup> November 1993, it created a single institutional framework, the European Union, based on three pillars - the second of which was the Common Foreign and Security Policy. The second pillar was (as well as the third pillar) built strictly at intergovernmental level. *The European Commission and the European Parliament thus could not took decisions in this area, but there is important role of the Commission as an initiator and proposer for "way forward"*. The European Council was designated as a Coordinator for the CFSP (taking strategic principles and guidelines) together with the Presidency country. The main actor in the framework of CFSP was the Council, where common approaches and actions were adopted, for its approval it was necessary to reach unanimity (The Lisbon Treaty [online], 2008).

While the European Union recognized ambitious objectives in the field of external security and defence through the Maastricht Treaty, it would not be until the late 1990s, after conflict in the former Yugoslavia, including Kosovo War, 1998-1999 and a policy change in the United Kingdom, that a specific steps were introduced for an independent Common European Security and Defence Policy equipped with substantial crisis management capabilities.

Bilateral meeting between France and the UK held in Saint-Malo (December 1998), a key acceleration aspect leading to the creation of European Security and Defence Policy. Following the Saint-Malo Declaration, numerous European Council summit meetings defined the military and civilian capabilities needed to fulfil the *Petersberg tasks* (defined in the Petersberg Declaration of the former Western European Union in 1992 – see below). Examples include especially the Cologne European Council Meeting (1999), where the concept of a European Security and Defence Policy was first officially used, and the Helsinki European Council Meeting (1999), which contributed to the ESDP assembling the list of resources needed to implement the tasks identified, which was defined as the *European Headline Goal* (EHG) 2003. It was about a planned military capabilities of the European Union by 2003. The list of military ESDP capabilities - the Force Catalogue - was revised several times thereafter. In 2000, the European Council in Santa Maria de Feira, in addition to more precise relationship between ESDP and NATO, has also discussed the function of new institutions of ESDP, which were finally established at the end of 2000 at the Nice summit. It was the *Political and Security Committee, the Military Committee and the Military Staff* (see chapter 3). At its meeting in Laeken (2001), the European Council agreed on the operational side of ESDP in the context of crisis management. ESDP was formally recognized as a combat-ready finally. (Kaňa and Mynarzová 2012, 2014a).

In 2003, ESDP became operational through the first ESDP missions and operations. Since 2003, the EU has initiated over thirty five crisis-management missions and operations. In addition, the EU presented its first ever *European Security Strategy* in December 2003, outlining key threats and challenges facing Europe – *terrorism, proliferation of weapons of mass destruction, regional conflicts, state failure and organised crime*. This strategy was revised in 2008 so as to respond to new security challenges and remained in place until the presentation of a follow-on *EU Global Strategy* in the summer of 2016. In May 2004, the *Headline Goal 2010*, has been approved which included the concept of *EU Battlegroups* (EU

Battle Groups Concept). These comprehensive security military units have to give the EU the ability to quickly intervene mainly in lower intensity conflicts. The first units reached operational capability in January 2007 (EEAS [online], 2013).

Treaty of Lisbon (2009) renamed the European Security and Defense Policy by the new term *Common Security and Defense Policy*, the latter continue to be a part of the Common Foreign and Security Policy. The Lisbon Treaty also established the post of High Representative of the Union for Foreign Affairs and Security Policy, merging the two positions of High Representative for CFSP and Commissioner for External Relations – Vice President (HRVP). This treaty canceled the pillar structure of the EU. The original second pillar - CFSP, however, continues to maintain its specific *intergovernmental* properties. The Lisbon Treaty formally endorsed the extension of the mentioned *Petersberg tasks*, which now include (see Article 43 TEU): “joint disarmament operations, humanitarian and rescue tasks, military advice and assistance tasks, conflict prevention and peace-keeping tasks, tasks of combat forces in crisis management, including peacemaking and post-conflict stabilisation”. In addition, these tasks could contribute to the fight against terrorism, including the possibility to support other (third) states in combating terrorism in their territories (Rehrl, 2017).

