*The contribution deal with the evaluation of the use of EU funds in the field of environment in the closed programming period 2007-2013 in the Slovak Republic. Implementation of this programming period was completed in 2015 and concluded by the evaluation report in 2017. In the paper we focused on analyzing the direction of the financial contribution to the regions according to the individual environmental priorities in the Slovak Republic as well as in the EU. We also mentioned the implementation status of approved grants from the European Structural and Investment Funds for the program period, based on data from central information system ITMS. At the end of the paper, we draw attention to the specifics and shortcomings that occurred during the implementation of the Operational Program Environment, which need to be taught in the current 2014-2020 programming period.*

**Keywords:** cohesion policy, EU funds, Operational Program Environment, Slovakia

**JEL Classification:** O18, O22, Q58, R58

### **1. Introduction**

The current economic problems in the world and Europe are forcing to pay more and more attention to the EU Member States and regional disparities. The EU 2020 Strategy underlines the role of the structural economic policy and stated that the crisis has wiped out over the years sought economic and social progress and exposed structural weaknesses in the European economy. Sustainable regional development and cohesion problems renew after the EU expansion, foremost due to the increasing inter-regional socio-economic differences in the appreciation of both national and international levels. (Rakauskienė, O. G., Kozlovskij V., 2014). Cohesion policy has a major impact on the economy Member States, reducing economic differences and promoting environmental and social development. The investments help to deliver many other EU policy objectives. Cohesion Policy provides the necessary investment framework and strategy to meet our agreed growth goals. Through the Partnership Agreements and the operational programmes, the Member States and the regions take ownership of their strategy and commit to see it through.

The contribution provides an insight into the use of the environmental grants in order to highlight the importance of the EU funds as a tool to meet the environmental objectives of international conventions to which the Slovakia has committed itself. On the basis of the analyse of the programming period 2007-2013, we are trying to summarize the most important aspects affecting the success of the drawing of the EU funds in Slovakia. We also try to draw attention to the specifics and shortcomings that occurred during the implementation of the

Operational Program Environment, which need to be taught in the current 2014-2020 programming period.

Promoting climate change adaptation, risk prevention and management, is one out of eleven thematic objectives which EU cohesion policy funding addresses in the programming period 2014-2020. The European Climate Adaptation Platform is a web-based tool that supports cities, regions and countries in implementing the EU climate policy, through the scientific and operational instruments (Bankwatch. 2015; Thoidou, E. 2017). The environment has been a focus for support from Cohesion Policy since 1989. Along with transport, it is one of the policy areas eligible for financing from the Cohesion Fund, on the grounds that it is important to have common environmental standards across the EU for both the health of people and to protect the eco-system (European Commission [online], 2015). Support of the area of environmental protection with funds from EU in the programming period 2007-2013 in Slovakia was solved primarily through the Operational Program Environment (OP Environment). Monitoring and evaluation of the implementation of projects aimed at fulfilling the priorities of the OP Environment is possible through the monitoring of measurable indicators, which summary are described in the following table 1.

**Table 1: Indicators at the Level of Outcome and Impact**

Oper. goal	Outcome indicator	Impact indicator
1.1	Number of inhabitants connected to the newly built drinking water supply	Share of inhabitants supplied with the drinking water from the verified water supply on total number of inhabitants
1.2	Number of inhabitants connected to the newly built sewage network	Share of inhabitants connected to public sewage network on total number of inhabitants
1.3	Compliance of the monitoring of status of waters in Slovakia with the requirements of the EU Water Framework Directive	Amount of pollutants released to waters in Slovakia according to selected indicators of pollution
2.1	Reducing flood damage in the areas with flood protection measures	Reducing flood damage in Slovakia
	Share of predicted floods on total number of floods	
3.1	Reducing emissions of selected pollutants NO <sub>x</sub> , PM <sub>10</sub> , NH <sub>3</sub> , VOC, etc.	Reduction of total emission production (in %)
3.2	Reducing greenhouse gas emissions	
4.1	Share of recycled municipal waste	Share of reutilized waste on total amount of produced waste
4.2	Share of materially utilized waste	
	Share of energetic utilized waste	
4.3	Share of modified hazardous waste	
4.4	Share of remediated sites on total number of sites with the registered environmental load	Share of area with the remediated environmental load and landfills with the zero load on total registered area with environmental load and landfills
4.5	Share of closed and cultivated landfills on total number of landfills registered until January 1, 2017	

Source: Ministry of Environment [online], 2014

Targets according to Climate change and energy (by Strategy Europa 2020) are aimed to decrease greenhouse gas emissions 20% lower than 1990 levels, increase the use of the energy

to 20% of the energy coming from the renewables and 20% increase in energy efficiency. Goals that the individual EU Member States set to achieve the objectives of the Europe 2020 strategy is probably considerably differentiated. Slovakia set its national targets in the National Reform Program 2010. In the current 2014-2020 programming period in Slovakia, the reduction of greenhouse gas emissions (excluding ETS) by 13% by 2020 (compared to the base year 2005) is mainly addressed through the OP Research and Innovation, Integrated Regional OP and OP Integrated Infrastructure. Quantitative data and trend analysis indicate that emissions by 2020 will fall by about 24% by 2020 compared to base 2005 (Baláž et al., 2015). Slovakia aims to increase the use of renewables in gross final energy consumption from 6.7% in 2005 to 14% in 2020. This objective should be met and is mainly addressed through the OP Quality of the Environment with the allocation at 173.23 mil. €. The objective of reducing final energy consumption by 11% by 2020 (compared to the 2001-2005 average) is mainly addressed within the OP Research and Innovation, OP Environment and Integrated Regional OP with allocation of 986.28 mil. €. According to the monitoring, the planned savings and insulation values are filled and exceeded. The impact of structural funds and cohesion fund interventions is very important in this area. The area of the environment was in Slovakia already supported in the programming period 2004-2006, mainly through the OP Basic Infrastructure, Priority 2 Environmental Infrastructure. In this period were implemented 205 projects with the allocation of 122,283,864 € (state 28<sup>th</sup> February 2010).

The effectiveness of the interventions in the 2007-2013 programming period has been affected by several factors. While managing authorities had partial or no impact on some. This includes factors such as the tools used within the implementation system and general institutional mechanisms at national level, the readiness of applicants or the lengthy legislative process leading to the adoption of relevant legislation in a certain area (Ministry of Environment [online], 2016).

## **2. Problem Formulation and Methodology**

In the following chapters, we formulate the problem whose analysis represents the objective of the contribution. At the same time, we mention the data sources that were needed for our analysis.

### **2.1 Problem Formulation**

The implementation of cohesion policy through the use of EU funds is linked to various specifics. In our contribution, we focus on the priorities of the environment and the impact of the use of EU funds in this area as one of the priorities of the sustainable development in Slovakia. The contribution deal with the evaluation of the use of EU funds in the closed programming period 2007-2013. The implementation of this programming period was completed and there are more possibilities for complex evaluation. We focused on analyzing the direction of the financial contribution to the regions according to the individual environmental priorities in Slovakia as well as in the EU. We also mentioned the implementation status of approved grants for the program period. At the end of the research, we draw attention to the specifics and shortcomings that occurred during the implementation of the OP Environment, which need to be taught in the current 2014-2020 programming period.

## 2.2 Model and Data

We based our research on data from central information system ITMS, a tool for applying, implementing and monitoring EU funds that serves applicants involved in the preparation, administration, selection, control, analysis, monitoring and evaluation of European Structural and Investment Funds. We also used the documents of the Ministry of the Environment, as the Managing Authority of the Operational Program Environment in Slovakia, Evaluation Reports and Manuals of European Commission at EU level as well.

## 3. Problem Solution

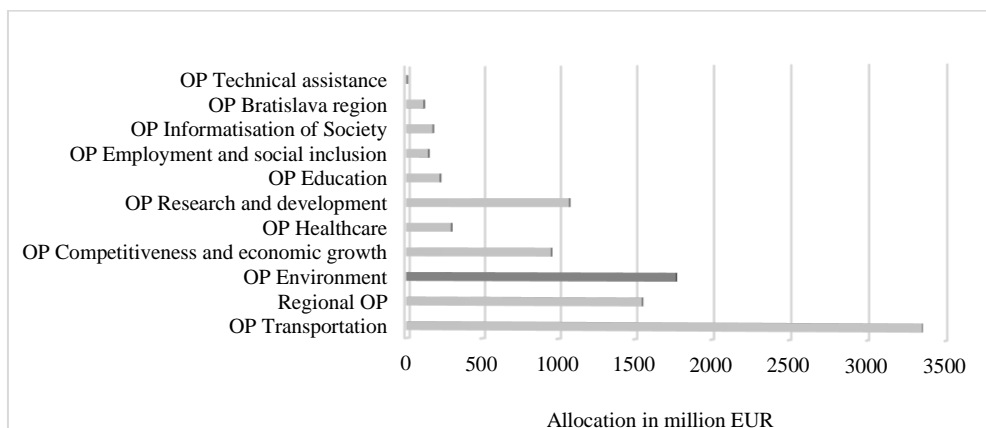

In the following chapters we describe the situation and focus on the evaluation of the use of EU funds in the field of the environment and the process factors influencing the implementation of the OP Environment in Slovakia.

### 3.1 Evaluation of the Use of EU Funds in the Field of the Environment

Operational Programme Environment was a programming document of the Slovak Republic for the utilisation of EU assistance for environmental sector defined for 2007-2013 programming period. OP Environment was financed jointly from the European Regional Development Fund (ERDF) and the Cohesion Fund (CF). OP Environment Strategy created conditions for Slovakia to converge with EU-15 in the area of the environmental infrastructure and protection. At the same time, it was significantly contributing so that economic conversion of the Slovak economy to EU-15 average is executed through the sustainable development. Global objective of OP Environment was to improve the environmental situation and ensure for the rational utilisation of resources, through the completion and improvement of the environmental infrastructure in Slovakia in the compliance with the EU and SR regulations, and to strengthen efficiency of the environmental part of the sustainable development.

Based on analyse, we can conclude the Operational Program Environment was the second most successful operational program in the 2007-2013 programming period in Slovakia, in terms of the real drawings of the allocation of the OP Environment. As is it visible in the figure 1 more funds were allocated only to the OP Transportation.

**Figure 1: Drawing of the Allocation According to Operational Programmes in Slovakia**

Source: ITMS (2016); own elaboration (2018)

In the programming period 2007-2013, OP Environment has been divided into 7 priority axes. Each priority axis of the OP was implemented in accordance with the specific strategic priorities of the National Strategic Reference Framework of the Slovak Republic for the period 2007-2013. Table 1 lists defined priority axes together with the source and amount of funding.

**Table 1: The Structure of the OP Environment According to the Priority Axes**

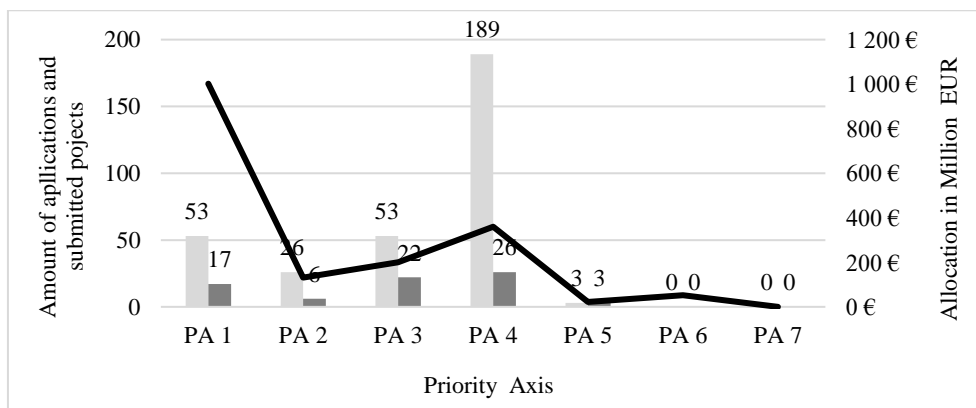

Priority Axis	Fund	EU Funds (€)	National Funds (€)	Sum (€)
PA 1: Integrated Protection and Rational Utilisation of Water	CF	944 712 965	166 714 053	1 111 427 018
PA 2: Flood Protection	CF	174 070 100	30 718 253	204 788 353
PA 3: Air Protection and Minimisation of Adverse Effects of Climate Change	ERDF	180 000 000	31 764 706	211 764 706
PA 4: Waste Management	CF	401 860 000	70 916 471	472 776 471
PA 5: Protection and Regeneration of Natural Environment and Landscape	ERDF	50 756 935	8 957 106	59 714 041
PA 6: Technical Assistance	CF	48 600 000	8 576 470	57 176 470
PA 7: Flood Warning and Forecasting System	ERDF	20 000 000	3 529 412	23 529 412
<b>Sum</b>		<b>1 820 000 000</b>	<b>321 176 471</b>	<b>2 141 176 471</b>

Source: OP Environment [online], 2017

The individual priority axes were then subdivided into the specific operational objectives, which bring together the activities aimed at achieving the defined objectives of the OP Environment. For each operational objective have been defined the groups of the eligible activities for drawing funds.

Under the OP Environment 324 applications for non-repayable financial contribution were submitted (see Figure 2). However, the success of the projects was only 23%. As Figure 2 indicate, most of the project applications 189 were noticed (light colour) under the priority of waste management, with only 26 projects submitted (dark colour) of 189 projects.

**Figure 2: An Overview of Success of Project Applications According to Priority Axes**

Source: ITMS (2016); own elaboration (2018) Legend: light colour - amount of project application; dark colour – submitted projects

For these purposes, most of the funds, namely 360 million €, have been allocated for Priority Axis 4. The exhausted subsidies also represent a contribution to meeting the waste management objectives of the Slovak Republic by 2020. They have made a significant contribution in particular to the area focused on addressing priority and financially the most demanding activities in terms of the implementation of the environmental acquis in the field of water management, flood protection, waste management, mitigating the adverse impacts of climate change and nature protection with total allocation of 1.7 billion €. The highest financial allocations were allocated to projects focusing on integrated protection and rational use of water. Of 53 projects were approved 17 projects application, with allocation of 1 billion €.

The allocated funds in the calls of OP Environment, has achieved almost 100 % of the disposable allocation towards the end of the year 2012. In terms of contracting during the first 3 years of the implementation (2008, 2009 and 2010) there had been contracting of over 54 % of the allocation. In the following five years the rate of contracting has decreased as the level of contracting was just over 42 % of the allocation of OP Environment.

The suitability of the OP Strategy is also demonstrated by the results of the implementation of the OP Environment from the point of view of the substantive progress of the implementation, j. from the point of view of meeting the objectives and results (the target values of the indicators) as well as the absorption capacity. As we can see in figure 2 the demand for applicants significantly exceeded the available allocation (the amount of the requested contribution was more than 3 times the amount of the approved contribution), which demonstrates that the objectives of the OP Environment correspond to the identified problems and the real needs of the potential applicants. It follows that from the material point of view, it is not appropriate to divert the orientation of the environmental infrastructure strategy defined in the OP Environment in the 2007-2013 programming period towards the 2014-2020 programming period. But the focus should be on further development in the light of the new legislative and conceptual starting points of the EC and the Slovak Republic and current developments in the environment sector.

### ***3.2 Assessment of the Contribution of Allocated EU Funds***

As we mentioned in the introduction, the impact of realized projects could be assessed on the basis of the predefined indicators (see Table 1). Based on analyse of ITMS data and the documents discussing the *Results of implementation, experience and lessons learned from the 2007-2013 programming period* (Operational Programme Quality of Environment [online], 2015) we can conclude that in the area of the water management, the realisation of the completion of public sewerage systems and waste water treatment (located mainly in the urban environment) has increased the population's connection to the newly constructed sewerage network. In the area of securing the population's supply with safe drinking water, after the implementation of all approved projects were connected to newly built potable water distribution by 73,045 inhabitants.

To reduce the emissions of the air pollutants and at the same time to improve the air quality, 103 projects were supported, out of which 33 projects aimed at promoting the use of the renewables and 6 projects for the greening public transport. The projects have contributed to the improvement of the level of the air monitoring and their implementation has been modernized by 27 monitoring stations of the National Monitoring Network for the Air Quality.

The funds provided through the OP Environment have contributed to the construction and modernization of the sorted municipal waste collection facilities, created conditions for the clearance of more than 110 000 t of the municipal waste. Also 46 landfills were closed and

reclaimed. Interventions directed at the waste management and the air protection have also contributed to the support of 79 small and medium-sized enterprises, which together created 52 new jobs, and the introduction of environmentally-friendly technologies.

The implementation of OP Environment has enabled the creation of an environmental burden information system, which has created a space for data collection and provision of the information on environmental burdens as a part of the public administration information system. An important contribution in the field of flood protection was the creation of the national project for the construction and operation of the Flood Warning and Forecasting System. The project is in the initial phase of implementation. Project outputs are the appropriate inputs for a comprehensive Early Warning System to be built in the 2014-2020 programming period. In the area of the climate change adaptation, support has been prioritized for the flood protection activities. The flood protection on an area of more than 160.85 km<sup>2</sup> has been provided. Also, we can conclude that with more than 500 nature and landscape conservation activities, the awareness and the environmental awareness of the public, with more than 146,000 inhabitants, was raised.

### ***3.3 The Process Factors Influencing the Implementation of the OP Environment***

Based on analyse of the implementation of OP Environment, we can conclude that a series of factors and causes have signed upon the resulting situation of the implementation of OP Environment either only once or systematically. The most problematic area was considered to be the public procurement (PP). The infringement of the rules and policies of the Act No 25/2006 Coll. of the public procurement from the side of the beneficiary has been causing high level of errors in PP made by the beneficiaries with the need of repetition, this has prolonged the implementation of the projects and as well the drawing of financial funds (Ministry of Environment, 2016). Another problem in this area is the development of the situation on the market due to the global economic crisis. Implementation of the projects was affected by the financial crisis and subsequent economic crisis in 2008/2009 (Begu, Spataru, Constantin, 2014; Ministry of Environment [online], 2016). The applicants have also had problems with the provision of co-financing of projects due to inaccessibility of funds in banking system. Except the area of PP in the projects implementation process, there had been issues with the applications from the beneficiaries' side about the alteration of the project (time management, financial plan, technical solutions), which has prolonged the realization of the projects and also the with the limitations in the payment requests submitted by the beneficiaries. This has led to the requirement of their addition, or in some cases to their cancelation. In the field of the administrative capacities in the programming period 2007 - 2013, the direct impact on the effectiveness of the implementation of the OP Environment mainly included the professional level of the administrative capacities and their fluctuation. Insufficient professional level of the administrative capacities of the Managing Authority has had a negative impact on the correct, timely and effective implementation of the OP implementation activities.

Another reason that has mainly occurred in the lower pace of draw launching was the character of the majority of the projects in the OP Environment. In regards to the investment projects, which are characterized by the time, administration and financial intensity in the development phase. This prolongs the draw launching of the projects costs. Realization of the investment projects bears the risk of unforeseen circumstances that are necessary in the alternation procedure. Among the causes, that have had the solution in the cross-sectoral nature and were not in direct competence of the MA for OP Environment, contain adopting significant legislative changes. Many of these factors may be objectively considered to be the factors that were caused beyond the procedures and processes of the MA for OP Environment. The

realization of the Action plan for the drawing acceleration and the implementation of OP Environment on the MA level has been implemented since 2012. This plan is evaluated on the two-month basis and is then sent to the Central Coordinating Body, CO, in the consciousness of the Audit Authority and also electronically sent to the EC for the reconsideration.

At the same time, however, we consider it important to create the conditions enabling potential applicants to estimate the probability of the support for their projects. Therefore, a specific call definition is important in order to reduce the number of projects not approved due to non-fulfilment of the project eligibility and completeness criteria. At the same time, it brings fewer submitted projects and their better processing, easier and faster approval of the projects due to their lower number, higher success rate and effectiveness of the challenge and savings of the applicants' funds and the Managing Authority.

#### **4. Conclusion**

The experience with the implementation of the OP Environment under the 2007-2013 programming period shows a generally well-chosen OP strategy that was focused on addressing the priority and financially most demanding activities in terms of the implementation of the environmental acquis in the field of water management, flood protection, waste management (Operational Programme Quality of Environment [online], 2015; Government of Slovakia, 2015) and protection and minimisation of adverse effects of climate change. At present (reports 31st August 2017), the implementation of the Environmental Quality Operational Program 2014-2020 at the level of approved payment applications amounts to drawing 3.3%, which represents 103,488,424.99 €, of 3,137,900,110 €. The Cohesion Fund draws 3.6% and from the ERDF at 2.78%.

The first step, conditional on the use of OP, is the announcement of calls for the applications for NFPs. The managing authority should manage the calls according to create the conditions for a sufficient use of resources, taking into account the absorption capacity of the applicants and the overall administrative capacity. This would allow for the timely fulfilment of both annual and total commitments. As was already pointed out by Jackson (2005), it is necessary to provide and use the investment grants, while at the same time ensuring the effective public administration in this area. It will be important in the future to implement the tools to strengthen absorption capacity (e.g. disseminating examples of successful projects, providing training and seminars), the secondary effect of which will be to increase applicants' awareness and, at the same time, reduce the formal or inaccuracy of the submitted projects. The Ministry of Environment of Slovakia has legal, economic and administrative tools to manage the implementation of the OP. In response to the problems, at the level of the OP with a link to the national level it is necessary in the current programming period 2014-2020 to introduce the comprehensive system tools for training, evaluation and remuneration of the administrative capacities in order to ensure the efficient management of the OP through the qualified, motivated and stabilized employees.

### **Abstract**

*The paradigm of the development of impact-investing is based on the fundamental provisions of the sphere of social entrepreneurship. Social entrepreneurship is an innovative activity, initially aimed at addressing or mitigating the social problems of society on the terms of self-sufficiency and sustainability. Innovative investment instruments in the modern business environment are Impact investing, Crowd funding, Crowd sourcing, and Crowd investing. In the article the basic alternatives and forming the paradigm for the development of impact-investment in the coordinates of globalization changes and European integration are explored by authors; the application of new mechanisms of innovative development of the economy and its investment support is justified; analyzed and presented the European practice of successful impact-investment and outlined the preconditions for the development of social entrepreneurship in Ukraine. Thus, transforming investment or Impact-investing is, in fact, an investment whose main task is not to extract profit, but to achieve a certain effect of social impact.*

### **1. Introduction**

Today, investment is a powerful basis for the development of enterprises, individual industries, sectors of the economy and the country as a whole. The ability to attract and implement investment depends on the growth or decline of production, the broad opportunities for solving social and environmental problems, the current level and the potential dynamism of physical, financial and human capital. At the present stage of development of the world economy, important and topical issues are the development of investment activity, attraction and use of foreign investments. Almost all countries of the world are focusing their efforts on increasing the investment attractiveness of foreign investment and increasing their volumes in the national economy.

A peculiar catalyst for the economic development of any country is investment. The investment process is considered as a vector of strategic development and forms the basis for successful socio-economic development of the state and its regions. The intensification of

investment processes and the effective increase of investment volumes are important factors in carrying out structural reforms in the economy and implementing an innovation-investment model of development in Ukraine. Consequently, realization of current and long-term tasks of economic and social reforms requires today not only a well-balanced and well-founded investment policy, but also the formation of effective mechanisms for the regulation of investment processes, taking into account the peculiarities of the current state of economic development of the regions.

Research of investment activity, innovation potential production, its structure and methods for evaluation, innovation investment into enterprises development was conducted in the studies by foreign and Ukrainian scientists: (Edvin J. Elton, 2014), (Frank J. Fabozzi, 2008), (Ilysheva N., 2014), (Krylova S., 2014), (Karpenko L., 2015), (Mollick E., 2014), (Lipkova L., 2013), (Mamut M., 2018), (Martin J. Gruber, 2014), (Voronzhak P., 2017) and others. Analysis of the recent scientific materials indicates the results of comprehensive research on the development and implementation of the elements of innovation and investment mechanism, improvement of the investment climate, some economic and statistic calculations. Thus, strategic planning, investment development management, elaboration of economic and financial mechanisms are examined in details. It should be noted that much attention is paid to problems of innovation investment management processes on the level of country economics and particular industries; base alternatives of impact investing development in the coordinates of globalization changes and euro integration.

## **2. Problem Formulation and Methodology**

The aim of the work consists of studying the features and rationale for applying innovative investment tools in practice in today's business environment – impact investing; the analyse of the European practice of successful impact investing and the preconditions for the development of social entrepreneurship in Ukraine.

Theoretical and methodological basis of the research is the position of modern economic concepts of management, informatization, system theory. The following methods are used for solving the tasks: scientific abstraction, generalization and comparison, classification-analytical - for the characterization and classification of the types of successful investment impact; economic-statistical and correlation analyzes - to study trends in the volume of capital construction of industrial enterprises, determination of predictive validity; generalization, systematization - for the development of managerial tools and methodological support for the process of impact-investing in the enterprise.

The information base of the study consisted of the works of domestic and foreign scientists, specialists-practitioners on the problems of research analysis.

## **3. Problem Solution**

The newest mechanisms of innovation development of the economy and its investment support are organizational and economic investment instruments, which are applicable for activating innovation and investment development of industrial enterprises. Domestic industrial enterprises are confronted more often with the problems of investing large and longer than small and short innovative investment projects aimed at bringing innovation products to the market, carrying out certain researches, and introducing innovative technologies. Alternatives for attracting funds to such projects for them is getting a loan from banks, searching for large investors, and attracting funds from venture funds. But in the Ukrainian realities, lending is

financially worst for the enterprise by way of attracting investments: interest rates are high, policies are unstable, loan conditions are large for the borrower, and in case of failure of the project, its initiator may find itself in a situation of need to pay a large debt, which is growing rapidly due to fines for delay.

Innovative investment instruments in the modern business environment are Impact Investing, Crowd Funding, Crowd Sourcing, and Crowd Investing.

The paradigm of the impact-investing development is based on the fundamental provisions of the social entrepreneurship sphere. Social entrepreneurship is an innovative activity, initially aimed at addressing or mitigating the social problems of society on the terms of self-sufficiency and sustainability. In fact, this is a business solution to the social problem that the social entrepreneur tries to solve; this is the starting point of his business. There is no problem – there is no social entrepreneur (and there is simply a business with elements of the criteria of social entrepreneurship or a social project without an entrepreneurial approach). Social entrepreneurship is a balance of social goals and a commercial component, where money is not the goal, but a means to achieve these social goals, allowing the entrepreneur to remain stable and independent of constant donor infusions.

It should also be interpreted social Entrepreneurship as a business whose purpose is to address social problems. The profits of social entrepreneurship are directed primarily at business development, community affairs, or addressing acute social problems. Social entrepreneurship is a system of management, the components of social enterprises. Social enterprises are socially oriented entrepreneurs, whose activities are aimed at achieving the welfare of territorial communities (social, environmental and ethical goals) through the use of systemic interconnection of the social entrepreneurship development and the local economies development.

The constituent components of social enterprise are social enterprises, owners or cofounders, which are non-governmental, non-profit, non-governmental organizations, such an enterprise operates under all business laws and makes a profit, and therefore it is not considered a charitable organization. It covers such areas as education, environmental protection, poverty alleviation, the protection of human rights, etc.

Criteria of social entrepreneurship are: social mission; entrepreneurial approach; innovation (innovation in solving a social problem, a new combination of resources, a new service for the region); reliability; self-sufficiency and financial sustainability.

From the point of world history view, social entrepreneurship is a very young phenomenon. Over the ocean, it exists about 30 years, in Russia and Ukraine – less than a decade. Despite such a young age, social business already today ranks among the non-profit initiatives, charity, venture philanthropy and corporate social responsibility. According to the chosen research problem it is expedient to investigate the socio-economic nature of the impact-investing process. Impact investing is a new word; it is not only in the area of social entrepreneurship: this approach is innovative for the modern market as a whole. Today's practice of impact investment can not be called widespread or very extensive, but nevertheless examples of this type of investment are currently in America, Asia, and Russia.

In June 2013, a meeting took place in London, in the title of which there is a defining phrase "impact investing" - the trend and "mantra" of the current sphere of development financing. The level of the meeting – no less than a lot – is the forum of the G8 Social Impact Investment Forum. Within the framework of the meetings, the guests of the event talked about giving this direction of investment a generally accepted structure, standardizing its tools, and also trying to provide all kinds of support. Members of the Forum decided to create a number of working

groups, besides the main driving force for the implementation of their efforts in life – the Social Impact Investment Taskforce. We suppose that the subject of impact investing is paid special attention in their publications by the European Commission, the OSCE and the World Economic Forum.

We will outline the main definitions of impact-investing, which most fully reveal its socio-economic essence:

- impact investing - the formation of new models, technologies and standards to ensure the entry of "investors from developed countries" into "new areas (previously inaccessible) of third world countries";
- impact investing - involvement of all stakeholders in the process of creating infrastructure and operating mechanisms in new zones and investment sites in order to solve social and economic problems;
- impact investing - popularization, implementation, mediation, consulting, study of tools and models for the further development of a new class of investments. Governments, international organizations and others are involved (Mamut M., 2018).

The most important thing is the concept of impact investing: the pursuit of profit is compatible with the benefits for society, solving environmental problems and social justice.

It is obvious that social impact investing is more a general concept than a specific investment strategy. The main criterion here is the desire to invest in a project that can bring tangible social benefits, in addition to economic benefits. Nevertheless, this type of investment is far from examples of pure charity and follows the classical principles of investment project management, most often implemented in developing countries.

There are historical outline of the formation and development of Impact-investing. In 2012, the Global Impact Investment Network conducted a survey among 99 investors who identified themselves as impact investors. According to the results, their total investments reached \$ 8 billion in 2012 and were planned at \$ 9 billion in 2013. More than half of the respondents stressed that they focus on average market rates of return in their investments, that is, they are far from excessive altruism. There are, however, also those who knowingly go to invest with a yield substantially below the market (Social Entrepreneurship [online], 2018).

The most important thing is the concept of impact investing: the pursuit of profit is compatible with the benefits for society, solving environmental problems and social justice.

There is comparative statistical information. According to the estimates of the Monitor Group, by 2020, global volumes of impact investing can reach a qualitatively different threshold - \$ 500 billion. Investors provide funds in various forms - purchase of a share in the capital, provision of a loan, credit lines or loan guarantees. Recently, impact investments have been contrasted with traditional "philanthropic projects" and interstate development financing programs that look less predictable and are more likely to change the subjective considerations of their main donors.

It is advisable to propose economic and mathematical recommendations for assessing the effectiveness of impact-investing in the regional aspect. Several models have been used to identify whether a stock is mispriced. Stocks that undervalued should be purchased; stocks that are overpriced should be shorted - assuming that the manager is given authority by the client to short stocks. These models fall into two general categories: dividend discount models and factorized models (Edvin J. Elton and Martin J. Gruber, 2007).

In the Table 1 we had systematized different Examples of Successful Impact Investing (Statistical yearbook of Odessa area in 2015, 2016).

**Table 1: Examples of Successful Impact Investing**

Examples of Impact Investing	Characteristics
Trade Finance Loans	An investment fund based in the UK finances small developing companies from the trade sector in Latin America and Asia. The amount of investments reached almost \$ 200 million, covering about 300 enterprises. According to the fund's estimates, over 98% of loans were returned on time. For example, part of the funds was invested in the company Fair Trade – Ecuadorian cooperative, specializing in the production of organic coffee. The cooperative numbered 300 active members-farmers, who needed to finance operating expenses and purchase new equipment.
Budget accommodation	The Brazilian private investment fund manages assets of \$ 75 million. Its investment policy focuses both on the average market rate of return and on investments in agricultural communities in South America, which make it possible to achieve tangible social returns. The Fund invested \$ 4 million in the construction of affordable housing for low-income families in agricultural areas. Within this investment project, more than 10.000 homes were built in South America, mainly in areas affected by natural disasters.
Access to "clean energy"	The € 150 million investment fund, based in Europe, makes investments of € 2-10 million in companies supplying "clean energy" to the agricultural areas of developing countries, where access to energy infrastructure is limited. For example, the fund invested € 2 million in a company supplying solar energy for lighting and cooling to Indian rural homes, schools and hospitals without access to electricity. Investment occurs through the acquisition of a stake in the capital of an Indian firm. The very same company, thanks to this investment, installed about 40 thousand systems.
Drinking water	Base of impact investing in India has been involved in microfinance for more than a decade. The base was managed to achieve a profitability level of 14% per annum, after which the second direction was opened. Within the framework of this direction, the fund provides risk capital and support to enterprises at the initial stage from the sphere of agriculture, medicine, education and renewable energy. The average size is \$ 50 thousand.
JPMorgan	JPMorgan has repeatedly stressed the importance of impact investing for its corporate mission. It chooses the course to receive investment returns in the social sphere and the sphere of environmental protection. So, by entering into an agreement with the African Agricultural Capital Fund, JPMorgan made an investment in Wilmar Flowers, a Kenyan flower exporter that purchases flowers from more than 3,000 suppliers - private Kenyan farmers. Based on JPMorgan's investments, Wilmar plans to expand the supplier base to 5,000 farmers by 2016.
Goldman Sachs	According to Alicia Glen, who is a head of the Goldman Sachs department for investing in urban infrastructure, for her company the idea of social impact investing is to increase the financing of public social services at the expense of private capital. Recently Goldman Sachs has invested in the funds of social impact of the order of \$ 10 million within the limits of one of the financing programs of New York.

In this article, we focus on how to determine the fair value or theoretical price of an equity option. The model for doing so is more complicated than the model for determining the fair value of a futures contract. The performance of a stock index option position can be replicated using stock index futures. Such strategies are called *option replication strategies*, the most popular being portfolio insurance. We discuss option replication strategies, the motivation for institutional investors using such strategies, and the associated risks.

We are interesting in researching the *Put-Call Parity Relationship*. There is a relationship between the price of a call option and the price of a put option on the same underlying instrument with the same strike prices and the same expiration dates. To see this relationship, commonly referred to as the put-call parity relationship. It can be shown that the put-call parity relationship for an option where the underlying stock makes cash dividends is:

$$\begin{aligned} \text{Put option price} - \text{Call option price} &= \text{Present value of strike price} + \\ &+ \text{Present value of dividends} - \text{Price of underlying stock} \end{aligned} \quad (1)$$

This relationship is actually the put-call parity relationship for European options; it is approximately true for American options. If this relationship does not hold, arbitrage opportunities exist. That is, portfolios consisting of long and short positions in the stock and related options that provide an extra return with (practical) certainty will exist.

The next, we present *Option Pricing Models*. Theoretical boundary conditions for the price of an option also can be derived using arbitrage arguments. For example, it can be shown that the minimum price for an American call option is its intrinsic value; that is:

$$\text{Call option price} \geq \max [0, (\text{price of stock} - \text{strike price})] \quad (2)$$

This expression says that the call option price will be greater than or equal to either the difference between the price of the underlying stock and the strike price (intrinsic value) or zero, whichever is higher. The boundary conditions can be "tightened" by using arbitrage arguments coupled with certain assumptions about the cash distribution of the stock. The extreme case is an option pricing model that uses a set of assumptions to derive a single theoretical price, rather than a range. As we shall see below, deriving a theoretical option price is much more complicated than deriving a theoretical futures price because the option price depends on the expected price volatility of the underlying stock over the life of the option.

Several models have been developed to determine the theoretical value of an option. The most popular one was developed by Fischer Black and Myron Scholes in 1973 for valuing European call options. Fischer Black explains how he and Myron Scholes came up with the formula for the option pricing model.) In October 1997, Myron Scholes, along with another pioneer in option pricing theory, Robert Merton, were awarded the Alfred Nobel Prize in Economic Science for their work. Fischer Black died in 1996 and under the rules of the Nobel Committee could not be awarded this prestigious honour. However, the Nobel Committee made it dear he would have been a co-recipient.

Several modifications to the Black-Scholes model have followed since then. Another pricing model that overcomes some of the drawbacks of the Black-Scholes option pricing model is the binomial option pricing model. Basically, the idea behind the arbitrage argument in deriving these option pricing models is that if the payoff from owning a call option can be replicated by (1) purchasing the stock underlying the call option and (2) borrowing funds, then the price of the option will be (at most) the cost of creating the replicating strategy.

So, we recommend using in practise *Black-Scholes Option Pricing Model*. Arbitrage conditions provide boundaries for option prices; but to identify investment opportunities and

construct portfolios to satisfy their investment objectives, investors want an exact price for an option. By imposing certain assumptions and using arbitrage arguments, the Black-Scholes option pricing model computes the fair (or theoretical) price of a European call option on a non-dividend-paying stock with the following formula:

$$C = SN(d_1) - X e^{-rt} N(d_2) \quad (3)$$

$$\text{Where } d_1 = \frac{\ln(S/X) + (r + 0.5s^2)t}{s\sqrt{t}} \quad (4)$$

$$d_2 = d_1 - s\sqrt{t} \quad (5)$$

$\ln$  = natural logarithm

$C$  = call option price

$S$  = current stock price

$X$  = strike price

$r$  = short-term risk-free interest rate

$e = 2.718$  (natural antilog of 1)

$t$  = time remaining to the expiration date (measured as a fraction of a year)

$s$  = standard deviation of the stock price

$N(\cdot)$  = the cumulative probability density. The value for  $N(\cdot)$  is obtained from a normal distribution function that is tabulated in most statistics textbooks (Frank J. Fabozzi, CFA, 2008).

**Practical aspects of this work** are concerned with study of investment sector of enterprises in Odessa region. In this regard, statistical data concerning investment potential and enterprise activity on the market are examined below. The Table 2 presents data on dynamics of capital investment amount in Odessa during 2002-2017.

**Table 2: Capital Investment in Odessa Region in 2002-2017**

Year	The amount of capital in actual prices, mln. UAH	Chain indices dynamics		Capital investments for 1 person in the region (in actual prices, UAH)	Chain indices dynamics	
		absolute growth, mln. UAH	growth rate, %		absolute growth, mln. UAH	growth rate, %
2002	3062.0	...	...	543.2	...	...
2005	6112.0	3050.0	99.6	2149.4	1606.2	295.7
2008	14666.0	8554.0	140.0	5240.2	3090.8	143.8
2009	12772.0	-1894.0	-12.9	4183.7	-1056.5	-20.2
2010	9724.0	-3048.0	-23.9	4087.7	-96.0	-2.3
2011	9347.3	-376.7	-3.9	3931.7	-156.0	-3.8
2012	14631.0	5283.7	56.5	6145.7	2214.0	56.3
2013	11872.0	-2759.0	-18.9	4978.3	-1167.4	-19.0
2014	9361.0	-2511.0	-21.2	3924.4	-1053.9	-21.2
2015	11872.0	-2759.0	-18.9	4978.3	-1167.4	-19.0

2017	20022.7	5766.5	40.4	8402.0	2408.6	40.2

Source: calculated by authors (Analytic Report of Department Statistics in the Odessa region, 2002-2017; Karpenko L., 2016).

Generally speaking, amount of direct investments is constantly increasing over the years. As a reminder, financing of innovation activity was affected mostly at the expense of enterprises (see Table 2).

The economic and statistical analysis of investment activity in the regional context acts as a practical side of the work. Total investment (equity and debt instruments) from foreign direct investors on December 31, 2017 amounted to 1.844 million USD. United States, including the level of investment in the authorized capital (equity) amounted to 1.629 million USD (Statistical yearbook of Odessa area in 2015, 2016). Consideration should also be given to *investment relations of enterprises* in Odessa region with the countries of the world.

In addition to this, calculations show that only in 2012 a real increase of the level of capital investments is observed to region economy (+56.5% according to data of Table 2) in 2009-2011 and the similar growth situation can be traced for the last 2016-2017; in 2013-2015 is observed decrease of the level of the rating in view of deflationary function. In general, unstable dynamics can be traced.

#### 4. Conclusion

Impact investing is a new concept and paradigm of the world economy, effectively operating today, supported by most developed countries of the world. In pursuit of profit, it was decided not to pay much attention to the value categories. However, life put everything in its place. When the infinite growth is impossible, and the crisis follows the crisis, it's time to reconsider the foundations that existed more than 300 years, towards helping humanity and the value ideals of social justice. No matter how pathetic this may sound, the concept works and bears fruit. Thus, transforming investment or Impact-investing is, in fact, an investment whose main task is not to extract profit, but to achieve a certain effect of social impact. That is, the business plan, which is part of the investment declaration, should clearly reflect the social goals that are planned to be achieved. Impact-investment is closely correlated with the notion of social business itself. And if social business is a business with social goals, then the obvious question arises: what do people who finance it achieve? They just want to get a small income or to support the achievement of the goals for which the social business is working. Those who proceed from the second premise are the impact-investors.

We believe that impact is an investment process with a growing horizon of time. This raises the question of whether such investments should remain a special case of traditional investment or it is necessary that impact-investment becomes a kind of global trend into which, as a particular case, ordinary commercial investments enter. That is, the process of investment is transformed through a social mission and contributes to the creation of a "social capitalism" formation. To date, impact-investment, transforming investment is quite popular in the world. In the west, this direction is rather well developed (Switzerland, Italy, Austria). In Russia and in Ukraine, this story exists rather as an assumption than a fact. We will single out the main direction of stimulating the development of the sphere of impact-investment - the formation of a standard of transforming investments that will determine the content of the social investment agreement. The norm of the standard is the primacy of the social impact objectives before the income that the investor receives.

Microfinance has a significant impact on the development of the sphere of impact-investment. The concept of "microfinance organization of an entrepreneurial type" is introduced. Financial sector regulators have the opportunity to create a system of incentives for microfinance organizations to invest part of the resources in the development of social business, social entrepreneurs.

In Ukraine, large companies are in no hurry to impact-investment, there is no toolkit, and the optimality of attracting monetary resources in the form of grants prevails. However, social entrepreneurship is the more effective solution to social problems, and in order for it to develop well, a tool like impact-investment is needed.

Social entrepreneurs prefer grants without debt. World practice shows that a business that can only live on grants is not business. And he has no long-term impact. The role of social business is growing. It is necessary to form an understanding that it is necessary to focus not on grants. Grants on the starting line have advantages; however, generate dependence on this type of support. At the end, this study provides the analytical basis of the integrated management analysis of investment activities of domestic enterprises in a competitive environment, to determine the investment potential of the industry by means of using predictive validity.