Another newly established institution was the *European External Action Service*. It should help the High Representative with his coordination role. Another change that the Lisbon Treaty brought was contractual confirmation of *European Defense Agency*, EDA into primary legislation. It also introduced the so-called starter fund for the EU military operation, which complements the existing mechanism for financing of EU military operations - ATHENA. *Crisis Management and Planning Directorate* (CMPD) was established in November 2009, this led to the integration of civilian and military dimensions of strategic planning and crisis management (Staab, 2011).

On December 2013 (EUCO 217/13), for the first time since the entry into force of the Treaty of Lisbon, the European Council held a thematic debate on defence, which was preceded by a meeting with the Secretary General of the NATO. The European Council identified at this meeting priority actions for stronger cooperation in CSDP areas. In June 2015 (EUCO 22/15), The European Council tasked the High Representative with continuing the process of strategic reflection with a view to preparing an EU global strategy on foreign and security policy. In June 2016 (EUCO 26/16), the European Council welcomed the presentation of the *Global Strategy for the European Union's Foreign and Security Policy* prepared by the HRVP Federica Mogherini, and also discussed EU-NATO cooperation in the presence of the NATO Secretary General and called for further enhancement of the relationship. On November 2016, the Commission presented the *European Defence Action Plan* (EDAP), which outlined how a *European Defence Fund* (launched in July 2017 by J. C. Juncker) and other actions can support Member States' more efficient spending in joint defence capabilities, strengthen European citizens' security and foster a competitive and innovative industrial base. In December 2016 (EUCO 34/16), the European Council urged swift action for implementing the *EU Global Strategy* and the *Joint Declaration* signed in Warsaw by EU and NATO leaders on July 2016 (Rehrl, 2017).

### ***2.1 Key Initiatives Under the Present Development of the CSDP***

The new momentum was given to the development of the CSDP with the implementation of the *EU Global Strategy of 2016* (June 2016, presented by HRVP). Security and defence has become one of the priority areas for work on the implementation of the EU Global Strategy (EUGS), which also includes resilience building and an integrated approach to conflicts and crises, strengthening the connection between internal and external policies, updating existing

or preparing new regional and thematic strategies, and stepping up public diplomacy efforts. Priorities of the EU Global Strategy are as follows (Europa [online], 2018c):

1. *The Security of our Union* - NATO remains the primary framework for most member states, a more credible European defence is essential for EU internal and external security. This includes *fighting terrorism, hybrid threats, economic volatility, climate change, and energy insecurity*,
2. *State and Societal Resilience* - The EU invests in the resilience of states and societies to help them withstand and more quickly recover from conflict and crisis,
3. *An Integrated Approach to Conflicts and Crises* - The EU engages in a practical and principled way in peacebuilding. Human security is at the core of all EU actions and priority is early to prevent conflict and save precious human lives. EU stays engaged in the aftermath of conflict to ensure that peace is deeply rooted in society,
4. *Cooperative Regional Orders* - Regional governance should make easier to manage security concerns, reap economic gains, and project influence. This is the rationale for the EU's own peace and development. Working with regional organizations around the world is necessary,
5. *Global Governance for the 21st Century* - The EU believes in the force of law rather than the law of force and support human rights, sustainable development, and access to global commons for everybody. A strong UN is the core of the multilateral order and a cross cutting priority for all EU policies is a strong focus on "Human Rights, Women, Peace and Security and Gender Equality and Women's Empowerment"

From a geographical point of view, the EUGS is focusing on the *extended region* that includes Eastern Europe with its Central Asian extension, as well as the Mediterranean and Central African zones. The EU therefore has no longer the ambition of being a global actor in the structures of international order. The document determines specific scenarios and perceptions of threats, including a change in the context of European security caused by the aggression of Russian Federation against Ukraine. The strategy also articulates other threats associated with the Russian activity: disinformation activities associated with military threats and hybrid activities aimed at internal political methods of destabilizing other countries. It also refers to previous threats, such as transnational terrorism and those threats, that can increasingly and clearly destabilize individual countries – related to cyber security and energy security, organized crime or climate change (EEAS [online], 2018c; Koziej, 2017).