### **Abstract**

*For decades, problems related to environmental protection have been treated as a barrier to socio-economic growth. Actions for green growth and sustainable development, however, contribute to a gradual change in the perception of environmental issues. In integrating Europe, many of these elements are to be found in environmental and economic policy as part of its strategy (Europe 2020). What's more the resources and values of the environment are often considered in terms of natural capital, as a source of achieving competitive advantage at different levels. The main goal of the paper is to compare the green competitiveness of the European Union countries. Research was carried out based on the taxonomic metrics and indicators of state, pressure, and protection of the environment. Based on certain predefined criteria the environmental potential of each country was assessed for the years 2000-2016. The adopted method made it possible to evaluate the studied phenomenon as a whole, providing grounds for assigning the selected countries into four groups characterized by a similar level of green competitiveness.*

**Keywords:** competitiveness, environment, Europe 2020, green growth, sustainable development

**JEL Classification:** O44, O57, Q56

### **1. Introduction**

The importance of competitiveness of spatial units increased after intensification of economic integration processes. In the market system continuing improvement of competitiveness in all ranges and sections is an absolute necessity (Majerová and Nevima, 2016; Wojarska, 2014). According to European Commission (2010b), '*...competitiveness is a multilevel concept. At the level of the economy, competitiveness refers to the capacity of a nation or region to provide its citizens with a sustained increase in living standards with jobs available for those willing to work*'.

A significant element enhancing the productivity and at the same time competitiveness of national economies is the correct management of natural capital. Natural capital, for the purposes of this paper understood as all natural resources and values used for the needs of social and economic processes, is mentioned in many studies as a fundamental factor ensuring competitive advantage.

Correct management of natural capital is a significant element of environmental protection policy. At the age of integration processes, globalisation and increasing crises (including those concerning resources), environmental protection policy is based on the strategy of continuing and sustainable development. It assumes that the obligation to protect the natural environment

is an element of correct management and it cannot be deemed in conflict with the economic interest, whereas all activities violating such an order are considered incorrect (Jaśkiewicz, 2008).

The sustainable development strategy of the European Union, amended many times, sets the directions for a long-term vision of sustainable development combining economic development, social cohesion and environmental protection as mutually complementary elements (Commission of the European Communities, 2009). The essence of this concept is preventing or at least reducing the imbalance between economic and social development and between socio-economic development and the natural environment, which should contribute to mitigating social and environmental risks (Baumgärtner, 2008).

The significance of natural capital for socio-economic processes is equally strongly emphasized in the green growth strategy. Recently, this term has rapidly encroached on the international public debate. It should also be remembered that green growth, despite being a separate category, is not in opposition to the assumptions of sustainable development. According to the European Commission, the concept of green growth was developed in order to supplement the concept of sustainable development (European Commission, 2012). What is more, green growth is seen as an efficient tool to ensure long-term sustainable development (Kasztelan, 2017).

Both the concept of sustainable development and that of green growth indicate that competitive advantage can be built based on natural capital. This is reflected in the provisions of the EU strategy – Europe 2020 (European Commission, 2010). The new strategy and related challenges created a need for approaching the issue of competitiveness differently. Authors preparing the report for the European Commission defined the term emphasizing the necessity to change to a more dynamic path of economic growth which fosters social inclusion and is determined by environmental conditions.

Thus, competitiveness was defined as the “ability of a specific state (region, location) to deliver overproduction targets both for the present and future citizens”. The proposed definition emphasizes the equivalence of three pillars, i.e. the income pillar, that is initially based on the GDP and then shifts to a household’s available income and consumer spending; the social pillar, reflecting the country’s socio-economic ratios (including the risk of poverty, inequality); and the environmental pillar, which evaluates environmental ratios (Aiginger et al., 2013).

Thus, it can be stated that the concept of green competitiveness is inscribed within the framework of the strategy “Europe 2020” with continuous development promoting an economy that utilizes the resources more effectively, is more environment-friendly and more competitive, being one of its priorities.

The main goal of this paper is to evaluate the green competitiveness of EU countries, based on the Eurostat and OECD data and taxonomic linear ordering method enabling multidimensional comparative analysis of multi-featured objects. This type of analysis provides answers to the following questions: (1) At what stage are the individual countries placed in terms of the green competitiveness? (2) What is the overall situation of EU countries according to the studied phenomenon? (3) What are the weak points of the analyzed countries? For the purposes of implementing the main research objective, the article utilises the literature method, comparative method, and deductive reasoning. The article concludes with a summary identifying the areas for further research.

## 2. Problem Formulation and Methodology

The assessment of green competitiveness was based on the taxonomic linear ordering method (taxonomic classification) (Hellwig 1968). Taxonomic procedures are used in the study of complex phenomena that cannot be measured directly. This kind of analysis provides an estimate of the level of diversity of objects (e.g., countries) described by a set of statistical characteristics (e.g., indicators). Linear ordering is used to establish a hierarchy of individual objects based on their distance from a reference (e.g., the country for which a particular index is a reference). In a linear hierarchy the maximum degree is 1 (Łogwiniuk, 2011).

At the first stage of the study procedure, the indicators were initially selected and also constructed. The reference years 2000-2016 were chosen due to data availability on Eurostat and OECD database (OECD Environment Statistics). Diagnostic variables defining the level of green competitiveness for particular countries were adjusted in an attempt to meet two criteria: substantive and formal. Substantive indicators selection was based on literature studies (Borys, 2005; Kasztelan, 2010; 2016; Kijek and Kasztelan, 2013; Kruk, 2010), as well as on review of the databases. The next step was to check, if they meet formal criteria, i.e. whether they are measurable, complete and ensure comparability. Ultimately 26 diagnostic variables were selected for the green competitiveness analysis (table 1). The indicators were assigned to the three thematic groups: natural resources, anthropopressure and eco-behaviors. Taking into account data from the years 2000–2016 the average annual values for each indicator were calculated.

Among the selected variables, twelve were considered to be smaller-the-better (de-stimulants) reducing the synthetic measure of green growth, whereas the rest were regarded as larger-the-better (stimulants) characteristics having a positive influence on the measure. Stimulants (selected indicators) are explanatory (independent) variables whose increased values cause an increased value in the dependent variable (green growth of countries), while de-stimulants are explanatory variables whose increased values induce a decrease in the value of the dependent variable.

Since the set of independent variables (metrics) contains variables that cannot be aggregated directly using appropriate standardization, normalization formulas were applied. Among the normalization formulas, unitarization methods were selected based on the interval of a normalized variable. The zero unitarization method was used as follows (Kijek A., 2013; Kukuła, 2000):

For stimulants:

$$z_{ik}^t = \frac{x_{ik}^t - \min_t \min_i \{x_{ik}^t\}}{\max_t \max_i \{x_{ik}^t\} - \min_t \min_i \{x_{ik}^t\}} \quad (1)$$

For de-stimulants:

$$z_{ik}^t = \frac{\max_t \max_i \{x_{ik}^t\} - x_{ik}^t}{\max_t \max_i \{x_{ik}^t\} - \min_t \min_i \{x_{ik}^t\}} \quad (2)$$

where:

$z_{ik}^t$  is the normalized value of the  $k$ th characteristic in the  $i$ th object in the  $t$  period ( $t = 1, 2, \dots, T$ )

$x_{ik}^t$  is the initial value of the  $k$ th characteristic in the  $i$ th object in  $t$  period

**Table 1: Indicators of Green Competitiveness**

Indicators group	Indicator symbol	Indicator name
<b>Natural resources</b>	X <sub>1</sub>	Protected terrestrial area (% of mainland national territory)
	X <sub>2</sub>	Woodland (% of total land cover)
	X <sub>3</sub>	Water areas (% of total country area)
	X <sub>4</sub>	Renewable freshwater resources (Cubic metres per inhabitant)
	X <sub>5</sub>	Resource productivity (Euro per kilogram)
	X <sub>6</sub>	Soil erosion by water (Tonnes per hectare)
<b>Anthropopressure</b>	X <sub>7</sub>	Energy dependence by product (% of imports in total energy consumption)
	X <sub>8</sub>	Greenhouse gases emissions (Kilograms per capita)
	X <sub>9</sub>	Particulates (< 10µm) emission (in tones/km <sup>2</sup> )
	X <sub>10</sub>	Noise from neighbors or from the street (% of total population)
	X <sub>11</sub>	Domestic material consumption (Tonnes per capita)
	X <sub>12</sub>	Consumption of inorganic fertilizers (nitrogen and phosphorus) (tonnes)
	X <sub>13</sub>	Sulphur oxides (SO <sub>2</sub> equivalent) emissions (Kilograms per capita)
	X <sub>14</sub>	Total amount of waste generated (kilograms per capita)
	X <sub>15</sub>	Annual freshwater abstraction (Cubic metres per inhabitant)
<b>Eco-behaviors</b>	X <sub>16</sub>	Final Energy Consumption (Thousand tonnes of oil equivalent)
	X <sub>17</sub>	Organic crop area fully converted and under conversion (% of total utilized agricultural area)
	X <sub>18</sub>	Domestic biomass consumption (in tones per capita)
	X <sub>19</sub>	Gross inland consumption of renewable energies (Thousand tonnes of oil equivalent)
	X <sub>20</sub>	Urban wastewater treatment plants (Number per 1000 km <sup>2</sup> )
	X <sub>21</sub>	Circular material use rate (Percentage)
	X <sub>22</sub>	Eco-innovation index (EU = 100)
	X <sub>23</sub>	Organizations and sites with eco-management and audit scheme (EMAS) registration (Number)
	X <sub>24</sub>	Share of renewable energy in gross final energy consumption (Percentage)
	X <sub>25</sub>	Environmental tax revenues (% of GDP)
X <sub>26</sub>	Environmental protection expenditure of general government (% of GDP)	

Source: own elaboration

Diagnostic features normalized in the abovementioned way take the value from the interval [0; 1]. The closer the value to unity, the better the situation in terms of the investigated feature, and the closer the value to zero, the worse the situation.

Among the methods for creating synthetic metrics, a non-reference method with the system of constant weights was selected, which was influenced by the previously used normalization method of the investigated features. Taxonomic metrics of green growth for the respective periods were built as follows:

$$z_i^t = \frac{1}{k} \sum_{k=1}^m z_{ik}^t \quad (3)$$

The procedure chosen for evaluating the green growth provided multidimensional comparative analysis, allowing comparison of multi-featured objects. Taxonomic meters were applied, which replaced research description using a set of diagnostic features with one aggregate volume that is a synthetic variable. It allowed a comparison between member states of the EU providing grounds for classifying them into uniform groups characterized by similar levels of green competitiveness.

### 3. Problem Solution

The analysis shows that Sweden achieved the highest level of green competitiveness (Table 2). The taxonomic metric of this country was estimated at 0.6477 and it was the only country in the highest rating group. Four classes of countries were distinguished in terms of the level of the studied phenomenon. The lowest evaluation of the green competitiveness among all 28 member states was Cyprus for which  $z_i$  indicator amounted to 0.3614. Cyprus, together with Greece, Malta and Bulgaria, was assigned to the lowest class IV. It is worth emphasizing that 22 countries (78.6%) failed to achieve at least an average synthetic measure, which testifies to the low level of environmental competitiveness of EU member states.

**Table 2: Classification of 28 EU Member States According to the Value of the Synthetic Measure Describing the Level of Green Competitiveness**

Class	The level of synthetic measure	The number of countries in the class	EU countries
I	above 0.6000	1	Sweden (0.6477)
II	from 0.5000 to 0.6000	5	Croatia (0.5668); Latvia (0.5447); Austria (0.5399); Finland (0.5383); the Netherlands (0.5249)
III	from 0.4000 to 0.4999	18	Slovenia (0.4925); Denmark (0.4874); Hungary (0.4808); Belgium (0.4777); Italy (0.4722); the United Kingdom (0.4666); Slovakia (0.4647); Lithuania (0.4589); Czech Republic (0.4570); Luxembourg (0.4538); Germany (0.4521); Portugal (0.4469); Spain (0.4461); Poland (0.4406); France (0.4336); Ireland (0.4172); Estonia (0.4038); Romania (0.4015)
IV	below 0.4000	4	Greece (0.3913); Malta (0.3865); Bulgaria (0.3755); Cyprus (0.3614)

Source: authors' calculations based on 2000-2016 data from Eurostat and OECD

Deeper analysis showed that only one STB ratio (level of energy consumption by products) was characterized by an outstanding standardized mean value for all the analyzed member

states – 0.3788. Other STB values considerably exceeded 0.5000, whereas for LTB characteristics, the average level of synthetic measures was not exceeded with reference to any ratio covered by the analysis.

Particularly disadvantageous values of indicators were noted with reference to the level of consumption of inorganic fertilizers (0.8215), final energy consumption (0.8130), number of municipal wastewater treatment plants (0.1656) and the number of entities with registered EMAS (0.2139).

On the other hand, if we wish to identify areas with reference to which relatively advantageous standardized average values of synthetic indicator measures were recorded, in addition to the above-mentioned low level of energy consumption by products, without any doubt we should mention indicators describing the percentage of forestland (0.4741), increase in the number of eco-innovations (0.4499) and noise level (0.5081).

It is worth emphasizing that in 2000-2016 for 28 EU member states, in total an improvement was observed in 22 out of 26 indicators covered by the analysis (nearly 85%). The largest progress was made in the utilization of renewable energy sources and reduction of emissions of air pollutants. In turn, a significant problem to be solved has been a high level of overall consumption of energy. In addition, in the analyzed period a decreasing percentage of the proceeds of environmental taxes in the GDP was recorded (Eurostat, 2018; OECD, 2018).

#### 4. Conclusion

From the utility point of view, the resources and values of the environment can be used in socio-economic processes, and at the same time are a value in themselves (climate, landscape). Uneven distribution of natural capital is therefore a source of additional benefits or disadvantages for business entities, regions or countries.

The concept of green competitiveness fits into the framework of the Europe 2020 strategy. One of its priorities is a sustainable growth that means promoting a more resource-efficient, greener, and more competitive economy. The strategy intends to achieve the “20/20/20” climate/energy targets based on a project ‘Resource Efficient Europe’. It is *‘to help decouple economic growth from the use of resources, support the shift towards a low carbon economy, increase the use of renewable energy sources, modernize transport sector and promote energy efficiency’* (European Commission, 2010a).

The article presents the results of assessment of the environmental competitiveness of EU countries in the years 2000-2016. The use of the taxonomic linear ordering method in the research, allowed the classification of the EU countries into one of four classes identified based on their green competitiveness level. In this respect, the best result got Sweden, while the worst - Cyprus. The results of the study show that the overall level of the studied phenomenon is still low. Only 6 out of 28 countries have managed to exceed the average level of the synthetic measure of green competitiveness.

The research results support the usefulness of synthetic metrics for evaluating the level of green competitiveness at the national level. It should be stressed, however, that the research was based only on 26 indicators constructed and selected from the Eurostat and OECD databases. Due to better data availability, it would be possible to expand the set of indicators for the analysis which in turn would lead to more comprehensive evaluation of green competitiveness.

It should be also mentioned that non-model based clustering is one of many tools used for assessing the level of competitiveness and development of territorial units. It seems reasonable to continue the studies using other methods of analysis, e.g. Ward's clustering, which would enable confronting the results.

### **Abstract**

*This paper is focused on the integration of the financial markets in the EU expressed by EPS ratio. Whilst the integration of the financial markets to date is a fact, yet it needs to be furthered. 561 listed companies selected among the EU member states have been subject to the analysis. The analysis comprised the following EPS factors: industry concentration, liquidity ratio, company age, company growth, capital intensity, company size, total debt ratio, risk market share, international activity and assets turnover. There are significant differences to be noted within ESP values for the listed production sector companies from Western and Eastern Europe, whilst the ESP ratios can be considered relatively similar. The crucial indicators include the size of a company and its international activity.*

**Keywords:** capital market integration, earnings per share, EU, manufacturing companies

**JEL Classification:** G15, G39, L60

### **1. Introduction**

To date integration within the EU has taken a volatile course and it brought about success as well as failures. A part of EU legislation was passed as obligatory for the member states and some other part on discretionary basis. The latter was mostly largely spread in time and it brought about partial success. The EU Directives for Accounting can be quoted as such example. They should be incorporated by the national legislation to allow the players on the capital markets comparing financial information of listed companies. It took the EU member states almost twenty years to implement Directive IV for Accounting. A real breakthrough in that process became the obligation to comply with the directive by the selected IFRS listed companies (Grabiński, Kędzior, Krasodomska, 2013, p. 168). Further, more thorough integration of the EU legislation seems prerequisite in view of the on-going globalization, increased international competition or finally rising global anxiety. According to the surveys the support amongst numerous EU states for the integration has been high (Dian, 2005).

From the historical perspective, the integration of the securities markets started in the early 1980s, and it reached its high following 1996. Bringing euro currency to the member states made the process more dynamic, and the European Securities market grew in importance. Stabilization of currency rates fluctuations which resulted from launching euro as a common

currency made an important impact on the development of European securities market (Fratzscher, 2002, pp. 165-193). The introduction of euro increased the transparency of capital markets, standardized the methods of fixing prices on capital markets, and lowered the transaction costs for the investors. The absence of detailed regulations bringing order to stock exchanges turnover might hinder the process of integration of the European capital markets (Hardouvelis, Malliaropulos, Priestley, 2006. pp. 365-392).

It was also confirmed that the segmentation of capital markets is much deeper along the line of the EU member states and the other countries. Interestingly enough, it was not noted that the introduction of euro caused a substantial segmentation of stock markets between the euro zone and the other EU member states (Bekaert, Harvey, Lundblad, Siegel, 2013, pp. 583-603). It should be noted, however, that within the EU the development of local capital markets is very diverse indeed. Within the EU member states, stock market capitalization of listed companies of individual countries divided by GDP fluctuates between a few percentage points to over a 100%. It seems that the integration of capital markets initiated by the EU is especially desirable for the member states showing a relatively low development of capital markets (Guiso, Jappelli, Padula, Pagano, 2004. pp. 524-577).

In view of K. Adam, T. Jappelli, A. Menichini, M. Padula, M. Pagano (2002, pp. 1-95) there are three basic concepts for the evaluation and analysis of the financial market integration. We should distinguish the indexes of credit market and bond market integration, stock market integration, indexes of integration of economic decisions made by the companies and households as well as the indexes of institutional differences integration. This paper will focus on the financial decisions and integration of listed companies shown on the example of earnings per share (EPS).

There are numerous papers analysing the values of EPS measure and its determinants. Most commonly, the analysis included the internal factors dependent on an economic entity (Babalola, 2013. pp. 90-94; Spanos, Zaralis, Lioukas, 2004, pp. 139-165; Omil, Lorenzo, Liste, 2011, pp. 29-42; Korkmaz, Karaca, 2014, pp. 21-29; Baños-Caballero, García-Teruel, Martínez-Solano, 2012, pp. 517-529). The literature also included the analysis of the external factors (Tan, Floros, 2012, pp. 267-273; Dischinger, Riedel, 2009, pp. 1-35; Derbali, 2011, pp. 1256-1269; Pervan, Kramaric, 2010, pp. 231-238; Alexiou, Sofoklis, 2009, pp. 93-118). This paper will focus mostly on macroeconomic factors which are dependent on a company, industry concentration, liquidity ratio, company age, company growth, capital intensity, company size, total debt ratio, risk market share, international activity and assets turnover. Most of them were empirically verified within a limited scope, especially in the companies from Eastern Europe. Regrettably, there are no comparisons of EPS factors and the factors affecting EPS amongst the companies from Eastern and Western Europe. Hence, this paper is poised to analyse the integration of the EU capital markets with the use of EPS factor and its determinants within elected countries of Western and Eastern Europe.

## **2. Determinants of EPS and Their Characteristics**

The analysis will include the internal factors dependent on a company which determine EPS factor such as: industry concentration, liquidity ratio, company age, company growth, capital intensity, company size, total debt ratio, risk market share, international activity and assets turnover. Company age, industry concentration, international activity and market share are relatively new factors. Other factors were not included in the comparative analysis of Western and Eastern European companies.

Concentration of the market share within a sector exerts an important impact on the EPS value. Most often, the operational, investment, and frequently financial advantage allows a small number of business entities conquer a large part of the market in terms of operating activity. Concentration of the market share within a sector may be attributable to the informal agreements among the most important players (Lee, Mahmood, 2009, pp. 351–380). Large players in a sector usually generate high profits and frequently sustain their dominant position over a long time. High concentration of the market share usually results in high prices, hence there are conditions conducive for generating high EPS value. We must not forget about the economies of scale and the possibility to affect the competitive companies, customers or contractors (Czarnitzki, Kraft, 2010, pp. 1941–1953). Hence, it is necessary to assume positive relationship between the concentration of the market share and the value of EPS.

Profitability ratios, including EPS are strongly influenced by the financial liquidity of economic entities. Highly liquid companies are less prone to insolvency. They are more flexible to react to volatile changes in their economic environment (Goddard, Tavakoli, Wilson, 2005, pp. 1269–1282). Once a company maintains a safe level of liquidity, its development is more sustainable (Maślanka, 2014, pp. 223-256; Maślanka, 2009, pp. 260-270). In addition, high liquidity allows implementation of a greater number of investment projects. Yet, excessive liquidity exerts a negative impact on EPS. It reflects the implementation of objectives by the managers, (minimization of risk and preserving their positions) which do not have to be the owners. Under such circumstances the opportunity costs rise, and the ROA usually deteriorates (Goddard, Tavakoli, Wilson, 2005, pp. 1269–1282). Hence, a negative relationship should be assumed between liquidity and EPS.

Investment potential of an enterprise understood as a dynamics of revenues from operating activity also makes an impact on EPS, allowing implementing highly profitable projects. Most often, the implemented projects bring increased revenue from sales, which translates into higher profits and EPS (Spanos, Zaralis, Lioukas, 2004, pp. 139–165). Nevertheless, it should be noted that the excessive, unsustainable development of a company may bring about increased risk and imbalance in many aspects of entity's functioning. It is also important whether the development is based on investment diversification (Glancey, 1998, pp. 18–27). To conclude, we should assume positive relationships between development possibilities and EPS.

Capital intensity determines many processes of an economic entity. High capital expenditure on operating assets causes an extensive development of a company, yet they do not necessarily improve its financial performance (Kotha, Nair, 1995, pp. 497–518). Such partnerships manage their assets in a less efficient way, which is reflected by the financial results. Hence, there may appear adverse relationships between capital expenditure and the rate of return. A part of the financial result must be used to finance the external cost of capital (Feeny, Rogers, 1999). Insufficient operating efficiency, usually connected with high indebtedness, will make capital intensity to be negatively connected with EPS ratio values.

The size of a company also affects the profitability of economic entities understood in various ways, including EPS. Large companies enjoy high cost efficiency, the economies of scale, and they influence in various ways the players on the market. Hence, the ratio of EPS should be high for large companies (Majumdar, Sen, 2010, pp. 33–45; Nunes, Serrasqueiro, Leitão, 2010, pp. 1313–1341). As a rule, large companies have highly skilled managers in executive positions, hence it is more likely that EPS will be high in large companies. In addition, these are relatively stable companies, of large market potential, a lower cost of capital in comparison to less credible (smaller) partnerships (Babalola, 2013, pp. 90–94). The adverse elements include higher agency costs, short-term motivation of managers, large impact on the

environmental issues, or the potential political costs. A positive relationship should be assumed between the size of a company and EPS ratio.

Indebtness also makes a significant impact on EPS ratio value. In most cases, moderate debt ratio makes a good impact on EPS (Qian, Li, 2003, pp. 881–887). As a result of indebtedness, the disposable capital of a company increases. Yet, that increase involves higher risk for a company. In that way, debt brings more discipline to the management, lowers the margin of errors, enforces efficient management of resources and implementation of profitable investment projects (Joh, 2003, pp. 287–322). It should be remembered that in most cases cost of debt financing is lower than equity financing. However, excessive leverage lowers the flexibility of functioning whilst increasing the risk for the company and the cost of capital. On the final count, an adverse relationship should be assumed between EPS and indebtedness.

The classical theory of economics formulates a positive relationship between risk and revenue (EPS). Higher risk translates into the expected higher rate of return from securities. In literature, risk is most commonly measured with the volatility of the financial result (Nunes, Serrasqueiro, Leitão, 2010, pp. 1313–1341). The higher volatility of that result, the higher anxiety and risk. It is particularly acute in highly competitive sectors, particularly in terms of prices as well as in the sector of small and medium companies (Qian, Li, 2003, pp. 881–887). Quite frequently companies encumbered with high risk cannot implement profitable, albeit risky investment projects, which has a bearing on the present and future value of EPS ratio. Hence, it should be assumed that the relationship between EPS and risk is positive.

Operating on international markets mostly makes a positive impact on EPS value. Companies may trade on various markets, hence they are not dependent solely on prices and the local demand (Lin, Rowe, 2006, pp. 120–141). Presence on many markets often raises innovation and care for building brand and development of new products. Operating globally increases the acquisition of valuable knowledge about markets, about products, consumer behavior, new market trends (Qian, Li, 2003, pp. 881–887). Beyond any doubt, the benefits include international diversification of products, co-ordination of procurement or R&D in global dimension, or minimization of payroll costs (Qian, Li, 2002, pp. 325–335). Hence, the relationship between international operation and EPS ratio value is positive.

EPS ratio is also affected by assets turnover, which expresses the operating efficiency of an economic entity. Once the dynamics of revenue is higher than assets, the efficiency increases (Chi, Padgett, 2006, pp. 28–50). The higher operating efficiency, the higher value of EPS ratio. Usually, high assets turnover translates into higher development possibilities and higher profitability. The companies practicing cost leadership strategy are usually characterized by the efficient use of assets (high assets turnover ratio). However, it seems that it affects to a greater extent profitability of mature companies (Dickinson, 2011, pp. 1969–1994). It should be assumed that assets turnover ratio makes a positive impact on EPS.

The dependencies between the age of a company and profit per share merit our attention. Older companies usually have better experience on the market, more experienced management, a better reputation (goodwill). They are mostly mature companies, with a proven track record which yields positive financial results (Malik, 2011, pp. 315–321). Besides, those companies show lower volatility of profits, large share of long-term investment assets, higher cost efficiency due to the economies of scale (Pástor, Pietro, 2003, pp. 1749–1790; Babalola, 2013, pp. 90–94). Nevertheless, it should be also noted that younger companies can successfully compete with the older ones as they operate faster devoid of bureaucratic barriers, implement fast changes and demonstrate faster development (Markman, Gartner, 2002, pp. 65–75). Consequently, positive relationships should be assumed between EPS and the age of a company.

The definitions of variables are listed below:

- $\text{EPS} = \text{net financial result} / \text{quantity of issued shares}$ ,
- $\text{liquidity} = \text{current liabilities} / \text{current assets}$ ,
- $\text{capital intensity} = \text{fixed assets} / \text{total assets}$ ,
- $\text{assets turnover} = \text{revenues from operating activity} / \text{asset value}$ ,
- $\text{indebtness} = (\text{value of short-term and long-term liabilities}) / \text{total liabilities and equity capital}$ ,
- $\text{risk} = \text{standard EBIT deviation for the past 4 years}$ ,
- $\text{company size} = \ln(\text{current revenues})$ ,
- $\text{age of a company} = \text{years on the market}$ ,
- $\text{development potential} = \text{annual percentage increase of current revenues}$ ,
- $\text{international operation} = \ln(\text{the number of foreign branches})$ ,
- $\text{share in a sector} = \text{the volume of operating activity revenues of four largest entities in a sector} / \text{the sum of operating activity revenues of all entities in a sector}$ ,
- $\text{market share} = \text{operating revenues of an entity} / \text{total revenue from operating activity of all companies in a sector}$ .

### 3. Empirical Results

Empirical material has been collected from 561 listed companies from 10 EU states, with 2805 observations that were conducted. Primarily, the analysis of the empirical material included the analysis of average values, standard deviation, median, minimum values, maximum values, the first and the third EPS quartile in the selected countries of Western and Eastern Europe. Mann-Whitney and Kruskal-Wallis test were used to compare across countries and regions (tables 1-3) since lack of normality in EPS' distribution was detected (with Shapiro-Wilk test). Pairwise Mann-Whitney test with Bonferroni correction were used as a post-hoc analysis in case of significance of Kruskal-Wallis test. Correlations between EPS and other quantitative variables were examined with Spearman's rank correlation coefficient, again due to lack of normality in EPS (tables 4-5). Linear regression was applied (tables 6-7) to find correlations between chosen variables and EPS. Extend to which examined features explain variation in EPS was quantified by R2 coefficient.

We did not note normal EPS distribution within the countries included in the analysis (p-value from Shapiro-Wilk test below 0.05), hence Kruskal-Wallis test was applied (Table 1). In Kruskal-Wallis test, p-value is smaller by 0.05, hence statistically significant differences were noted between particular countries. To answer the question which countries differed from others, the analysis by Mann-Whitney post-hoc tests with Bonferroni correction was applied. The analysis showed that EPS for French and German companies was significantly higher than for Finnish companies. In turn, the latter was much higher than EPS for Greek and British companies. Hence, distinctive differences were observed in the values of EPS ratio amongst the selected companies from Western Europe. It follows that the integration of the capital markets of Western Europe should be furthered.

**Table 1: EPS Ratio for Listed Production Companies in the Selected Countries of Western Europe**

Country	EPS							p	post-hoc *
	Average	SD	Median	Min	Max	Q1	Q3		
<b>Finland</b>	0.83	1.09	0.78	-3.22	4.05	0.10	1.45	p<0.001	B
<b>France</b>	8.07	25.48	1.2	-23.1	192.02	-0.02	4.36		C
<b>Germany</b>	9.93	36.98	1.64	-111.42	513.13	0.14	6.75		C
<b>Greece</b>	0.33	1.89	0.12	-4.57	20.24	-0.12	0.39		A
<b>Great Britain</b>	0.37	2.49	0.12	-41.56	54.13	0.00	0.43		A

\* – The results of post-hoc analysis. No significant statistical differences found for the countries denoted with the same letter.

Source: Author's own elaboration

The distribution for EPS for the countries of Eastern Europe was not normal either (p-value of Shapiro-Wilk test dropped below 0.05), and for this reason Kruskal-Wallis test was applied. The p-value of that test is below 0.05, which indicates that there were significant statistical differences among particular countries. Post-hoc Mann-Whitney test with Bonferroni correction was used to visualize the differences between the countries. The analysis showed that EPS for Slovenian and Slovak companies was much higher than EPS of Lithuanian, Latvian and Polish companies (Table 2). Yet, EPS of Polish companies was much higher than the values for Lithuanian companies. It follows that the integration of capital markets of the selected Eastern European countries should be furthered.

**Table 2: The Analysis of EPS Ratio for Listed Production Partnerships in the Selected Countries of Eastern Europe**

Country	EPS							p	post-hoc *
	Average	SD	Median	Min	Max	Q1	Q3		
<b>Latvia</b>	0.29	0.7	0.14	-2.09	2.52	0.01	0.45	p<0.001	AB
<b>Lithuania</b>	0.21	0.59	0.02	-0.14	2.35	-0.02	0.14		A
<b>Poland</b>	0.68	2.31	0.14	-4.41	26.69	0.02	0.48		B
<b>Slovakia</b>	6.19	20.05	0.96	-8.09	164.6	-1.36	6.09		C
<b>Slovenia</b>	3.25	11.96	1.22	-50.1	49.22	0.11	3.69		C

\* – The results of post-host analysis. No significant statistical differences found for the countries denoted with the same letter.

Source: Author's own elaboration, based on M. Kędzior (2017)

Further analysis considered values of ESP ratio for two groups of countries: those from Western and Eastern Europe. EPS values did not display a normal distribution within the analysed parts of Europe (p-value of Shapiro-Wilk test below 0.05), and for this reason Mann-

Whitney test was applied. P-value of that test fell below 0.05, hence it could be asserted that EPS values for Eastern Europe differed significantly (i.e. it was much lower) from ESP of Western European countries (table 3). The differences between the mentioned geographic regions should be perceived as significant, hence further integration of West and East European capital markets is a must.

**Table 3: The Analysis of EPS Ratio for Listed Production Companies in the Selected Countries of Western and Eastern Europe**

Europe	EPS							p
	Average	SD	Median	Min	Max	Q1	Q3	
Eastern	1.53	8.30	0.16	-50.1	164.6	0.01	0.72	p<0.001
Western	4.16	21.89	0.30	111.42	513.13	0.00	1.61	

Source: Author's own elaboration

Table 4 presents the results of correlation analysis among the selected EPS factors for the production sector listed companies of Eastern Europe. Almost all factors should be considered statistically significant, with the exception of industry concentration and indebtedness. The results prove the negative impact of liquidity and capital intensity whilst a positive impact of company's age, development potential, the size of a company, risk, international operation and assets turnover. EPS is mostly determined by the size of a company, market share and international operation. Majority of factors is statistically significant at  $p < 0,001$ .

**Table 4: Correlation Factors of EPS and Its Determining Factors in the Selected Listed Production Companies in Western Europe**

Factor	EPS
Industry concentration	-0.004
Liquidity ratio	-0.134***
Company age	0.303***
Company growth	0.232***
Capital intensity	-0.061**
Company size	0.518***
Total debt ratio	-0.001
Risk	0.286***
Market share	0.427***
International activity	0.349***
Assets turnover	0.215***

Source: Author's own elaboration

Table 5 presents the results of the analysis of factors affecting EPS in the production sector listed companies from Eastern Europe. Statistically significant factors include all the factors with the exception of indebtedness and share in the sector (similarly to companies from Western Europe). The table indicates negative impact of liquidity and capital intensity on ESP as well as the positive impact of the age of a company, its growth potential, the size of an entity, risk, operating on international scale, share in the market and assets turnover. It should be noted that the dependencies between the selected factors and ESP are identical with those presented for Western European countries. Within that group, the most significant factors included the size of a company, its market share and risk. The initial analysis of ESP determinant factors seems to show their similarity.

**Table 5: Correlation Factors Between EPS and Its Determining Factors in Listed Production Companies in the Selected Countries of Eastern Europe**

Factor	EPS
Industry concentration	0.072
Liquidity ratio	-0.105**
Company age	0.210***
Company growth	0.267***
Capital intensity	-0.078*
Company size	0.478***
Total debt ratio	-0.032
Risk	0.282***
Market share	0.320***
International activity	0.234***
Assets turnover	0.235***

Source: Author's own elaboration, based on M. Kędzior (2017)

Tables 6 and 7 present the analysis of a pooled model. The companies from Western Europe indicate a larger number of statistically significant EPS determinants. They include share in the sector, the age of a company, international operation and assets turnover. The biggest impact is made by capital intensity, assets turnover and the size of a company.

**Table 6: Regression Analysis of Factors Affecting EPS in Listed Production Sector Companies in the Selected Countries of Western Europe**

Variables	Parameter	95% confidence interval		p-value

Source: Author's own elaboration.

The number of statistically significant factors for the selected listed production sector companies from Eastern Europe is smaller, yet their joint impact on ESP is greater than it was demonstrated by the companies from Western Europe. The significant factors include the size of a company, indebtedness and international operation. From that perspective, the integration of capital market seems much more likely than anticipated. For both groups of countries. ESP factors are relatively similar, even though there are some discernible differences.

**Table 7: Regression Analysis of EPS Factors for Listed Production Sector Companies within the Selected Countries of Eastern Europe**

Variables	Parameter	95% confidence interval		p-value

#### 4. Conclusion

In summary, it is worth noting that further European integration is imminent despite numerous legal, economic or cultural barriers. The integration of capital markets within EU has been progressing even though it could have been more rapid. Beyond any doubt, the introduction of euro, a common currency in some EU states was a significant factor which accelerated the formation of the European capital market. It lowered the transaction costs, currency volatility and the risk level.

The integration of capital markets calculated with EPS produced quite interesting results. It should be stressed that there are some significant differences in EPS ratio values of listed production sector companies in Western and Eastern Europe. Within the group of Western European countries, the highest EPS ratio values were found in German and French companies, whilst among Eastern European countries, the companies from Slovenia and Slovakia showed highest values. EPS ratio of Polish companies remained relatively low. From that perspective, it is postulated to promote larger integration of capital markets. The most important EPS determinant factors remain relatively similar. There is a larger number of EPS determining factors in Western European companies, whilst their joint impact is greater among the companies from Eastern Europe. The size of a company and international operation are to be considered the most important EPS determinant factors.

Future research may include a larger number of countries. It seems advisable to include in the analysis some other macroeconomic factors such as those describing corporate governance or institutional environment, i.e. the development of securities exchanges, banking systems, freedom of investment or freedom of economic activity.

### **Abstract**

*The processes of European integration and membership in the Union have been successively contributing to the improvement of the situation in many areas of social and economic life of individual countries. One of the areas in which changes take place relatively quickly is the environmental policy. Actions taken at the level of the Community for environmental protection have contributed to a dynamic increase of expenditure for this purpose. Environmental protection expenditure is defined as the amount of money spent on all activities directly aimed at the prevention, reduction and elimination of pollution or nuisances resulting from the production or consumption processes. The main goal of the paper is to present the level and structure of environmental protection expenditure in the European Union countries. The article explains the differences between the investment expenditure and current expenditure. Research was carried out based on the descriptive and comparative analysis methods. For this purpose, Eurostat data for the years 2001-2013 were used. The research results allowed to distinguish 5 groups of countries in terms of the level of environmental protection expenditure.*

**Keywords:** *current environmental expenditure, environment, environmental protection, investment expenditure*

**JEL Classification:** *F36, O57, Q56*

### **1. Introduction**

At the beginning of the 1990s we could see increased dynamics of activities for hindering unfavourable phenomena in relations between society, the economy and the environment. Environmental protection and shaping became one of the fundamental issues for the present-day world (Costanza and Daly, 1992; Rogall, 2010; Drastichová, 2016). The recent financial and economic downturn has increased the dynamics of the processes for implementing the concepts of a 'green' economy and 'green' growth, which will ultimately lead to continuous and fully sustainable development (Kasztelan, 2017; 2016; Rutkowska-Podołowska et al., 2016). The involvement of public and private entities in environmental protection activities is measured by the amount of related expenditure.

One of the factors determining the fulfilment of objectives and tasks set forth in the environmental policy is a sufficient quantity and quality of information. According to Broniewicz (2007), attempts at comprehensive calculation of costs and benefits related to management of the natural environment have been undertaken since about 1970. In 1993, one of the deliverables of the United Nations Conference on the Environment and Development held in Rio de Janeiro (1992) was the publication of System of Integrated Environmental and

Economic Accounts (SEEA). The next year (1994), Statistical Office of UE Eurostat developed the *European System for the Collection of Economic Information on the Environment*, called SERIEE (Eurostat, 1994). It includes basic definitions and methods applied in data collecting of environment protection expenditure. The environmental protection expenditure account (EPEA) is one of two satellite accounts that have been developed within the SERIEE system. In 2002 Eurostat published modification of SERIEE – *SERIEE Environmental Protection Expenditure Accounts – Compilation Guide* (Eurostat, 2002). In 2014, EPEA got a legal basis and was included as the fourth module added to EU Regulation on environmental economic accounts. Regulation (EU) No 538/2014 describes the module for environmental protection expenditure accounts and defines the data to be collected, compiled, transmitted and evaluated by the Member States (Federal Statistical Office of Germany, 2015).

Previous studies concerning expenditure on environmental protection have mostly focused on identifying conditions for environmental protection activities (Aysen, 2014; Haller and Murphy, 2012; Leiter et al., 2011; Kasztelan, 2009), the level and structure of expenses (Broniewicz, 2017; Broniewicz and Domańska, 2016; Ercolano and Romano, 2017; European Communities, 2002) and the effectiveness of environmental protection expenditure (Adewuyi, 2016; Singh et al., 2016; Wang et al., 2014; Charles et al., 2012).

The purpose of the paper is to analyse the level and structure of environmental protection expenditure in the European Union countries. Research was carried out based on the descriptive and comparative analysis methods. For this purpose, Eurostat data for the years 2001-2013 were used. The research results allowed to distinguish 5 groups of countries in terms of the level of environmental protection expenditure.

## **2. Methods of Studies Concerning Environmental Protection Expenditure**

The most versatile source of information about environmental protection spending is EPER (The Joint OECD/Eurostat Questionnaire on Environmental Protection Expenditure and Revenues). This is the main tool for collecting data concerning environmental protection expenditures provided by statistical offices of member states. The questionnaire comprises all sectors of the economy (public, businesses, households and specialised producers of environmental protection services). The EPER questionnaire contains economic variables referring both to own expenditures on environmental protection and to the financing of environmental protection by third parties, i.e.: investment expenditures, own running expenses, revenues from side products, grants/transfers, payments for and purchases of environmental protection services (Olsson and Johansson, 2005b).

The questionnaire is based on CEPA (Classification of Environmental Protection Activities and Expenditure), which in practice means that every variable (expenditure) is assigned to one of 7 areas of environmental protection. The CEPA classification was developed by the UN and it was adopted as an international standard by the Statistical Commission in 2002 (Moe and Braathu, 2014).

According to Eurostat guidelines, environmental protection (EP) expenditure is a sum of investment expenditure and running expenditure on activities related to environmental protection. *Investment expenditure on environmental protection covers all capital expenditures related to environmental protection (including methods, technologies, processes, equipment or its part) with the main objective being collection, disposal, monitoring, reduction, prevention and elimination of environmental pollution or any environmental losses due to investing activities of the business* (Commission Regulation (EC), 2003). According to

the Eurostat methodology, investments in environmental protection comprise fixed assets, that is, land, buildings and structures, machines and equipment and other expenditures related to intangibles and financial assets used for the purposes of environmental protection provided they are amortized.

EP investment expenditure is often defined as a sum of expenditures on pollution treatment (end-of-pipe) investments and investments preventing pollution (so-called integrated technologies). End-of-pipe investments are defined as capital expenditures on methods, technologies, processes or equipment for collecting, reducing, disposing of and treatment of the produced pollutants, preventing their distribution as well as for monitoring the level of pollution. In turn, investments preventing pollution are defined as capital expenditures on new or modification of existing methods, technologies, processes, equipment or its parts oriented at preventing or reducing the amount of pollutants at source, so as to decrease their environmental impact. Irrespective of the type of investment, it is emphasized that in order to be deemed a protective investment its main goal should be environmental protection (Olsson and Johansson, 2005a).

In turn, *running expenses on environmental protection cover costs of labour, rent payments, consumption of energy and other tangible assets as well as the purchase of services with the main objective being collection, disposal, monitoring, reduction, prevention and elimination of environmental pollution or any environmental losses due to investing activities of the business* (Commission Regulation (EC), 2003). Running expenses are exclusive of depreciation of environmental protection equipment and amortisation of taxes and fees not connected with the purchase of environmental protection services.

Running expenses can also be classified according to operating functions as the costs of treatment and reduction of pollution (end-of-pipe) and the costs of preventing pollution (integrated actions). The costs of treatment and reduction of pollution comprise, for example, costs of actions and inspection of equipment used for such purposes, costs of waste collection, treatment and disposal, costs of measuring and monitoring pollution levels. Costs of integrated actions comprise running expenses in connection with the operation of equipment preventing pollution, costs of organisational changes (environmental management), and costs of using new raw materials in production to decrease the level of pollution or other environmental losses caused by business operations.

The allocation of running expenses to own operating expenses and to payments for and purchases of environmental protection services is important from the point of view of total EP expenditure calculation methods. Such allocation underlies the calculation of global expenditures in different sectors and prevents expenditures from being included in calculations more than once.

Own operating expenses include: costs of operation of environmental protection devices and equipment, costs of measuring and monitoring the levels of pollution on the business's own account, costs of purchasing environmental protection goods not directly related to environmental protection equipment, costs of administration and other activities not directly related to environmental protection equipment, and costs of research and development in the area of environmental protection on the business's own account.

The second type of running expenses, in addition to EP payments for financing environmental protection activities, is also inclusive of payments to third parties, including but not limited to payments for: waste collection and treatment, wastewater disposal and treatment, administrative fees for waste discharge authorisations and environmental impact audits (Olsson and Johansson, 2005a).

The paper will present results of analyses of environmental protection expenditure in EU member states in 2001-2013 according to the following criteria: share of respective sectors of economy in environmental protection expenditure (due to a large information gap the household sector was not included); share of EP expenditure in the GDP; level of expenditure per capita; expenditures according to types (investments and running expenses).

### 3. Research Findings

In 2001-2013 the average annual EP expenditure in the public sector (state and local government expenditure) in the EU amounted to nearly EUR 78 billion, increasing by nearly 40% in the analyzed period from a level of slightly above EUR 62 billion in 2003 to more than EUR 87 billion in 2012. (Table 1).

GG - General Government; BST - Business Sector Total (mainly all NACE activities except E37, E38.1, E38.2, E39 and O); PaPS - Private and public specialist and secondary producers of environmental protection services (mainly E37, E38.1, E38.2 and E39); n.a. – not available. Source: author's calculation based on Eurostat data.

In the industry of producers of environmental protection goods and services, the average annual expenditure reached nearly EUR 125 billion, ranging from more than EUR 95 billion in 2001 to nearly EUR 145.5 billion in 2012. However, Eurostat statistics do not provide complete information regarding the level of EP expenditure in the private sector. Residual data makes it possible to only suppose that such expenditure amounted to about EUR 80-90 billion on an annual basis.

The fundamental ratios used in the evaluation of the dynamics of EP expenditure are its share in the GDP and the level per capita. In 2013 the share of EP expenditure in the GDP was 2.18%, whereas in 2001 – 2.16% (Eurostat, 2018). Thus, it can be concluded that it remained unchanged in EU member states in the analyzed period. In countries such as: Estonia, Austria, Cyprus, France, Italy and Denmark, EP expenditures were largely generated by the sector of producers of environmental protection goods and services (Figure 1). To compare, public sector expenditure was predominant in the Netherlands, Bulgaria, the United Kingdom, Malta and Latvia. In turn, in most countries of Central Eastern Europe (Slovenia, Czech Republic, Poland, Hungary, Slovakia and Croatia), according to the ‘polluter pays’ principle, the prevailing portion of environmental protection expenditure was the private sector’s expenses.

**Figure 1: Environmental Protection Expenditure (% of GDP), Last Available Data**

Source: own elaboration based on Eurostat data.

As regards the level of expenditure per capita, clear disparities could be observed between respective countries (Figure 2). Austria (nearly EUR 1209) is definitely the leader, while the lowest expenditure per capita was recorded in Croatia (EUR 102.3). However, it must be remembered that the country only became a member state of the Community in 2013, that is, in the last year covered by the study. It can be believed that in subsequent years environmental protection expenditure increased as a result of the necessity to adopt EU standards.

Information in Table 2 indicates that in only 3 out of 26 EU member states (11.5%), environmental protection expenditure per capita exceeded EUR 1000. On the other hand, in 9 of them (nearly 35%) the level of expenditure was lower than EUR 250, and in 17 (65%) it did not exceed EUR 500.

**Figure 3: Average Annual Levels of Investment and Current Expenditure for Environmental Protection in EU Countries in the Years 2001-2013 (Euro per Inhabitant)**

Source: author's calculation based on Eurostat data.

The analysis of environmental protection expenditure has also provided information on the types of such expenditure (Figure 3). In the analyzed period, in most EU member states running expenses connected with environmental protection oriented operations of economic entities prevailed. They accounted for nearly 73% of the overall expenditure. The highest level of running expenses was recorded in Austria (about EUR 786 per capita), and the lowest in Croatia (less than EUR 40). In turn, funds allocated to environmental protection investments accounted for about 27% of the overall expenditure, whereas the highest level per capita was noted in Sweden (EUR 326.3), and the lowest in Bulgaria (EUR 31.4). Out of 26 countries for which data could be retrieved, only in 4 were investment expenditures higher than running expenses related to environmental protection, i.e. Croatia, Lithuania, Slovenia and Sweden.

#### 4. Conclusion

For many years the statistical office of Eurostat has attempted to develop a uniform scheme for systematic gathering of data referring to different forms of impact that economic entities have on the environment. Information retrieved in that manner is used for monitoring the effectiveness of environmental protection policy, analysing the economic effects of such policy, e.g. potential impact on the competitiveness of businesses or during environmental impact reviews, for presenting efficient actions undertaken by the member states in order to reduce environmental pressure.

In 2001-2013 a nearly 40% increase in environmental protection expenditure was noted in the member states of the EU, which must be attributed to the phenomenon of 'greening' the social and economic processes – and intensification of activities for sustainable development. In the analyzed period EP expenditure on average accounted for about 2.2% of EU GDP, whereas the ratio was subject to large variances within respective member states. Individual expenditure (per capita) was also highly differentiated. Here, a certain pattern can be identified – the more developed the country, the more funds it allocated to environmental protection.

It seems that, in the coming years, emphasis should be put on increasing the involvement of the private sector in environmental protection activities. Results of analyses indicate that the share of businesses in financing environmental protection was considerably lower than the share of the public sector and that of entities specializing in the production of environmental protection goods and services. Such a situation means that the 'polluter pays' principle is not implemented in full.

### **Abstract**

*The development of the integration processes in the world economy is connected with the production internationalization and, as a result, with the economic integration since the main objective of integration is to gain access to the effects which can be obtained within the system of a higher level. The aim of the article is to analyze the current changes in the banking system of Ukraine within the process of the European integration. The special attention is paid at the dynamics of the main indicators of the banking system of Ukraine functioning. The lists of the main foreign financial groups having their subsidiary banks in Ukraine as well as the most profitable and reliable banks were presented in the paper. The dynamics of the banks liquidation as well as the causes of such a reform step was given by the author. The main challenges the banking system of Ukraine is facing within the European integration process were identified in the paper.*

**Keywords:** banking system, banks performance, European integration, NBU

**JEL Classification:** E58, F15, G21

### **1. Introduction**

The development of the integration processes in the world economy is connected with the production internationalization and, as a result, with the economic integration since the main objective of integration is to gain access to the effects which can be obtained within the system of a higher level. More and more interconnections of economic processes of different levels and different systems are observed. Nowadays the key words are the interdependence of nations and the imperatives that a global system imposes on national economies (Gazzola et al., 2016). The sharp increase in the inter-firm and interstate competition for markets and sources of raw materials cause the need for cooperation of material and financial, as well as industrial efforts of territorially connected countries, allowing them to save on customs duties, to avoid additional expenses of production and circulation and to act as a united force against common competitors in the world market. The development of integration processes in the world economy is inextricably connected with the internationalization of production, and hence with economic integration.

The actual tendencies in the development of the world financial system, namely: globalization, internationalization, institutionalization, aggravation of the international competition, integration and computerization - contribute to the increase of the international banking services and open up wide opportunities for banks foreign economic activity. The European integration intentions of Ukraine have made changes to the development of its economy in

general and its financial sector in particular. These changes affected the development of the banking system, which is a system-building link between the financial and credit markets, especially substantially. The essence of the said changes is in the increase of the foreign banks presence on the national market, the necessity to implement the norms of the EU banking legislation as well as the European methods of banking business conduction into the domestic banking system practice. The conduction of the effective reforms in the banking sector of Ukraine will help accelerate the pace of its European integration, the establishment of closer international economic cooperation and increase the competitiveness of the Ukrainian banks on the global financial market as well as increase the ability to balance the interests of both banks and clients.

## **2. Problem Formulation and Methodology**

For over three decades, the deepening process of globalization and widening regionalization have been driving force in the development of various entities of the contemporary economy (Głodowska et al., 2016). Worldwide globalization and integration processes update the challenges of realizing the benefits and minimizing risks for the Ukrainian national economy from the establishment of a free trade zone with the European Union (NISS, 2017). As a rule, banking sector is a leader in reforming and implementing the best world and European banking practices. At the same time, the deepening of the economic and financial integration with the EU in the course of the aggravation of the financial and economic crisis in the euro zone countries creates certain challenges for the banking system of Ukraine. In this context, Ukraine faces a difficult task - to preserve the macroeconomic stability as well as to strengthen its banking system, continuing, at the same time, the implementation of the European integration strategy and ensuring the compliance of the obligations under the Free Trade Agreement.

The aim of the article is to analyze the current changes in the banking system of Ukraine within the process of the European integration. The special attention is paid at the dynamics of the main indicators of the banking system of Ukraine functioning. The analysis included the dynamics of the number of registered and operating banks in Ukraine, the dynamics of the banks with foreign capital and their share in the total number of banks functioning on the territory of Ukraine, the dynamics of the banks with 100% foreign capital and their share in the total number of banks functioning on the territory of Ukraine as well as the dynamics of the number of banks in the stage of reorganization and liquidation. To more clearly present the analysis results, the graphic method was used by the author. To build the trend line and to make the prognosis of the said dynamics for two years, the polynomial approximation was used in the paper taking into consideration the highest value of the coefficient of determination  $R^2$  compared to that when using other functions. The analysis of the total assets and total liabilities of the Banks Functioning on the Territory of Ukraine was made using the tabular method as it is the main and one of the most effective methods of the synthesis results presentation as well as analytical data grouping. The method mentioned above was also used for presenting the results of the research concerning the main foreign financial groups having their subsidiary banks in Ukraine in 2017, the most reliable and the most profitable banks in Ukraine in 2017. The data for analysis were taken from the databases of the National Bank of Ukraine, the Ministry of Finance of Ukraine and the Association of Ukrainian Banks.

## **3. Problem Solution**

Ukraine has defined the course for integration into the European Union as the strategic goal of its foreign economic policy. Ukraine's participation in the European integration processes

determines the necessity for defining the directions and substantiation of adaptation principles of all the sectors of the Ukrainian economy activity to the requirements of the economic globalization. Because of everything mentioned above, the special attention should be paid to the financial and credit system of the country in general and its banking sector in particular. The strategic direction of Ukraine's financial policy is to ensure the stability of its banking system. The solution of this problem involves the improvement of the correspondent banking standards and regulations. Therefore, the goals and consequences of the European integration of the Ukrainian banking system should be in line with the said strategic priority. To continue the research, let's analyze the dynamics of the number of registered and operating banks in Ukraine with the help of Figure 1.

**Figure 1: The Dynamics of the Number of Registered and Operating Banks in Ukraine**

Source: author's own elaboration based on the data from the National Bank of Ukraine (NBU, 2018)

The data of the figure given above allow us affirm, that till the year 2015 the number of registered and operating banks didn't coincide, but due to the reforms in the banking sector of Ukraine, the number of the said banks became even. The prognosis made for the years 2018 and 2019 show us the possibility of increasing the number of operating banks in the country, but the trend line is still downward in the years under prognosis that is in accordance with the general trend present in the European banking system.

To continue the research, the dynamics of the number of banks in the stage of reorganization, banks recognized as solvent and those to which the Deposit Guarantee Fund introduced the interim administration as well as banks that are in the stage of liquidation, can be followed in Figure 2.

Most often, the bank liquidation process is started when the existing level of the bank capitalization does not allow it to repay its depositors. A large number of liquidated banks in Ukraine had the described situation because of the illiterate leadership or the fictitious role of the bank. Of course, not all the liquidated banks were created with dark goals and not all of them were closed for the same reason but, one way or another, the existence of a bank with problems is a threat not only to its depositors but to the entire banking system as well. Let's hope that in the future the liquidation of banks will soon be an exception rather than a norm. According to the prognosis for the years 2018 and 2019 shown in Figure 2, we may conclude that the year 2018 is critical in terms of the dynamics of the liquidated and

reorganized banks and either the National Bank of Ukraine will stop the process of banks liquidation or it should find another steps of the banking sector reforming.

**Figure 2: The Dynamics of the Number of Banks in the Stage of Reorganization and Liquidation**

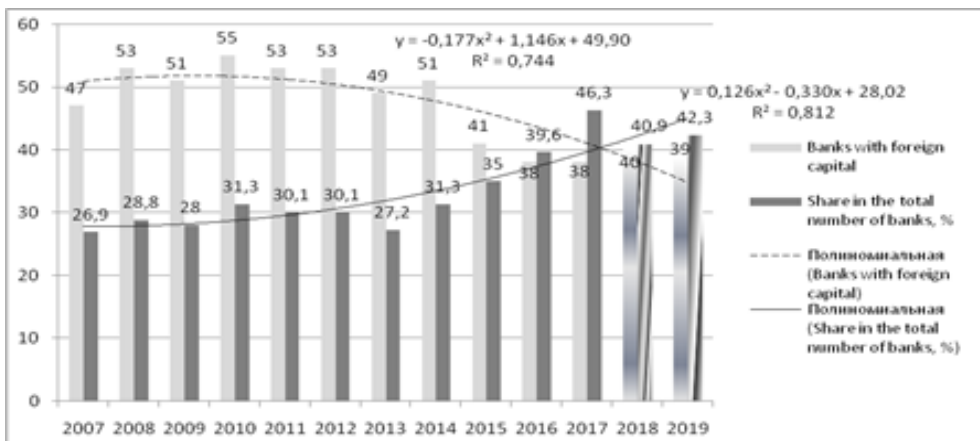

Source: author’s own elaboration based on the data from the National Bank of Ukraine (NBU, 2018)

But, in spite of that, we understand that the liquidation of banks is a necessary step to clean up and effectively operate the banking system in Ukraine. At the same time, a consistent and well-considered liquidation campaign guarantees all the depositors the timely repayment and minimization of the risks to the economy.

Nowadays, the Ukrainian market of banking services has a significant development potential and is therefore very attractive for foreign banks. At the same time, banks in the EU countries are focused on solving their problems with liquidity, that is through the financing cessation of the foreign affiliates and subsidiaries as well as fundswithdrawal from the less developed countries. To develop the statement expressed, let’s follow the dynamics of the number of banks with foreign capital and their share in the total number of banks functioning on the territory of Ukraine according to Figure 3.

**Figure 3: The Dynamics of the Number of Banks with Foreign Capital and their Share in the Total Number of Banks Functioning on the Territory of Ukraine**

Source: author’s own elaboration based on the data from the Ministry of Finance of Ukraine (MFU, 2018)

According to the data shown in Figure 3, we don't see one clear tendency in the number of banks with foreign capital till the year 2014 – the dynamics of the said banks was once upward, once downward. But after the year 2014 there was a considerable drop in the number of the banks mentioned above, that is of ten units or 20 %. In the next year, the downward tendency didn't change showing the decrease in the number of the banks with foreign capital operating on the territory of Ukraine of three units or 7 %. In 2017 the number of the said banks didn't change. Such a downward tendency is not odd at all as it is in compliance with the general tendency in the banking sector of the most European countries. According to the prognosis made by us for the years 2018 and 2019, the number of the banks with foreign capital on the territory of Ukraine is to increase. Though, the trend line for the said years is still downward.

If we talk about the share of the banks with foreign capital in the total number of banks operation on the territory of Ukraine, we also don't see a clear tendency in the dynamics of the number of the said banks till the year 2014 just like with the general number of the banks with foreign capital. But we observe the opposite situation with the share of the banks with foreign capital in the total number of banks functioning on the territory of Ukraine after 2014, that is we see an increase in the said share till the year 2017 including. The prognosis for the year 2018 yet shows the drop in the share mentioned above with the next increase in the year 2019. Though the trend line for the years under prognosisis upward. As we see in the figure presented above, 2017 is the decisive year as it is when the downward trend line of the number of banks with foreign capital and the upward trend line of their share in the total number of banks functioning on the territory of Ukraine intersect.

The attraction of foreign capital into the banking system of Ukraine to increase the sufficiency level of its resource potential is very topical nowadays. The dynamics of the number of banks with 100% foreign capital and their share in the total number of banks functioning on the territory of Ukraine can be analyzed with the help of the data depicted in Figure 4.

**Figure 4: The Dynamics of the Number of Banks with 100% Foreign Capital and their Share in the Total Number of Banks Functioning on the Territory of Ukraine**

Source: author's own elaboration based on the data from the Ministry of Finance of Ukraine (MFU, 2018)

Analyzing the dynamics of the number of banks with 100% foreign capital functioning on the territory of Ukraine, we see a clear upward trend till the year 2012, after which there was a drop in the number of the said banks of three units or 14 %. We observe the next drop in the

number of the banks mentioned above in 2015, meaning of two units or 11% and the increase in the number of banks with 100% foreign capital in 2017, that is of one unit or 6% if compared to the previous year.

The prognosis for the years 2018 and 2019 shows us the next increase in the number of the said banks of another one unit or 6% but the trend line for the years under prognosis is still downward.

The dynamics of the share of banks with 100% foreign capital in the total number of banks functioning on the territory of Ukraine is very much like the one of the number of banks with 100% foreign capital with the exception in 2008, that is an upward trend till the year 2012 with the afterward drop in 2013. But after that, we see a clear upward tendency till 2017 including. But according to our prognosis, the drop in the share of the said banks in 2018 with the afterward increase of the share of the banks with 100% foreign capital are expected.

The presence of banks with foreign capital in Ukraine has a positive effect on the development of its financial system contributing to the attraction of the foreign investment and expanding the resource base for socio-economic development of the country. However, there exist quite serious financial and economic risks of a rapid increase in the share of the foreign bank capital connected with the possible loss of sovereignty in the area of a monetary and credit policy, the increase in instability, unexpected fluctuations of the banks liquidity, the speculative changes in the demand and supply on the money and credit market, as well as the possible outflow of financial resources from the country. That's why, the forms and extent of the expansion of the foreign bank capital presence on the banking market should be subordinated to the strategic objectives of the socio-economic development, the increase of the national competitiveness, the economic security and the strengthening of the monetary and credit system of Ukraine. The structure and dynamics of the total assets of the banks functioning on the territory of Ukraine can be analyzed with the help of the data presented in Table 1.

It is a matter of common knowledge, that the assets of a commercial bank are the direction of placement and use of the commercial bank resources. Bank assets are formed as a result of the bank's active operations, that is, the placement of its own and attracted funds in order to receive income, support liquidity and ensure the bank's successful functioning. The quality of a bank's assets is determined by their structure, the major part of which is taken by loans. The analysis of the structure of the banks operating on the territory of Ukraine gives us the following results – the share of the loans granted in the total assets of the banks operating on the territory of Ukraine lies in the range of 71 % in 2013 (the lowest value) and 82 % in 2017 (the highest value). The general ratio of 2017 to 2010 is 319672 mln UAH or 42.3 % in the upward direction, which is a positive indicator that testifies of the recovery of the Ukrainian economy in general and banking sector in particular. The share of the loans granted to the business entities in the total assets of the banks operating on the territory of Ukraine lies in the range of 54 % in 2010 and 2012 (the lowest value) to 69 % in 2017 (the highest value). The general ratio of the said kind of loans in 2017 to that of 2010 is 389172 mln UAH or 76.6 % in the upward direction. If we take a look at the share of the loans granted to individuals in the total assets of the banks operating on the territory of Ukraine, we'll see that it lies in the range of 8 % in 2014 (the lowest value) to 20 % in 2010 (the highest value). The general ratio of the said kind of loans in 2017 to that of 2010 is 10878 mln UAH or 5.8 % in the downward direction, that is a very disturbing result, because it points out that the banks operating on the territory of Ukraine prefer to give loans to business entities and to individuals.

The next item of our analysis is the liabilities of banks that is part of the balance sheet, which reflects in the monetary terms the source of a bank's funds. The liabilities of the bank consist of its own funds (capital) and liabilities (attracted resources).

**Table 1: Total Assets of the Banks Functioning on the Territory of Ukraine, mln UAH\***

\*Exchange Rate of UAH (NBU, 2018)

Bank's capital is a source of its financial resources, has a legal basis and functional purpose, is a prerequisite for the formation and operation of any commercial bank and forms the basis for the formation of the bank's value. The structure and dynamics of the total liabilities of the banks functioning on the territory of Ukraine can be followed in Table 2.

The general dynamics of the banks' capital has the following tendency – it is upward till the year 2013 including, in which the said capital had the highest value during the time zone under analysis, that is 192599mln UAH. But after 2013 the tendency changed to the opposite one and continued one more year, that is 2015, in which we can see the lowest value of the banks' capital (103713mln UAH). In 2016 the tendency changed to the upward one and continued till the year 2017 including. The general ratio of the capital of the banks operating on the territory of Ukraine is 18781 mln UAH or 13.6 % in the upward direction, which is a good signal cause an adequate amount of the bank's capital contributes to its stable functioning and neutralization of risks as well as determines its place in the banking system.

The important constituents of a bank's liabilities are funds of business entities funds of individuals. The dynamics of the funds of business entities in the amount of the banks' liabilities is upward during the whole time zone under analysis.

**Table 2: Total Liabilities of the Banks Functioning on the Territory of Ukraine, mln UAH\***

Indicator	2010	2011	2012	2013	2014	2015	2016	2017	Ratio of 2017 to 2010, +,-

Source: author's own elaboration based on the data from the Ministry of Finance of Ukraine(MFU, 2018)

\*Exchange Rate of UAH (NBU, 2018)

The general ratio of the said funds in 2017 to those in 2010 is 240967mln UAH or 167.3 % to the upward direction, that testifies to the preserved trust of the said entities to the banking system of Ukraine in general and to separate banks in particular. If we talk about the funds of individuals in the amount of the banks' liabilities, their dynamics differs from that of the funds of business entities, meaning – it is upward till the year 2013 included, followed by the downward one in the following two years, that is in 2014 and 2015. But in the year 2016 the dynamics of the funds of individuals changed to the upward one and remained so in 2017. The general ratio of the funds of individuals in the amount of the banks' liabilities in 2017 to those in 2010 is 206232mln UAH or 76 % to the upward direction. Taking into account the fact that the growth of the funds of individuals is mainly due to the predominance of the short – term deposits with a term up to one year, we don't see the reason to talk about the restoring of the individuals' trust to the banking system.

One of the criteria for assessing the level of a country's competitiveness is the indicator of its banks' reliability. The rating of the most reliable banks in Ukraine in 2017 can be followed in Table 3.

The rating presented in the table given above was compiled taking into account the ability of a bank to pay back the deposits in case of financial difficulties or problems related to the repayment of loans with the growth of its customers' debts. The level of the support of the state and shareholders was also taken into account. The rating was significantly influenced by the so-called the owner factor as the stability of a bank under the influence of stressful conditions is ensured by the timely replenishment of capital and liquid resources.

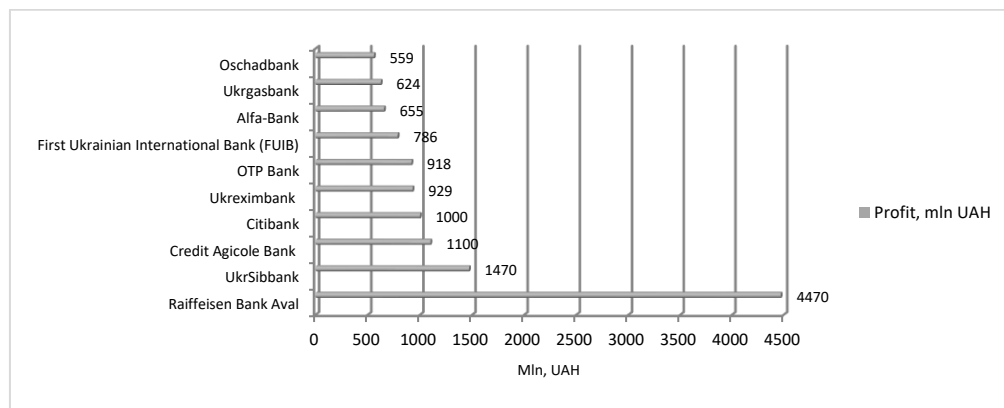

**Table 3: Rating of the Most Reliable Banks in Ukraine in 2017**

№	Bank	Owned by	Capital Origin Country
1	Raiffeisen Bank Aval	Raiffeisen Intl	Austria
2	Credit Agricole Bank	Credit Agricole	France
3	UkrSibbank	BNP Paribas	France
4	Oschadbank	Ukrainian State	Ukraine
5	Ukreximbank	Ukrainian State	Ukraine
6	KredoBank	PKO Bank Polski	Poland
7	Citibank	Citigroup	USA
8	ProCredit Bank	ProCreditGruppe	Germany
9	Ukrgasbank	Ukrainian State	Ukraine
10	Alfa-Bank	ABH Holdings S.A.	Luxemburg

Source: Forinsurer (2018)

The proof to the statement expressed in the latter sentence is the fact that the first three places in the said rating is taken by the banks with foreign capital, owned by the international financial groups from Austria and France. The Ukrainian State banks Oschadbank and Ukreximbank follow them taking respectively the fourth and the fifth places. The capital origin countries of the banks presented in Table 3 represent Europe, with the only exception – Citigroup (USA, America).

The mission of any bank is to provide high-quality banking services, impeccable service and an individual approach to each bank's client. On the other hand, the main objective of each bank as a business entity is to increase profits. Top – 10 of the most profitable banks in Ukraine in the first half of 2017 are presented in Figure 5.

**Figure 5: Top – 10 of the Most Profitable Banks in Ukraine in 2017, mln UAH\***

Source:Ukrinform(2018)

\*Exchange Rate of UAH (NBU, 2018)

As stated by the National Bank of Ukraine (Ukrinform, 2018), according to the results of 2017, the largest profits were recorded in Raiffeisen Bank Aval (4.47 bln UAH), UkrSibbank (1.47 bln UAH), Credit Agricole Bank (1.1 bln UAH), Citibank (1 bln UAH), Ukreximbank (929 mln UAH), OTP Bank (918 mln UAH), First Ukrainian International Bank (FUIB)(786 mln

UAH), Alfa-Bank (655 mln UAH), Ukrgasbank (624 mln UAH) and Oschadbank (559 mln UAH). Along with that, the largest losses were recorded in Privatbank (22.97 bln UAH), Prominvestbank (7.67 bln UAH) and VTB Bank (4.1 bln UAH).

Under the conditions of the international financial markets expansion, the effective activity of the national financial institutions depends on their ability to cooperate with similar, judging on their activity nature, international financial entities. More than that, the development of the financial and commodity markets requires additional capital attraction in the external financial markets and from the foreign financial institutions. The list of the main foreign financial groups having their subsidiary banks in Ukraine in 2017 can be followed in Table 4.

**Table 4: List of the Main Foreign Financial Groups Having their Subsidiary Banks in Ukraine in 2017**

№	International Banking Group	Capital Origin Country	Assets of International Banking Group, mln EUR	Subsidiary Bank in Ukraine
1	BNP Paribas	France	2077759	UkrSibbank
2	Citigroup	USA	1517922	Citibank
3	Credit Agricole	France	1762763	Credit Agricole Bank
4	Deutsche Bank	Germany	1708703	Deutsche Bank DBU
5	ING Group	the Netherlands	992856	ING Bank Ukraine
6	Intesa Sanpaolo	Italy	646427	Pravex Bank
7	PKO Bank Polski	Poland	58135	KredoBank
8	Raiffeisen Intl.	Austria	121624	Raiffeisen Bank Aval
9	SEB	Sweden	280847	SEB Corporate Bank
10	Unicredit	Italy	844217	Ukrsotsbank

Source: Association of Ukrainian Banks (2018)

Since 2006, more than a dozen of foreign financial groups have appeared in Ukraine. Since that time they have invested more than 10 blnUSD into the Ukrainian banking sector. There exist several motives for banks to enter foreign markets, these are managerial decisions, empire-building tendencies of banks, profitmaximization, the need to acquire new customers on new markets or to keep (and multiply) the relationship with existing customers on the new markets etc (Badulescu and Moruțan, 2016). Nowadays, the largest amount of the foreign assets is controlled by the investors from France, Austria, Germany, the Netherlands, Italy, Sweden, USA and Poland, that, in turn, testifies to the interest of the financial institutions from the European Union in the Ukrainian banking business controlling. What is interesting to point out here is, that till the year 2013 the share of the Russian Federation in the total assets of the banks operating on the territory of Ukraine had steadily increased, but due to the political power change and the events in the Eastern part of Ukraine, the situation changed to the opposite one and the Russian banks finished the year 2017 with big loses. So, we don't observe the domination of one single country on the Ukrainian banking services market. Such a diversification of banking assets owners can be considered a positive feature of the Ukrainian banking system, as it is less dependent on the economic and political conditions of the said single state.

Everything mentioned above as well as the analysis of the general economic development of Ukraine result in the defining of the following risks related to the European integration of the Ukrainian banking system:

- the increase of the competitiveness on the banking services market;
- the increase in the currency imbalances in the structure of the banks' assets and liabilities;
- the increase in the gap between the development level of the financial and real sectors of the economy, the imbalance between the aggregated demand and supply, and therefore the balance of payments;
- the unfavorable competition conditions because of the domination of banks with foreign capital in the most profitable segments of the Ukrainian banking services market;
- the implementation of such a credit policy by the banks with foreign capital that doesn't correspond to the national interests of the Ukrainian strategic development;
- the increase of the external dependence of the Ukrainian banking system on the instability in the international financial markets.

#### **4. Conclusion**

The actual tendencies in the development of the world financial system contribute to the increase of the international banking services and open up wide opportunities for banks foreign economic activity. The European integration intentions of Ukraine have made changes to the development of its economy in general and its financial sector in particular. These changes affected the development of its banking system as well. The conduction of the effective reforms in the banking sector of Ukraine will help accelerate the pace of its European integration, the establishment of closer international economic cooperation and increase the competitiveness of the Ukrainian banks on the global financial market as well as increase the ability to balance the interests of both banks and clients.

To draw the conclusions, it's necessary to note that not only the economic advantages, but also the shortcomings of the Ukrainian integration into Europe have not been thoroughly assessed and fully understood. The Association Agreement and the Free Trade Zone allow Europe to have Ukraine as a reliable partner and an outpost of the European integration without formal its membership but with a large-scale involvement into certain European integration mechanisms. The key idea of this process is Ukraine's convergence with the EU norms, standards and policies in all the directions, including its banking sector. Both Ukraine and the European Union would benefit from that. So, the integration of the Ukrainian banking sector into the European financial market, on the one hand, could lead to the activation of a number of risks of the financial and economic nature, and, on the other hand, could definitely have positive effects.

Thus, the main directions of the integration of the Ukrainian banking system into the European Union and the measures for their practical implementation should be the following ones:

- the assurance of the stability and increase of the competitiveness of the national banking system in the international banking services markets;
- the development of the mechanism for preventing and reducing risks which could be additionally introduced into the Ukrainian banking system because of the European integration process as well as the instruments for its implementation;
- the improvement of the Ukrainian banking system functioning in the context of Ukraine's integration into the European economic community;
- the continuation of the dialogue with the regulators of the banking activity from the EU countries.

Taking into account the risks and problems that exist in the EU banking system nowadays as well as the significant shortcomings of the banking regulation system, which were identified by the financial crisis, added by the constant changes in the regulatory environment of the EU, the European integration process should be approached in a very balanced and careful way.

## Consumer in the European Union and Dual Food Quality

**Naděžda Klabusayová**

### **Abstract**

*Free movement of safe and full-fledged food is a necessary characteristic of internal market; it contributes to health and well-being of citizens as well as to their social and economic interests. The problem with different food quality usually relates to the countries in the Eastern part of the EU. The consumers of those countries complain that quality of some products is lower in their country than quality of the same brands and the same producer is abroad. Studies provided in the food field and focusing on its quality really confirm that seemingly similar products are sold in the EU market differing by its content by individual country though; consumers are not able to defend themselves against such producers' acting. The article analyses the legislative regulations related to the food right and consumer protection in the EU and in the Czech Republic as it comes to food field, deals with dual food quality and considers the ways and possible solutions how to fight against it by current valid acts or new regulations.*

**Keywords:** consumer protection, deceptive acting, dual food quality, European single market, legal regulations

**JEL Classification:** A20, D18, K20

### **1. Introduction**

Discussions on dual quality are being held in irregular waves at least since 2011 when the Association of consumers in Slovak Republic published a partial comparison of the goods bought in the eight EU countries. It has emerged that some producers supply consumer goods with different ingredients but under the same sign or trademark.

Consumers complain that in some cases the goods is offered in better quality in the market of traditional EU countries contrary to other member countries. Also Czech consumers point out that the same product bought in the Western Europe is of different quality from the product bought in the Eastern Europe. Recently, media have repeatedly published the results of products comparison, which showed that in some cases the goods quality differs – sometimes in favour of consumers of the EU states, sometimes not. Different content of products or dual quality does not refer to the only goods of daily use but mainly to the food; by the research of Focus Agency provided in November 2015 for the Czech Agriculture and Food Inspection Authority (CAFIA), 88 % of Czech consumers are not satisfied with dual quality - (SZPI [online], 2016)

Dual quality means that the food being sold under the identical sign and packing has different content depending on the place where it is being sold. In different countries, the food differs in both aspects – content and ingredients quality. Thus, dual standard of food quality exists while in “the old EU countries” the quality is higher compared to “the new EU countries”.

Consumers expect the food to have the same content thus the same quality in the frame of the entire European Union. Because it is not true, they are being misled. The practice of dual food quality has to be considered unfair; the same trademark being put on less quality food and on better quality food at the same time is also unequivocally considered the unfair competition.

## 2. The Legislative Regulations of Food Quality

### 2.1 EU Legislation

The European Union has implemented many strict rules as it comes to consumer protection and by the article 169 of the Treaty on the Functioning of the European Union, the EU should contribute to an achievement of high level of consumer protection. At the beginning, the European Commission has reacted to indignation and findings of some member states referring to the dual quality by the conclusion that producers can change their products depending on market specifics and preferences of individual member states consumers. The only condition is truthful information on the packages.

At present time, the European Commission considers the problem of the food dual quality very significant. President of the European Commission, Jean-Claude Juncker, mentioned in his speech about the European Union status held on 13<sup>th</sup> September 2017: *“It is not acceptable to have the food of lower quality in some countries contrary to others. In the Union where all citizens are equal, it is not possible to consider some of consumers the second category. The European Commission has to provide with all means helping the national authorities to eradicate all illegal practices whenever they occur”*- (European Commission [online], 2017)

Because there are still big differences as for the food law among member states considering conception, rules and processes, which can avoid free movement of the food, the member states are adopting regulations involving the food. It is necessary though to determine common definitions, rules, requirements and processes to create a clear frame and common base for regulations at the level of the EU and individual member states regulating the provision with information about the food. Motlíček and Vavřina (2016) say that *“Business entities should consider opportunities of EU Food safety and quality policy, especially in the area of food production' quality towards enhancement of their competitiveness.”*

General aim of the food law is to provide consumers with awareness, which gives them an option to choose the food being consumed as well as to prevent them from any practices, which can be misleading. This aim is the part of the Regulation (EC) No 178/2002 of the European Parliament and of the Council of 28 January 2002 laying down the general principles and requirements of the food law, establishing the European Food Safety Authority and laying down procedures in matters of food safety.

Some aspects of providing consumers with information aiming to avoid misleading acting and lack of information are the part of Directive 2005/29/EC of the European Parliament and of the Council of 11 May 2005 concerning unfair business-to-consumer commercial practices in the internal market. This directive deals with commercial practices, which directly influence consumer's decision-making about trade transactions referring to products, protects economic interests of consumer against unfair practices and protects companies indirectly against competitors not following the rules of this directive. The aim of this directive is to make internal market to function properly and to achieve high level of consumer's protection by harmonization of legal and administration regulations of member states as it comes to unfair competition.

General rules involving unfair competition are added by special rules dealing with providing the consumers with food information. To guarantee a unified access to information being given to consumers about food, wide spectrum of legal regulations are implemented. Those regulations involve the rules of general and specific character as well as information about food, which contains the data given also by different means than labels do.

As it comes to providing the consumers with food information, the Regulation (EU) No 1169/2011 of the European Parliament and of the Council of 25 October 2011 on the provision of food information to consumers is, in which among others is said that: *“The free movement of safe and wholesome food is an essential aspect of the internal market and contributes significantly to the health and well-being of citizens, and to their social and economic interests. In order to achieve a high level of health protection for consumers and to guarantee their right to information, it should be ensured that consumers are appropriately informed as regards the food they consume.”* (Regulation (EU) No 1169/2011)

Regulation (EU) No 1169/2011 determines general rules, requirements and duties in the field of information about food, mainly food labeling and means to guarantee consumers' rights to information and processes for provision with information, concretely with the aim to avoid misleading acting and misleading information omission. Petrescu-Mag and Petrescu, (2017) say that *„around 45% of tested people searched for the country of origin, 67.6% for producer's name and 47.5 % for special labels in at least half of the cases when they bought food“*.

Regulation (EU) No 1169/2011 also involves operators of food companies within all phases of food chain and all food determined to final consumer, nutritive information as well as it determines the rules as for the content and nutritional values on packed food.

Another important legislative regulation is the Regulation (EC) No 2006/2004 of the European Parliament and of the Council of 27 October 2004 on cooperation between national authorities responsible for the enforcement of consumer protection laws. This regulation determines the conditions, under which particular authorities dealing with enforcement of consumer protection laws in member states will cooperate mutually as well as will cooperate with the Commission; it is based on the necessity to guarantee proper functioning of internal market and consumer protection. Such conditions are needed for particular authorities to be able freely and mutually cooperate when exchanging information, uncovering and investigating the illegal acting inside the EU. Therefore, it is proper to make this cooperation easier. Each body of public power is considered the particular authority mentioned in this regulation, which has been established at the state, regional or local level and is especially authorized to enforce the act on consumer protection and which has to be determined by each member state.

## **2.2 Legislation in the Czech Republic**

The Czech food legislation involves many acts and sub-legal regulation. Harmonization of the Czech law with EU regulations has been a big developing step, which refers to many fundamental regulations. European food law involves tens of obligatory regulations dealing with conditions for the production and manufacturing of food while some of them are determined in regulations, which have direct effect in the EU member states. Thus, it is very difficult set of regulations, which is partially transposed to the national legislation of each member state and partially is of direct effect once it is published in Official Journal of the EU.

As far as consumer protection is concern, the most important act is probably the Act No. 110/1997 Coll., on food and tobacco products, the purpose of which is to implement particular EU regulations and adjust the duties of operators of food company, producers, suppliers, retailers and distributors in connection with directly used EU regulations.

The act and implementing regulations issued by the Ministry of Agriculture and Ministry of Health determine wide spectrum of obligations for food company operators such as serious requirements for harmlessness, quality, goods or ingredients circulation, technological demands, hygienic conditions etc.

Many requirements refer to food circulation. Food, which is harmless, deceptively labeled or offered to be consumed in misleading way, food of unknown origin and with expired date of use is banned to be given for circulation.

Another important act referring to food, the Act No. 258/2000 Coll. is on public health protection, which adjusts the rights and duties of natural person and legal entities in the field of protection and support of public health and the set of bodies of public health protection, their scope of authority and sphere of activity.

As far as “non-food” regulations are concern but connected to consumer protection, dual quality and misleading acting, mainly the Act No. 634/1992 Coll. on consumer protection and the Act No. 89/2012 Coll. Civil Code are. Both acts involve among others misleading trade practices and unfair competition.

General requirements for product labeling are mentioned in the Act on consumer protection. In §10 of the Act on consumer protection, it is said: *„The seller has to guarantee that products sold by him are visibly and understandably labeled by producer, supplier or importer’s name. If the form of selling requires it, also by data about weight, volume or size or other data needed for the product to be identified or used”*. (Act No. 634/1992 Coll).

Concrete request for food labeling can be found in the act on food in § 7 where it is said that: *„Operator of food company is obligated to guarantee that there is the following information on the food package determined for the consumers or boarding facilities (based on conditions determined by directly used regulation of the EU on food labeling): name and surname or trade company and business address of company producing particular food, food name, net value, ingredients list, country of origin, storage way in case such food is concern, bad storage of which could be danger or quality determined by legal regulation or declared by the producer, could get worse, use-by date etc.”*. (Act No. 110/1997 Coll.).

The list of obligation of food company operator is then added by the links to art. 10 and art. 44 of the Regulation (EU) No 1169/2011 of the European Parliament and of the Council of 25 October 2011 on the provision of food information to consumers.

### **3. Dual Food Quality**

Each of us is being interested in the safe and quality food. Food is indisputably the field, in which consumers search for information the most. Although there is no list of all regulations, directives, acts and rules mentioned in this article, it is clear that for producer or other operator of food company, an orientation in all issues can become very difficult so is for consumers. Although subjects producing and placing their food product in the EU single market are bounded by all kinds of legislation and norms, such cases occur recently when those are not followed in 100 %. In some European markets, such food occurs, which by its quality does not refer to information being declared on its packages or labels.

Internet, media or different professional forums show information being disquieting for many consumers. The research provided by the Ministry of Agriculture of the Czech Republic in the beginning of 2017 proved that in Czech shops such food is being sold not being of the same content as in Germany or Austria although it has the same name and package. The test results

of the University of Chemistry and Technology in Prague, which provided this research showed that food not only differs by quality but ingredients as well. Former minister of the Ministry of Agriculture of the Czech Republic, Marian Jurečka said at the Žofínské fórum on 3<sup>rd</sup> October 2017 that there were 21 products tested. It was found out that Tulip Luncheon meat from Germany contains pork while in the version for the Czechs there is poultry separates; fish fingers Iglo being sold in the Czech Republic have by 13 % less meat contrary to those in Germany and big difference was also found in frozen sausage pizza. The test also uncovered that e.g. ketchups contain different amount of tomatoes and pineapple slices are canned in own juice in Germany and Austria while those for the CR, Slovakia and Hungary are canned in sugar syrup.

Dual food quality has been also monitoring by the magazine dTest for long time; this magazine deals with comparison of products' quality in the market. This magazine provided the test of food of several countries in 2016 and came to similar conclusions as the Ministry of Agriculture.