Another key step towards strengthening the CSDP and closer cooperation between the Member States of the EU, which should aim at the gradual creation of the European Defense Union (*J. C. Juncker made the case for creating a fully-fledged European Defence Union (EDU) by 2025* – see European Commission [online], 2018b) was establishment of the *European Defence Fund (EDF)* in June 2017, which should accelerate the integration processes in the scope of spending used especially for armament purchases. The EDF has two strands – "Research", fully funded from the EU budget, with 90 million EUR until the end of 2019, with 25 million EUR allocated for 2017, then 500 million per year after 2020. Second source is "Development and acquisition" for Member States to cooperate on joint development and the acquisition of defence equipment and technology through co-financing from the EU budget and practical support from the Commission, with 500 million EUR in total for 2019 and 2020, then 1 billion EUR per year after 2020. The programme will leverage national financing with an expected multiplying effect of 5. It could therefore generate of 5 billion per year after 2020 (European Commission [online], 2018a).

Crucial for further development and cooperation in the CSDP framework was establishment of the *Permanent Structured Cooperation (PESCO)* in December 2017 (based on Article 42 and 46 TEU). It enables close cooperation of a group of the Member States in the area of

security and defence. A fixed framework of cooperation will allow Member States, which have the will and capabilities, to jointly develop defence capabilities, invest in the same projects and increase contribution and operational readiness of their armed forces. Consequently, it would enable the development of joint formations of the land forces, naval forces or air forces (Koziej, 2018).

### 3. Indispensable Institutions Within the CSDP Framework

The *European Council* defines the general EU political direction and priorities, including the area of the CFSP and the CSDP. Due to Article 22 TEU, The European Council shall identify the strategic interests and objectives of the Union relating to the CFSP and in other areas of the external action of the Union, on the basis of the following principles, as stated in Article 21 TEU, including matters with defence implications, and shall adopt the necessary decisions (Article 26 TEU), (Europa [online], 2018d).

The *Council of the European Union (EU Council, Council)* according to the policy area to be discussed is composed of government ministers from each EU country and meets in 10 different configurations of 28 national ministers. Under the Lisbon Treaty is responsible for defining and implementing of the CFSP and CSDP based on European Council guidelines - by unanimous/consensus decision (Article 42 TEU). The Foreign Affairs Council is responsible for CSDP and chaired by the HRVP. The Council take action to implement EU foreign and security policy, including possible sanctions. The Council Secretariat is headed by the Secretary-General and is divided into seven directorates-general (A-G), Directorate-General C is responsible for Foreign Affairs, Enlargement and Civil Protection (Europa [online], 2018a).

The *Political and Security Committee (PSC)* is a preparatory body for the Council of the EU and meets at the ambassadorial level. Its main roles are monitoring the international situation and helping to define policies within the CFSP including the CSDP (Article 38 TEU). PSC prepares understandable EU response to a crisis and exercises its political control and strategic direction of civilian and military crisis management missions and operations.

The highest military body established within the Council (Council Decision 2001/79/CFSP) is the *European Union Military Committee (EUMC)*. It is composed of the Chiefs of Defence of the Member States, who are regularly represented by their permanent military representatives. The EUMC provides the PSC with information assistance and recommendations on all military matters within the EU.

The *Committee for Civilian Aspects of Crisis Management (CIVCOM)* together with the EUMC advises the PSC. This committee provides information, drafts recommendations, and gives its opinion to the PSC on civilian aspects of crisis management. It is chaired by a representative of the High Representative and is composed of Member States' delegates.

The *Politico-Military Group (PMG)* carries out preparatory work in the area of CSDP for the PSC. It covers the political aspects of EU military and civil-military issues, especially operations and missions. It prepares Council Conclusions, provides Recommendations for PSC, and has a particular responsibility regarding partnerships with third states and other organisations, including EU-NATO relations. The PMG is chaired by a representative of the High Representative and is composed of Member States' delegates (EEAS [online], 2018b).

Key element player in the CSDP is the *European External Action Service (EEAS)*. It is the European Union's diplomatic service and "foreign and defence ministry". The EEAS is headed by the High Representative for Foreign Affairs and Security, who is President of the Foreign

Affairs Council and Vice-President of the European Commission too, and carries out the EU's CFSP and CSDP. Main competences of the EEAS are primarily determined by TEU (Article 18, 27), organization and functioning matters were adopted by Council Decision 2010/427/EU. By the Article 1 EEAS Decision, the EEAS was established as a functionally autonomous body of the EU. *In general, the tasks of the EEAS include ensuring the consistency and coordination of the Union's external action and preparing policy proposals and implementing them following approval by the Council. The EEAS does not propose or implement policy in its own name, but prepares acts to be adopted by the High Representative or the Council.* The EEAS is in charge of EU diplomatic missions and ensures intelligence and crisis management structures. In general, is necessary to note that the tasks of the EEAS are quite complex (Article 2 and 3 EEAS Decision), (EEAS [online], 2018a; Europa [online], 2018b).

The *European Union Military Staff (EUMS)* - working from 2001 as a Council body under the direction of the EUMC and since 2009 under the authority of the High Representative – as a Directorate-General of the EEAS. EUMS is the source of cooperative military expertise within the EEAS and commanding non-executive operations through its *Military Planning and Conduct Capability (MPCC)* operational headquarters. The EUMS coordinates the military instrument, with particular focus on operations/missions (both military and those requiring military support) and the creation of military capability. Simultaneously, the EUMS is charged with sustaining the *EU OPCEN (EU Operations Centre)* and providing its core staff when activated (EUMS [online], 2018).

The *Military Planning and Conduct Capability (MPCC)* is from June 2017 a permanent operational headquarters at the military strategic level for non-executive military missions deployed as part of the CSDP. The MPCC is part of the EU Military Staff, a department of the EEAS, and the Director General of the EUMS also serves as Director of the MPCC - exercising command and control over the operations. The MPCC is single military strategic command and control structure. *The Civilian Planning and Conduct Capability (CPCC)* is part of the EEAS as the permanent structure responsible for the autonomous operational management of civilian CSDP operations. CPCC is under the political control and strategic direction of the PSC and the overall authority of the High Representative, and is the permanent operation headquarters for all civilian EU missions (EEAS [online], 2018b).

The *Crisis Management and Planning Directorate (CMPD)* contributes to the achievement objectives of the EEAS (as its part), the CSDP and a more secure international environment through political-strategic planning of CSDP civilian missions and military operations, ensuring a coherent and effective EU-wide approach to crisis management partnership development, policies, concepts and capabilities of the CSDP (EEAS [online], 2018d).

#### 4. Conclusion

The possibility of a common defence policy is enshrined in the Lisbon Treaty's Article 42. Gradually, after the adoption of the Maastricht Treaty, the necessary structures were built, but the proverbial impetus was brought by the Treaty of Lisbon. It was not just renaming the European Security and Defense Policy by the new term Common Security and Defense Policy but establishing the post of High Representative of the Union for Foreign Affairs and Security Policy, merging the two positions of High Representative for CFSP and Commissioner for External Relations – Vice President. This made it possible for the Commission to be more involved in the initiation process in this strictly intergovernmental area. Creation of the EEAS then unambiguously contributed to better coordination and management of all processes within the CSDP.

In recent years, this has been primarily the Commission's initial efforts and the intensive work of the EEAS, which have contributed to a more vigorous development of the CSDP. The creation of a European Defence Fund, the creation of a single headquarters for operations - Military Planning and Conduct Capability, the implementation of permanent structured cooperation - PESCO and many other initiatives have taken the necessary steps towards the gradual establishment of some form of "Common European Defense". These events, in the future, likely to lead to the establishment of a European Defense Union. But one have to remember that a key player in the security area is NATO and that the CSDP itself is an intergovernmental issue where unanimous decision by all EU Member States is needed.