In this connection, several questions occur:

**a) In case of dual quality, does consumer protection exist and is the Czech food market sufficiently supervised?**

The offer in the market is wide and each consumer can choose such product fitting his taste, habit and financial possibility. Approach and realization of food control in the Czech Republic is based on the legal regulations mainly the Act No. 110/1997 Coll. on food and tobacco products, the Act No. 146/2002 Coll. on the Czech Agriculture and Food Inspection Authority (CAFIA) or the Act. No. 255/2012 Coll. on the control and they refer to the food control principles exercised in the EU member states. The website of CAFIA states in the section "Consumers' questions": *„CAFIA controls in the frame of its competences given by the law whether food is produced, warehoused, transported and sold in accordance with legal regulations conditions, whether is safe and whether it suits the quality requests if given by the law. So, if the quality parameters are given for some food, producer has to follow those. CAFIA as the state controlling authority cannot demand a fulfilment of quality indicators above the frame of the legal regulations. In other words, CAFIA has no legal authority to compare food content with the same trade name of different EU countries neither is authorized to punish operators in case those would sell the products with different content in the Czech Republic contrary to the other EU member states if those products follow valid legal regulations dealing with the safety, hygiene and quality”.* (SZPI [online], 2016)

When buying food, consumers can be recommended to watch the content of the products – what the particular product contains, in what amount and based on this information they can make decision whether particular product will be bought or not. It is true though that so called substitute food can be bought in the market, too. For example, milk products alternatives. Those are such products in which milk part was partially or fully replaced by another one, the most often by vegetable fat. As for meat products, e.g. small sausage (špekáček) produced in the CR has to contain min 40 % of meat. If there are quality parameters determined for some food, producer has to follow those and in case those products are save and are not labeled in breach of the law, CAFIA cannot punish the sale of them.

**b) Why dual food quality?**

While current European regulations and directives adjust mainly food safety, the product content is regulated at different levels. As said above, milk and meat products' content is under the only national legislation of individual states. The products' content is mainly on the producers' side. Dual quality is the fact. On the other hand, the statement that the difference

in ingredients, quality and amount is labeled on the product so thus this labeling is in accordance with the EU rules cannot be agreed with. Dual food quality is misleading practice because it omits to declare serious information, which is needed by average consumer to make decision on trade transaction. Such specification is considered the serious information saying that particular food is of lower quality contrary to this expected by the customer because of the same labeling. Average customer thus makes decision he would not make knowing the true.

As it comes to problem solution, it could be the implementation of products specific labeling into the EU law, based on which consumer would be able to recognize the product characteristics at first sight without the need to investigate e.g. product content. Correction could become real just by food because this is usually very delicate topic and there is much more probability to implement such solution. Grunert and Aachmann (2016) also mention that „*The EU promotes three types of food quality labels, PDO, PGI and TSG in order to protect producers of food with special qualities and to aid consumers in their decision-making.*“

Another possible solution at the EU level as well as in national legislations, voluntary products labeling by the producers could be. Effectiveness of such labeling becomes questionable though as well as interests of producers in such option.

### **c) Dual quality or price versus quality?**

In the countries of the Middle and Eastern Europe where a purchase power of inhabitants is lower contrary to the Western Europe countries, market sensitivity to the price is significantly higher. More quality food is usually more expensive. Therefore, in the frame of competition, producers supply food of different quality to the markets of the Middle and Eastern Europe, which, in most cases, are of lower quality, lower producing costs and thus of lower selling price.

Producers mask this fact saying that customers of the Middle and Eastern Europe have different taste preferences so the products have to be adjusted to those. When looking closer though, it is often discovered that different taste is caused just by lack of the most costly ingredient. This fact can be demonstrated on e.g. lower share of meat in the meat products determined for the markets of the Middle and Eastern Europe or different share of sugar and artificial sweeteners in the beverages of different markets etc.

Price consequences of higher products quality have to be solved by producers themselves in the frame of the costs. Such premise has to be applied that the same product in the different markets does not have to be of the same price but has to be of the same quality. And, it is the task of state institutions, consumers' associations and last but not least consumers themselves to put pressure on the producers and sellers to have the products of the same quality in all markets.

## **4. Quality Food in All EU Member States**

The EU legal regulations for food field involve the list of the most important information, which has to be stated on the product package. This information and norms dealing with food safety have to be uncompromisingly followed. Food industry cannot resort to misleading or unfair practices being forbidden by the EU regulations on unfair competition.

In October 2017, the Commission issued the instructions, which could help the member states when fighting unfair competition. Those instructions can help the national authorities to decide whether the company offering dual quality products in different countries violates the EU legal regulations. The instructions involve and explain the demands of the EU legal regulations as

it comes to food and consumer protection, which have to be exercised when evaluating particular problem with dual food quality. Those are as follows:

- *regulation on the provision of food information to consumers*, which requests consumers to have sufficient and true information about particular product. For example, the label has to contain all ingredients the particular product contains;
- *directive concerning unfair business-to-consumer commercial practices in the internal market* forbidding unfair competition such as introducing identical brand products to the market in the way, which misleads consumers.

Based on those legal regulations, the instructions determine such process, based on which national authorities dealing with consumer protection and authorities responsible for food control find out whether producers violate given law or not. In case the violation of the law is of cross-border character, authorities of consumer protection can solve this issue at the European level in the frame of the net for cooperation in consumer protection area.

Except those instructions, the European Commission will work on the methodology leading to improvement of comparing food tests in order to make the member states to be able to issue this question based on reliable and shared scientific knowledge, which will be obligatory for all. To elaborate this methodology, the Commission provides the Joint Research Centre with 1 million EUR. Further, the Commission will also finance another activity focused on a collection of evidence and rules exercise – thus studies or coercive measures.

Harmonization of the rules makes consumers' and companies' certainty higher. Consumers and businesses will be able to rely on unified legal frame based on clearly determined legal terms issuing all aspects of unfair competition in the entire European Union. The result of such activities, the remove of barriers resulting from fragmentation of regulations on unfair competition damaging economic interests of consumers will be; and, achievement of unified conditions in internal market.

## 5. Conclusion

Food safety and consumers interests' protection is the subject of increasing interest of wide public, non-governmental organizations, professional associations, international business partners and trade organizations. The trust of consumers and trade partners is necessary to be guaranteed by open preparation of the food law and by the fact that public power bodies would adopt the suitable measures aiming to inform the public in case the sufficient reasons for suspicion that some food can represent the risk occur.

The legal regulations on the provision of food information should forbid the use of such information, which would mislead the consumers. Mainly when food characteristics and its effects is concern. Experience shows that in many cases voluntary information about food is stated at the expense of obligatory one. Therefore, it is necessary to determine such criteria, which would provide with the balance between provision of obligatory and voluntary information.

The provision of food information should lead to high level of health protection as well as consumers' interests because the consumer will be able to make informed choice of food and its safe use with regard to health, economic, environmental, social and ethical aspects.

Faculty of International Relations, Department of International Law  
Dolnozemska cesta 1, Bratislava, 852 35  
Slovak republic  
e-mail: michal.klenka@euba.sk

### **Abstract**

*This article is giving an overview about the European Commission 's "Single European Sky" initiative. As a response to the dramatic growth in air travel witnessed in the last two decades, the European Commission passed two Single European Sky (SES) packages to create a legislative framework for European aviation. In order to ensure that the Single European Sky is an airspace without frontiers, the European Commission proposes in the regulation on the organisation and management of airspace to set up a unique flight information region by merging all the national regions into a single portion of airspace within which air traffic services will be provided according to the same rules and procedures. The aim is to reduce environmental pressures, and fares, since airlines' extra costs for operating within such a fragmented market are enormous. This would increase efficiency and cut costs.*

**Keywords:** *air traffic management, European air integration, functional airspace block, Single European Sky*

**JEL Classification:** *K23, K33*

### **1. Introduction**

After the first decade of the 21st century we are on the threshold of a new global order. One of the most dominant trends involved is globalization, which is a spontaneous and uncontrolled process (Czegledy, 2012, p. 38; Hauer, 2016, p. 321). The globalization of economic governance reflects the contradictory interaction of innovative communication elements of the productive forces of the information society and the need to regulate the use of dwindling traditional resources (Eletsky, 2016, p. 198). Aviation contributes much to our culture and our global economy. It shrinks the planet and integrates people of vastly different backgrounds (Klenka, 2017, p. 127). Europe needs strong transport connections to drive trade and economic growth, and to create employment and prosperity. Transport networks are at the heart of the supply chain and are the foundation of any country's economy. They allow goods to be distributed efficiently and people to travel. They make places accessible, bring and bind us together and allow us a high quality of life. Transport is a cornerstone of the European integration process and is firmly linked to the creation and completion of the internal market, which promotes jobs and economic growth. As one of the first common policy areas of today's European Union (EU), it was seen as vital for fulfilling three of the four freedoms of a common market as established in the Treaty of Rome in 1957: the free movement of individuals, services and goods. Without smooth transport connections and networks, there would be no such movement. Therefore, EU transport policy has always focused on overcoming obstacles between Member States and creating a single European transport area with fair competition conditions for and between the different forms of transport: road, rail, air and waterborne (European Commission [online], 2014).

As well as being a key sector of the economy, transport is a major contributor to the economy (4.8% – or €548bn – in gross value added overall for the 28 EU countries) and sustains over 11 million jobs in Europe. The European Commission (Commission) aims to develop and promote transport policies that are efficient, safe, secure and sustainable, to create the conditions for a competitive industry that generates jobs and prosperity (European Union [online], 2014). A strategically important sector that makes a vital contribution to the EU's overall economy and employment, aviation supports 5.1 million jobs, directly and indirectly, and contributes €365 billion, or 2.4 %, to European GDP (European Commission [online], 2014).

## **2. Problem Formulation and Methodology**

Airport together with air traffic management (ATM) services providers constitutes the key elements of the infrastructure of civil aviation. The quality, efficiency and cost of these services have become increasingly important to the competitiveness of the industry. In Europe, airports and air traffic management can safely handle up to 33 000 flights per day. Yet, Europe as a whole is inefficiently managed and unnecessarily fragmented, and a slow implementation of the Single European Sky (SES) framework means higher costs for the airlines, which directly affects their competitiveness. The estimated costs of the EU's fragmented airspace represent at least €5 billion a year. Such an inefficient use of the airspace causes higher prices and delays for passengers, increasing fuel burn and CO<sub>2</sub> emissions for operators, and impedes our efforts to improve environmental performance (European Commission [online], 2015). How will the European airspace accommodate the increasing air traffic flows, whilst cutting costs and improving its performance?

This article is developed using theoretical methods such as abstraction, analysis and subsequent synthesis, and deduction. In the early stages of research, we focus on the analysis of normative sources of law and the current state of the legal framework concerning airspace in the EU. General scientific methods will be used, especially methods of analytical synthesis, exemplification, systematic analysis and legal methods.

## **3. Single European Sky (SES)**

Since 2004, the EU has gained competences in ATM and the decision-making process has moved away from an intergovernmental practice to the EU framework. The EU's main objective is to reform ATM in Europe in order to cope with sustained air traffic growth and operations under the safest, most cost and flight efficient and environmentally friendly conditions. The answer came with the initiative of organising airspace into functional blocks, according to traffic flows rather than to national borders (EUROCONTROL [online], 2018a). This implies de-fragmenting the European airspace, reducing delays, increasing safety standards and flight efficiency to reduce the aviation environmental footprint, and reducing costs related to service provision. Achievements have already been made at operational, technological and institutional levels; efforts are ongoing to maximise the benefits of activities initiated under the SES framework. Such a project was not possible without common rules and procedures at European level (European Commission [online], 2018a). The technology required for the future single sky is provided through the Single European Sky ATM Research (SESAR) Programme, which aims to modernise infrastructure and raise efficiency by optimising capacity – and so enable the SES to become a reality. A second package of measures, known as the single European sky II (SES II), followed in 2009 and focused on the environment and cost efficiency. The aim is to modernise Europe's air traffic control system,

implement the single European sky and complete the European common aviation area. However, Europe is still far from meeting its single European sky ambitions and more efforts are needed to make sure that the benefits of a genuinely integrated operating airspace are delivered as soon as possible (European Commission [online], 2014).

### ***3.1 The Creation of the Single European Sky***

Launched by the European Commission in 1999, its primary aim was to meet future capacity and safety needs through legislation. This Communication aims to optimise air traffic management and satisfy all airspace users, whether civil or military, airspace being a common asset which should be managed collectively regardless of national borders. The Commission considered that urgent measures are still required to bring air traffic management into line with principle of the smooth operation of the internal market and ensure the creation of a SES. Airspace congestion is one of the most obvious signs that such action is needed. The delays on many European flights are frequently due to saturated airspace and infrastructure. Measures must be taken to deal with congestion and prevent crisis situations for all users. In this context, the Commission considered that the creation of a SES requires not only joint technical and operational measures, but the collective management of airspace, which should permit a substantial reorganisation of its structures and organisation. The reorganisation will be based on specific measures:

1. sectors being subdivided, and routes established regardless of national borders. This will permit the airspace to be used more efficiently;
2. the division of airspace between civil and military users taking account of the new geopolitical realities and forming part of a consistent and efficient framework.

In making its proposals, the Commission is aware that each action and change depends on the collaboration of all the actors concerned. In particular, EUROCONTROL should continue to play a vital role in realising the measures, in view of the experience it has acquired. In order to avoid any obstacles which may present themselves in the course of implementing its proposals, the Commission has set up two specific working frameworks:

1. dialogue will be opened with the two sides of industry, as they will be using and operating the single sky;
2. a high-level group will be set up under the chairmanship of the Member of the Commission responsible for transport. The group will bring together those responsible for air traffic management in the Member States and will take account of the proposals for action contained in the Annexes to the Communication. The actions include: evaluating the performance of the European air traffic management system, developing the capacity of aeronautical infrastructure, planning capacity, developing incentives, carrying out research and technological development, and standardising systems (Eur-lex.europa.eu [online], 2007).

### ***3.2 Framework for creation of the Single European Sky***

The SES means a package of measures to meet future capacity and air safety needs. It applies to both the civil and military sectors and covers the regulatory, economic, safety, environmental, technological and institutional aspects of aviation. The Regulation (EC) N° 549/2004 forms part of a package of legislation on air traffic management designed to create a SES by 31 December 2004. The objective of the SES is to ensure an optimum use of European airspace to meet the requirements of all airspace users. The SES package consists of

this framework regulation plus three technical regulations on the provision of air navigation services (N° 550/2004), organisation and use of the airspace (N° 551/2004) and the interoperability of the European air traffic management network (N° 552/2004). These regulations are designed, in particular, to improve and reinforce safety and to restructure the airspace on the basis of traffic instead of national frontiers, cover the provision of air navigation services (ANS), the organisation and use of airspace and the interoperability of the European Air Traffic Management Network (EATMN) (European Commission [online], 2018a). The objective of this regulation is to enhance current safety standards and overall efficiency for general air traffic in Europe, to optimise capacity meeting the requirements of all airspace users and to minimise delays (European Commission [online], 2014a).

The Regulation (EC) N° 550/2004 establishes requirements for the safe and efficient provision of air navigation services for general air traffic in the EU as part of the SES initiative. The regulation outlines the air navigation service provider certification procedures to be adopted by the supervisory authorities of EU countries. Certificates, valid in all EU countries, specify the rights and obligations of air navigation service providers. This includes access to services for airspace users (operators of aircraft used for general air traffic) without discrimination, and regarding safety, and the possibility of offering services to other providers, airspace users and airports within the EU. National supervisory authorities in EU countries are each responsible for designating a certificate-holder to provide exclusive air traffic services. They also ensure compliance for blocks of airspace under their control. This takes place jointly (or by agreement) if a block extends over more than one country, or if a certificate holder operates in more than one country. If a provider does not meet the requirements, the authorities concerned can take action, including revoking the certificate. The authorities then become responsible for assuring continuity of service (European Commission [online], 2015).

The Regulation (EC) N° 551/2004 objective will help to optimise the use of European airspace, reducing delays and promoting the growth of air transport. The creation of the Single European Sky seeks to:

1. increase air traffic control capacity;
2. improve safety;
3. reduce the fragmentation of air traffic control;
4. improve the integration of military systems into the organisation of air traffic control;
5. facilitate the introduction of new technology.

The ultimate objective is to enable Europeans to make journeys in a SES without frontiers, while maintaining the highest levels of air safety (European Commission [online], 2014b).

The Regulation (EC) N° 552/2004 objective will enable optimum use to be made of European airspace, which will help to reduce delays and boost growth in air transport. The aim of this regulation is to define common requirements to guarantee interoperability between the various air traffic management systems used. It establishes a harmonised system of certification for components and systems. The aim of the regulation is two-fold:

1. to achieve interoperability between the different systems, constituents and associated procedures in the European air traffic management network;
2. to ensure the introduction of new agreed and validated concepts of operations and technology in air traffic management.
  1. The implementing rules for interoperability must in particular:
    1. determine any specific requirements, in particular in terms of safety;
    2. describe, where appropriate, any specific requirements, in particular regarding the coordinated introduction of new concepts of operation;

3. describe the specific conformity assessment procedures involving notified bodies to be used to assess the conformity or suitability for use of constituents, as well as for the verification of systems;
4. specify the conditions of implementation including, where appropriate, the date by which all relevant stakeholders are required to comply with them (European Commission [online], 2014c).

On the technology side, SES is supported by the SESAR Programme, which will provide advanced technologies and procedures with a view to modernising and optimising the future European ATM network (EUROCONTROL [online], 2018a). The SES framework has been supplemented by an integrated approach towards safety by the extension of the competencies of the European Aviation Safety Agency (EASA) in the field of aerodromes, air traffic management and air navigation services, through the establishment of a Joint Undertaking (JU) on research & development, the SESAR and of a SESAR Deployment Manager. A Network Manager for the European ATM network has been created, while an independent Performance Review Body (PRB) supports the Commission in the development and management of the SES performance scheme in which Functional Airspace Blocks (FABs) have a key role to play (European Commission [online], 2018a).

The overall SES objectives will be achieved through a holistic approach that encompasses five interrelated pillars:

1. the performance pillar, comprising the Performance Scheme, the Functional Airspace Blocks, the charging regulation, the network manager;
2. the safety pillar aiming to achieve the highest safety standards through a total system approach. For this purpose, the competences of EASA have been extended to ATM and aerodromes. The early involvement of EASA in SJU's activities will facilitate transition towards deployment;
3. the technology pillar, which is the SESAR Programme that will provide the new generation of ATM technologies and procedures developed and validated by the SJU and that are compliant with SES objectives and requirements (SES technologies & procedures);
4. the human factor pillar, which places the human operators as a central element for implementing the changes to the new system and for building a genuine safety culture. The staff operating the ATM network will ultimately implement the legislative and technological aspects of the SES and, therefore, effectively manage the change brought by SES and SESAR;
5. the airport pillar ensures that SES covers all segments of flight from departure to arrival gates („gate to gate“ approach). Airports are an integral part of the ATM infrastructure and constitute critical nodes for the network's efficiency. They will benefit from SES technologies and procedures, contribute to their synchronized deployment and the optimisation of airport infrastructure (European Commission [online], 2010).

#### **4. Single European Sky II**

The four Regulations adopted in 2004 (the SES I Package) were revised and extended in 2009 with Regulation (EC) N° 1070/2009 aimed at increasing the overall performance of the air traffic management system in Europe (the SES II Package). On this basis, the Commission adopted and implemented extensive and comprehensive implementing legislation; this framework also includes more than 20 Implementing Rules and Community Specifications adopted by the Commission in view of ensuring the interoperability of technologies and

systems. Major developments have been possible due to the extensive involvement of stakeholders from the ATM community: industry partners, air navigation service providers (ANSPs), national supervisory authorities (NSAs), social dialogue with staff unions, airport authorities, the military and the certification authorities, and enhanced cooperation with EUROCONTROL (European Commission [online], 2018a).

With the SES II package, a step forward was made towards establishing targets in key areas of safety, network capacity, effectiveness and environmental impact (EUROCONTROL [online], 2018a). Its ultimate objective is to increase the economic, financial and environmental performance of the provisions of the ANS in Europe. In particular, the amendments to the SES I regulatory package introduced a comprehensive EU-wide Performance Scheme; a refocus of the Functional Airspace Blocks to be not just about airspace but service provision in general, and a Network Manager, that is a centralised function at EU level to carry out the management of the ATM network functions (airspace design, flow management) and management of scarce resources (transponder code allocations, radio frequencies). The SES drove the transformation of the role of EUROCONTROL, as defined in Commission Regulation (EU) N° 677/2011, the function of Network Manager has been entrusted to EUROCONTROL up to 2019. Furthermore, it extended the competences of EASA to air traffic management and thus shifted rulemaking support for technical implementing rules, as well as oversight of Member States, from EUROCONTROL to EASA (European Commission [online], 2018b).

## **5. Functional Airspace Block (FAB)**

Although airspace is a common resource, ATM in the EU is still largely organised in a fragmented way, mostly according to national boundaries. Every time a plane enters the airspace of a Member State, it is serviced by a different ANSP because of different rules and operational requirements. Each service provider procures tailored equipment and most maintain their own training schools and all other support functions. This fragmentation impacts on safety, limits capacity, and above all, adds to cost. The key to improved capacity and efficiency, enhanced safety and lower costs for air navigation services, is through enhanced cooperation and integration across borders (European Commission [online], 2018c).

The establishment of functional airspace blocks was aimed at fostering increased cooperation between and the integration of air navigation service providers, irrespective of national borders. The FAB concept was expounded in the first legislative package of the SES I namely Regulation (EC) N° 1070/2009 amending Regulation (EC) N° 549/2004, as an airspace block based on operational requirements and established regardless of State boundaries, where the provision of air navigation services and related functions is optimised through enhanced cooperation among air navigation service providers or, when appropriate, an integrated provider, always in a performance-driven perspective. The SES II tackled the creation of FABs in terms of air navigation services provision, in addition to the airspace organisation issues (EUROCONTROL [online], 2018b).

This also implies civil-military coordination in airspace and air traffic management. FABs shall be established regardless of State boundaries. The provision of air navigation services shall be performance-driven and optimised. FABs will become drivers for performance and change the landscape of ATM service provision; they will provide an invaluable tool for ANSPs in reaching binding performance targets. Together with the introduction of a performance regulation and a strengthening of the ATM network functions, the acceleration of the creation of FABs represents the key measure in the new regulatory approach to reach the objectives to enhance current air traffic safety standards, to contribute to the sustainable development of the air transport system, and to improve the overall performance of air traffic

management and air navigation services in Europe. FABs are a vital for reducing airspace fragmentation and are necessary to accommodate the steadily growing traffic, as well as to minimise delays by managing the traffic more dynamically. Objectives for enhancing current safety standards and overall efficiency can best be achieved by increasing the scale of operations, regardless of national borders. This also implies civil-military coordination in airspace and ATM. Under EU legislation, Member States are legally obliged to seek and investigate the possibilities for cooperation that would best meet the objectives whilst ensuring that several requirements are met before establishing FABs through agreements between Member States. Such agreements should also cover the issues of responsibility and liability. Moreover, FABs will become drivers for performance and change the landscape of ATM service provision as they will provide an invaluable tool for ASNPs in reaching new binding performance targets put in place as a consequence of the implementation of the EU Performance Scheme. The formal establishment of FABs was the first aspect monitored by the Commission and implementation is still far too slow for almost all FABs. Delays in delivering operational FABs are holding back the implementation to a significant degree, which in turn generates inefficiencies in the entire European air traffic management system. This results in extra costs of close to € 5 billion a year which are passed on to airlines and their customers in addition to increased journey times, delays and emissions (European Commission [online], 2018c).

## **6. Single European Sky 2+ (SES2+)**

The 2009 SES II package has shown great promise, especially about the application of a more hands-off performance-oriented model of economic regulation. With the implementation of that approach, important lessons have been learned that needed to be included in the regulations to refine the approach. Additionally, the SES II initiative left some overlaps in legislation, so that same provisions were found in several pieces of legislation. To perform these updates, the Commission proposed an interim update of the SES rules, called Single European Sky 2+. The SES2+ proposal was made in June 2013 and is currently in the process for approval by the European Parliament and Council. It focuses on seven main areas: Independence and resources of National Supervisory Authorities (NSAs); Support services; Customer focus; Performance scheme and the Performance Review Body (PRB); Functional Airspace Blocks (FABs); Network Manager (NM); EASA, EUROCONTROL and the institutional landscape. So far, the European Parliament and Council have agreed on their initial positions and in the next step of work, they should agree on a compromise position to enter into force as soon as possible (European Commission [online], 2018b).

## **7. Conclusion**

The Single European Sky is a concrete example of where the EU can make a difference by raising capacity, improving safety and cutting costs while minimising aviation's environmental footprint. This was the initial ambition more than a decade ago, but, the project is still not delivering. Despite some achievements towards a better performing network, the level of cooperation between Member States air navigation service providers is still far from optimal, and the technology used is not harmonised or state-of-the-art. EU Member States must overcome these challenges to achieve a true Single European Sky, which is one of the most fundamental challenges affecting the performance and competitiveness of the EU's aviation system today. For example, a fully optimised air traffic management system would reduce the costs stemming from inefficiencies (delays, and longer routes etc.). As an important step in unleashing this potential for the EU aviation sector, the Commission urges the Council and

European Parliament to adopt the Single European Sky (SES2+) proposals, to ensure the effectiveness of functional airspace blocks and network functions and the swift implementation of the EU-wide targets for the performance scheme based on a fully independent performance review body. The efficient governance of the SES remains a priority for the Commission. The respective tasks of the EASA and EUROCONTROL should be defined in a manner that ensures that both organisations complement each other's tasks, so that overlaps can be avoided, and costs reduced (European Commission [online] 2015).

The SES does not stop at the border of the European Union. Its extension to third 'neighbouring' countries primarily relies on the EU's policy in the field of international relations. This policy, which gives priority to the association and/or integration of third countries into the EU legal framework, also considers the added value of regional cooperation activities carried out at the level of international organisations, such as the International Civil Aviation Organisation and EUROCONTROL. EU representatives are active in these organisations to ensure overall consistency between its action in the external field and action undertaken under the aegis of such organisations. Cooperative operational arrangements with ANSPs from key partners of the EU are also being promoted by the Commission as a significant task of the Network Manager in order to better manage intercontinental traffic to/from the EU and improve the performance of the European ATM network (European Commission [online] 2018a).

### **Abstract**

*Nowadays, free-to-play revenue model is growing in popularity with both game developers and players. The basic game is provided free of charge, but players are encouraged to purchase virtual goods, varying from cosmetic elements such as new skins for game character to items offering significant advantage over other players. Due to the relative newness of this phenomena, little research has been devoted to this topic, especially in the European region. In this paper, we identify motivations and antecedents influencing the purchasing behavior of free-to-play gamers, such as the support of the game developer, gaining advantage in the game or player's relationship to their game character. We conduct a quantitative study of 1 107 European gamers (from Czech Republic and Belgium) to compare whether overall attitude, average spend on virtual goods and factors influencing customer's behavior vary across the nations. This approach also allows us to develop a typology of free-to-play gamers in Czech Republic and Belgium.*

**Keywords:** customer behaviour, European gamers, free-to-play games, virtual goods

**JEL Classification:** D12, M31, M37

### **1. Introduction**

According statistics, almost 80 % of the EU inhabitants use the internet regularly and more than half of the EU inhabitants bought some goods on the internet (Pawlasová, 2016). Furthermore, many users from younger generations are highly dependent on the technology (Valečková, 2016). The video game industry is no exception. It is not the obscure relative of movie or book industries it once was. While there are some difficulties in comparing the industries, mainly due to different revenue models, video game sales were almost two thirds of movie sales in 2014 according to Egenfeldt-Nielsen et al (2008), reaching 64.9 billion USD.

Certain part of this growth can be accredited to the rise of free-to-play video games. According to Alha et al (2014), free-to-play games are acquired and played free of charge, but players are encouraged to purchase virtual goods during the play, which can take the form of in-game benefits over non-paying players or skins for game character. In contrast, traditional pay-to-play games require players to purchase the game either upfront or in the form of monthly subscription.

While the phenomena itself is nothing new and can be traced back to the 80s and 90s shareware culture (Cox, 2012), the rise of modern free-to-play titles begun in the early 00s with titles such as RuneScape or MapleStory. Most of these games were produced mainly for the markets with lower purchasing power such as South Korea, Russia or Brazil, the increased competition

for those games soon led some traditional pay-to-play or subscription based games such as Lord of the Rings Online or Dungeons and Dragons Online (Tack, 2013) to be transitioned to the free-to-play model in the late 00's even in the developed markets.

Despite the obvious importance of video game industry and especially the free-to-play phenomena, we find relatively low number of scientific publications in this field. Our aim in this study is to focus on the motivations and reasons that lead gamers to purchase of in-game goods using the Theory of Consumption (Sheth et al, 1991). We also provide a segmentation of gamers and their classification by variables such as age, income and gender. Furthermore, our sampling allows us to compare Czech and Belgian gamers.

## **2. Literature Review**

While free-to-play games are present on various gaming platforms, including PC and console game markets, the free-to-play-games are particularly strong in the mobile and massive multiplayer online (MMO) games segments. The worldwide smartphone market still grows (Spáčil, 2016), which in turn helps to spread the mobile games. In mobile games, in-app purchases in free-to-play made 79 % of total revenues in 2014 in iOS and Android games (Grubb, 2014), with games such as Candy Crush Saga, Clash of Clans or Pokemon GO. Free-to-play massive multiplayer online games are also gaining popularity. The leading title in this category, League of Legends, made 2.1 billion USD revenues by itself in 2017 (Stewart, 2018).

### **2.1 Free-to-Play Revenue Model**

Some free-to-play games don't contain any revenue model and are distributed under freeware license model, generally being released as either fan-made projects or as a part of promotion campaign. Free-to-play games are also not to be confused with game demo versions or trial periods, which some pay-to-play games use to demonstrate the quality and elements of the full version with limited features or game time. Most of free-to-play use a revenue model that is usually called "freemium" (Kumar, 2014). In this model, the game is free to download and play. Players can opt to pay for acquiring game boosts, extra lives or other advantages over non-paying players. Other paid benefits can be merely cosmetic or symbolic, such as graphical enhancements (skins) for player character or other game elements (weapons, vehicles etc.) (Berlo & Liblik, 2016).

In some cases, virtual currency is established and used to purchase virtual goods (Frieling, 2013). Players can either gain the currency by completing game objectives, or by outright purchasing it for real-world money. Usually, this currency is one-way, meaning the currency is only available from the vendor and not from other players, and can't be exchanged back for real-world currency. However, in several rare cases (such as Linden Dollars in Second Life), the virtual currency is freely convertible (two-way), so the players can actually make money by playing the game (Frieling, 2013). The process of purchasing a virtual goods (or virtual currency, which is then used to purchase virtual goods) is often called "microtransaction" (Berlo & Liblik, 2016). It is also worth noting that some authors, such as Alha et al (2014), use the terms free-to-play and freemium interchangeably.

Moreover, the terms freemium and microtransaction is somewhat controversial and is sometimes used in a derogative sense. According to Alha et al (2014), in some games, paying players are offered unfair advantage over non-paying players (pay-to-win approach). In some cases, non-paying player's progress through the game is made very difficult, creating a "paywall". The authors convincingly show that these practices are perceived as unfair and negative by players.

## 2.2 Theory of Consumption Values

Ho & Wu (2012) use Theory of consumption, which was first developed by Sheth et al. (1991) values, to establish context of researching the intent of purchasing virtual goods. Originally, there are five values influencing customer's decision to purchase certain product: functional value, social value, emotional value, epistemic value and conditional value. However, extant literature (Guo & Barnes, 2011; Ho & Wu, 2012; Lehdonvirta, 2009) suggests that due to the specific characteristics of virtual goods, only three groups of motivating factors are particularly important: functional, hedonic and social factors.

Just as ordinary goods have their functionality, people have some demands in terms of **functional values** and performance of virtual goods. Performance of virtual goods is measured most often by the price and benefit of the purchase. Players want to know that buying was worth the cost and helped them to get higher in the players' ranking. So, if are the functional factors important for a player, we can say that his motivation to purchase is mainly in the progress of their character (Van Berlo and Liblik, 2016).

There is no doubt that people feel good feelings when buying goods (**hedonic values**). These feelings are related to the satisfaction of their inner needs and enjoyment. Hedonism also sees the aesthetic aspect of the matter and puts emotion at the forefront. In the online games world, you can also find a hedonistic view of the players because it is not just the functional benefits that players acquire by purchasing virtual goods (Van Berlo and Liblik, 2016). Many players take into account the visuals of their character, the design of the game environment in which they exist. According to individual tastes, they create an aesthetic visual in the game.

Gameplay represents also a **social value** for gamers. It is based on communication and cooperation with other players and social groups. This can have a positive or a negative reaction, which depends on how the teammates react to the purchase of virtual goods to other players. Some authors have already stated that by purchasing goods people want to express their social status and prestige (Bourdieu, 1984). Even when purchasing virtual goods it is. Players often buy virtual goods also to develop relationships with other players. At the same time, they express their game level and experience in the game (Berlo & Liblik, 2016). Buying virtual goods is a way how to distinguish themselves from other players.

## 3. Research Methodology

To examine the attitude and motivation of gamer's purchase of virtual goods, we adopt quantitative approach, using online questionnaire. While some authors apply qualitative approach to a similar issue (see Berlo & Liblik, 2016; Alha et al., 2014), our aim in this paper is to come up with a segmentation of gamers based on their motivations. To develop such segmentation, we use factor and cluster analysis (similarly to Frank et al; 2015) for the typology followed by statistical testing to find out whether segmentation influences gamer's purchasing behaviour. We conclude the analysis by testing the effects of country of origin on gamer's segmentation and said behaviour.

### 3.1 Data Collection and Sampling

We used an online questionnaire to collect the data. In the introductory part, we explained what we mean by free-to-play games and premium content. The main item of our questionnaire were 27 statements inquiring about gamer's opinions on free-to-play games and motivations to purchase premium content. The statements were adapted from the works of Frank et al (2015), Ho & Wu (2012) and Lin & Sun (2007) and elaborated to enable us to study more of Sheth et

al. (1991) consumption values. The respondents were requested to express their agreement on a 5-point Likert scale. The statements are presented in the Appendix. The respondents were also asked about their purchasing behaviour – frequency and usual monthly spend in free-to-play games. Further questions included gamer's favourite free-to-play titles and demographic questions - their age, income, economic status and gender.

The data was collected from October 2017 to January 2018. We collected data from two European Union countries – Czech Republic and Belgium. Similarly to Frank et al. (2015), we used non-probability sampling technique of judgemental sampling (Malhotra & Birks, 2006). As gamers tend to form coherent communities (Hsiao & Chiou, 2012), we inserted a link to our survey on several free-to-play gaming forums and social media sites both in Czech Republic and Belgium, asking gamers for their input. In the end, we collected data from 1 107 respondents. This dataset is significantly larger than in similar studies by Frank et al. (2015) (98 respondents) and Ho & Wu (2012) (523 respondents).

### **3.2 Methods of Analysis**

Factor analysis is a multidimensional statistical method used for data reduction and summarisation. There may be a large number of variables, most of which are correlated and which must be reduced to a level, which is acceptable (Malhotra & Birks, 2006). In this case, factor analysis was used to identify the basic factors to identify smaller groups within a large dataset. We worked with the exploratory factor analysis.

One of the very important goals of factor analysis is to review the structure of relations between the tracked variables and get notice, if it is possible divide them into groups, in which variables from the same groups correlate more than variables from the different groups. The next goal of factor analysis is to create new uncorrelated variables (Hebák et al., 2007).

The estimation of the factor analysis model is based on the principal component analysis. The basic approach is to reduce the size of a task and to create new (auxiliary) variables (Řezanková, 2011).

The next step in this research was cluster analysis. We applied hierarchical and also non-hierarchical clustering. Hierarchical clustering was used to find the appropriate number of clusters. We applied Ward's procedure and as a distance, author of this article used squared Euclidean distance, as suggested in Malhotra & Birks (2006).

We entered the factor loadings (created in the factor analysis) into the hierarchical clustering to determine the ideal number of clusters. Using the agglomeration schedule, we determined that 5 clusters are ideal (Řezanková, 2011). Non-hierarchical cluster analysis was then used to determine cluster membership for each case.

## **4. Findings**

In this section of the paper, we disclose the results of our analysis. First, we focus on the typology of the gamers and then on the effects of country of origin.

### **4.1 Typology of Free-to-play Gamers**

Both results of the KMO measure of sampling adequacy (0.856) and Bartlett's Test of Sphericity (Sig. < 0.001) are well within recommended values (Field, 2013), and we can therefore proceed with the factor analysis. Using the Eigenvalue-one criterion, we determine that our original 27 variables were reduced to 7 factors with total variance explained 58.60 %. Varimax rotation was used. Results of the factor analysis are seen in Table 1.

**Table 6: Results of the Factor Analysis**

Factor	Variables						
	V19	V26	V27	V18	V20	V17	V24
Social	V8	V13	V16	V14	V7		
Functional	V10	V9	V15				
Hedonic	V23	V22	V21				
Quality	V5	V6	V12	V11			
Economic	V3	V4					
Identification	V1	V25	V2				
Emotional							

Source: author's calculation

Then, we combined the works of Sheth et al. (1991), Frank et al. (2015), Berlo & Liblik (2016) and Ho & Wu (2012) to name the factors, using the variables loaded into each factor as a base and utilizing the common theory of consumption values terms.

The first factor comprises mainly of variables concerning player's social motivations, such as reviews (V20) or friend's recommendations (V19). The second factor consists of variables regarding the functional aspect of virtual goods and their ability to help players gain advantages over non-players (V8, V13).

The third factor is composed of variables concerning the visual aspect of the game (V9, V10) or enabling better self-expression (V21). Fourth factor describes the general quality standards of premium content, including the graphical quality (V21, V22).

The fifth factor comprises of economic factors such as the reasonability of premium content prices (V5, V6), and support of game developer (V11). Sixth factor consists of two variables concerning player's relationship to their game character and their goals (V3, V4). Finally, the seventh factor relates to the emotional response to gameplay (V1, V2) and balance of premium content within the game (V25, this item has negative factor loading – if gamers think premium content generates unbalance in the game, it raises the value of the factor).

To develop the typology of gamers based on their beliefs and motivations, cluster analysis was used. First, we applied hierarchical cluster analysis to determine the ideal number of clusters. Using agglomeration schedule, we found out that 5 clusters would be most suitable. Then, we used non-hierarchical cluster analysis (k-means) to determine cluster centres and cluster membership for each case. We named each cluster based on cluster centres for each factor (see Table 2 on the next page): Social aesthetes, Economic aesthetes, Satisfaction seekers, Egocentrics and Performers.

**Table 7: Cluster Centers with the Lowest and Highest Value Highlighted**

	Cluster names				
	Social aesthetes	Economic aesthetes	Satisfaction seekers	Egocentrics	Performers
Cases in each clusters (n)	211	195	154	229	250
Social	0.4566	0.5363	-0.3614	<b>-0.9564</b>	0.2950
Functional	<b>-0.8729</b>	0.2847	-0.7271	0.3303	<b>0.6601</b>
Hedonistic	<b>0.7292</b>	0.5809	-0.6749	0.2172	<b>-0.8518</b>
Quality	-0.3130	0.2381	0.2344	0.1271	-0.1823
Economic	-0.1564	<b>0.7095</b>	-0.8508	0.2307	-0.1086

Emotional	-0.0612	-0.1543	<b>0.4770</b>	<b>0.4948</b>	-0.5752

Source: author's calculation

We proceeded with a chi-square test of independence to examine the relation between respondent's purchase of premium content purchase and their cluster membership. The relation was significant with  $\chi^2(4, N = 1039) = 70.24, p < 0.0001$ . See Table 3 for the relative frequencies (portions) for each cluster for the "Premium content purchase" variable.

**Table 8: Premium Content Purchase Based on Cluster Membership**

		Cluster names					Total
		Social aesthetes	Satisfaction seekers	Economic aesthetes	Egocentrics	Performers	
Premium content purchase	yes	37.4%	63.6%	70.1%	65.9%	72.8%	62.8%
	no	62.6%	36.4%	29.9%	34.1%	27.2%	37.2%

Source: author's calculation

The segment of Social aesthetes is far less likely to purchase premium content than the other groups (37.4 %). On the other hand, the segment of Performers (gamers who focus mainly on the functional value of the premium content and use it to gain in-game benefits over non-paying gamers) is the most likely to purchase premium content (72.8 %).

#### 4.2 The Effects of Country of Origin

After coming up with the typology of gamers, we focused on another variable present in our research: gamer's country of origin. Because of to the cultural and economic differences between the two countries, where we conducted the survey (Czech Republic and Belgium), some differences in behavior can be expected. Due to the rather limited range of this paper, we focused on two influences: cluster membership and the Premium content purchase in each country.

Chi-square test of independence was used to determine the relation of the Cluster membership and Country of origin. The relation was significant with  $\chi^2(4, N = 1039) = 35.69, p < 0.0001$ . In Table 4 (see next page), the relative frequencies are presented for each of the clusters and country. Perhaps rather surprisingly, Belgian gamers tend to be more in the function-focused clusters (Egocentrics and Performers), with Czech gamers more often occupying the hedonistic segments of Social and Economic aesthetes.

**Table 9: Cluster Membership Based on Country of Origin**

		Cluster names				
		Social aesthetes	Satisfaction seekers	Economic aesthetes	Egocentrics	Performers
Country	Czech Republic	20.2%	14.1%	23.2%	19.8%	22.7%
	Belgium	13.0%	17.9%	8.7%	30.9%	29.5%
Total		18.8%	14.8%	20.3%	22.0%	24.1%

Source: author's calculation

We proceeded with the chi-square test of independence for variables Country of origin and Premium content purchase. The relation was significant with  $\chi^2(1, N = 1093) = 5.52, p < 0.05$ . The relative frequencies are displayed in Table 5. Higher proportion of Belgian gamers tend to purchase premium content in free-to-play games (69.4 % compared to 60.7 % of Czech gamers).

**Table 10: Premium Content Purchase Based on Country of Origin**

		Country		Total
		Czech Republic	Belgium	
Premium content purchase	yes	60.7%	69.6%	62.4%
	no	39.3%	30.4%	37.6%

Source: author's calculation

## 5. Conclusion

This paper investigates the genre of online free-to-play games and purchasing of premium content by the players. Using an online questionnaire, we surveyed 1 107 gamers from two countries, which we used to develop a typology. Using the theory of consumption values, we identify seven factors influencing the purchase of premium content. Applying the statistical test of independence, we found out that some segment of gamers (e. g. the Performers, who seek mainly functional values) are more likely to purchase the premium content.

Furthermore, there is a significant effect of country of origin. Belgian gamers are more likely to purchase premium content than Czech (69.6 % to 60.7 %), while their cluster membership is also varying (Belgian gamers tend to belong to the functional Performers and Egocentrics clusters more, while Czech gamers seem to prefer the more hedonistic factors in segments of Social and Economic aesthetes).

Our research also extends existing theory of consumer values in the field of video games (see Guo and Barnes, 2011; Ho & Wu, 2012; Lehdonvirta, 2009), as those authors were able to identify only 3 values. In our study, we identify 7 influencing values (see Table 1).

While our sample size is quite significant and by far the largest of similar studies, it is still quite limited. We used the method of judgemental sampling, using the forums and social media sites for popular free-to-play games. Gamers who participate in such forums could be potentially different from the population of said game, as they have already invested the time in being part of the community, and their behaviour could vary from the general, casual players of free-to-play games. However, these casual players are rather hard to identify and survey.

Our research could also spread into more diverse countries with different attitude to gaming and other characteristics, which is also the goal of the authors. We also plan to explore more variables within the research, such as the genre of games played, or frequency and amount spend on the purchase of premium content.

### **Appendix: Questionnaire Statements**

- 10.1. I am satisfied with this type of games.
- 10.2. When I play free-to-play games, I am more satisfied than I am playing paid games.
- 10.3. When I play an online game, I identify myself with the game character.
- 10.4. The goals of the character become my own goals.
- 10.5. The price of a premium content is reasonable.
- 10.6. Premium content is a good product given the price.
- 10.7. If I use a premium content, I can enjoy the game more.
- 10.8. I buy a premium content, because it gives me an advantage in the game.
- 10.9. I buy a premium content, because I want to improve my self-expression to other players.
- 10.10. I buy a premium content, because my game character(s) look better and/or more attractive.
- 10.11. When I buy a premium content, it is important to me that I support the game developer for their work as well as the future development of the game.
- 10.12. Using a premium content helps me make new friends.
- 10.13. I buy game bonuses that bring some advantages (e.g. faster healing, faster restoring mana, faster getting materials, more XP, etc.)
- 10.14. I buy virtual goods that bring new equipment to the game (heroes, tanks, additional equipment for heroes, etc.)
- 10.15. I buy virtual goods that change the game design (skins for equipment, avatars, changing of profile picture, changing view of game surroundings, etc.)
- 10.16. If possible, I buy a premium account which brings me more advantage together.
- 10.17. Special events motivate me to buy premium content (Halloween events, Christmas events, Easter events, Birthday of game events, Summer events, etc.)
- 10.18. Newsletters or banners with news in the game motivate me to buy premium content.
- 10.19. Recommendations from friends motivate me to buy premium content in the game.
- 10.20. Review from streamers motivate me to buy premium content in the game.
- 10.21. Premium content has an acceptable standard of quality.
- 10.22. Premium content is graphically sophisticated enough.
- 10.23. The offer of premium content is sufficient.
- 10.24. The offer volume of premium content should be extended.
- 10.25. Premium content creates improper balance in the game.
- 10.26. My willingness to buy premium content will grow in the future.
- 10.27. I would buy more premium content if I played the game long enough.

## Smart Specialization Concept as a Way of Regional Innovation Performance Boosting

### **Abstract**

*The concept of smart specialization represents a theoretical approach that suggests an entrepreneurial process of discovery as a way to reveal the areas in which a country or region does the best. In practice, this concept focuses on priorities of regional innovation policy. The concept has been developed within the "Knowledge for Growth" Expert Group advising the EU Commissioner for Research in the field of achieving of Lisbon Strategy goals. Based on this concept, the initiative Research and Innovation Strategies for Smart Specialization RIS3 was launched. All countries and regions have to design their own RIS3 strategies if they want to use the European Structural and Investment Funds to support innovation activities. The paper analyses these key strategic documents for the 2014-20 programming period in Czech regions. It deals with the visions of individual regions as well as the definition of key areas of change and strategic objectives. The evaluation is focused on definitions of individual concepts, particularly regional visions, the specification of areas of change and the reality of the objectives set.*

**Keywords:** European innovation policy, innovation, region, research and development, smart specialization

**JEL Classification:** R11, O31, O38

### **1. Introduction**

In developed countries, innovations represent a key factor for economic growth and socio-economic development. However, the innovation activity is spatially uneven and many countries and regions are not able to exploit their innovation potential (Prokop et al., 2017). This topic is strongly emphasized by institutional theories whose ideas have a significant impact on public policy. In the last about 30 years, innovation policy has shifted increasingly to the regional level (e.g. Hlaváček, 2017). Particularly, this is caused by two facts: The first of them is that innovations are perceived as a territorial phenomenon. Innovations are often the result of specific local conditions that cannot be quickly and cheaply copied or transferred elsewhere. Thus, the regional environment has an important role as the background of the innovation processes (Páger, 2015). The second one is the heterogeneity of the regions, which makes it impossible to create a policy mix that is universally applicable in each region. Policy tools have to be rather tailored to the specific conditions of a particular region. (Isaksen and Nilsson, 2013)

The fundamental requirement for a regional innovation policy is that it has to be based on the region's socio-economic environment and has to focus on the specific needs and problems of

the region. This approach is often called "place-specificity" (e.g. Morgan, 2017). Creation of regional innovation strategies is quite a new phenomenon in the Czech Republic and individual regions differ in experience with it. Another problem can be the fact that regions have limited financial resources for innovations directly governed by regional bodies and they often depend on the sources from the European Union (Šipikal and Parížková, 2009).

The objectives of our article are to compare the application of the smart specialization concept in the Czech regions with low knowledge and innovation potential and to evaluate the visions and strategic objectives of their Research and Innovation Strategies for Smart Specialization (RIS3) strategies with respect to the reality of their achievement. The Ústí, South Bohemian, Hradec Králové and Vysočina Regions have been selected as the regions with low knowledge and innovation potential.

## **2. Development of Smart Strategy Concept in the European Union**

The European Union (EU) approved innovation policy as its political priority, because through its implementation many problems can be solved (Lipková, 2012). In the context of adapting public policy to specific regional conditions, the place-based approach is broadly discussed in scientific literature as well as policy debates. Place-based policy is defined as a long-term strategy oriented to the fight against unexploited potential and elimination of persistent social exclusion at specific locations through external interventions and multi-level governance. The core idea of the approach is that geographical context really matters. Another important feature of this approach is the interventions based on the partnership among different government levels and a combination of knowledge from local and external resources. A place-based approach accents that there are different development paths and that it is necessary to pay attention to details and the institutional context. (Barca et al., 2012) For policy purposes, this approach has been further developed by Barca (2009) in his report for the European Commission that dealt with the reform of the European Cohesion Policy. This report emphasized that the reform of cohesion policy requires a strong political concept and a focus on priorities. It recommended defining about 3 or 4 key priorities for which approximately 60% of resources will be allocated. Innovation was mentioned as the first priority.

While the place-based approach is focused on general public policy, the concept of constructing regional advantage approach (CRA) concentrates more on innovation. This concept stems from similar theoretical ideas. The CRA approach builds on theory development: comparative advantage - competitive advantage - constructed advantage (Cooke, 2007). This concept builds on the theory of competitive advantage developed by M. Porter (1998), but enriches it with the ideas of the concept of innovation systems (Asheim et al., 2011), particularly knowledge base concept (Asheim and Coenen, 2009) and theory of related variety (Boschma and Iammarino, 2009). Constructing regional advantage has to be based on the unique capabilities of regional actors, not just research efforts. Each industry can be innovative, the division of the industries into high-tech and low-tech is not relevant and the regions should build their advantage on the development of the industries that have tradition there. (Asheim et al., 2011) In the practical policy context, the CRA concept is used by the expert group set up by the European Commission (DG Research) and led by professor P. Cooke (European Commission, 2006).

Recently, the greatest attention of the political sphere has been put on the concept of smart specialization, which also stems from the above-mentioned theoretical ideas. This concept deals with the selection of regional innovation policy priorities, in particular (McCann and Ortega-Argilés, 2013). The emergence of the concept is attributed to the expert group Knowledge for Growth led by prof. Dominique Foray, that acted as an advisory body to

Commissioner Janez Potočnik in the area of achieving the objectives of the Lisbon Strategy (European Commission, 2010). The concept suggests entrepreneurial processes of discovery to help identify where the region is doing best. In other words, it is about finding out the research and innovation domains in which the region can excel. Subsequently, the region should orient its specialization around these domains. (Foray et al., 2009) Innovation policy should reinforce strategic technological diversification around key domains and, in particular, build on "technology of general purpose" (sometimes called as key enabling technologies).

An important milestone of the regional innovation policy in Europe was the launch of the RIS3 initiative (Research and Innovation Strategy for Smart Specialization) in 2014, which was inspired primarily by the smart specialization concept, but also by the CRA concept. This initiative has a significant impact on the allocation of resources from the European Structural and Investment Funds to research, development and innovation. In other words, if any EU member state wants to get funds for this field, the ex-ante conditionality is to prepare its own national RIS3 strategy and possibly its regional annexes. The national / regional RIS3 strategies represent an integrated and place-based approach to economic transformation that is built on these 5 key characteristics: focus on national and regional priorities, based on strengths in each country / region, support for practice-based innovation, involvement of stakeholders, and monitoring and evaluation (European Commission, 2012).

### **3. RIS3 Strategies in Regions with Low Innovation Potential**

In our paper, we have focused on four regions in the Czech Republic that have a low knowledge and innovation potential in the long term. According to the analysis by Žitek and Klímová (2016), the Ústí (ULR), South Bohemian (SBR), Hradec Králové (HKR) and Vysočina (VYS) Regions belong to this group of regions. The analysis evaluates the period from 2006 to 2012, and although some of these regions have made some improvements in some indicators, no significant structural change has been detected. There has not been observed any larger differences among the selected regions in terms of overall rating.

The analysed regions have the lowest R&D expenditures expressed as a percentage of GDP (values between 0.45 and 1.24% in 2012). The Ústí Region and the Vysočina Region have below-average share of employees with university degree in the total number of employees. The Ústí and Hradec Králové Regions have a strongly below-average share of enterprises that have introduced technology innovation (according to the survey on innovation activities, CSO 2014). These regions have a logic natural need to eliminate the mentioned shortcomings. However, the extent to which the regions can be successful by 2020 remains a question.

#### **3.1 Strategic Visions**

The introductory point of the design part of RIS3 strategies is their strategic vision. Table 1 shows how the four regions defined their vision. Although we cannot expect more than general ideas from the formulation of strategic visions, let us comment on some facts about the practicability of achieving the vision. The statement "The Usti Region's economy is growing" is quite universal and the economic situation will depend on the general economic situation in 2020. It will show over time, whether the knowledge-intensive industries are developed in the region. Nevertheless, we appreciate the intention to cooperate more intensively with Saxony and this can be good opportunity for this region. A problematic is the question of cooperation "with enhanced regional research" in the region without greater tradition of research. The vision of the South Bohemian Region is limited to a statement of general conditions for the implementation of the mentioned activities, and therefore can be considered realistic.

However, this vision is not sufficiently concrete and ambitious. The Hradec Kralove Region is in a different situation. Although it has the potential of qualified people, it does not achieve good results in innovation enterprise and excellent research. The essence of the Vysočina Region's vision is "systemic support". On the one hand, the Vysočina Region practically does not have R&D capacities in the public sphere, on the other hand, there are many companies with their own R&D activities. It is therefore a question how the policy makers will manage to propose a stimulating support system that will be attractive to the relevant industries in the region.

**Table 1: Strategic Visions of the Selected Regions**

<b>Ústí Region</b>
The Ústí Region's economy is growing and creating job opportunities for educated people. Traditional industries are upgrading, increasing their added value and looking for new directions for development. There is an increase in the number of enterprises that actively use and exploit knowledge and new technologies. This is reinforced by cooperation with enhanced regional research as well as R&D centres in the Czech Republic and Saxony.
<b>South Bohemian Region</b>
The South Bohemian Region is attractive for living and work of talented people, offering attractive conditions for business, investments and innovations, both in the traditional and the new industries that use the knowledge base of the emerging local science and research sphere.
<b>Hradec Králové Region</b>
The Hradec Králové Region – A competitive region with developed innovation enterprise, excellent research and qualified people.
<b>Vysočina Region</b>
The Vysočina Region will be ranked among the regions systematically supporting research, development and innovations by 2020, through specialization on selected traditional as well as new prospective industries with a significant growth potential.

### 3.2 Key Areas of Change and Specific Objectives

The crucial element of the implementation of the RIS3 strategy is the identification of the key areas of change (KAC), strategic (SC) and specific objectives. Their structure is significantly different in the analysed regions and to a certain extent illustrates the approach of regional authorities to knowledge and innovation management. In general, the RIS3 strategy of the Hradec Králové and Ústí Regions seems to be the most sophisticated.

#### 3.2.1 Ústí Region

The Ústí Region considers human resources and technology transfer as a key focus of the RIS3 strategy. In particular, the former is an important barrier to the development of the region. The strategic objectives within the first KAC are oriented to all levels of education. Popularization of technical fields is primarily concerned to primary schools. The region expects to increase interest in technical secondary schools that produce an insufficient number of graduates. It also expects a close cooperation with businesses. In the case of university graduates it is stated that the only public university in the region produces other type of graduates than those that are demanded in the region. At the same time, graduates are not usually willing to do business themselves. The region will therefore strive for changing the situation. For the second KAC, the starting situation is more complicated for especially two reasons: a lack of information of research organizations and enterprises about the needs and possibilities of the other part, and companies in the region are often not innovative and do not need R&D results. The stated objectives aim at overcoming barriers and support for research activities in the region.

With regard to the indicators that determine the success of the RIS3 implementation (low R&D expenditures expressed as a percentage of GDP, low share of enterprises with R&D as the main activity, low share of enterprises that have introduced technical innovation), it is clear that it will be difficult to achieve targets concentrated on R&D and technology transfer. The region correctly perceives their importance and has to apply various measures to make progress in these areas. On the contrary, some progress can be achieved in the area of human resources through cooperation with businesses, as the strategy rightly supposes.

### *3.2.2 Hradec Králové Region*

The Hradec Králové Region has developed its key areas of change into four domains. In particular, the first three of them (the fourth is the implementation of RIS3) demonstrate the rich experience of strategy makers: increase in innovation performance, excellent public research and the development of human resources for R&D. These domains can certainly be crucial for competitiveness increase. As regards innovation performance, which is very low in the region, the strategy searches for a way of raising interest in doing business in general through consultancy, education and popularization activities. At the same time, it tries to create a system of support for R&D activities in enterprises, particularly to support their ability to cooperate and network. In the case of the second KAC, like the Ústí Region, the Hradec Králové Region also tries to declare its ambition to support R&D transfer. The suggested ways are both promotion of applied research in public research organizations and an increase in the motivation of companies to exploit the results of public R&D. In the field of human resources, it is considered important to popularize science and technology already at primary schools, and to increase the share and quality of graduates of vocational schools. Strong emphasis is put on cooperation of enterprises and schools. According to the RIS3 strategy, it is necessary to set up mechanisms for timely capture of talented students. Simultaneously, the need to improve the quality of secondary schools and university teachers is explicitly mentioned.

The Hradec Králové Region is not only characterized by a low share of enterprises that have introduced technology innovation but also a low degree of cooperation on innovation. The research potential of the region is low too. Support for technology transfer will be similarly difficult as in the case of the Ústí Region. Some of these steps can positively stimulate both research organizations and businesses. The orientation on activities that support education corresponding to the demand in the labour market can be perceived as a suitable approach.

### *3.2.3 South Bohemian Region*

The South Bohemian Region has only set one strategic objective for each of the three key areas of change. The strategic objectives are very similar to the KAC and do not actually develop them. In the area of quality human resources, it is a priority to improve the quality of the workforce so that it meets the requirements of the labour market. This is also related to the need to increase interest in technical fields already at primary schools. At the same time, the region considers it important to positively influence mobility of workforce. The region wants to prevent the departure of qualified people from the region, but also to attract mainly technically educated and researchers from other regions. The second key area is technological transfer. The main problem is the lack of cooperation between academic institutions and the business sphere. The solution is to introduce appropriate policy tools to increase the incentive for enterprises to collaborate with R&D organizations and their willingness to engage in industry platforms and cluster initiatives. The third area of change is the development of enterprise, which means its support in various ways (support for start-ups, consultancy, intellectual property rights protection, support for internationalization).

The South Bohemian Region has the highest level of knowledge indicators among the analysed regions: the highest number of students of natural sciences and engineering & technology, the highest expenditures on R&D expressed as a percentage of GDP, and the highest share of employees with university degree in the total number of employees. This fact increases the chances of the region to succeed in implementing the RIS3 strategy, especially in the first two key areas of change. The impact of measures to promote entrepreneurship depends on the ability of the public administration to connect with businesses through a good communication strategy.

### *3.2.4 Vysočina Region*

The Vysočina Region has defined three key areas of change: higher innovation performance of companies, accessible and skilled workforce and ICT infrastructure. The aim of the first KAC is to increase the share of innovative enterprises and businesses with their own R&D. This aim should be reached mainly through providing various types of business consultancy. In the field of quality of workforce, the emphasis is put on increasing the interest in technical fields (popularization) and increasing cooperation of schools (secondary schools and universities) and enterprises (internships, professional practices, excursions, competitions). The only goal in KAC ICT infrastructure is to cover "gray and white spots" of the region where high-speed internet is not available. This is considered a barrier to enterprise development in these parts of the region.

Evaluating the potential success of the RIS3 strategy in the Vysočina Region, it is worth mentioning, in particular, that the share of enterprises with technology innovation in all enterprises exceeds the average share of the Czech Republic. It also has a sufficient number of students of technical and natural fields. In terms of achieving the specific goals, the building of the ICT infrastructure appears to be the easiest one (if financial resources are available). The question is whether its existence will automatically lead to an increase in entrepreneurial activity.

## **4. Conclusion**

The article dealt with application of the smart specialization concept in selected Czech regions that have a low level of knowledge and innovation potential in a long-time period. We have selected four regions, which are the Ústí, South Bohemian, Hradec Králové and Vysočina Regions. Their common characteristic is mainly a low level of R&D activity, but also other structural problems.

By analysing the key areas of change and strategic objectives of the RIS3 strategies, it was found out that the regions mainly focus on improving the quality and availability of the workforce in technical fields as well as on improvements in the technology transfer. The ambitions of the individual regions are similar, but the prerequisites of their success are different. For the regions with little tradition of research, it is certainly difficult to achieve a qualitative change. The effectiveness of various measures in the education sphere or in the field of business consultancy depends on a number of other aspects. The RIS3 strategies can be an important positive incentive on the way to increasing the competitiveness of the regions.

The concept of smart specialization also recommends regions to focus their strategies on those industries that have tradition and good prerequisites there. In the Czech Republic, seven industries representing the areas of national specializations have been identified. Furthermore, most of Czech regions have added special areas that are concentrated in their territory. Only

two of the four analysed regions, the Ústí and Hradec Králové Regions, defined their own areas of regional specialization.

We are aware of the fact that our research has some limitations. We focused on some basic characteristics of the RIS3 strategies, but more detailed analysis is needed. Further research should be aimed at two main topics. The first of them is the relation and harmony between RIS3 strategies and the Initiative Industry 4.0 that was approved by the Government of the Czech Republic in 2016. The second topic represents the efficiency of implemented policy interventions and their real impact on innovation development and achieving strategy targets.

### **Abstract**

*The aim of regional policy is to strive for a balanced development of areas so that they can exploit their potential and achieve state growth. In accordance with the objectives of the European Union, the growth of the competitiveness of the territory is at the forefront. Especially the countries that have undergone the transformation process solve a number of problems related to the structural changes in the economy and the spatial concentration of industry. These changes are further influenced and shaped by the integration process and the entry of countries into the common the European Union market. The organization Visegrad four was established in 1991 to promote cooperation between countries and strengthen the identity of Central European countries in the European Union. The main objective of these countries was the cooperation of countries in the integration with the European Union. The aim of this article is to assess the position and status of the V4 countries in the European Union. Analyse the competitiveness of these countries and their economy performance compared to the original European Union Member States.*

**Keywords:** *integration processes in EU, regional competitiveness, regional disparities in European Union member states*

**JEL Classification:** *R11, R12, R58*

### **1. Introduction**

Competitiveness as a criterion for assessing the success of companies, states and regions is today regarded as a basic indicator of the degree of economic development of market economies. In the European environment, the notion of competitiveness has come to the fore, especially in the context of the European Union's objectives which are focused on achievement of greater competitiveness and employment. They are the main objectives for the 2007-13 programming period. The European Union (EU) uses the notion of competitiveness in the context of economic, social and territorial cohesion, when comity is seen as an essential aspect of contemporary development and a prerequisite for deeper integration. The European Union, using a range of instruments, is trying to help all regions achieve their potential, ie to improve their competitiveness, to raise their standard of living. Supporting the growth of weak regions should lead to the growth of the entire transnational grouping. Cohesion policy in Europe originated in the 1970s as a response to the entry of the European Community with large interregional differences. Cohesion policy has been identified as essential for strengthening the Community and in 1986 the Single European Act introduced legislation for an integrated regional policy. This has led to the development of this policy and focusing on support for underdeveloped regions and the principles of concentration, programming, partnership and complementarity have been introduced.

The Visegrad Four (V4) is the name for the group of Central European regions, namely the Czech Republic, the Slovak Republic, Poland and Hungary. This alliance was formed on February 15, 1991, primarily due to mutual cooperation in the given areas, strengthening of competition and stability in Central Europe and common European integration. These countries are linked not only during the geographical proximity but also there is historical or political proximity. These are the states that have undergone transformation processes since 1989 that have influenced their further development. Transformation processes have been accompanied by rising unemployment, rising inflation, sectoral restructuring, and widening regional disparities. Cooperation has helped states move towards a free democratic society and pan-European integration.

The aim of this article is to evaluate the position of the V4 states in the European Union in terms of their economic performance. The subject of the analysis will be to compare the state of the given economies in 2004 when the V4 countries entered the European Union with their current position. The Regional Competitiveness Index will be used to compare.

## **2. Theoretical Aspects of Competitiveness**

Although the notion of competitiveness is now often bent and used, its exact definition does not exist. Porter (1990) contributed significantly to the development of the theory of competitiveness and laid the foundation for the microeconomic theory of competitiveness. The theory does not stem from the idea that a balanced balance of payments territory is competitive, but stressed the importance of clusters, ie geographical concentration of interconnected firms, specialized suppliers and other institutions. The competitive advantage is seen in the location of factors, knowledge, companies, institutions and customers. Macroeconomic competitiveness can be seen as a competitiveness that has the basics of microeconomic competitiveness, the competitiveness of firms, the quality of the business environment is a necessary condition for macroeconomic competitiveness, which implies high productivity and resource efficiency (Ezeala-Harrison, 2006). Camagni (2002) offers another view on the issue. He said that regions do indeed compete over attracting firms and workers as well as over markets, so regions can be thought that they have advantage in infrastructural, social assets, after that, they are more attractive for firms.

However, the Krugman (1994) rejects the territorial unit to the firm, which emphasizes that the country can not, as a company, exit the market and disappear as a company reaches the point of reversal. A negative view of Czech authors have Klvačová (2008) or Malý (2011), who disagree with the comparison of competitive conditions and a competitive environment at the national level with corporate competition, which according to these authors are subject to tougher and stricter conditions. According to Klvač's competitiveness, it is based on the attractiveness of the country for foreign investors, and emphasizes the role of the government as a creator of environmental stability. These conclusions also identify Nečadová and Soukup (2013) who see a questionable choice of indicators and the representation of soft data or the way data is aggregated as a problem. Despite a number of critical views, the notion of competitiveness is increasingly being used to assess the economy, prosperity and quality of life in the country. In line with this concept, it defines the competitiveness of the Commission of the European Union or the international organization of the Organization for European Cooperation and Development (OECD). The European Commission in the Sixth Report on the Social and Economic Situation and Development of Regions in the European Union of 1999 (European Commission, 1999) as "the ability to produce goods and services that meet the conditions of international markets, while at the same time the ability to achieve high and sustainable incomes ..." (Mouqué et al., 1999 ). The European Commission's Competitiveness

Report says that the economy is competitive if its population enjoys a steadily high and growing standard of living and sustainable high employment (Skokan, 2005). Given the increasing importance of regions for the national economy; experts are increasingly engaged in regional competitiveness rather than national competitiveness.

It is clear from the literature that the definition of regional competitiveness can be viewed from two perspectives. The first is based on the idea that regional competitiveness is given by the aggregation of enterprise competitiveness, the second approach then derives regional competitiveness from macroeconomic competitiveness. For example, Storper (1997, p. 264), which defined regional competitiveness as "the ability of the local economy to attract firms with stable or growing market shares, and at the same time the ability of the regional economy to secure a stable or rising standard of living for the participating parties", stressed the macroeconomic concept. Tvrdň and Šuranová (2007), who argue that there are companies in the region that produce products in line with price and quality requirements of the market and show a sustained profit. Wokoun in the book *Competitiveness of the Regions of the European Union and the Czech Republic* (2012) adds that if the region wants to be competitive, it must secure jobs in reasonable quantity and quality.

Competitiveness is conditioned by a number of interrelated factors that reflect the functioning of the economy in the region. Due to rapid technological development, information technology upgrades, and lower transport costs, cost reduction alone can not provide a competitive advantage for the territory, but its focus is on creating and using new knowledge, innovation, human resource quality, and collaborating with each other. (Dunning, 2000) Today, the systems used to assess competitiveness are based primarily on the productivity of the economy, which is supplemented by other factors that predict, in particular, the quality of life and the sustainability of development. The World Economic Forum (Global Competitiveness Index) and the International Institute for Management Development (World Competitiveness Index) are based on the assessment of competitiveness from disaggregation of aggregate macroeconomic indicators. Martin (2004), seeks a comprehensive analysis of the issues by defining the key factors of economic development, productivity and economic growth. An important indicator of the competitiveness of the area is the amount of goods and services produced. The European Commission, in its sixth periodic report on the social and economic situation and development of the regions of the European Union, considers productivity and employment as the main indicators of competitiveness.

The following analysis will compare countries based on the Regional Competitiveness index from 2016. It is relative new approach which we can use for measurement of competitiveness. This indicator has been brought by Huggins, who has built the UK competitiveness index. It was the first attempt to capture competitiveness with one number. By that time, competitiveness has only been assessed by means of individual indicators. Huggins (2003) attempted to include in the index the indicators evaluating the inputs, outputs and results of the economy. The Regional Competitiveness Index was further developed by the European Union. The European Commission has proposed the Regional Competitiveness Index (RCI), which compares the European Union's Member States and the NUTS2 regions of the European Union in terms of their competitiveness. The RCI Index was also constructed in accordance with the World Economic Forum methodology. The RCI index points to the strengths and weaknesses of the area. The index is constructed using 73 indicators, divided into three areas: Basic group, Efficiency group, Innovation group. Index development began in 2008, and for the first time this index was designed for 2010. The index was also calculated for 2013 and 2016.

### 3. Comparison of the Position of V4 Countries in the European Union

The European Union is one of the largest multinationals in the world. From the original six Member States (France, Italy, Germany, Belgium, the Netherlands and Luxembourg), which established after the Second World War the European Community, today is a group of 28 states. The increasing number of countries brought with them the need for a revision of international treaties and a deepening of the integration process. The basic pillars of successful integration included the need to reduce interregional disparities between Member States and the need to build an active regional cohesion policy. This demand arose already in the 1980s, when Greece, Spain and Portugal became new member states. The importance of regional policy became more important after the accession of 10 new states in 2004. The members of the European Union became Central and Eastern European states. Among them were the V4 countries, whose economic development was influenced by the process of transformation in the 1990s. and struggling with structural problems and the different economic levels of each region. The best position for transformation processes had the Czech Republic and Slovak republic. It was given by economic situation and by situation on labour market. The conclusions of study of Ružeková, Kašťáková, Žatko (2016) confirms that the position of the Czech Republic is the best from these countries; the worst situation was in the Slovak Republic and in Hungary. The study compared countries of V4 based on Global Competitiveness Index and World Competitiveness Index.

For the purposes of regional policy, the European Union divides regions into three categories - less developed regions (gross domestic product (GDP) per inhabitant < 75% of the European Union average), transition regions (GDP per inhabitant > 75 - < 90% of the European Union average) more developer regions (GDP per inpatient > 90% of the European Union average). Based on these criteria, it allocates money to support regional development. V4 regions, with the exception of capital regions, fall into the less developed regions.

More detailed analysis will be done by using RCI index, which was defined in previous text. When comparing countries according to the Competitiveness Index, they are worse ratings. As can be seen from the graph in Figure 1, the highest value of the index was reported by Luxembourg (RCI +0.97), Greece being the worst rated country with RCI = -1.28. The index values for the V4 countries were negative; the countries are in the second half of the countries surveyed. The best rating was achieved by the Czech Republic, the average rating of the regions was -0.16, Slovakia -0.46, Poland -0.53 and Hungary -0.73.

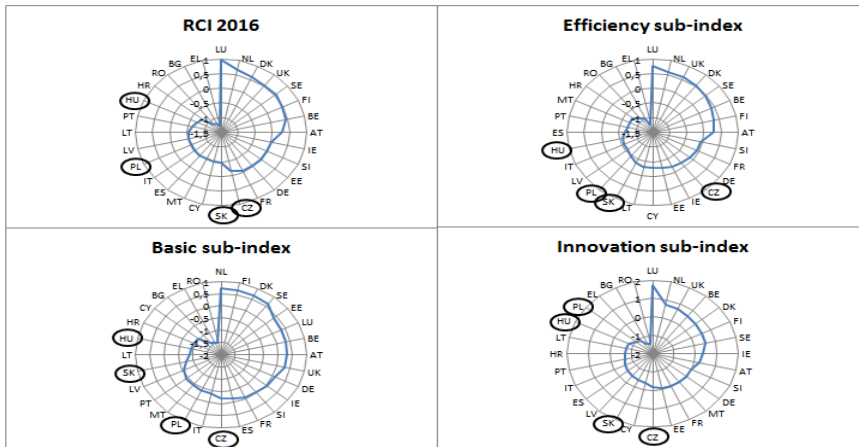

**Figure 1: Regional Competitiveness Index for Members of European Union**

Source: own elaboration based on European Commission (2017)

If we compare the countries in terms of individual sub-indices, V4 countries are in all indicators in the second half of the evaluation, see Figure 2. The Czech Republic has a better rating in the case of an efficiency sub-index that evaluates higher education and lifelong learning, labor market efficiency and market size. Poland has the worst ranking from the above-mentioned countries in the case of the Innovation sub-index, which evaluates the Technological Readiness, Business Satisfaction and Innovation. The basic sub-index includes institutions, macroeconomic stability, infrastructure, health, basic education.

**Figure 2: Comparison of Countries According to Values of Sub-Indices**

Source: own elaboration based on European Commission (2017)

Comparing the country in terms of GDP per capita is in chart in Figure 3. It is clear that the founding countries of the European Union are at higher levels in comparison with the V4 countries.

**Figure 3: GDP per Capita in Time**

Source: own elaboration based on data from Eurostat (2017)

However, if we compare the trend of the GDP per capita share of the European Union average between 2004 and 2016 (see Figure 4), the growth rate is higher for V4 countries. In the Netherlands, France and Italy, there has even been a decline. Belgium and Germany recorded

an increase of 2% points. The largest growing of share of GDP per capita on the European average was achieved in Slovakia, 23%. The growth of these economies is also evidenced by the rising GDP growth rate, which in 2016 was higher in all V4 countries than in 2006, although in a number of founding countries (the Netherlands, France, Italy) the situation was the opposite.

**Figure 4: Comparison of GDP per Capita of the State with an Average Value in the EU**

Source: own elaboration based on data from Eurostat (2017)

Growth potential also illustrates the findings of the correlation analysis that tested the relationship between GDP per capita and sub-indices RCI. The correlation analysis will be processed in statistical software Statistica 12. This method makes it possible to quantify the dependence of two variables and the aim of this analysis is to determine and describe the relation between the variables. The data from V4 countries were used for this analysis. The analysis emphasizes the determination of the strength of this relationship. The Spearman correlation coefficient ( $r$ ), which examines the dependence between the character sequences and is given by (1): (Hindls, 2007) where  $i$  expresses the sequence number of the variable in the ordered row and  $n$  is the number of cases.

$$r_{i_x r_{i_y}} = 1 - \frac{6 \sum (i_x - i_y)^2}{n(n^2 - 1)} \tag{1}$$

**Table 1: Results of Correlation Analysis**

	Basic sub-index	Efficiency sub-index	Innovation sub-index	RCI 2016	GDP per capita
GDP per capita	<b>0.80</b>	<b>0.77</b>	<b>0.87</b>	<b>0.85</b>	1.00

Source: own elaboration (2017)

The correlation index takes values from -1 to +1, and if the correlation coefficient is +1 between the variables, there is a strong linear dependence, the magnitudes are correlated. If the correlation coefficient is -1, there is a strong indirect linear dependence between the variables. Quantities are uncorrelated if the correlation index is equal to 0. There is no relationship between the magnitudes or the given relationship is not linear. The conclusions of the analysis (see Table 1) show that the second group of indicators included in the Efficiency sub-index is not in so strength relationship with GDP. The growth potential of the given economies is shown in the following graph in Figure 5. While the countries with a higher rating of competitiveness will not achieve such a growth in the competitive index growth of with GDP, worse evaluated countries can improve their situation.

**Figure 5: Graphical Representation of the Relationship - GDP per Capita and RCI**

Source: own elaboration based on European Commission (2017)

#### 4. Conclusion

This article dealt with the evaluation of the position of the V4 countries in the European Union. These are the countries that have undergone a series of social and policy changes that have affected the economic development of the areas in question and influence the development of economic variables over the last 25 years. The paper analysed the situation in the country only on the basis of the competitiveness index, which is considered an indicator of the economic development of the area. Although the European Union V4 rating from the competitive point of view is rather worse, their economic situation, as evidenced by GDP per capita development, has improved. Positive correlations between sub-indices and GDP also result from correlation analysis. These are states with a potential for growth. Countries V4 are among the countries that fund European Union funds to reduce the gap in Europe, and further improvements in their economic situation can be expected in the future. These countries have got potential for further development. The current economic situation indicates it also. This analysis is fundamental analysis and it will be used for more detailed comparison of the countries and evaluation of their integration processes.

### **Abstract**

*After the collapse of the WTO global negotiations, the EU initiative is under way to conclude bilateral free trade agreements between EU member states and third countries in order to deepen the cooperation in common foreign and trade policy. An agreement between the EU member states and Vietnam (EVFTA) should enter into force in 2018. The subject of the EVFTA agreement is not only the elimination of customs tariffs, but also the provisions on non-tariff barriers to trade, public procurement, investment, trade in services and others. The aim of the article is to assess the impact of the EVFTA on the Czech economy and the economy of the EU. The Computable General Equilibrium (CGE) model was selected as an impact estimation tool. The applied model's specification and calibration for the purposes of quantification of the EVFTA's impacts are included in this article. The results represent the quantified economic impacts of elimination of both the tariff and non-tariff barriers to trade between the Czech Republic and Vietnam.*

**Keywords:** CGE model, EVFTA, European Union, free trade agreement, trade policy

**JEL Classification:** F11, F13, F15

### **1. Introduction**

After the collapse of the WTO global negotiations, the EU initiative is under way to conclude bilateral comprehensive free trade agreements between EU member states and third countries in order to deepen the cooperation in common foreign and trade policy and enhancing the contribution of the trading system to sustainable development. (Gazzola, 2016)

The official discussions on Free Trade Agreement between Vietnam on one side and the European Union and its member states on the other side (hereinafter the EVFTA only) began in June 2012. The European Union published the EVFTA consolidated text on 1<sup>st</sup> February 2016. The text of the agreement is currently under way legal revisions and translations into all the official languages of the European Union. Then the agreement will be dealt with by the Council of the EU and the European Parliament. After all necessary endorsements have been completed the procedure will become the EU - Vietnam Free Trade Agreement, binding under international law. The EVFTA will be submitted for ratification to both Chambers of the Parliament of the Czech Republic. The submitted documentation will also include a national study of the EVFTA's impacts on the economy of the Czech Republic. EVFTA should enter into force in 2018, after the ratification by the parliaments of all EU member states.

The EVFTA is modern, sophisticated trade agreements of a new generation. The subject of the EVFTA agreement is not only the elimination of customs tariffs, but also the provisions on non-tariff barriers to trade, public procurement, investment, trade in services and others. The

EVFTA integrates key areas affecting international trade and thus modify synergistically and comprehensively the bilateral trade relations. The goal of this article is to quantify the EVFTA's impacts on the Czech national economy, specifically in the area of elimination of the tariff and non-tariff trade barriers concerning the goods and services exchanged between the Czech Republic and Vietnam.

EVFTA eliminate customs duties on all goods. An overwhelming portion of customs tariffs will be removed when the agreement becomes effective, while a small portion will be removed three, five, seven, ten and more years later (European Commission [online], 2016).

Customs duties on the goods are already very low. Under the EU common customs tariff, the duty on imports from Vietnam represents approximately 4.96 % of the value of Vietnamese goods imported to the Czech Republic, whilst the average Vietnamese duty on goods from the Czech Republic is 5.91 % of the value of imported Czech products. The Vietnamese also still impose export duties, which represent approximately 0.0057 % of the price of goods exported from Vietnam to the Czech Republic.

In terms of exports of goods and services, Vietnam accounts for only 0.06% of Czech exports, while about 0.37 % of Czech imports come from Vietnam. The balance of mutual trade in goods is considerably deficit from the point of view of the Czech side (imports are six times higher than exports). The balance of trade in goods and services in 2016 amounted to -17 billion CZK. However, the traditional trade statistics based on recording the import and export flows in the individual countries do not give us a real picture of the creation of domestic and foreign value added. (Fojtíková, 2016) The economic relations of the Czech Republic and Vietnam take place in a wide range of industries, sectors, business and business activities. In summary, however, it can be said that it is a mutual exchange of value added or trade in value added (TiVA). Estimates of TiVA statistics are conducted internationally by the OECD and WTO. After the last update, data are available for the years 1995, 2000, 2005, 2008, 2009, 2010 and 2011. The share of domestic value added in Czech exports to Vietnam is 69.0%. On Vietnamese exports to the Czech Republic, the share of domestic added value is almost two thirds (65.6%) (OECD [online], 2017).

The estimation of the EVFTA's impacts on the Czech economy was achieved through the Computable General Equilibrium (CGE), which is based on the GTAP world trade database operated by the Purdue University in West Lafayette, Indiana, USA. The CGE method and GTAP database represent one the most advanced analytical instruments applied to macroeconomic impacts of economic shocks. They include, for example, the quantification of the impacts of changed economic and trade strategies used by numerous international organizations (OECD, WTO, WB, etc.). The GTAP database underpins thousands of economic model applications worldwide and to date, the GTAP website contains more than a thousand International Trade studies (Aguar, 2016).

## 2. Methodology

The CGE models were created in order to find a way of predicting economic strategy's impacts on complex and interconnected systems: e.g. a single customs tariff change's impact on multiple markets of a given economy or even more markets of more economies (regions). One of the lines of the CGE models development may be seen as a direct extension of the input-output analysis application, in which the original input-output analysis weaknesses like the absence of induced effects or substitutions among products, semi-finished products, or production factors are compensated for through the inclusion of economic behavioural models of firms, consumers, and selected limitations (budgets, maximum debt, trade balance setting, etc.).

There are two basic limitations that must be followed during the model design: availability of data necessary for the model's basic calibration and mathematical solubility, i.e. the correct number of exogenous variables and parameters, since the number of variables used in CGE models exceeds the number of their equations. It means that reaching usable results requires adding the correct number of "variables" to the model from outside. Despite the fact that even the CGE basic model in the GTAP database may only be described as extremely comprehensive and complex, there are still numerous factors that are not included in the model and its results (Burfisher, 2012):

1. Neither the model, nor the database works with any product quality differences. For example, they do not consider any potential changed quality impacts on value provided to the consumers. In these days, there is probably no sufficiently empirical model (and database), which would be completely able to process this requirement.
2. The results do not significantly reflect on any potential impacts in the form of expanded consumer choices that are often associated with the trade liberalization.
3. Neither the basic GTAP model structure, nor GTAP database directly includes any data on non-tariff barriers. This data must be either added to the model from outside, or these barriers' impacts must be approximated through other parameters.
4. The model does not analyse impacts on foreign investment flows or changes in the public contracts area.
5. The model does not include any effects of changed consumer behaviour and its impacts on the long-term accumulation of savings and subsequent capital generation in the individual sectors.
6. The model does not reflect the multiplication effects of additional household expenses.
7. The model does not include any import quota regimes.

### ***2.1 Mathematical Structure of the Model***

The design of the model consists from several steps in which the concrete, most suitable structure of the model is defined:

1. For simpler interpretation purposes, all the 140 regions available in the GTAP database were merged into nine areas, which seemed to be key for the EVFTA's impacts analysis. They were: Czech Republic, the rest of the EU countries, Vietnam, the rest of the ASEAN and the rest of the world. The goal was to analyse effects associated with exports through the European market and impacts on imports from semi-finished products source countries.
2. The sectors were left in their completely disaggregated into 57 branches. Despite the fact that the majority of the specified branches will not be critical for the Czech economy, this depth of detail seems to be justified due to the more detailed mapping of the partial impacts of the liberalization of trade between Vietnam and the European Union. The goal is to cover sectors key for the Czech Republic without any unnecessary complications.
3. Regarding the production factors, the standard GTAP model classification was preserved. It includes capital, land, natural resources, and educated and uneducated labour. To model short-term impacts, we kept both the uneducated labour and capital mobile. The long-term impacts were then estimated on the basis of inter-sector mobile labour and capital inputs.

4. The model's comparative-static variant was kept, i.e. its results indicate what the current Czech economy would have looked like (or the 2011 reference year economy), if it had faced significantly eliminated barriers of international trade barriers suggested by EVFTA, while its available capital, labour, firms behaviour, and consumer behaviour remained unchanged.
5. Cobb-Douglas production function is used, with constant returns to scale and decreasing returns to labour and capital.
6. Constant unemployment rate with flexible wages, in the short run mobile skilled labour force, but immobile capital and unskilled labour force, in the long run all types of factors are mobile.

If the mathematical model structure is applied together with the data from the GTAP database, it is possible to calibrate all the missing model parameters. During calibration, the unknown parameters are calculated, providing the analysed economies behaved. During the selected referential period as they should have optimally behaved. In the next phase, the mathematical model (now featuring information generated during the calibration) was used to simulate the EVFTA's impacts.

### 2.1.1 Calibration of the EVFTA's Economic Impacts Evaluation Model

To model the EVFTA's economic impacts on the Czech economy, it was necessary to record the custom tariff changes completed both in Europe and in Vietnam. We utilized the data from the World Trade Organization in our classification per the Harmonized system and applied a four-position code (WTO [online], 2017). The custom tariff savings were identified right after the EVFTA became effective and upon expiration of all the transitional periods (i.e. after four, eight and sixteen years after the EVFTA became effective).

These import custom tariff savings (the *tms* variable in the GTAP database) converted to percentages represent an economic shock whose impacts on the macroeconomic equilibrium of the Czech economy will be modelled. However, besides the custom tariff savings, the EVFTA will also contribute to the elimination of international trade non-tariff barriers. The scopes of non-tariff barriers faced by the Czech or European exporters in Vietnam and, on the other hand, the barriers affecting the Vietnamese goods exporters on the European markets, may be roughly estimated on the basis of the non-tariff barriers (NTBs) database produced by the World Bank (Kee, 2005) in classification per the Harmonized system and with its four-position code division. However, we may assume that the gradual implementation of coordination mechanisms in the Technical Barriers to Trade (TBT) and Sanitary and Phytosanitary Standards (SPS) areas will eventually contribute to even greater savings in the area of non-tariff trade barriers between the EU countries and Vietnam.

Therefore, to estimate the impacts of trade liberalization in the area of non-tariff trade barriers (the *ams* variable in the GTAP database), we model the reduced NTB's impacts as impacts of a 0% company costs reduction right after the EVFTA becomes effective and a rather modest 1%, 2% and 3% cost reduction respectively after four, eight and sixteen years after the EVFTA become effective. In connection with this, one may assume that the EVFTA will generate much greater savings in the NTBs area on a long-term basis. It is also important to remember that the NTB estimates completed by the World Bank are converted *ad valorem*; however, one may expect their relative importance will decrease with a greater foreign trade volume (Egger, 2015).

**Table 1: Annual Savings Through the EVFTA Tariffs and NTBs Reduction (in CZK)**

	<b>Right after EVFTA becomes effective</b>	<b>4 years after EVFTA becomes effective</b>	<b>8 years after EVFTA becomes effective</b>	<b>16 years after EVFTA becomes effective</b>
Import custom tariff savings during exports from the Czech Republic to Vietnam	4 200 206	23 049 160	64 648 576	97 374 901
Import custom tariff savings during imports from Vietnam to the Czech Republic	253 538 435	345 692 118	474 273 447	474 273 447
Export custom tariff savings during imports from Vietnam to the Czech Republic	0	569 329	1 521 847	3 722 013
NTB savings during exports from the Czech Republic to Vietnam	0	43 808 704	87 604 202	131 406 303
NTB savings during imports from Vietnam to the Czech Republic	0	66 247 899	132 517 808	198 822 933

### 3. Results and Discussion

Table 2 indicates only a very small change in aggregate performance of the Czech economy caused by the impacts of EVFTA. The Czech gross domestic product will probably decrease, but only in hundredths of percent, which is undoubtedly caused by a strongly deficit trade between Vietnam and the Czech Republic. It seems that even removal of the customs and non-tariff obstacles in international trade will not lead to rapid or fundamental improvement of the Czech position in international trade with Vietnam. This is also indicated by a very low increase in the total Czech exports and imports (again in hundredths of percent). The level of wages in the Czech economy will probably respond to adoption of the EVFTA Agreement by a slight drop, which will in fact gradually vanish over the time.

The deteriorated conditions of the terms of trade and the strongly deficit trade balance between the Czech Republic and Vietnam will be manifested by a drop in the real welfare of the citizens of the Czech Republic. Foreign trade and more efficient allocation of manufacturing sources will contribute to reduction of the drop in welfare of Czech citizens only after all of the transitional periods.

The GTAP model anticipates significant technological changes also in the case of Vietnam, which, however, are reflected negatively in the Czech economy. It should be pointed out again that also the real welfare responds to the EVFTA Agreement with only very little, or *de facto* negligible reduction (in single dollars per capita per year).

But it can be confirmed that the Czech economy as a whole will be affected by relief of the customs and non-tariff obstacles within the EVFTA Agreement very weakly, with slightly

prevailing negative effects. An analysis of the sectoral impacts caused by adoption of the EVFTA Agreement, however, indicates somewhat more reassuring perspectives.

**Table 2: Macroeconomic Impacts of Adoption of the EVFTA Agreement**

Sectors	Right after EVFTA becomes effective	4 years after EVFTA becomes effective	8 years after EVFTA becomes effective	16 years after EVFTA becomes effective
Gross domestic product	-0.026 %	-0.023 %	-0.019 %	-0.015 %
Exports	0.000 %	0.001 %	0.010 %	0.014 %
Imports	-0.007 %	-0.003 %	0.008 %	0.014 %
Wages	-0.023 %	-0.018 %	-0.012 %	-0.007 %
Welfare [in million USD]	-15.249	-13.088	-12.222	-10.366

Source: Own calculations based on (Aguiar, 2016)

**Table 3: Impact of EVFTA on the Change of Production of Selected Sectors in the Czech Economy**

Sectors	Right after EVFTA becomes effective	4 years after EVFTA becomes effective	8 years after EVFTA becomes effective	16 years after EVFTA becomes effective
Agricultural and food-processing	-0.005 %	-0.010 %	-0.014 %	-0.013 %
Textile	-0.041 %	-0.154 %	-0.433 %	-0.385 %
Engineering and electrotechnical	0.006 %	0.014 %	0.037 %	0.040 %
Automotive	0.001 %	0.000 %	-0.005 %	-0.009 %
Chemical	0.004 %	0.006 %	0.004 %	-0.002 %
Glass-producing	0.003 %	0.004 %	0.050 %	0.045 %
other manufacturing	0.004 %	0.009 %	0.042 %	0.040 %
ICT services	0.003 %	0.002 %	0.001 %	-0.001 %

Source: Own calculations based on (Aguiar, 2016)

All sectoral changes in the volume of production as they are summarized in Table 3 are in hundredths or rather thousandths of percentage points. The only exception is the textile industry, which will probably be affected by liberalisation of international trade between the EU and Vietnam most significantly (the model estimates a drop in production of the Czech textile industry by 0.385 % in the horizon of sixteen years after adoption of the EVFTA Agreement). By contrast, mechanical engineering, electrotechnical and other processing industries as well as the glass industry can expect a slight positive impulse.

Regarding exports from the CR to Vietnam (see Table 4), it seems that except for export of ICT services, the EVFTA Agreement will lead to increase of Czech exports to Vietnam in all of the analysed sectors. The GTAP model anticipates the most significant export in the sector of Czech glass and textile industries, then automotive, mechanical engineering,

electrotechnical and other processing industries and of course also in the segment of agricultural and food exports. However, at this point, it is again necessary to point out the strongly deficit balance of the Czech-Vietnamese trade, especially precisely in the textile industry. In the GTAP database, the chemical sector also includes the pharmaceutical area, so it is not possible to express the impact on the pharmaceutical industry separately. The impact of EVFTA on mutual trade in the pharmaceutical industry between the EU and Vietnam is presented by (Vu, 2016).

**Table 4: Impact of EVFTA on the Change of Export Structure from the Czech Republic to Vietnam**

Sectors	Right after EVFTA becomes effective	4 years after EVFTA becomes effective	8 years after EVFTA becomes effective	16 years after EVFTA becomes effective
Agricultural and food-processing	4.545 %	10.390 %	21.104 %	20.779 %
Textile	23.144 %	20.087 %	247.598 %	220.524 %
Engineering and electrotechnical	1.959 %	7.153 %	20.729 %	35.034 %
Automotive	3.061 %	-2.041 %	35.714 %	55.102 %
Chemical	5.903 %	8.912 %	20.255 %	13.657 %
Glass-producing	6.250 %	0.781 %	317.188 %	292.188 %
Other manufacturing	1.724 %	0.000 %	52.586 %	44.828 %
ICT services	4.714 %	2.357 %	2.357 %	-0.673 %

Source: Own calculations based on (Aguiar, 2016)

The structure of imports from Vietnam to the Czech Republic will be more markedly manifested by further growths of imports of textile products from Vietnam to the Czech Republic (with regard to the multiple deficit of the Czech-Vietnamese trade in this sector, a more significant pressure to equal this strong imbalance cannot be anticipated even after implementation of the EVFTA). Conversely, a drop in imports from Vietnam can be anticipated in the segment of mechanical engineering, electrotechnical and other processing industries and also in the field of ICT services.

However, it should be stressed again that even after removal of custom barriers and reduction of non-tariff barriers, which the EVFTA Agreement proposes, Vietnam will still remain rather a marginal partner in Czech foreign trade. Therefore, elimination of obstacles in international trade with Vietnam will be reflected in the structure and volume of total exports and imports from/to the Czech Republic only by marginal changes (see also Table 2).

**Table 5: Impact of EVFTA on the Change of Structure of Imports from Vietnam to the Czech Republic**

Sectors	immediately when EVFTA becomes effective	4 years after EVFTA becomes effective	8 years after EVFTA becomes effective	16 years after EVFTA becomes effective
Agricultural and food-processing	29.269 %	27.482 %	28.634 %	26.529 %
textile	27.251 %	36.669 %	89.992 %	80.892 %
Engineering and electrotechnical	9.925 %	2.416 %	-6.758 %	-8.880 %
Automotive	0.000 %	0.000 %	0.000 %	0.000 %
Chemical	19.524 %	12.307 %	3.089 %	-0.506 %
Glass-producing	7.080 %	7.965 %	7.080 %	4.425 %
Other manufacturing	3.715 %	-0.774 %	-10.217 %	-12.229 %
ICT services	-7.942 %	-9.386 %	-14.801 %	-15.162 %

Source: Own calculations based on (Aguiar, 2016)

#### 4. Conclusion

Elimination of tariff and non-tariff barriers to trade will take place under the EVFTA over a number of transition periods ranging up to 16 years. Czech exporters will save around 4.2 million CZK after the entry into force of the agreement, but this amount will gradually increase to 97 million CZK. According to our estimates, removal of non-tariff barriers could bring additional savings of up to 131 million CZK. The perspectives for the Czech textile industry are particularly promising in terms of Czech exports (the increase in exports up to more than twice the current volume), the glass industry (up to three times the current volume). Automotive exports have the potential to grow by as much as 55 %, the machinery and electrotechnical industry by 35 %, food and agriculture by 21 % and chemical industry by 14 %. The overall impact on Czech exports, however, is negligible (+ 0.014 %).

Czech importers could save about 253 million CZK immediately after the entry into force of the agreement, by gradually removing customs barriers (both import and export), their savings could increase to 478 million CZK. Removing non-tariff barriers has the potential to bring additional savings for importers rising up to 199 million CZK. From the point of view of Czech imports, the most significant increases can be expected in the textile industry (+ 80 %) and in the food industry (up to + 30%). The drop of imports according to GTAP estimates will affect the engineering and electrotechnical industry (down by - 10 %) manufacturing industry (approx. - 12 %). However, the overall impact on Czech imports is as tiny as in the case of exports (+ 0.014 %).

Thus, the impacts of the EVFTA are very weak. The EVFTA is likely to slightly slow down the pace of economic growth (GDP growth) of the Czech economy, in the order of 0.015 % to 0.026 %. The impact on wages can be expected in similar dimensions. Wage growth can be expected in the engineering, electrotechnical, glass and other manufacturing industries (in the order of hundredths percent), decrease of wages will affect especially the textile industry

(about – 0.4 %). The welfare impact is assumed to be rather negative (decrease in the range of USD 1 – USD 1.5 per inhabitant per year).

Multiple effects associated with the non-tariff barriers elimination, including the measures in the area of investments, public procurement, and services, depend on their implementation after the EVFTA becomes effective. That is why it is important for the Czech Republic to be involved either through its professional and special-interest associations and chambers, national certification bodies, and, of course, at the national administration level and diplomacy, in the implementation of the agreement measures and to actively strive to be represented in the EVFTA commissions. In connection with this, it is important to monitor the current issues and challenges of the international trade with Vietnam and to purposefully promote our interests on the international field. It is very important to:

1. Deepen cooperation with professional chambers, entrepreneurial special-interest (export) associations, etc. – for example through round table events such;
2. Stimulate contacts among trade and professional chambers in the Czech Republic and Vietnam – for example through trade (entrepreneurial) missions or at convenient occasions;
3. Increase the effectiveness of distribution of information on the current status of EVFTA implementation;
4. Monitor the impacts on the trade balance and Czech economy and continuously evaluate potential opportunities and threats (Kocourek, 2017).

## **Challenges of Inclusive Development in the Context of the EU 2020 Strategy. The Case of Poland**

**Maria Kola-Bezka**

### **Abstract**

*The aim of the article is to identify key challenges of inclusive development in Poland. The notion of inclusive development has not been unambiguously defined so far, although this issue has been dealt with for years by recognized opinion-forming international organizations such as EU, IMF, OECD and the World Bank. The paper reviews the definition of inclusive development. A universal definition of this development was formulated, and then a method of its measurement in Poland was proposed, taking into account the availability of public statistics data. The measurement was carried out at the level of communes, assuming that overcoming the challenges of inclusive development is particularly important in small regions inhabited by local communities. The conclusions from the analysis was confronted with the assumptions of the EU 2020 Strategy.*

**Keywords:** *inclusive development, Polish communes, the EU 2020 Strategy*

**JEL Classification:** *O15, R11, R19*

### **1. Introduction**

The growing interest in the concept of inclusive development stems from the increasing lack of acceptance for the social inequalities which continue to grow, and the rising unevenness in the distribution of the benefits caused by the economic growth. Today, the effects of growth are consumed by a small group of society, while the rest of the world's access to these benefits is very limited (IMF, OECD, UN, WBG, 2000; UNDP, 2016; G20, 2017; European Commission, 2010).

The gap between the economic growth and the social development can be observed not only on a global but also country and regional scale, and it is not exclusively the domain of poor countries. The contributing factor to this situation is the liberal economic system and also, in recent years, the world's financial crisis and its ongoing consequences. The increasingly visible income inequalities as well as the growing scale of poverty stunt the dynamism of the economic growth (Atkinson, 2017; Piketty, 2015; Stiglitz 2013).

However, no universal set of tools that would guarantee „the inclusiveness” of the socio-economic system has been developed yet. This is mainly due to the lack of an explicit, universally agreed on and respected definition of inclusive development. The lack of such definition hinders the measurement of this phenomenon, seriously limits the ability to diagnose its scale and makes identifying all the accompanying challenges difficult. An additional difficulty is the specific conditions that have an impact on the social situation in a given country or region, and thus on the degree of "inclusiveness" of its socio-economic system. The

lack of unambiguous understanding of “inclusiveness” hinders all the actions that might have been taken to generate the inclusive growth or, in the best-case scenario, makes them not optimally effective. As White said: “the absence of clarity about objectives is not helpful for policymakers” (White, 2012, p. 280).

The aim of this article is to identify the key challenges of the inclusive development in Poland. That is why various definitions of inclusive development will be discussed, a universal definition of such development will be suggested as well as the best way to measure it in Polish conditions. The measurement of the inclusive development will be made at the level of communes due to the fact that searching for ways to implement the idea of inclusive development and overcoming the accompanying barriers is particularly important in small regions inhabited by local communities, where setting a community of goals for a given idea may be the most effective.

## 2. Definition Problems

Literature and documents published by respectable and opinion-forming institutions that deal with social inequalities and inclusive growth, such as: International Monetary Fund, Organization for Economic Co-operation and Development, United Nations, The World Bank, European Commission do not define inclusive development unambiguously which causes difficulties in creating a precise line of action in order to achieve results expected by the society.

Ranieri and Almeida Ramos, who have analyzed over a dozen reports and studies on inclusive growth and development, indicate 15 elements that individual authors treat as crucial in defining such development. These are: poverty, inequality, growth, productive employment, capabilities/empowerment, gender inequality, access to infrastructure, social protection, participation, targeted policies, basic social services, good governance, opportunity, barriers for investment, benefits of growth (Ranieri, Almeida Ramos, 2013, p. 18).

In general, there are four different approaches to defining inclusive growth and development. The first deals with inclusive growth (and development) as a synonym of pro-poor growth, i.e. one that improves the economic situation of the poorest members of society (IMF, OECD, UN, WBG, 2000, p. 21; OECD, 2001, p. 18). Such improvement can be absolute, when incomes of the poorest grow (Ravallion, Chen, 2003, p. 93-99; Grosse et al., 2008, p. 1022), or relative, when the income of the poorest grows faster than the income of the rest of the society (Cord et al., 2003, p. 3; White, Anderson, 2001, p. 267-289; Grosse et al., 2008, p. 1022). In the latter case there is a reduction in income inequalities.

The second approach exposes the non-profit outcomes of growth, treating poverty as a multidimensional phenomenon (Kakwani, Silber, 2008, p. 987-991). Poverty can be demonstrated not only by low income but also by limited access to education and medical services, poor nutrition and a small share in overall well-being (Grosse et al., 2008, p. 1023). The improvement of the situation of people with the lowest income in terms of non-income dimensions of poverty is evidence of inclusive development, while the increase in their incomes is related solely to inclusive growth (Rauniyar, Kanbur, 2010; McKinley, 2010; Klasen, 2010).

There is also a process approach. Its supporters claim that the poorest people should participate actively in the process of inclusive growth (through involvement in the labour market) and should benefit to a large extent from its effects (Kakwani, Pernia, 2000, p. 3).

Another concept combines the effects of growth with the process approach. According to this concept, every member of society should participate in the process of growth, in a sense that they should participate in the benefits of economic growth and at the same time contribute in an efficient way to this growth. It means that inclusive growth is derived from improving the labour productivity and increasing the size of the economy that is based on investing rather than redistributing sources to the most economically weak (Ianchovichina, Lundstrom, 2009, p. 3).

Even though the discussions concerning inclusive growth and development in the practical and theoretical fields have not resolved the problem with finding an unanimous definition of these terms, by touching on the various aspects of inclusiveness, indicate its basic feature. It is social inclusiveness, broadly understood. Inclusive development is thus a development that enables social inclusion. Ensuring social inclusion requires: reducing unemployment, poverty and inequalities, improving employment efficiency, ensuring gender equality, providing access to infrastructure, social security and basic social services, good governance and participation in social life.

### **3. Inclusive Growth in Europe 2020 Strategy**

In Poland, the issue of inclusive growth is most commonly discussed in the context of Europe 2020 Strategy (*Strategy*). For Poland, as a EU member, the goals of this *Strategy* set the direction in which the socio-economic politics will go between 2010 and 2020. In the *Strategy*, the inclusive growth is one of the three priorities, next to the smart growth and sustainable growth, and all the efforts are subordinated to its needs. The inclusive growth is defined in the *Strategy* as supporting the economy with a high level of employment that guarantees social and territorial cohesion. The intended proof of achieving this goal would be reducing the scale of poverty (number of people living below the poverty threshold) through maximizing work activity and limiting structural unemployment, increasing social responsibility in the business area, providing help for children or anybody else who is financially dependent on another person, introducing the model of flexible labour market and flexicurity, providing people with opportunities to learn new skills in order to easily adjust to new circumstances or possible career changes, balancing the access to health services, as well as supporting healthy life style of the elderly (European Commission, 2010).

In Poland, a special role to play in ensuring social inclusion under the new national economic development strategy have regional and local governments (Ministry of Economic Development, 2017). To be able to pinpoint all the challenges that stand before the local governments and deal with social inclusion (through providing social services: education, health, social security) one must first and foremost diagnose the scale of social inclusion/exclusion. This will be the subject of the following part of the paper.

### **4. Research Methodology**

The essence of inclusive growth is broadly defined social inclusion. It is a multi-dimensional phenomenon. As mentioned above, it is indicated by: reduction of the unemployment rate, gender equality, providing access to infrastructure, social security, access to basic social services, good leadership and participation in social life. In the study on social inclusion, as in the study on other multidimensional phenomena, e.g. socio-economic development (Bařa, 2016), it is appropriate to apply methods of multidimensional comparative analysis.

The level of social inclusion in Poland was measured on the example of all 144 communes (regions NUTS 5) of Kujawsko-Pomorskie Voivodeship. Publicly available statistical data for 2009 and 2016 were used in the research (Local Data Bank [online]). There were 8 potential variables describing the level of social inclusion (table 1). X7 characterizes the level of unemployment. X1 characterizes the level of poverty. X2 characterizes the access to infrastructure. X4 and X5 describe the level of social security. X3, X6, X8 characterize access to the basic social services.

**Table 1: Potential Variables Describing the Level of Social Inclusion**

Symbol	Description
X1	Revenue of communes per capita, PLN
X2	Dwellings fitted with technical and sanitary installations (a bathroom), %
X3	Stationary social assistance centers per 1000 inhabitants
X4	Beneficiaries of social assistance at domicile, %
X5	Children up to the age of 17 for whom parents receive family benefit in the total number of children of this age
X6	Children under 3 years covered by nursery care, %
X7	Registered unemployed persons in the population of working age, %
X8	Children in pre-primary education establishments for 1000 children aged 3-5

Source: author's elaboration

A set of potential variables was reduced on the basis of variation coefficient which the threshold level equaled 10% and correlation coefficient which critical level was set at 0.7. Finally, a set of diagnostic variables for 2009 numbered 6 variables: X1, X3, X4, X6, X7, X8. For 2016 it was also X5. Three of them were destimulants (X4, X5, X7). They were transformed into stimulants using the differential method. The diagnostic variables have not been assigned different weighting factors. The next step of the procedure was normalization. Taking into account that the method of normalization influences the results of the research and its conclusions, normalization of diagnostic variables was done by using three formulas: standardization (1), unitarization (2) and normalization (3).

$$z_{ij} = \frac{x_{ij} - \bar{x}_j}{s_j}, \quad (1)$$

$$z_{ij} = \frac{x_{ij} - \min_i x_{ij}}{\max_i x_{ij} - \min_i x_{ij}}, \quad (2)$$

$$z_{ij} = \frac{x_{ij} - \bar{x}_j}{\bar{x}_j}, \quad (3)$$

where:  $z_{ij}$  – normalized value of the  $j$ -th variable for the  $i$ -th object,  $x_{ij}$  – value of  $j$ -th variable for  $i$ -th object,  $\bar{x}_j$  – arithmetic mean of variable  $x_j$ ,  $s_j$  – standard deviation of  $j$ -th variable.

The results of normalization were used to calculate six intermediate taxonomic indicators of social inclusion (three of them were calculated using the Hellwig method with Euclidean distance (4); another three were calculated using non-model method (5)).

$$d_i = 1 - \frac{c_{io}}{c_o}, \text{ where: } c_{io} = \left[ \sum_{j=1}^n (z_{ij} - z_{oj})^2 \right]^{\frac{1}{2}}, \quad c_o = \bar{c}_o + 2S_o, \quad \bar{c}_o = \frac{1}{m} \sum_{i=1}^m c_{io},$$

$$S_o = \left[ \frac{1}{m} \sum_{i=1}^m (c_{io} - \bar{c}_o)^2 \right]^{\frac{1}{2}}, \quad (4)$$

$$d_i = \frac{1}{m} \sum_{j=1}^m z_{ij}, \quad (5)$$

where:  $d_i$  – value of intermediate taxonomic indicators for  $i$ -th object,  $z_{ij}$  – normalized value of the  $j$ -th variable for the  $i$ -th object.

Six intermediate taxonomic indicators were used to calculate synthetic taxonomic measure of inclusiveness according to the formula:

$$D_i = \frac{1}{6} \sum_M d_i^{*M}, \quad (6)$$

where:  $d_i^{*M}$  – normalized value of intermediate taxonomic indicator of inclusiveness.

Synthetic taxonomic measure was used to rank communes according to their levels of social inclusion and group them into classes with similar levels of inclusiveness.

## 5. Results and Discussion

The number of communes in individual groups of communes was similar in both 2009 and 2016. In 2009, the group that was characterized by the highest social inclusion consisted of 16 communes, in the second class of communes in terms of the level of inclusiveness there were 38 communes, in the third one – 42, and in the fourth class, a group that was the least socially inclusive - 48. In 2016 in the first class there were 20 communes, in the second 34, in the third 47 and in the fourth 43. In 2009 the synthetic taxonomic measure of inclusiveness for the commune with the highest level of social inclusion accounted for 0.49387, and in 2016 equalled 0.5680. The synthetic taxonomic measure of inclusiveness for the commune with the lowest level of social inclusion was equalled to: 0.10281 in 2009 and 0.12503 in 2016. This shows that the communes of the analyzed region were characterized by a relatively low level of social inclusiveness (synthetic taxonomic measure could have a maximum value of 1), and the difference between the commune with the highest social inclusiveness and the lowest did not significantly change between 2009 and 2016. The most spectacular changes in terms of social inclusiveness during those two years happened in the Sępólno Krajeńskie commune (from 4th class in 2009 to 1st class in 2016) and Osie and Cekcyn communes (from 3rd class to 1st class). Such significant shifts of these communes in the ranking resulted from a relatively large increase in their budget revenues per capita, a decrease of the percentage of children under 17 years old, whose parents are granted family benefits, increased access to basic social services for residents (in all three communes significantly increased the percentage of children under 3 years covered by nursery care and the number of children aged 3-5 in pre-primary education) and the improvement of the situation on the local labour market reflected in the decrease in the share of registered unemployed in the working age population.

To identify the differences in the level of social inclusion in a given year and to determine whether these differences increased or decreased in the years 2009-2016, standard deviation and coefficient of variation were used. Both were calculated for synthetic taxonomic measure

of inclusiveness of the entire population of the analyzed communes, as well as for individual classes of communes (table 2).

**Table 2: Diversity of the Level of Social Inclusion in the Analyzed Communes in 2009 and 2016**

Groups of communes	2009			2016		
	$S(D_i)$	$\bar{x}$	$V(D_i)$	$S(D_i)$	$\bar{x}$	$V(D_i)$
All communes	0.18	0.40	0.443	0.16	0.46	0.351
1st class	0.17	0.61	0.279	0.13	0.61	0.218
2nd class	0.04	0.30	0.119	0.05	0.34	0.156
3rd class	0.02	0.22	0.093	0.03	0.21	0.144
4th class	0.04	0.13	0.310	0.05	0.10	0.448

Source: author's calculations

The standard deviation and coefficient of variation of the synthetic taxonomic measure of inclusiveness show that in 2016, in comparison to 2009, the level of social inclusiveness in the Kujawsko-Pomorskie Voivodeship has not changed in a significant way, and that the difference between the communes with the highest and the lowest levels of social inclusiveness decreased to a small extent. The most diverse group of communes in terms of inclusiveness was the 4th class consisting of communes with the smallest level of social inclusion. In this group of communes the disproportions in the level of social inclusiveness increased between 2009 and 2016. The 2nd and the 3rd class were the least diverse. The 1st class, consisting of the communes with the highest level of social inclusion, was the only one in which the disproportions in social inclusion had diminished between 2009 and 2016.

## 6. Conclusion

The condition for undertaking effective actions to increase the level of social inclusion in a given country or region is to determine the level of inclusion of its constituent parts and to identify differences existing between them. It is not an easy task due to the multi-dimensional nature of this phenomenon and the limited availability of statistical data describing it.

In this article, inclusive development is defined as a one that enables social inclusion, and therefore is associated with: reduction of unemployment, poverty and inequalities, the increase in employment efficiency, ensuring gender equality, ensuring access to infrastructure, social security, strong leadership, and participation in social life. The level of social inclusion was analyzed using the multidimensional comparative analysis methods. All of the communes of one Polish voivodeship were examined on the basis of statistical data for 2009 and 2016.

The results of the analysis indicate that the communes of this region are characterized by a low level of social inclusion. The synthetic taxonomic measure of inclusiveness for the commune with the highest level of social inclusion equalled 0.49387 in 2009 and 0.58680 in 2016, while its maximum value could amount to 1. Moreover, in the period from 2009 to 2016 there was a slight reduction in the diversity of the level of social inclusion in the region. The situation was the most unfavorable in the group of communes with the lowest level of social inclusion. It was the most diverse group in this respect, and the disproportions in the level of social inclusion in the period from 2009 to 2016 clearly increased here. A slight reduction in disproportions was visible only in the group of communes with the highest level of social inclusion.

The implementation of the idea of inclusive development in Poland is associated with many challenges. One of them is the measurement of the level of social inclusion in individual regions. While the availability of statistical data at the national or even regional level is good, there are problems at lower levels of public management. Meanwhile, it is at the local level that the implementation of the idea of inclusive development has the greatest sense and the greatest chance for effective implementation, because the issue of social inclusion/exclusion affects local communities. In addition, at the local level there is a real possibility of establishing a community of goals for the implementation of a specific idea.

In Poland, an important challenge associated with the implementation of the idea of inclusive development, and thus with the implementation of the Europe 2020 Strategy, is the lack of significant progress in improving the level of social inclusion. In the article, the analysis of the level of social inclusion has been made for one region, but the situation in other Polish regions, most of which are still regions lagging behind, looks similar. The example of the Kujawsko-Pomorskie Voivodeship shows that during almost eight years of implementing the Europe 2020 Strategy, the level of social inclusion in Poland has not improved noticeably, and the diversification of the level of social inclusion between individual communes has not significantly decreased. There are examples of communes where the level of social inclusion has improved spectacularly, but these are individual cases.

Inclusive growth is a particular challenge for regions lagging behind. Overcoming the distance that separates them from the goals set in the Europe 2020 Strategy requires increased efforts of public authorities in the region and mobilizing financial resources. It also requires involvement in the initiation, implementation and evaluation of development activities of local communities, which are often characterized by a lack of responsibility for the region that they live in, and a lack of willingness to engage in public affairs. Overcoming these barriers may prove to be crucial for the implementation of the idea of inclusive development in Poland.

### **Abstract**

*Small and medium-sized enterprises represent an important element of innovation driving force in developed economy and are a crucial element in European Union economy. They are considered to be the guarantor of stability and social cohesion, play an important role in innovation implementation and contribute to technological progress advancement in society. Small and medium-sized enterprises are equally important and are the most numerous stakeholders in headmost clusters in Slovak Republic and EU Member States. An inseparable part of SME business is a risk. The issue of SME risk management has been developed in different ways, but the focus on clustering is still missing. The main objective of this paper is to assess the risks that SMEs are considering within their involvement in cluster cooperation in terms of their territorial impact in Slovak Republic within the EU context. To accomplish the goal, the results of a questionnaire survey, being assessed by chi-square method, have been used.*

**Keywords:** cluster cooperation, EU innovation policy, regional policy, risk management, world economy development

**JEL Classification:** F29, L26, L53

### **1. Introduction**

In the process of globalization, small and medium-sized enterprises may lose a step, compared to large multinational companies, and thus it can often be advantageous for them to joint with other companies or institutions to increase their competitiveness. This engagement has gained particular popularity nowadays. In global competitive environment just the most competitive firms are beneficial in the long run. The competitiveness of companies is determined also by the ability to innovate their products, technologies or services. In this respect, small and medium-sized firms with insufficient sources and innovative capacities are handicapped. Therefore, networking and strategic partnerships are now an important prerequisite for companies' development, especially SMEs. Haviernikova (2016) argues that network organizations are more effective, more flexible, and more resilient to external influences than hierarchical ones. Their development factors appear to be not only the transfer of knowledge and information, intense communication, but also the process of permanent learning to each other.

Global economic environment, which also includes the economy of European Union, is characterized, among other things, by a wide range of heterogeneous risks. In economy only rarely it can be found a risk-free environment, i.e. an environment in which only the necessary

and desirable dependencies of phenomenon are carried out and the results which can be unambiguously expected (Zemanova and Drulakova 2016; European Commission, [online] 20187). However an increasing dependency among countries, regions and businesses, has many negative effects. Along with new technologies and knowledge being spread throughout the world, conditions for their abuse are being created; the impact of various crisis phenomena in world economy is being multiplied negatively. To eliminate the consequences of crisis events in particular economy is possible only in case of internal and external stability. According to Fojtikova (2016) to reduce inflationary pressures and achieve sustainable economic growth in economic and financial spheres can contribute to the economic performance improvement of EU member states.

The capacity of crisis management extends to all areas of social life and human activities, but it is also much focused on environment and risky technical facilities and technological processes. Vojtovic (2016) states that the capability of crisis management is closely interlinked with its basic tools being used to address the emergencies and crisis situations. Basic crisis management tools and various specific procedures make it possible to reduce the likelihood of crisis occurrences but also to handle them with the least damage and loss. It is possible to prevent the crisis phenomenon, to reduce their likely negative impacts on society and subsequently to handle them by using the prevention of crisis phenomena and its negative consequences as well as effective response to the emerging crisis phenomena.

This paper deals with assessing the risks that SMEs are considering within their involvement in cluster cooperation in terms of their territorial impact in Slovak Republic within the EU context. To accomplish the goal, the results of a questionnaire survey, being assessed by chi-square method, have been used.

## **2. Theoretical Background & Literature Overview**

The cluster concept represents a new direction in economic thinking. Jovanović (2014) consider clustering to be a higher form of networking, bringing together the interests of the state, public and private spheres. Already existing horizontal level networks have the possibility to link up to the vertical level in order to achieve a higher added value of their activity with a demonstrably positive impact on the development of regions. In principle, there are two types of clusters (Haviernikova and Strunz, 2014; Hitiris, 2003). The first one is so-called cluster based on the value chain made up of companies in the supply-chain of a final producer. A classic example is the automotive industry where a large number of supply companies are connected to the final manufacturer. The second type is the competence-based cluster, oriented rather to the application of specific solutions. A good example can be the IT technology sector.

From a practical point of view, it is necessary to distinguish between clusters and cluster initiatives, being defined as organized efforts by governments or firms to increase the clusters' growth and competitiveness. According to Jovanović (2014) cluster initiatives typically include three types of actors: cluster firms, governments and research organizations. Cluster initiatives are run by specialized institutions known as cluster organizations, ranging from non-profit organizations, through public agencies to private companies. It is now accepted that cluster organizations are important for the development of clusters.

Cluster organizations can also be defined as organized efforts to promote the growth and competitiveness of clusters in regions, and they include: different member organizations (four main types of actors: private industry, public organizations, academic and public-private, and non-profit organizations); cluster organization with office, cluster manager, website, etc.;

initiative management; initiative financing (national / regional / local public funding, membership fees, consulting, etc.) (Haviernikova. et al, 2016). Cluster organizations play an important role as a cluster support provider, acting not only in less developed regions but also in developing and developed countries (Baculakova and Harakalova, 2017). This means that the institutionalized form of clusters are to be cluster organizations being formed by engaging of enterprises and other relevant entities „around“ an ad hoc institution that meets the goal of central coordinating point. In this case there is no problem with cluster identification being clearly delineated by the membership in central coordinating point - the cluster organization (Tausser and Cajka, 2014).

Crisis management is defined as a sum of the activities of relevant institutions for the security risks and threats analysis, risk factors monitoring, crisis situations prevention, and for planning, organization, implementation and control of activities being designed to create the conditions for crisis situations solving. A business crisis is a state of an enterprise's integrity breach, or its interdependence with external environment, which in turn causes changes in the balance of business objectives and functions (Vojtovic, 2016). It is, therefore, a disturbance of company's balance which threatens to meet the company's objectives. On one hand a business crisis can be induced deliberately in order to gain and benefit for one's own business, or harm competition, on the other hand, unintentionally, by external and internal determinants. Dano (2014) urges that the balance of business processes can be disrupted due to disproportions between the society and corporate goals when the enterprise does not respect all-society needs and its products are not able to be sold. Disproportion between economic performance and social requirements may cause the lost regarding the company's ability to meet its financial obligations. Last but not least, the disproportion among producers, sellers and consumers may undermine the stability between supply and demand (Hamilton and Wepster, 2009).

Determinants of business crises depend on external as well as internal environment. Among the determinants of external environment can be added: international political environment (economic crises, economic sanctions), economic and financial environment (the ability of companies to pay), market environment (market protection by government, the purchasing power of population), legal, ethical and social environment (entrepreneurship support) and natural environment (Hitiris, 2003). On the other hand, the determinants of internal environment are strategies and tactics of corporate management, qualification level of employees, labor and technological discipline, labor productivity, production technology and so on (Okreglicka and Mynarzova and Kana, 2015).

Business crises can selectively affect different business and business segments, but they can also have a complex character and modify all aspects of company's life. The causes of corporate crises are very diverse, and they can be divided into two basic groups as internal and external causes (Mura and Sleziak. 2015; Lipkova, 2012; Delgadova et al, 2017). Within Slovakia, among internal causes, we can include, for example, lack of equity, unclear direction, low share of final production and market production program, mistakes in business activities (e.g. sale to insolvent or unknown customers), deliberate mistakes and enrichment of top executives, key employees loss, competition, risky business, the inability of top management to respond to environmental changes, little flexibility to predict and respond to market and price changes and others. The external causes of business crises include, for example, problems related to industry restructuring, formal industry revitalization, legal deficiencies in business sector, interest rate and wage growth, lack of credit (inappropriate credit conditions), customer insolvency, rising energy input prices, the entry of cheaper production from abroad into our market, gradual cancellation of governmental subsidies, negative impacts of military conflicts and international political instability, economic sanctions and embargoes, and others.

### 3. Problem Formulation and Methodology

The paper is part of results of scientific project VEGA 1/0918/16 Risk management of SMEs in the context of clusters' involvement activities in the Slovak Republic. In the frame of this project the pilot testing of questionnaire surveys were realized from July 2016 till January 2017 that was focused on identification of the small and medium-sized entrepreneurs' view on the risks associated with involvement into the clusters. The questionnaire surveys were realized among 123 small and medium sized entrepreneurs from two areas in which the Slovak clusters operate: technological and tourism. The research was executed over whole Slovakia, each region was presented. The definition of cluster cooperation was presented in questionnaire form to be clearly understood by each respondent. After making sure that the respondents are familiar with cluster cooperation issue, the authors try to establish the risk level in 25 different areas of business activity in the case it would be carried out within cluster cooperation (potential situation). The scale from 0-not applicable and 1-very low risk to 5-very high risk was applied.

For the processing of questionnaires the commonly used test for testing relationships between categorical variables - the Chi-Square test ( $\chi^2$ ) was used. Chi-Square test was used for verifying of null hypothesis (H0) about no association between two nominal variables.

Observed counts ( $f_{b_n}$ ) are compared to expected counts ( $f_{e_n}$ ).

Test statistic

$$\chi^2 = \sum_{i=1}^m \sum_{j=1}^n \frac{(f_{b_n} - f_{e_n})^2}{f_{e_n}} \quad (1)$$

In this paper we used the  $\chi^2$  statistic for ascertaining whether an association exists between the type of risks and enterprise's operating in terms of its localization.

By this test statistic we test null hypotheses H0 about no association against H1 about association between type of risk and placement of enterprise (local, regional, EU). A large size of the  $\chi^2$  statistic indicates that the observed data are unlikely under an assumption of no association between risk factors and enterprise' activities placement. The low level of p value  $< 0,05$  means that the H0 is rejected and we accept the alternative hypothesis H1, that between type of risk factor and placement of SME's activities an association is present. Large probability (p-value  $> 0,05$ ) means that the H0 is not rejected. It means that between type of risk and placement of SME's activities is not association.

### 4. Problem Solution and Results

The basic structure of respondents presents table 1. The most respondents belong to category of enterprises that employ less than 10 employees (68,29%) and operate in area of EU territory (47,15%).

**Table 1: Structure of Respondents**

Sized categorization	Local	Regional	EU	Total
less than 10 employees	31	22	31	<b>84</b>
from 10 to 49 employees	3	7	17	<b>27</b>
from 50 to 249 employees	0	2	10	<b>12</b>
<b>Total</b>	<b>34</b>	<b>31</b>	<b>58</b>	<b>123</b>

Source: author's research elaboration and calculations

The respondents assessed 25 risks' areas that SMEs are considering when join the cluster cooperation. The basic statistic characteristic of respondents' answers are presenting in the table 2

**Table 2: The Mean Assessment of Cluster Cooperation Risks by SME's Activities Location**

Notes: Min. 0,00; Max. 5,00 (scale: 0-not applicable, 1-very low risk, ..., 5 – very high risk)

Source: author's research elaboration and calculations

In general, it could be noticed that the potential risks of cluster cooperation was assessed higher by SMEs with regional operation. The highest risk areas for cluster cooperation were observed:

- Among SMEs operate in local area: competition and outflow of own costumers.
- Among SMEs operate in regional area: competition, partners, market area, taxation, Machinery and equipment, quality, competence, cluster production and outflow of own costumers.
- Among SMEs operate in EU area: competition and outflow of own costumers

The risk related with competition and outflow of own costumers were assessed by all SMEs as most risky. In the next step, the calculation of test statistic was calculated. The statistical analysis of the two hypothesis was realized:

H0: between type of risks and SME's activities placement is no association.

H1: between type of risks and SME's activities placement an association is present.

Due to the rules of Chi- Square test according which the expected variables must be higher than value 5 in 80% of cases, it was necessary to group the obtaining results of questionnaire surveys. The respondents' answers of value 1 – very low risk was grouped with value 2 – low risk and answers with value 5 – very high risk were grouped with value 4 –high risk. The results of Chi - Square statistics are presented in table 3.

**Table 3: Results of Chi-Square test**

<b>24. Cluster production</b>	Person chi-sq.: 6,65636, df=6, p=,353807
<b>25. Outflow of own customers</b>	Person chi-sq.: 8,51739, df=6, p=,202606

Source: author's research elaboration and calculations

The obtaining results showed that between type of risk and placement of SME's activities is not association. It means that H0 has not been rejected.

## 5. Conclusion

Up till now in Slovakia, there is no comprehensive system to support the emergence and development of technology clusters and cluster organizations. The current status represents a barrier for development of cluster, and hence individual companies, sectors and regions. This fact is highlighted by the fact that many member firms of cluster organizations are small and medium-sized enterprises (SMEs), which generally have many specifics. One of important ones is the fact that many SMEs are often inadequately innovative, or having a problem to convert the results of their activities into practical commercially successful innovations. The current situation also does not allow the development of promising industries with great innovation potential.

The development of Slovak clusters must be seen from the point of view of an enterprise development, but also in the context of events ongoing within the EU. It is necessary to create conditions for clusters development so that they are able to compete in global conditions but also to use the forthcoming European instruments and initiatives aimed at promoting the internationalization and export and the emergence of European meta-clusters. Slovak Republic is not much left behind by other European Union countries. Clusters of regional as well as supra-regional nature are emerging and align their activities with regional strategies in order to increase competitiveness and economic growth of particular regions. The role of clusters is not easy considering the economy's development. Their main task is to strengthen the economic development of regions in all types of capital. This underpins the need to implement a comprehensive support approach in Slovak Republic, which will help domestic clusters and their members to increase their competitiveness and create conditions for the involvement of cluster organizations in international networks and programs. It is necessary that the interest to build up clusters as a regional development tool would be met positively not only with the vertical level actors, but also regional policy actors should be involved in the process of regional strategy development. As research limitations can be mentioned issues such as pilot research to bigger project, all regions in Slovakia necessary to be covered, research sample a bit difficult to set.

### Abstract

*Innovation is an important improvement and development element in all areas of economic and social life, business environment as well as regional processes. EU Regional policy has a significant impact on many areas of economic and social life throughout the European Union. By means of analysis, comparative analysis methods followed by logical deduction the main goal of this paper is to figure out how and in what way the technology and innovation implementation processes in EU Regional policy can affect the sustainable economic growth in terms of the conditions of Slovak Republic to assure sustainable economic growth in Slovak regions and enhance the Slovak competitiveness within the European economy environment. Slovak regional and innovation policies are acting as a main synergic issue coming out of EU innovation and regional policies interaction. Their parallel collaboration and positive effects have significant fallouts on regional development and limiting the regional discrepancies in Slovak regions.*

**Keywords:** *European economy, regional competitiveness enhancement, regional discrepancies, technology and innovation*

**JEL Classification:** *F63, F68, O38*

## 1. Introduction and Theoretical Background

Generally understood, in current economic complex of European Union innovation plays an increasing role in European economy. The most basic definitions of innovation suggest that it is a change or novelty induced by human creativity (Brakman, 2006). Balaz (2014) argues that it provides benefits not only for citizens as both consumers and workers but also for regional development. It accelerates and improves the design, development, production and use of new products, industrial processes and services especially in backward regions to start up their development and to catch up with other more developed regions within the European Union states (Hamilton and Wepster, 2009; Reinert, 2012). Undoubtedly it is essential to creating better jobs, building a greener society and improving the quality of life, but also to maintaining EU competitiveness in the global market (Vojtovic, 2016). Hitiris (2003) argues that the role of innovation is to turn research results into new and better services and products in order to remain competitive in the global marketplace and improve the quality of life of Europe's citizens. Innovation policy is the interface between research and technological development policy and industrial policy and aims to create a conducive framework for bringing ideas to market and also into regions. The importance of innovation policy is widely recognized within the EU. It is also strongly linked to other EU policies, such as those on employment, competitiveness, environment, industry and energy but especially to EU Regional policy.

Regarding the world economy situation Europe spends 0.8% of GDP less than the US and 1.5% less than Japan every year on research and development (R&D) (Balaz, 2013); Obadi and Korcek, 2016). Although the EU market is the largest in the world, it remains fragmented and is not sufficiently innovation-friendly. With a view to changing these trends, the EU has developed the concept of an Innovation Union. This unique program has several issues to be executed. According to European Commission (2017) it aims to make Europe a world-class science performer, then to remove obstacles to innovation like expensive patenting, market fragmentation, slow standard-setting and skills shortages which currently prevent ideas getting quickly to market and finally to revolutionize the way the public and private sectors work together, notably through the implementation of Innovation Partnerships between the European institutions, national and regional authorities and business (Taušer and Arltová and Žamborský, 2015; Drulák and Druláková, 2014). The Innovation Union aims to create a genuine single European market for innovation, which would attract innovative companies and businesses. The Innovation Union is a crucial investment in EU portfolio. For example, achieving our target of investing 3% of EU GDP in R&D by 2020 could create 3.7 million jobs and increase annual GDP by EUR 795 billion by 2025 (Eurostat Press Office [online], 2017).

To make those targets work and being executed successfully several instruments have been introduced to measure and monitor the situation across the EU and the progress being made. In terms of regional development the most significant one is a Regional Innovation Scoreboard (RIS), which classifies European regions into four innovation performance groups, similarly to the Innovation Union Scoreboard. There are 41 regions in the first group of innovation leaders, 58 regions in the second group of innovation followers, 39 regions are moderate innovators and 52 regions are in the fourth group of modest innovators (Mynarzova and Sverkova, 2015). It provides a more accurate mapping of innovation at local level.

Within the implementation of innovation policy into regional development scenario the effective financial mechanism is very necessary to be set up. As a Europe 2020 flagship initiative aimed at securing Europe's global competitiveness, Horizon 2020 is the financial instrument which provides for the implementation of the Innovation Union (Lipkova, 2013; Cihelková and Hnát, 2008). This new program for research and innovation is part of the drive to create new growth and jobs in Europe, and combines all the research and innovation funding currently provided through the Framework Programs for Research and Technological Development, the innovation-related activities of the Competitiveness and Innovation Framework Program (CIP) and the European Institute of Innovation and Technology (EIT). By introducing a single set of rules, Horizon 2020 provides major simplification and addresses challenges in society by helping to bridge the gap between research and the market, for example by helping innovative enterprises to develop their technological breakthroughs into viable products with real commercial potential. Many authors such as Jovanović (2005), Baldwin and Wyplosz (2009), Lipkova (2012) state that small and medium size companies (SMEs) play a very important role as an intermediary between regional and innovation policy and they appear as a very important tool how innovation is implemented into regional policy and they create an environment how these policies are working in harmony together. There is also a unique program called Fast Track to Innovation (FTI) being designed to significantly speed up the time from idea to placement on the market and is expected to increase participation in Horizon 2020 and the number of first-time applicants. Finally the Structural policy tool focuses more on research and innovation. In more developed regions at least 80% of resources from the European Regional Development Fund at national level are allocated to innovation, with the priorities being a low-carbon economy and competitive SMEs while the corresponding share in less developed regions is 50% (Taušer and Čajka 2014).

The significant issue of EU Regional policy is that it appears to be the vehicle for delivering regional aid. European concern for the less developed regions has always been the main objective of the European Union (Jovanović, 2005). The aim of the European regional policy is to contribute to the development of backward regions in particular, the restructuring of declining industrial areas, and revitalization of deprived neighbourhoods. The emphasis is focused on creating sustainable jobs and improving the economic, social and territorial cohesion of the Union. The main important tool how EU Regional policy is being executed is structural funding mechanism system. Regional Policy is delivered through three main funds such as European Regional Development Fund (ERDF), Cohesion fund (CF) and European Social Fund. Together with the European Agricultural Fund for Rural Development (EAFRD) and the European Maritime and Fisheries Fund (EMFF), they make up the European Structural and Investment (ESI) Funds. The most important tool effectively enhancing and combining the regional and innovation aspects appears to be the European Regional Development Fund that aims to strengthen economic and social cohesion in the European Union by correcting imbalances between its regions. It focuses its investments on several key priority areas known as thematic concentration, namely innovation and research; digital agenda; support for small and medium-sized enterprises; and low-carbon economy. Resources allocated to these priorities will depend on the category of region. In more developed regions, at least 80 % of funds must focus on at least two of these priorities. In transition regions, this focus is for 60 % of the funds and 50 % in less developed regions (European Commission [online], 2017). The European Regional Development Fund also gives particular attention to specific territorial characteristics. ERDF action is designed to reduce economic, environmental and social problems in urban areas, with a special focus on sustainable urban development. At least five percent of ERDF resources are set aside for this field, through integrated actions managed by cities (Mitchel and Muysken and Van Veen, 2006). Areas being naturally disadvantaged from a geographical viewpoint (remote, mountainous or sparsely populated areas) benefit from special treatment. Lastly, the outermost areas also benefit from specific assistance from the European Regional Development Fund to address possible disadvantages due to their remoteness.

This study dealing with the role of Innovation in EU Regional policy within its implication in the conditions of Slovak Republic is supposed to be a follow up to the pervious researches which analyzed similar issues but from different perspectives and approaches.

## **2. Problem Formulation and Methodology**

This paper will discuss how the EU Innovation policy is implemented into EU Regional policy, how important role it plays within their synergies to assure sustainable economic growth in Slovak Republic and enhance its competitiveness within the European economy environment highlighting the impact of EU innovation strategy and EU Regional policy on Slovak regional development and regional discrepancies issue in the period of 2014-2020. By means of analysis, comparative analysis methods followed by logical deduction the main goal of this paper is to figure out how and in what way the European Regional and Innovation policies are affecting the execution of Slovak regional and innovation practices implementation processes in order to enhance and reinforce the sustainable economic growth and to reduce the fallouts of deepening the regional discrepancies process in Slovak Republic.

### 3. Findings and Discussion

Regarding the research outputs of this particular study following issues are to be analyzed and discussed. Firstly, regional policy and EU Commission's priorities being reflected into the Slovak regional policy environment underlining its success stories; secondly, the Slovak Innovation and Energy Agency is to be illustrated as a main subject combining and implementing the regional and innovation issues into an effective cooperation and synergies and lastly, the Innovation policy of Slovak Republic within the research and development background and current priorities being observed.

Regional Policy has a strong impact in many fields. Its investments help to deliver many EU policy objectives and complements EU policies such as those dealing with education, employment, energy, the environment, the single market, research and innovation. The European Structural and Investment Funds are directly contributing to the Investment Plan and the Commission's priorities. Regional Policy provides the necessary investment framework to meet the goals of the Europe 2020 Strategy for smart, sustainable and inclusive growth in the European Union. According to European Commission [online] (2017) the five targets for the EU in 2020 are as follows. Firstly it is employment with its goal 75 % of the 20-64 year-olds to be employed; secondly the research & development areas aiming at 3% of the EU's GDP to be invested in research and development; thirdly it is the climate change and energy sustainability (greenhouse gas emissions -20 % (base year 1990) - 20% of energy from renewable sources and 20 % increase of energy efficiency); fourthly, education - reducing the rates of early school leavers below 10% and at least 20 million fewer people in or at risk of poverty and social exclusion; and finally the fighting poverty and social exclusion - at least 20 million fewer people in or at risk of poverty and social exclusion.

Each Member State has adopted its own national targets in these areas. According to data from the Eurostat [online] (2017) the targets for Slovak Republic in 2020 are as follows. Employment: 72 % of the 20-64 year-olds to be employed. Research & Development: 1 % of the GDP to be invested in research and development. Climate change and energy sustainability (greenhouse gas emissions -13 % (base year 2005), 14 % of energy from renewable sources. Education - reducing the rates of early school leavers below 6 % and at least 20 million fewer people in or at risk of poverty and social exclusion. Fighting poverty and social exclusion with the goal 170.000 less people should be at risk of poverty or exclusion. As we can see, some of the objectives of the European Union are higher compared with the Slovak Republic, but on the other hand, the European Union has also targets lower compared with the Slovak Republic. Slovak Republic does not have one target concerning the energy efficiency issue.

To illustrate the Slovak regional policy background we have to keep in mind that Slovakia has one "more developed region" – Bratislava region and three "less developed regions" Western, Central and Eastern Slovakia regions. To sum up briefly, in terms of Regional Policy in Slovak Republic from the last finished period of 2007 – 2013 we can observe that the total allocation from Structural policy funding for the 2007-2013 period was 11.6 billion €. Since the beginning of the 2007-2013 funding period, amongst other achievements, EU Structural policy investments have helped Slovakia to create more than 2 671 jobs including almost 2 000 jobs created in SMEs; provide direct investment aid to almost 1 000 SMEs; support around 100 SME start-ups; serve 3 300 more people with waste water and water projects; and improve public transport in the regions of Slovakia, through the purchase of new passenger trains, the reconstruction of the railway lines, etc. (Fojtikova, 2016; Eurostat [online], 2017). In terms of some success projects of Regional Policy within the European Regional Development Fund projects there is an example how the modernization of public transport network can enhance the regional development of background regions via the project of Rolling stock renewal for

smoother public passenger railway transport. The Railway Company of Slovakia purchased new rolling stock to increase the number of passengers in interregional and regional rail transport by 10 % by 2014 as compared to 2008. Expected benefits of the project help regions enhance their efforts regarding tourism industry. Total cost was € 232 million with the ERDF contribution of 88.5 million € (Haviernikova and Strunz, 2014).

In 2014-2020 Slovakia will manage seven operational programs under EU Structural policy. Of these, five programs will receive funding from the European Regional Development Fund and the Cohesion fund, one program from both the European Social fund and ERDF, and one from ESF including the Youth Employment Initiative. According to European Commission [online] (2018) data for 2014-2020, Slovakia has been allocated around 14 billion € in total Structural policy funding namely 9.2 billion € for the less developed regions (all except Bratislava), 328.7 million € for more developed regions (Bratislava), 4.2 billion € under the Cohesion fund, 223.4 million € for European Territorial Cooperation, 72.2 million € for the Youth Employment Initiative. Of this, the European Social Fund represents almost 2.2 billion € and reflects the specific challenges the country needs to address in the areas covered by the European Social Fund. The investment priorities for 2014-2020 are set out in a Partnership Agreement with the European Commission. The goal of those priorities is to promote an innovation-friendly business environment by enhancing the competitiveness of SMEs, improving innovation and research performance and developing an e-economy; develop infrastructure for economic growth and employment in particular key transport networks and sustainable urban transport; develop human capital and improved labour market participation; encourage the sustainable and efficient use of natural resources through promotion of energy efficiency and a low carbon economy, protection of the environment and adaptation to climate change; and to build modern and professional public administration by means of a thorough reform aimed at improving governance, tackling corruption and ensuring the efficiency and impartiality of the judiciary.

Very important governmental body disseminating and enhancing innovation policy across Slovak regions is a Slovak Innovation and Energy Agency (SIEA) that carries the information service for the Ministry of Economy of the Slovak Republic, with special focus on innovations and energy sector. It gathers processes and disseminates information related to the increase of energy efficiency, using of renewable energy sources, combined heat and power and the development of innovation activities. SIEA has been established by the Ministry of Economy of the Slovak Republic as a professional state subsidy organization which makes an important contribution in the achievement of governmental energy policy objectives, principally by promoting energy efficiency, new energy technologies and renewable sources. One of the main tasks how SIEA contributes promoting and implementing the synergies of regional and innovation policies is giving a pieces of advice and information service regarding the establishment and functioning of clusters. It works as an implementation agency for EU Structural funds and for various support schemes aimed on the development of innovation activities providing free expert consultancy for households, investors, energy service companies and public sector in the field of energy efficiency and renewable energy sources within the active participation in international programs aimed at energy efficiency, renewable energy sources and support of innovation activities (Zak, 2012). At last SIEA appears to be as a crucial management and information point for funds provided for Slovakia under international agreements and support mechanisms such as subsidized programs, support programs for development of SMEs, etc. and also providing consultations regarding the development of regional energy concepts and local sustainable energy action plans (SEAP) for Upper Territorial Units and Municipal authorities. In fulfilling its tasks SIEA mainly cooperates with universities, research and development institutions, and organizations

operating in the area of technical standardization and testing, Ministries, Regulatory office for network industries. SIEA has a long-lasting experience in the implementation of international projects within various EU community programs (Intelligent energy – Europe, Central Europe Program, INTERREG IVC, 7FP). Through those it is able to gain, share and disseminate best practices in the field of innovations, energy efficiency, renewable energy and energy recovery from waste.

In this part two main documents being related to innovation policy of SR are to be discussed. These are two of them: RIS3 (research and innovation policy for smart specialization) and SR innovation strategy 2014-2020. RIS3 exceed the partial responsibility of individual ministries, regional, municipal and local governments, but also civil society organizations and the business community. Its effect is based on the integration of science with innovation, research institutions and industrial and economic practice by creating adequate conditions in regional and sectoral space. RIS3 also aims at increasing the contribution of research to economic growth through global excellence and local relevance, creating a dynamic, open and innovative society as one of the preconditions for improving quality and mainly improving the quality of human resources for innovative Slovakia. The strategic goal of the SR innovation strategy until the year 2020 includes improving the ability to commercialize and adopt innovation and technology and include SR among the successful industrialized countries of the 21st century and double the share of expenditure by enterprises on innovation carried out from results of research and development activities (Dubravská and Mura and Kotulič and Novotný, 2015). The promotion of competitiveness of enterprises should be carried out through various programs especially it is about the support for clusters or support for business start-ups. The strategy also puts emphasis on education because educated and skilled workforce is a key element of the development of innovation.

#### **4. Conclusion and Further Implications**

As conclusion we can say that the current innovation landscape suggests that understanding the causes of the current innovation gap in Europe might well be a necessary step towards finding an adequate solution, but is not likely to be enough to restore Europe's leadership in innovation. The new approach to support innovation in Slovakia will help to ease the major challenges facing the Slovak innovation system, and at the same time, will mobilize innovation in all the relevant sectors through significantly stronger participation of all relevant partners at governmental and regional levels.

In this paper we have shown how Slovak regional and innovation policies are acting as a main synergic issue coming out of EU innovation and regional policies interaction. Their parallel collaboration and positive effects have significant fallouts on regional development and limiting the regional discrepancies in Slovak regions.

Finally we can summarize that innovation is a very difficult subject for public policy; it is at once a pervasive and elusive subject. It is pervasive since it entails both government and private investment; it is pervasive since it permeates all areas of public policy, from tax to labour, from telecoms to energy, from competition to industrial policy, from education to intellectual property, from immigration to health and agriculture, from supply-side to demand-side policies; and also, because it requires actions at the global, EU, national, regional and local levels.

Regarding the further vision associated with this kind of research as the follow up issues that will be necessary to be taken into consideration and be assessed are the areas such as the linkage of Innovation Union and cluster policies / clusters development in terms of technology

advance and their impact on EU creative industries development; and Strategy 2020 assessment regarding its impact on EU economy competitiveness enhancement versus the US economy in terms of the TTIP agreement (Transatlantic Trade and Investment Partnership). Regarding this context the next research will be also geared to assessing the impact of EU innovation strategy and EU Regional policy on Slovak industry policy and Slovak innovation agenda; as well as the fallout of EU Innovation policy on EU Energy policy along with implications on Slovak energy security.

### **Abstract**

*Private investments are considered as a crucial element of economic growth in all countries. In recent years, there has been a worrying decline in private investment, also in the European Union. That is why many researchers concentrate on questions of how countries should work seriously to create an enabling environment for private investments. The aim of the paper is to find out the answers to the research questions: 1. What are the causes of the stagnation of private investments in Poland? and 2. What are the determinants of private investments in Poland? The paper is theoretical and empirical in character. The theoretical part, which presents literature review, uses literature-based studies, which involve collection, specification and characterisation of data. Based on the information gathered in the theoretical part, the empirical part was completed with the aim to achieve the objective of the paper. The paper relies on secondary data, mainly that published by Eurostat, GUS and mBank. The results show what factors affect the growth of private investment.*

**Keywords:** *determinants, European Union, private investments*

**JEL Classification:** *E22, O11, O52*

### **1. Introduction**

Investments are a precondition for continuity of the process of resources reproduction in every economy. Continuous and effective reproduction of resources stimulates economic growth, which is mainly manifested in an increased Gross Domestic Product. Investments also impact economic development, whose pace largely depends on a percentage change of the number of employees and the pace of qualitative changes called innovativeness. It should be noted that countries that are catching up with the world technological leaders are characterised by a higher rate of innovation, which they achieve not through high research and development spending, but rather by absorbing innovation resources accumulated in the leading countries. What drives this absorption? Above all, investments in fixed assets, appropriate qualifications of employees, and good quality of institutions (Gomułka et al., 2017).

A number of studies, covering both short periods (Khan, Reinhard, 1990; Coutinho, Gallo, 1991; Server, Solimano, 1990), and long periods (Khan, Mohsin, Manmohan, Kumar, 1997; Bouton, Lawrence, Sumlinski, 2000) supported the assertion that private investments are more efficient and productive than public ones. For a few years, EU countries have been recording a worrying decrease in private investments - whether those undertaken by enterprises or households. As profit is the basic reason why entrepreneurs start investing, their decisions depend on potential investment income, related costs, and risk and uncertainty connected with both income and costs (Gomułka et al., 2017, Korombel 2013). The aim of the paper is to find out the answers to the research questions: 1. *What are the causes of the stagnation of private investments in Poland?* and 2. *What are the determinants of private investments in Poland?*

## 2. Literature Review

One of the basic factors fostering the development of all enterprises in the market economy is investment activity. In most general terms, investments are defined as resignation from current consumption for the sake of future uncertain benefits (Flak, 2000). In economic studies, investments are divided into: financial, physical, and intangible and legal ones (Piózdioch, Janik, 2011). The aim of physical investments is to create new fixed assets or improve (modernise, reconstruct, develop or redevelop) the existing items of tangible assets, and inputs in the so-called first equipment of investments (GUS, 2006, p. 643). The characteristic features of enterprises' investments which determine their character are: a relatively long period of capital freezing, long time before potential benefits are achieved, the amount of expenditure exceeds that of an enterprise's operating expenditure, usually a large impact of investment results on entities' effectiveness and competitiveness and investment-related risk (Rózański, 1997, p. 16). For enterprises, investments are a way of achieving a short-term objective of profit maximisation and a long-term objective of increasing the value of the company (Nehrebecka, Białek-Jaworska, 2006; Kasprzak-Czelej, 2013; Lemańska-Majdzik, Okręglińska and Gorzeń-Mitka, 2016).

There is an extensive empirical literature worldwide on the subject of investments. So far, the attention of researchers concerned with the theory of enterprises' investments has been focused, among other things, on the impact of the current financial situation on investment decisions, the size of an enterprise, the status of an exporter and the company's ownership structure (Nehrebecka, Białek-Jaworska, 2016). There are numerous publications available which present findings on the impact of financial factors on enterprises' investment decisions. Many authors argue that analysis of cash flows helps to explain the issues of investment spendings (Bond, Elston, Mairesse, Mulkay, 2003, p. 153; Cleary, 1999; D'Espallier, Guargilia, 2011).

It should be stressed that the previous research on determinants of private investments has not been carried out comprehensively for European countries. The findings of research conducted in Greece show that generated effects and profitability are the factors that have the biggest impact on enterprises' investments. At the same time, it has been observed that investments are almost inflexible in relation to interest rates, which were treated as the basic determinant of investments (Michaelides, Roboli, 2005). In the case of Turkey, the findings show that in the long run the real GDP, real foreign exchange rate, the relation of private sector loans to the GDP, private foreign debt, inflation and openness of trade have a significant impact on private investments (Karagöz, 2010).

## 3. Problem Formulation and Methodology

The aim of this paper is to find out the answers to the following research questions: 1. What is the cause of the stagnation of private investments in Poland? and 2. What determinants shape their level? In order to achieve this objective, the paper analyses relevant literature and documents.

The paper is theoretical and empirical in character. The theoretical part uses literature-based studies, which involve collection, specification and characterisation of data. Based on the information gathered in the theoretical part, the empirical part was completed in order to achieve the objective of the paper and answer the research questions. The empirical part relies on the method of statistical temporal and spatial comparisons. The paper is based on secondary data, published mainly by Eurostat, GUS and mBank. The research period covers the years 2005-2016.

### 4. Private Investment in European Union – Statistics

Private investments are the main driving force for economic growth. In many countries, an increase in private investments is needed in order to increase the pace of economic growth and development. Decision-makers are trying to achieve the right balance between creating a climate that is good for investments and removing barriers to investments. Many researchers are studying the mechanisms that stimulate private investments (Batu, 2016). Total investments in European Union countries (% of GDP) are presented in Figure 1.

**Figure 1: Total Investments in European Union Countries (% of GDP)**

Source: Eurostat database [online] (2018), own proceedings

Figure 2 presents the level of investment rate in 23 European Union countries (data on investments in other countries was unavailable at the time of writing this paper).

**Figure 2: Business Investments in Individual Countries of the European Union in 2016 (% of GDP)**

Source: Eurostat database [online] (2018), own proceedings

The highest level of private investment in Ireland was the result of a favorable investment climate. Not only tax incentives had an impact, but also the overall policy as well as development potential, in particular the development of economic infrastructure, human capital, EU funds creating favorable internal conditions for investment, access to the integrated EU market and a generally positive attitude towards foreign capital.

## 5. Determinants of Private Investments in Poland

Investments in Poland entered a period of stagnation. In 2016, they reached the lowest rate since 2005, down by 2.02% compared to 2015. If the 2016 investment rate is compared with the 2008 figure, the fall is even bigger - 5.03%. Total investment rates for Poland expressed as a percentage of GDP are presented in figure 3.

**Figure 3: Total Investment in Poland (% of GDP)**

Source: Eurostat database [online] (2018), own proceedings

Private investments in Poland show a long-term downward trend. The rate of private investments in 2016 decreased against the previous year by 0.74%. Compared to the highest level of investment rate, which was recorded in 2008 at 12.48%, the 2016 rate fell by 2.13%. Figure 4 presents private investment rates expressed as a percentage of GDP.

**Figure 4: Business Investments in Poland (% of GDP)**

Source: Eurostat database [online] (2018), own proceedings

The causes of the stagnation of private investments in Poland are not clear. Various discussions are conducted on this subject, but no consensus has been reached. In attempting to answer the first research question, it can be indicated that the most likely reasons for stagnation of private investments in Poland are (mBank.pl, 2018) the following:

1. Low ability of enterprises to shape prices (power on the market) - in the Polish industrial sector, which is characterised by high competitive pressure, the majority of enterprises function with a very high level of production capacity utilisation. The competitive position of industrial enterprises after 2009 deteriorated relatively to the phase of the

business cycle. Due to the global character of the environment, the increase in prices is often not accompanied by increases in profit margins - which discourages enterprises from investments.

2. Labour shortages - supply limits on the labour market and competition among enterprises for the labour factor prevent investments.

Factors that had the least or no impact on the stagnation of private investments in Poland include (mBank.pl, 2018):

1. Enterprises' financial resources - financial resources of enterprises in Poland since 2013 have shown an upward trend. This is confirmed by: financial results of enterprises, data on bank deposits, and continuous structural surplus of savings over investments in the sector of non-financial enterprises.
2. Demand - Assessments of the current and future demand are close to historical maximums, the assessment of insufficient demand as the barrier to the development is at historical low.
3. Taxes and regulations - The percentage of enterprises declaring high tax burdens in relation to their budgets is relatively low, and in some sectors the lowest in history. The severity of regulations does not increase, except in the trade sector. In most sectors, the percentage of enterprises indicating this barrier to business activity has not changed since 2009.
4. Uncertainty - Despite the positive correlation between uncertainty and investment plans and activity, it is not a direct cause of the low rate of private investments. This is confirmed, among other things, by: 1. The shift in assessments of uncertainty over the last years in the opposite direction, 2. lack of a clear definition of the notion of uncertainty, and specification which aspects of the economy it refers to, 3. dynamic increase in demand.
5. Correlation between private investments in Poland and investments in other countries - The dynamics of private investments in the last cycle in Poland was clearly lower than in the Czech Republic - it refers to both the period of slow-down in 2016 and recovery in 2017. There is no statistically significant anticipating relationship between the dynamics of private investments in Poland and in neighbouring countries.

Uncertainty is the most often mentioned cause of a low rate of private investments. However, experts from mBank reject this assumption, arguing that uncertainty is treated as a word that does not have a single referent, but involves a range of concerns and barriers. They argue that uncertainty should be treated as a secondary barrier which results from other factors. One of the reasons of the low rate of private investments in Poland is, according to mBank experts, competitive pressure and enterprises' limited ability to shape market prices, which, by reducing the profitability of investments or increasing its uncertainty, have a negative impact on investments decision-making (mBank 2018).

G.A. Bokpin and J.M. Onumah (2009) deeply analysed determinants of investments in fixed assets of enterprises from 34 emerging markets. The paper verifies the impact of exogenous factors (development of the financial market and macroeconomic variables) and endogenous ones (microeconomic variables) on an enterprise's investments in fixed assets. Based on panel surveys carried out using data from the period 1992-2007 from 34 developing countries, including Poland, it has been found out that the current level of enterprises' investments in fixed assets is statistically significant and positively correlated with the investments in the previous year, and negatively correlated with free cash flows, profitability and the size of a company. Among macroeconomic variables, only the impact of *per capita* GDP has been found to be statistically significant (Onumah, Bokpin, 2009).

M. Gradzewicz, J. Growiec, J. Hagemeyer and P. Popowski (2010) studied the business cycle in Poland. The researchers showed that variability of investment expenditure is over four times as high as the variability of the GDP growth rate. This relationship shows that in explaining the process of economic growth, identifying the significance of savings in the business sector plays a very important role among determinants of the level of enterprises' investment expenditure. D. Juszczak, E. Kojder-Ogarek and J. Czyżowska (2017) studied general relationships between investment expenditure in Polish enterprises and macroeconomic variables resulting from the economic situation. The findings of these authors show that enterprises' investments are to a large extent determined by the economic situation - investments are pro-cyclical. Reductions of interest rates by the National Bank of Poland were accompanied by an increase in investment expenditure both in the national economy and in the industry. Increased investments also followed reduction of the credit rate. Moreover, the amounts of corporate deposits and loans are factors that to a large extent precede new investments.

Research into investment determinants can be divided into two groups: The first group uses macroeconomic analyses and analyses time series for one or more countries, whereas the second group of research relies on macroeconomic approach based on data at the level of enterprises (Kasprzak-Czelej, 2013). Thus, among the factors impacting enterprises' investment decisions, two basic categories are distinguished: external and internal factors. The external factors include: demand for an enterprise's products and services; cost of obtaining borrowed capital and access to external sources of financing; overall economic situation of the country; investment climate; resources in the economy (including natural ones); system solutions (financial, economic, institutional); socio-political stabilisation; state policy; formulation of requirements in various spheres of business activity (e.g. environmental protection standards); regulations on access to public procurement for the different groups of enterprises; stability of the existing legal regulations and predictability of potential changes; tax policy; legislation on investments, including the system of investment permissions; present and potential competition; degree of the economy's openness; technological progress; barriers (e.g. to the import). The group of internal factors usually includes: size, mobility and profitability of an enterprise's own resources; ability to obtain resources to meet an enterprise's needs; organisation and system of management, organisational culture and conducting of negotiations; an enterprise's adaptation to high changeability of its environment; ability and willingness to invest; available financial resources; an entity's credit capacity; degree of production capacity utilisation; degree of physical wear and tear and obsolescence of fixed assets; level of knowledge and skills of the management (ability to assess potential economic, strategic and consequently financial effects of investment projects); expectations connected with potential impact of investments on their professional career and propensity to take risk (Towarnicka, 2004; Różański, 2006; Kornecki, Głodek, Nowak, Czyż, 2008; Kasprzak-Czelej, 2013). These factors may impact the ability to carry out investments, on the one hand, and investment attractiveness, on the other hand.

Currently, one of important issues of economic politics is access to widely understood EU funds and their significance for the development of enterprises (Kornecki, Głodek, Nowak, Czyż, 2008). The European Union, as part of co-financing of its fundamental goals, provides support for improvement of regional cohesion that respects the principles of sustainable development and protection of the natural environment (Ławińska, 2016).

As an answer to the research question 2, we can indicate three groups of determinants of private investments in Poland (table 1).

**Table 1: Determinants of Private Investments in Poland**

Determinants of private investments	Factors
Investment income	Expectations about the future economic situation
	Level of economic activity and production capacity utilisation
	Technological change
	Public policy
Investment costs	Interest rate
	Cost of capital goods
	Costs of other production factors
	Public policy
Risk and uncertainty	Risk of the situation stability
	Bad public policy creates uncertainty

Source: own elaboration based on (Gomułka et al. [online], 2018)

The most important determinants of the investment in Europe are:

1. Uncertainty about future economic conditions and expected profits;
2. Microeconomic factors - weaknesses in the business environment and rigidities in labour and product markets hinder the reallocation of resources;
3. Macroeconomic factors;
4. Financing conditions of investment.

The business environment influences a firm's decision to invest through channels modernising equipment, entry in a market, expanding in new activities/markets. Business regulations are the key to functioning of the private sector. These regulations apply to areas such as: creating and scaling up a business, getting credit, protecting minority shareholders, enforcing contracts, resolving insolvency and closing a business, paying tax, compliance costs, the predictability and stability of legislation (European Union, 2017).

## 6. Conclusion

It is difficult to talk about economic development or growth, when investments are in the phase of stagnation. In the case of public investments, it is the government that decides how much financial resources will be allocated for investments. In the case of private investments, their amount results from individual decisions of entrepreneurs, who make investment decisions mainly based on the profit and effectiveness of potential investments. Currently, there is stagnation of private investments in Poland. It is impossible to indicate one single cause of this situation. Undoubtedly, high competitiveness of enterprises and resulting limited capability of shaping market prices combined with labour shortages do not encourage entrepreneurs to undertake private investments. Building a positive climate for private investments is connected with the amount of potential investment income, related costs as well as risk and uncertainty concerning revenues and costs. A factor fostering the development of private investments in Poland is undoubtedly EU funds allocated to new operational programmes.

### **Abstract**

*Rapidly progressing urbanization processes, the creation of multi-million cities and agglomerations, have a negative impact on the conditions and quality of life of residents. Reduction of unfavorable phenomena related to the expansion of urban centers is one of the priorities of global development. The expansion of urbanized areas and simultaneous separation of the functions of urban areas increase the mobility of urban residents and increase the average travelled distance. Therefore, the transport factor becomes the basic condition for future development of large cities and the quality of life in the city. The concept of sustainable mobility in cities is related to the objectives aimed at improving both energy consumption and environmental indicators in cities. The European Commission points out the need to undertake actions aimed at better planning of mobility taking into account the principle of sustainable development. The aim of the article is to present EU documents related to creating sustainable urban mobility and relevant solutions and instruments.*

**Keywords:** EU, public transport, sustainable city, sustainable mobility, transport policy, urban transport

**JEL Classification:** O18, Q01, R41

### **1. Introduction**

Transport is an important element of the functioning and development of modern economy. Transport is required to meet expectations in the area of increasing mobility, timeliness of deliveries and quality of service. To meet these requirements, the transport system should be modern, integrated and developed in an optimally planned way (Tomanek, 2016). The basis for the creation of an integrated transport system of the countries forming the European Union is a common transport policy, with legal basis included in the EEC Treaty of Rome (European Commission, 2018a). The European Union countries sought to develop a common transport policy and to form a coherent transport system, which would be the basis for the smooth functioning of the common internal market. Along with the development of the European Union, new issues and areas covered by the common transport policy appeared, such as: effective development of the transport system taking into account the principles of market economy and fair competition, liberalization of transport services, creation of uniform transport and telecommunications infrastructure, design and development of new transport technologies (Janic, 2001), integration of collective and individual transport, ensuring sustainable transport development. As a modern transport system must be a sustainable system from economic, social and environmental points of view, particular issues have been the subject of documents published by the European Commission such as Green and White Papers and Communications. The EU transport policy focuses on the goals that foster the integration of the Union, the liberalization of the transport services market within the grouping, the

protection of the natural environment and guaranteeing traffic and transport safety (Mesjasz-Lech, 2016).

The common transport policy aims at increasing mobility, removing major barriers in key areas and accelerating economic growth and employment. Reducing Europe's dependence on oil imports and carbon dioxide emissions in the transport sector by 60% by 2050 are also vital goals of EU's transport policy. The key goals for 2050 are:

- withdrawing the vehicles with conventional drive from cities,
- achieving a 40% level of sustainable low-carbon fuel consumption in aviation,
- reducing emissions in the maritime transport sector by at least 40%,
- shifting 50% of medium-distance interurban passenger traffic and transport of goods from roads to rail and waterborne transport.

All these goals are focused on reducing total emissions in transport by 60% in the first half of this century. Other issues covered by the EU transport policy relate to infrastructure planning, use of information technology, safety and security, passenger rights and international cooperation (European Commission, 2018b).

## **2. Problem Formulation and Methodology**

The issue of reducing the negative impact of transport on natural environment has assumed a growing importance, especially in urban areas, where most of economic and social activities take place.

The process of rapid urbanization has been going on since 1950s, and it is predicted that it will continue in the coming decades. In 1950 more than two-thirds of people lived in rural areas and only less than one-third in cities. But the situation has changed since then and already in 2014 more than half of the world population lived in urban areas. Over next 30 years the population of cities is expected to grow even further, and by 2050 the reversal of 1950 situation (2/3 population living in cities and 1/3 living in rural areas) is predicted (United Nations, 2014). The same trend can be observed in the EU: in 2010 73% of EU population lived in urban areas and this number is expected to increase to over 80% by year 2050. At the same time many European cities currently face severe problems resulting from transport and traffic. Ongoing social and economic changes accompanied by growing mobility and growing number of private cars resulted in increased urban sprawl and longer commuting time. Comparatively slower development of public transport network only makes the problems (e.g. congestion, air and noise pollution, road safety) more severe (European Union, 2017). Table 1 presents population changes in selected capitals of EU countries in the years 2000-2030.

**Table 1: Changes in the Population of Selected Capitals of EU Countries in the Years 2000-2030**

\*City Proper, \*\* Urban Agglomeration, \*\*\*Metropolitan area

Source: based on (United Nations, 2016).

Taking into consideration the increasing population living in urbanized areas and the current problems resulting from the inefficiency of the urban transport system, it is necessary to pay more attention to solutions promoting sustainable urban mobility. Therefore, the aim of the study is to analyse EU documents that include issues of mobility and sustainable urban mobility. To achieve this goal the analysis of the content of selected EU documents regarding transport policy will be performed.

### 3. Problem Solution

In 1992 the European Commission presented “Green Paper on the Impact of Transport on the Environment. A Community Strategy for ‘Sustainable Mobility’” (European Commission, 1992). Another EU Commission- COM document, referring to the topic of sustainable mobility, called „The Common Transport Policy. Sustainable Mobility: Perspectives for the Future” was published in 1998 (European Commission, 1998). The Commission pointed out the negative effects (especially on environment) of the development of individual motorisation.

On September 12, 2001, the Commission of the European Communities presented the White Paper "European Transport Policy for 2010: time to decide" (European Commission, 2001). It defined the directions of the European Union's transport policy up to 2010, underlining the relevance and timeliness of the current EU transport policy objective of sustainable development, indicating the need to manage the development of the transport system in a more sustainable way.

The next stage of the EU transport policy was the "Green Paper. Towards a new culture for urban mobility" of August 25, 2007 (European Commission, 2007). The document presented a new approach to urban mobility, consisting in optimizing various modes of transport and creating favorable conditions for multimodal travels, making use of various collective transport systems (railway, metro, bus, taxi) and individual transport. Five main challenges for transport in cities were defined:

- increasing traffic flow in cities,
- ecological problems resulting from the domination of combustion engines,
- implementing the intelligent transport systems,
- improving the accessibility of public transport,
- increasing the reliability and security of urban transport.

The document stressed that mobility directly affects the quality of life of urban residents and is one of the important factors affecting the economic development of cities and the environment. One of the most frequently indicated problems of the transport system in cities is the growing road congestion. In order to increase the flow of traffic in cities, efforts should be made to increase the attractiveness of alternative forms of locomotion, in particular public transport, cycling and pedestrian traffic (Kos-Łabędowicz, 2016). In accordance with the document municipal authorities are also tasked with promotion of multimodal travel and the development of the necessary infrastructure. Another important element of the urban policy is the implementation of intelligent transport systems, the use of which affects the increase of the capacity of the road system without its physical extension.

The next stage of the policy of sustainable urban mobility was the publication of the European Commission Communication „Action Plan on Urban Mobility”(European Commission, 2009). Short- and medium-term practical actions that address the problem of sustainable urban mobility in an integrated manner were pointed out. The proposed actions were focused on the six following issues:

- supporting integrated policy,
- taking into account the well-being of citizens,
- greener urban transport,
- increasing funding,
- sharing experience and knowledge,
- optimization of urban mobility.

The document stated that urban development problems are very complex and that their solutions require an integrated approach. As a consequence, urban mobility plans should be developed and implemented in accordance with the principles of sustainable development. Urban transport, organized according to the idea of sustainable development can significantly improve the quality of the environment.

In the White Paper "Roadmap to a Single European Transport Area – Towards a competitive and resource efficient transport system" of 2011, it is pointed out that it is necessary for urban areas to create strategies including spatial planning, pricing systems, efficient public transport

services and infrastructure for non-motorized transport. In Annex I, "List of initiatives" of the White Paper, one of the actions indicated the analysis of the possibility of introducing mobility plans as a mandatory solution for cities of a certain size. The recommendations contained in the document, which has a time horizon up to 2050, concern (European Commission, 2011):

- growth of the transport sector while reducing greenhouse gases emitted by the sector by 60%,
- developing an effective multimodal travel and transport network between urban centres,
- equal opportunities for long-distance travel and intercontinental cargo transport all over the world,
- liberalization of transport regulations,
- supporting urban transport.

The document indicates the necessity of systemic support for the development and implementation of mobility plans and the need to prepare such plans in the context of the distribution of EU funds.

Almost simultaneously with the described White Book, a Community Development Strategy was prepared, which also addressed the issues of sustainable mobility. Europe 2020 - a strategy for smart, sustainable and inclusive development was a document setting out a long-term vision for the development of the European Union by 2020. The vision was focused on three priorities (European Commission, 2010):

- innovation and knowledge-based economy,
- development of a resource efficient economy, competitive and environmentally friendly,
- support for an economy characterized by a high level of employment and ensuring economic, social and territorial cohesion.

The issues of urban transport and mobility were addressed directly in the framework of actions for sustainable development.

In December 2013, the European Commission issued a communication: "Together towards competitive and resource-efficient urban mobility" (European Commission, 2013). According to the European Commission, a fundamental change in the approach to urban mobility was necessary, aimed at creating a competitive and resource-efficient European transport system. The implementation of systematic actions for sustainable mobility required cooperation of public entities at all levels of government and the involvement of the private sector. This cooperation should be focused on the following areas (in accordance with the provisions of the White Paper):

- urban logistics (e.g. by creating cooperation platforms, data exchange and information for all participants of urban logistics chains),
- intelligent regulations on access to cities and road toll systems (implementation and evaluation of regulations on the payment systems for the use of municipal roads),
- coordinated application of urban intelligent transport systems (creation of interpretive databases on multimodal transport containing information on urban mobility),
- road safety in cities (collecting data on road safety with the highest possible level of detail).

The Urban Mobility Package including proposals of actions on different administrative levels (local, national, EU's) was adopted by Commission in December 2013. Urban mobility was

recognized primarily as a responsibility for local actors, who were encouraged to plan and undertake appropriate actions concerning urban transport and mobility. The concept of Sustainable Urban Mobility Plans (SUMP) focusing on the following areas: city logistics, access regulation, urban ITS and urban safety, was introduced by Commission (European Commission, 2014).

SUMP is a strategic plan created to meet the needs of people's mobility and the economy in cities and their surroundings, for a better quality of life. It is based on existing planning practices and takes into account the principles of integration, public participation and process evaluation. The aim of SUMP is to present directional, integrated activities that clearly lead to an increase in the sustainability of transport and in the mobility of the society in the area covered by the planning (Wefering et al., 2014). In order to effectively implement the SUMP, it is necessary to use a range of instruments, measures, tools and strategies that will ultimately help sustainable urban mobility. The basic instruments include: legal, planning, investment, financial and instruments related to creation, sale, booking of mobility products, coordination and organization of solutions and transport services; educational, information and promotional activities under influence of which communication behavior of urban population can change (Kos, 2015; Nosal and Starowicz, 2010; Ungemah and Dusza, 2009; Murray et al., 1997). An important role in these solutions is attributed to public urban transport, which due to technical, economic and organizational solutions may become more attractive way of moving than an individual car.

Eltis, The Urban Mobility Observatory has played a significant role in supporting activities in the area of planning sustainable urban mobility. The portal was launched in 2000 and since then it has developed into platform vital for all issues related to urban mobility. By targeting individuals working in transport and related disciplines (e.g. urban and regional development, health, energy and the environmental sciences) it has facilitated the exchange of information, knowledge and good practices concerning the urban mobility. Currently Eltis is the main European urban mobility observatory and as such it provides wide range of information and serves as a channel for discussion helping European cities adopt the concept of sustainable urban mobility. The section dedicated to the Sustainable Urban Mobility Plans (SUMP) provides information concerning development and implementation of such plans as they are more widely recognized and nearly universally needed.

#### **4. Conclusion**

Coordinated actions of public authorities at different levels (both local, national and EU's) are needed in order to successfully transform urban mobility. European Commission has been actively supporting different initiatives and projects in this area (e.g. research, development, training) for nearly two decades. Many EU documents indicate the necessity to take measures limiting the negative impact of urban transport on the natural environment. Transport is one of the factors determining the development opportunities of big cities and the quality of life in the city. The concept of transport planning through mobility modelling is related to the creation of such a mobility system in the urban area, which on the one hand will increase the availability of individual areas and services, constituting a significant development impulse, and on the other hand will contribute to improving the quality of life of residents and the environment. Therefore, the undertaken actions should indicate how to effectively create a transport system in the city with use of all available resources and taking into account the need to promote eco-friendly and energy-saving ways of travelling. Creating sustainable mobility requires the implementation of activities in various spheres of city and society development. The implementation of SUMP can accelerate the process of changing urban mobility towards more

efficient forms and methods in accordance with the concept of sustainable development. Policies concerning urban mobility commonly relate to other EU policies concerning such areas as energy, climate change, air quality, economy, social equity and accessibility, innovation, IT deployment and smart cities.

### **Abstract**

*The development and use of ICT has been treated for over twenty years as a priority area of action affecting the economic competitiveness of the European Union. Documents and initiatives in this area are developed at the EU level and implemented by individual Member States, most recently within the framework of the European Digital Agenda. The transport sector in the European Union, which is to support the development of trade, economic growth, create new jobs and conditions conducive to prosperity is also considered to be an important area of activities. Considering the complicated relationship between the development and dissemination of ICT and their impact on transport, analysis of EU transport policy documents has been carried out in view of the approach to various types of ICT solutions that can be implemented in the European transport system.*

**Keywords:** European Union, European Union policies, ICT, transport sector

**JEL Classification:** O14, O19, O52

### **1. Introduction**

Transport and communication are two factors that shape the economic reality to a large extent and determine the conditions affecting all market players. This results to a large extent from the complementarity of functions performed by these two factors. Transport - or rather the transport system - enables the flow of resources, goods and people, and communication systems enable the flow of various types of information - including those important for the realization of transport processes (Kos-Łabędowicz, 2015).

The dynamic development and dissemination of various types of modern information and communication technologies (ICTs), which have been underway since the 1990s, affect almost all aspects of life and business. ICT development and its widespread use have long been perceived by the European Union as, on the one hand, important factors affecting economic growth and competitiveness, and on the other as an area where the European Union has been losing, in terms of development, speed in comparison with other highly developed economies such as the United States or Japan. Measures undertaken within the framework of EU structures to increase the use of ICT and the resulting improvement in the competitiveness of the EU economy have had a long tradition (the beginnings date back to the 1990s) and continuous character (consecutive strategies and action plans compatible and subject to the EU's overall development strategies).

The transport sector of the European Union is both an area of great importance from economic, social and environmental points of view and also the one in which changes related to the increase in the use of ICT are clearly visible. Research on the impact of ICT on transport largely runs in two distinct directions. On the one hand, it is examined how the use of ICT

affects transport (passenger and freight), both how the use of new technologies can change (usually improve) ways of providing transport services by enterprises or how it changes (improves) travelling for individuals. On the other hand, researches embracing broader socio-economic context, attempting to identify and analyse how the use of ICT by individuals and enterprises is changing the demand for transport services, are carried out (Kos-Łabędowicz, Urbanek, 2017).

Nearly universal access to the Internet, increasingly cheaper phones and other mobile devices combined with the development of e-commerce and various types of e-services (e.g. e-payment, e-learning, e-health) significantly affect both the behaviour of individuals and all types of organizations (including enterprises, NGOs, public administration). And so consumers more and more often decide to use the opportunities offered by e-commerce and various types of e-services, accessing them in the place and time they chose. Enterprises are also increasingly seeking new opportunities offered by ICT in order to improve their operations through the use of systems such as ERP (Enterprise Resource Planning), CRM (Customer Relationship Management) crowdsourcing platforms or by enabling employees to work remotely. All these changes have an impact on the transport sector and their inclusion is necessary in the process of formulating transport policy both at the EU and Member States levels.

## **2. Problem Formulation and Methodology**

The analysis of EU documents regarding the use of ICT potential has revealed some areas of the broadly understood transport sector, in which the use of ICT may be beneficial. (Kos-Łabędowicz, 2016). Those highlighted areas of the transport sector are: the development of Intelligent Transportation Systems (ITS), included in all key EU ICT policy documents; public transport, included in eEurope - An Information Society for all (Eur-Lex, 1999) and Action Plan: eEurope 2002 (Eur-Lex, 2000); actions aimed at implementing ICT systems to improve security, indicated as a model initiative in the field of improving the quality of life in the i2010 strategy - A European Information Society for Growth and Employment (Eur-Lex, 2005).

Taking into account these inter-dependencies between transport and methods of transferring information (that currently take on the form of different ICTs) and the selective treatment of the transport sector in strictly ICT-related documents, it is justified to undertake research to determine to what extent ICT is included in EU transport policies. Achieving such a goal will require analysis of the content of relevant documents in the field of EU transport policy. European transport policy documents selected for analysis are presented in Table 1.

All documents selected for the analysis were prepared and published after the year 2000 and are available on the Eur-Lex platform. Selection includes the White and Green Books, Strategies and various Communications of the European Commission.

## **3. Problem Solution**

In the first of the analysed documents, the 2001 White Paper, attention is drawn to new requirements for the transport system. The possibility of further infrastructure development is questioned, pointing to the need for more efficient use of the existing one while maintaining the principles of sustainable development - paying more attention to the economic, social and environmental goals. The document proposes about 60 actions that should be implemented in the foreseen time - by 2010 - with the indication of key areas: "... shifting the balance between

the modes of transport, eliminating bottlenecks, placing customers in the heart of transport policy, managing the globalization of transport "(Eur-Lex, 2001).

**Table 1: European Transport Policy Documents Selected for Analysis**

Date	Title of the Document	Main Focus
<b>Lisbon Strategy</b>		
2001	White Paper: European transport policy for 2010: time to decide	Modern transport system should be sustainable.
<b>Renewed Lisbon Strategy</b>		
2006	Freight Transport Logistics in Europe - The key to sustainable mobility	Advanced logistic solutions are needed to optimise European transport system.
2007	Freight Transport Logistics Action Plan	Logistics has a key role in ensuring sustainable and competitive mobility in Europe.
2007	Green Paper: Towards a new culture for urban mobility	As a majority of EU's population lives in urban areas, urban mobility requires rethinking.
2008	Greening Transport	Setting price signals for transport users that will reflect real cost of their choices.
2009	Action Plan on Urban Mobility	List of integrated actions related to the urban mobility.
2009	Green Paper: TEN-T: A policy review. Towards a better integrated Trans European Transport Network at the service of the Common Transport Policy	Policy review pointing to the need of placing climate change objectives in the centre of further TEN-T policies.
2009	A sustainable future for transport: Towards an integrated, technology-led and user friendly system	Review of past policies and basis for further consideration for development of further policies.
<b>Europe 2020</b>		
2011	White Paper: Roadmap to a Single European Transport Area – Towards a competitive and resource efficient transport system	Staying competitive in the transportation area, supporting mobility and at the same time ensuring sustainability and reaching emission reduction targets.
2016	A European Strategy for Low-Emission Mobility	Shift to low-emission mobility is essential for ensuring EU's competitiveness and catering to mobility needs of people and goods.
2016	A European Strategy on Cooperative Intelligent Transport Systems, a milestone towards cooperative, connected and automated mobility	The potential of cooperative, connected and automated vehicles to boost EU's industry competitiveness and ensuring transition to low-emission mobility.

Source: based on Eur-Lex (2018)

The use of new technologies is indicated in relation to particular modes of transport, and for example digital tachograph, Galileo program, GSM or telecommunication satellites are considered as a means to improve the road transport and deployment of European Rail Traffic Management System (ERTMS) as a useful tool for improving railways performance. Great

importance in the document is attributed to the improvements in the intermodality of the transport system, but most programs focus on infrastructure and ways to encourage business entities to change their transportation behaviours. Information, communication and management systems are mentioned, but rather as some of the factors required but not crucial for the success of the recommended actions. Two most prominent ICT solutions mentioned in this document are satellite radionavigation project (Galileo) and ITS, but only Galileo programme is elaborated in more detail (and with clear timeframe of application) (Eur-Lex, 2001).

Another of the analysed documents: Freight Transport Logistics in Europe - the key to sustainable mobility (Eur-Lex, 2006) and the associated Action Plan (Eur-Lex, 2007a) are the answer to the mid-term review of the 2001 White Paper. Fast growth of road freight transport and its negative effects (e.g. congestion, pollution, dependency on fossil fuels) require optimization of the transport system with the use of advanced logistics solutions. Advanced Logistics solutions are seen as an answer for ongoing problems and at the same time as a means to maintain know-how, skills and jobs in Europe. ICT solutions are seen as an important factor for all parties involved and as a prerequisite for efficient logistics. Solutions as Galileo, ITS, ERTMS are listed with appropriate new technologies as radio frequency identification (RFID), common messaging standards and new communications platforms (Eur-Lex, 2006). Action Plan takes on the importance of the ICT solutions for all types of freight transport (inland, waterborne, urban) with introduction of the term e-Freight. Concept of the e-Freight is based on the vision of paperless flow of information accompanying the movement of the goods and in future may lead to the „Internet for cargo” (Eur-Lex, 2007a).

The next analysed document is Green Paper "Towards a new culture for urban mobility" (Eur-Lex, 2007b) dealing with urban mobility. European cities differ from each other, but most of them face similar problems (e.g. congestion, pollution, inadequate transport systems). The answer is to adopt an approach consistent with the concept of sustainable development and to promote sustainable urban mobility. Among the indicated activities, ICTs take a prominent place, especially ITS, safe and intelligent vehicles and means of “virtual travel” such as tele-working or tele-shopping (Eur-Lex, 2007b).

European Commission Communication „Greening Transport” (Eur-Lex, 2008) focuses mostly on the environmental and social costs of transport (e.g. different kinds of pollutions, congestion, accidents) and on measurements aiming at reducing these externalities by setting appropriate („right”) prices for transport choices. ICT solutions such as ITS and Galileo are mentioned as the tools useful for reaching that goal, but main focus is on appropriate measures and regulations (Eur-Lex, 2008).

“Action Plan on Urban Mobility” (Eur-Lex, 2009a) lists 20 actions that should be undertaken to ensure sustainable mobility in cities under 6 Themes. Different ICT solutions are mentioned as parts of several actions, mainly the application of ITS. Galileo and is also mentioned, but more interestingly some other solutions focused on promoting alternative transportation like bike-sharing and car-sharing schemes. There is also strong focus on ICT solutions dedicated to improving public transport in cities with solutions like electronic ticketing and payment, traffic management, travel information (Eur-Lex, 2009a).

“Green Paper - TEN-T: A policy review - Towards a better integrated transeuropean transport network at the service of the common transport policy” (Eur-Lex, 2009b) is an European transport policy document focusing mainly on the infrastructure: past achievements, current state and potential further proposals and legislations. The inventory of past achievements and projects enumerates mostly the realized infrastructure projects carried out in order to further develop Trans-European Transport Network (TEN-T). Nevertheless some projects including

development and deployment of ICT solutions (like ITS, Galileo and Traffic Management and River Information Services, intelligent vehicles) are mentioned among those already completed or nearing completion. ITS has been clearly recognized as a potential versatile tool for enhancing effectiveness within different sectors and a need for ensuring its interoperability was stressed. ITS systems are also perceived as a crucial component of logistics systems (especially in terms of tracking and tracing goods) and in other sectors as a means to achieve Community policy objectives in such areas as safety, security, reducing congestion or fighting climate change. Concerns about further needs of ITS resulting from ongoing research and innovation were mentioned (e.g. need for filling stations in case of electrically-powered vehicles). Taking all into consideration it should be noted that ICT solutions, especially ITS, are given far more attention than in previously analysed transport policy documents.

European Commission Communication: “A sustainable future for transport: Towards an integrated, technology-led and user friendly system” (Eur-Lex, 2009c) resulted from the review of previous legislations and aimed at starting a discussion for preparation of further policies. Trends and challenges that should be taken into consideration were identified (e.g. ageing, migration and internal mobility, urbanization) and seven broad policy objectives for further consideration were presented (e.g. more environmentally sustainable transport or protecting and developing the human capital). ICT solutions were taken into consideration but only as a part of a broader picture – important but not prominent.

The discussions evoked by the previously described document resulted in preparation of the “White Paper: Roadmap to a Single European Transport Area – Towards a competitive and resource efficient transport system” (Eur-Lex, 2011). The White Paper stays true to the goals of the European Development Strategy: “Europe 2020 - A strategy for smart, sustainable and inclusive growth” and its ambitious goals and sets its own goals concerning the future shape of efficient European transport system. Two (out of ten goals) set by this document concern directly widespread use and deployment of ICT solutions: “7. *Deployment of the modernised air traffic management infrastructure (SESAR) in Europe by 2020 ... Deployment of equivalent land and waterborne transport management systems (ERTMS, ITS, SSN and LRIT, RIS). Deployment of the European Global Navigation Satellite System (Galileo).* 8. *By 2020, establish the framework for a European multimodal transport information, management and payment system*” (Eur-Lex, 2011, pp. 9-10). Initiatives to be undertaken in order to fulfil all set goals also include projects dealing with research, development and implementation of various ICT solutions in accordance with overall goals of both Strategy Europe 2020 and the White Paper described. The member states undertake various activities to ensure the sustainable development of the EU transport system in line with the development strategy assumptions and goals (Mesjasz-Lech, 2016).

Another European document dealing with transport and its environmental impact is “A European Strategy for Low-Emission Mobility” (Eur-Lex, 2016a). It mostly focuses on the need of optimization of the transport systems and making all of their elements more effective and more sustainable. The digital technologies (ICT solutions) are seen as a means of increasing the effectiveness, safety and inclusiveness of the transport system. Even if ICT solutions are mentioned, the main focus of this documents highlights more issues concerning deployment of low-emission solutions and technologies in transport. Nonetheless, the need of developing and deploying Co-operative Intelligent Transport Systems across the EU was mentioned. It should be noted that this trend towards green transport and low-emission economy raises concerns related to maintaining EU competitiveness (Hon, Honová, 2012).

The last document chosen for this analysis, “A European strategy on Cooperative Intelligent Transport Systems, a milestone towards cooperative, connected and automated mobility”

focuses on the changes and new transport demands brought by the “...wave of technological innovation and disruptive business models” (Eur-Lex, 2016b, pp. 2). The need for rapid development and deployment of Cooperative Intelligent Transport Systems (C-ITS) previously mentioned in the “A European Strategy for Low-Emission Mobility” (Eur-Lex, 2016a) is detailed. Actions ensuring its operationality (and ideally interoperability across EU Member States) are listed. It is the first European transport policy focusing mainly on development and implementation of the ICT solutions in EU’s transport sector.

#### 4. Conclusion

ICT solutions to a greater or lesser extent are present in all analysed EU transport policy documents, but their roles and meaning differ. Three groups of documents can be distinguished due to the role and place attributed to the importance of ICT solutions in transport. In the first group of documents, ICT solutions are present and indicated as potential factors that can affect the achievement of overall goals, but the main focus is on other issues. In the second group, ICT solutions are indicated as important tools that can influence the implementation of the indicated activities - there is a slow shift towards granting them more and more importance also for the implementation of the Community's overall development objectives. And in the third group ICT solutions are perceived as the key to achieving the goals of both transport policy and the overall development objectives of the Community. Among the analysed documents, the two first categories predominate - as presented in Table 2.

**Table 2: The Place and Role Attributed to ICTs in the Analysed Documents**

Document	ICT
White Paper (2001)	ICT solutions are present but main focus is elsewhere.
Freight Transport... (2006)	ICT solutions are perceived as an important factor and a prerequisite for efficient logistics.
Freight Transport Logistics Action Plan	Importance of ICT solutions for logistics is further stressed with introduction of concept of e-Freight.
Green Paper (2007)	ICT solutions are seen as important tools for promoting sustainable urban mobility.
Greening Transport (2008)	ICT solutions are present but main focus is elsewhere.
Action Plan on Urban Mobility (2009)	ICT solutions are perceived as an important tools for ensuring sustainable urban mobility.
Green Paper (2009)	ICT solutions are seen as important tools for further functioning of Trans-European Transport Network.
A sustainable future... (2009)	ICT solutions are present but main focus is elsewhere.
White Paper (2011)	ICT solutions are seen as important tools for fulfilling objectives set for transport sector and whole Community.
A European Strategy... (2016)	ICT solutions are present but main focus is elsewhere.
A European strategy on Cooperative... (2016)	ICT solutions are seen as important tools for fulfilling objectives set for transport sector and whole Community.

Source: based on Eur-Lex (2018)

The analysis of selected EU transport policy documents shows the importance of ICT solutions for the transport sector as well as for the implementation of the Community's overall development objectives.

### **Abstract**

*The author analyses the impact of the Portability Regulation [Regulation (EU) 2017/1128 of the European Parliament and of the Council of 14 June 2017 on cross-border portability of online content services in the internal market] on the rights of consumers guaranteed by the currently negotiated proposal for a Directive on certain aspects concerning contracts for the supply of digital content (Digital Content Directive). Both the Portability Regulation and the proposal for a Digital Content Directive address the issue of access to digital content from different perspectives and complement each other, although they use different legal terminology and in some respects have a different scope of application in the question of cross-border portability of the digital content provided for monetary counter performance to consumers. The author aims to answer whether a consumer who is not allowed to use the digital content in other EU Member States besides the Member State of his residence will be entitled to pursue claims arising from the non-conformity of the digital content with the contract.*

**Keywords:** consumer protection, cross-border issues, digital content directive, licence agreements, portability regulation

**JEL Classification:** K12, K11, D18

### **1. Introduction**

Differences in the laws of the EU Member States regarding national consumer protection and contract law are seen as the main obstacle which prevents consumers from enjoying the full benefits of cross-border e-commerce with digital assets and also as a serious barrier for business operators who must adapt their services to different legal conditions set by the national legislations (Arnerstål, 2015, p. 882; Helberger et al., 2013, p. 42) in the field of contracts, consumer or copyright protection (Loos et al., 2011, p. 14, 39, 102).

From the legal perspective, we can see several phases where EU law interferes with the process of making digital content available to users (consumers). At the beginning of the regulatory chain, we find the legal regulation of rights which apply to digital content. In the middle of the distribution chain, we find the legal regulation of the (i) intermediaries; (ii) collecting societies; (iii) rights to access the digital content of libraries, universities, and research institutions; or (iv) legislation on audio-visual media suppliers [COM (2016) 287 final]. Last but not least, it is necessary to set forth rules for consumer protection in the digital market [COM (2015) 634 final], and in this regard to focus on the aspects of the portability and geo-blocking [Regulation (EU) 2017/1128; COM (2016) 289 final].

The aim of this paper is to analyse possible convergences of the current European Commission legislative proposal on adopting the “Digital Content Directive” [COM (2015) 634 final] and

its relation to the “Portability Regulation” [Regulation (EU) 2017/1128]. We will focus especially on the rights of consumers who use digital content in other EU Member States besides the state, where the subscriber has his or her actual and stable residence. To achieve the aim, we will use the method of the legal hermeneutics based on the interpretation of legal texts and their comparison.

### ***1.1 Digital Content Directive***

With the Digital Content Directive proposal, the European Commission is responding to the needs of the digital economy (Kerber, 2016, p. 759) in the area of private law. The proposal pursues a viable and a technology-oriented approach; it covers all types of digital content, harmonizes contractual aspects of B-2-C obligations (Kunesova In Kovarova/Melecky/Stanickova, 2016, p. 538) where the consumer’s counter performance is based on monetary payments or on providing personal data. Moreover the proposal intends to regulate consumer rights in case the digital content is not in conformity with the contract and stipulates consumer rights and remedies. The proposal is strongly inspired [COM (2015) 634 final, p. 2] by the provisions of the Commission’s proposal for a Regulation on a Common European Sales Law which was intended to constitute an optional instrument that would actually create a parallel contract-law regime to coexist alongside national contract-law provisions (Beale, 2013, p. 22 ff.; Twigg-Flesner, 2013, p. 45 ff.).

The Digital Content Directive proposal has a broad scope which will be applied on different types of contracts concerning digital supply. This is one of the important distinctions (Zoll, 2016, p. 251) from the Online Sales Directive proposal [COM (2015) 635 final], which covers just the contract of sales [Art. 2 (a) Online Sales Directive]. The proposal also does not differentiate between the categories of digital content, because such differentiation in the field of rapidly evolving technologies would probably lead to discrimination between suppliers (Recital 11 Digital Content Directive). Therefore all kinds of data, copyrighted works (films, music, photos, computer games), as well as all possible forms of digital content provided by consumers (blogs, discussion forums, text-based collaboration formats etc.) are covered by the material scope of the directive, no matter if they are available on-line or if the digital content is contained on CDs or DVDs [Article 3 (3) and Recital 11 of the Digital Content Directive].

In a similarly broad manner, the Commission regulates types of contracts with regard to counter performance. The Commission treats contracts in which a consumer provides personal data as contracts for consideration (Recital 13 Digital Content Directive). Although the consumer receives digital content from the supplier for free, if he or she gives access to his or her personal or other data, the contracts will fall under the material scope of the directive proposal (Beale, 2016, p. 13).

Finally, the directive is not intended to have any effect on copyright issues (Recital 21 Digital Content Directive), especially on the distribution right applicable to digital goods under the copyright law (Recital 12 Digital Content Directive). Thus, all questions concerning digital rights management systems, as well as the effects of the principle of exhaustion, are omitted. The consumer therefore cannot argue that the limitations on further use of the digital content (such as the re-sale or lending of e-books) are not in conformity with the contract since the consumer, upon receiving the digital content, is not entitled to further distribution of the copyrighted content due to the copyright limitations, which are still applicable.

## **1.2 Portability Regulation**

Portability is positively characterized as the ability “to play, listen, and watch digital content on different kinds of devices, to lock-in or lock-out situations that are the result of product bundling or interoperability issues, social exclusion, and geographical impediment because of region coding and restrictive licencing practices” (Helberger et al., 2013, p. 40).

Portability reflects consumers’ natural expectations that the digital content, which covers many kinds of “intangible assets”, will be available across borders. If consumers complain [SWD (2015) 270 final, p. 3, 6] about territorial restrictions on the broadcasting of copyrighted works or sporting events applied by the suppliers, we can remark that consumers are merely applying their “common sense”. They see no relevant reason for the lack of availability of digital content in the Digital Single Market (or even in the global market), even though they know nothing about the theoretical aspects of intangible assets (non-rivalrous, ubiquitous; Merges, 2011, p. 36, 57; Cooter/Ulen, 2012, p. 40).

The Portability Regulation removes barriers to cross-border portability and prohibits the implementation of geo-blocking [SWD (2015) 270 final, p. 3, 6, 55; Hoffman, 2016, p. 16] measures within the EU Digital Single Market. This should enable the digital content consumers who subscribed to content services in the Member State of their permanent residence to receive a service or a download of pre-paid content, in a country which they are temporarily visiting. Further, the Portability Regulation targets the illegal use [COM (2015) 626 final, p. 4, 11] of copyrighted content which is currently supported by the use of geo-blocking practices. Consumers who do not have access to legally obtained copyrighted works because they are distributed in the EU on a territorial basis tend to use the digital content from illegal sources (Hoffmann, 2016, p. 152).

## **2. Digital Content Directive and Portability Regulation Overlaps**

Both proposals regulate similar issues related to consumers’ expectations that they will be able to effectively use digital content without technological, functional or cross-border restrictions. The question of cross-border availability is the key subject matter of Art. 3 (1) of the Portability Regulation, and might also be seen as an “accessibility” issue and therefore be subsumed under the concept of “conformity of the digital content with the contract” within Art. 6 (1) (a) of the Digital Content Directive.

It is obvious that the Digital Content Directive regulates a considerably wider range of legal relations. The reason for this is that it applies to all contracts with digital content and is targeted not only at cross-border relations, but also at situations in which digital content is supplied by the content provider to the consumer within the territory of a state. Although the directive does not aim to regulate any intellectual property issues (Recitals 12 and 21 Digital Content Directive), the proposal for the Digital Content Directive will have a direct impact on copyright licences. This is because digital content is generally supplied based on licence contracts. Many service providers of digital content use contractual terms in which the user receives a limited licence to use the digital content. If you subscribe to Spotify, Netflix, iTunes or Google-Play, you enter into a licence agreement, not a purchase agreement. The content providers keep the intellectual property rights and provide the consumer a limited, non-exclusive, revocable licence to make personal, non-commercial use of the digital content (Arnerstål, 2015, p. 752; Loos et al., 2011, p. 14).

The impact of the Digital Content Directive on licence contracts will consist in definition of digital content, its integration into the consumer's digital environment, but especially in the

regulation of the rights the consumer will have if the digital content is not in conformity with the licence contract.

Compared with the wide range of consumer issues prescribed by the Digital Content Directive, the Portability Regulation creates new consumer rights for when a consumer uses digital services in a Member State of his or her “temporarily presence” [Art. 2 (4), Art. 3 (1) Portability Regulation]. Whereas the Digital Content Directive applies for domestic transactions as well as for cross-border transactions, the Portability Regulation is applicable only in the case of cross-border delivery of on-line services. On the other hand, the Portability Regulation lays down rules which are directly applicable not only to the service providers, but simultaneously to copyright holders. This is because geo-blocking practices are primarily asserted by a copyright or by the related rights holders [COM (2015) 627 final, p. 2, 4; Recital 10 Portability Regulation].

### **3. Non-Portability as the Non-Conformity with the Contract**

The obligation stipulated by Art. 3 (1) of the Portability Regulation that enables a “subscriber who is temporarily present in a Member State to access and use the online content service” makes the contract law in EU Member States “cross-border and consumer friendly” [SWD (2015) 274 final/2, p. 18].

The central role of European consumer law is to function as corrective justice (Micklitz, 1999, p. 167 ff.) and to protect the weaker party (Cherednychenko, 2007). Contractual dealings between consumers and suppliers must respect the legitimate interests of both parties and must reflect a fair balance between their legitimate interests. When assessing the fairness of consumer transactions, it is important to compare them with the principle of “reasonable expectation”. If a product or service does not meet the reasonable expectations of the consumer, such as the availability of a product in the required time and place, then the contract can no longer be assumed to reflect the consumer's free will to commit to the transaction (Helberger/Hugenholtz, 2007, p. 1082). In the event that a consumer cannot utilize a product in a way that corresponds to his or her reasonable expectations, we can find grounds under which the consumer can contest the conformity with the contract.

In practice we can identify three main conformity problems: (1) accessibility, functionality and compatibility issues, (2) insufficient quality, and (3) deficiencies, errors or other safety and security issues (Loos et al. 2011, p. 108). These challenges can be caused by matters such as lack of connectivity, the application of DRM mechanisms which create obstacles for the transfer of digital content from one device to another, incompatibility of formats and standards, or even the abuse of the copyright protection when prohibiting the consumer from making private copies of lawfully acquired software or film.

Portability matters [Art. 2 (6) Portability Regulation] are primarily concerned with “accessibility requirements” [Art. 6 (1) (a) of the Digital Content Directive]. From the perspective of accessibility, both the Portability Regulation and Digital Content Directive aim at facilitating access to digital content and they seem to be complementary. Although the Digital Content Directive does not mention the cross-border portability of digital content, it is obvious that the reasonable expectations of consumers on the accessibility of digital content in other EU Member states are supported by the Portability Regulation and the Digital Content Directive as well. We may conclude that the Portability Regulation should be considered as a special piece of legislation in terms of Art. 3 (7) of the Digital Content Directive.

For these reasons, a consumer's inability to access the digital content which was contractually provided in their home Member State while he or she is temporarily located in another Member State is to be considered a breach of "conformity with the contract" according to the objective criteria test regulated by Art. 6 (2) of the Digital Content Directive.

#### **4. Consumer's Remedies due to the Breach of the Cross-Border Portability**

If an online content service that is normally available to a subscriber in the Member State of his or her permanent residence is not accessible in other EU Member States [Art. 2 (6) Portability Regulation], it not only breaches Art. 3 (1) of the Portability Regulation, which entitles the consumer to have online access to digital content in other Member States, but also is not in conformity with the contract [Art. 6 (2) of the Digital Content Directive].

The hierarchy of remedies that the consumer may require is guaranteed at two levels. The basic remedy is that the consumer is entitled to have the digital content brought into conformity with the contract free of charge [Art. 12 (1) Digital Content Directive]. At the second level, the consumer is entitled to terminate the contract, request a price reduction, or claim damages.

In this regard, we can point to the criticisms of the hierarchy of remedies. In the sphere of remedies there are significant differences, thus the Online Sales Directive [Art. 9 (1), Art. 11] guarantees that a consumer may choose between the repair and the replacement of goods. It becomes evident that terminating a contract for the supply of digital content is effectively less harmful than terminating a contract for physical goods. In this respect it is argued that a consumer's option to immediately terminate a contract upon the breach of the conformity would enhance his or her negotiating position (Mak, 2016, p. 24).

Such criticism makes sense especially when we pay attention to portability issues. On the one hand, we can argue that if a supplier uses geo-blocking practices and the digital content is not available in another EU Member State, it is logical to remedy the situation by ensuring cross-border portability, since Art. 3 (1) of the Portability Regulation requires that the provider of an online content service will enable a consumer to access the online content service. On the other hand, we may ask why the consumer should be required to notify the provider in order to restore their access.

We believe that in the sphere of the portability of the copyrighted works a consumer should not first be forced to request that the provider enable cross-border portability, and only as a secondary claim be entitled to choose between terminating the contract and reducing the price. The Digital Content Directive should contain a rule that (in specific cases in which non-conformity with the contract represents a serious breach of the legal obligation arising from the special EU or national legislation) the consumer should be entitled to pursue a price reduction or termination of the contract as a first course remedy.

#### **5. Conclusion**

When we analyse the relation between the Digital Content Directive and the Portability Regulation we see that both proposals address the issue of access to digital content from different perspectives. The Portability Regulation focuses on the cross-border portability of digital content in other EU Member States [Art. 3 (1) Portability Regulation], while the Digital Content Directive specifies the consumer rights related to the distribution of digital content and subsumes the accessibility of the digital content under the notion of the "conformity of the digital content with the contract" [Art. 6 (1), (2) Digital Content Directive].

Based on the relation between the Portability Regulation and the Digital Content Directive we have come to the conclusion that the consumer will be entitled to pursue claims arising from the non-conformity of digital content with the contract, as provided by Art. 6 and 12 of the Digital Content Directive, in the event that he or she is not allowed to access digital services in states other than the Member State of his residence due to the application of geo-blocking measures by digital content providers. However, the hierarchy and structure of the consumer's claims should be more favourable. Hence the consumer should be entitled to terminate the contract as a first course remedy if he or she is not allowed to use the digital content in other EU Member States.

### **Abstract**

*Mobility is one of the universal features of human species. People have been migrating since the beginning of time. Because of existence of international borders, migration is not considered a matter of course in presence as in the past. European society faces new challenges concerning immigration due to unstable situation in Middle East and non-acceptable living conditions in Sub-Saharan Africa. The number of people coming to the European Union from these two regions has increased in a dramatic way recently. Total number of the asylum applications registered in the EU Member States reached 1,259 million in the year 2016. Aim of the paper is to bring the overview of the number of asylum applicant coming to the EU from Sub-Saharan Africa's countries between years 2008-2016 and to identify their age structure with the use of methods of descriptive statistics. Results of the analysis are interpreted in wider context and emphasize the child immigration to the EU as a new phenomenon.*

**Keywords:** *Asylum applicants, Child migration, European Union, Refugee, Sub-Saharan Africa*

**JEL Classification:** *F22, J15, O15*

### **1. Introduction**

Mobility is one of the universal features of human species. People have been migrating since the beginning of time. Movement has been permanent phenomenon throughout the human history. Because of existence of international borders, migration is not considered a matter of course in presence as in the past. Policy and economic barriers existing in current world constrained natural human ambition to reach better living conditions.

If migration is discussed by the general public, it is usually understood in terms of migration from developing countries to rich countries in Europe and North America. This misleading interpretation is based on the fact that on average three quarters of international migrants come to a country with a higher level of human development than their country of origin has. However, countries with higher level of human development do not have to be understood simply as countries in Europe or North America. South-North migration flows represent only one third of international migration. In 2015, more than 243 million people could be classified as international migrants, and only 50 % of them lives in Europe and North America. At the same time, international migrants coming from these two regions represented 26 % of all international migrants (UNICEF [online], 2016).

In recent years, the number of immigrants coming to Europe has increased in dramatic way – including both refugees and economic migrants (Nová, 2016). They come from two regions,

located not far from Europe – Middle East and Sub-Saharan Africa. Immigrants coming from the former one are usually considered (with regard to the actual insecurity there) refugees and need special treatment, but those coming from the latter one are usually considered economic migrants coming to Europe because of non-acceptable living conditions there. The European Union has been hit by the current migration wave especially since the year 2014 when the number of asylum seekers coming from Sub-Saharan Africa registered in the EU Member States started to increase.

## **2. Methodology and Research Objectives Formulation**

Enormous number of studies concerning international migration is found in many scientific journals indexed in the most famous databases. As a discussion topic, migration attracts attention of many serious conferences as well as public meetings. Many official documents and statistical reports complete actual feature of the phenomenon of international migration and highlight its urgency.

International migration is multidimensional phenomenon that has been an integral part of the history and presence of human society. It is examined in many consequences and with the use of qualitative as well as quantitative methods. Less research attention is focused on international child migration despite increasing number of children living outside their country of origin. They move for the same reasons as adult migrants, but their mobility follow their parents' mobility and their aspiration for better life.

The aim of the paper is to bring the overview of the number of asylum applicants coming to the European Union from Sub-Saharan Africa's (SSA) countries between years 2008-2016 and to identify their age structure with the use of methods of descriptive statistics. Results of the analysis are interpreted in wider context and emphasize the child immigration to the EU as a new phenomenon. Paper's conclusions are based on a review of relevant scientific sources as well as on own analysis of statistical data concerning immigration to the EU Member States within specified period that was reported by Eurostat in September 2017 within the theme Asylum and first time asylum applicants from Extra-EU28 countries.

Analysis is divided into three parts. First defines term SSA's asylum applicant. Second presents data concerning the total number of asylum applications registered in the EU Member States between years 2008-2016 and those submitted by immigrants coming from SSA's countries. Third part deals with the age structure of asylum applicants coming from SSA and emphasizes increased number of child asylum applicants. Paper also opens briefly discussion on bidirectional relation between migration and development.

## **3. Empirical Analysis of the Age Structure of Asylum Applicants Coming to the EU from Sub-Saharan African Countries**

The European Union is generally understood as a developed region of the world economy with high standard of living and social welfare system. Its economic, political and social stability is attractive not only for people coming from other developed regions, but also for those coming from less developed ones or regions affected by various forms of insecurity. If people are mobile in industrial countries, one usually speaks enthusiastically about flexible labour markets (Ellis, 2003), and whole migration between developed countries is considered to be natural process. However, migration to developed countries from the less developed ones is usually interpreted in negative terms. Regardless immigrants' countries of origin and causes of migration, it is automatically supposed that they are economic migrants wanting to obtain

social benefits offered in the European Union. However, in many cases, people coming to the EU are eligible to obtain refugee status.

### ***3.1 Definition of the Sub-Saharan Africa's Asylum Applicants***

According to the 1951 Refugee Convention (known as Geneva Convention) a refugee is someone who owns well-founded fear of being persecuted for reasons of race, religion, nationality membership of a particular social group or political opinion. When people flee their own country and seek sanctuary in another country, they apply for asylum, understood as the right to be recognized as a refugee and receive legal protection and material assistance (UNHCR, 2018). The European Union, based on full and inclusive application of Geneva Convention, means an asylum applicant (AP) a person having submitted an application for international protection or having been included in such application as a family member.

Because of extreme vulnerability, child refugees are eligible to be guaranteed extraordinary treatment in international scene. EU Directive 2011/95 recognizes principle the best interests of the child that should be a primary consideration of the EU Member States when implementing this directive concerning refugees. With respect to the UN Convention on Rights of the Child, a child means every human being below the age of eighteen years unless the law applicable to the child, majority is attained earlier (UN, 1989). This Convention (in Article 22) also states that signatories shall take appropriate measure to ensure that a child who is seeking refugee status, or who is considered a refugee in accordance with applicable international or domestic law and procedures, shall receive appropriate protection and humanitarian assistance.

Paper focuses primarily on migrants coming to the EU from Sub-Saharan Africa. Political instability, frequent civil and ethnic wars, human rights violations have been present in many SSA's countries since the downfall of colonial system. South Sudan, Democratic Republic of Congo, Central African Republic are typical examples of the SSA's tragic history and presence. Sub-Saharan Africa is quite frequent term used in various circumstances. However, each researcher covers different number of states with this regional or socio-economic designation. Eurostat does not recognize explicitly Sub-Saharan Africa as defined region when reporting data on migration. In the paper, own definition of SSA is applied and this term covers 49 countries, namely: Angola, Benin, Botswana, Burkina Faso, Burundi, Cabo Verde, Cameroon, Central African Republic, Chad, Comoros, Congo, Congo Dem. Rep., *Côte d'Ivoire*, Djibouti, Eritrea, Ethiopia, Equatorial Guinea, Gabon, Gambia, Ghana Guinea, Guinea-Bissau, Lesotho, Liberia, Kenya, Madagascar, Malawi, Mali, Mauritania, Mauritius, Mozambique, Namibia, Niger, Nigeria, Rwanda, Sao Tome and Principe, Senegal, Seychelles, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Swaziland, Tanzania, Togo, Uganda, Zambia, Zimbabwe.

### ***3.2 Asylum Applicants in the EU Member States***

Total number of asylum applications registered in the EU 28 Member States has increased in recent years. However, in the 1990s, the EU faced similar phenomenon. Because of political crises and armed conflicts, number of new asylum applications started to grow in 1987, where the peak was reached in 1992 when EU 15 Member States registered about 700 thousand applications. In the second half of the 1990s, number of application permanently declined. Between years 1998 and 2003, EU15 recorded from 300 to 400 thousands asylum applicants annually. Since 2004, significant drop was monitored and the EU 27 Member States registered 192 300 new asylum applications in 2006 (Juchno, 2007).

Between years 2008-2012, total number of asylum applications submitted in the EU Member States was growing slowly because of increased migration especially from unstable Middle East, and poor Sub-Saharan Africa. Year over year changes in the number of registered asylum seekers started to grow in 2013. In 2014, the EU recorded more than 600 thousand asylum applicants and in 2015 their number doubled to 1,300 thousand (see Figure 1).

**Figure 1: Number of Asylum Applicants in EU Countries**

Source: Eurostat (2017), own data processing

However, beginning of the refugee crisis was evident worldwide. In 2015, every minute 30 people had to flee from their homes. 55 % of all refugees worldwide came from three countries – Syria (5.5 million), Afghanistan (2.5 million) and South Sudan (1.4 million). Majority of refugees stayed in countries neighbouring with their country of origin. The largest number of asylum seekers was registered in Turkey (2.9 million) and Pakistan (1.4 million). Only one EU Member State – Germany – belonged to the top 10 refugees' hosting countries.

In 2015, more than 5,300 thousand refugees coming from Africa were registered worldwide, but at the same time, 4,800 thousand of them applied for asylum in another African country. In Africa, important phenomenon is present – some countries serve as host countries for refugees but also as countries, which citizens flee them because of violence and non-acceptable living conditions. Only a minority of SSA asylum seekers comes to Europe annually. Total number of asylum applicants coming to the EU Member States from SSA's countries varied within the period of years 2008-2016. It exceeded 100 thousand for the first time in the year 2014, when growing between years 2013-2014 by 56 %. Although the total number of asylum applicants was lower in the year 2016 than in the year 2015 by 4.75 %, number of asylum seekers from SSA continued to grow and accounted for 200 thousands (see Tab.1).

**Table 1: Asylum Applicants from SSA and Total Number of Asylum Applicants from Third Countries**

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Total number of APs	225 150	263 835	259 400	309 040	335 290	431 090	626 960	1 322 825	1 259 955
Number of APs from SSA	68 595	75 650	61 660	84 435	72 925	97 000	152 245	167 315	219 330
Percentage share	30.47 %	28.67 %	23.77 %	27.32 %	21.75 %	22.50 %	24.28 %	12.65 %	17.41 %

Source: Eurostat (2017), own data processing

Although the absolute number of asylum seekers coming to the EU from SSA has been growing since 2010, share of SSA's applicants in total number of asylum applicants declined in 2015 and 2016. It is caused by increased number of refugees coming to the EU from Middle East countries.

### 3.3 Age Structure of Asylum Applicants Coming to the EU from SSA

Communication from the European Commission to the European Parliament and the Council (Brussels, 12 April 2017, p. 2) starts: *In recent years, the number of children in migration arriving in the European Union, ..., has increased in a dramatic way. In 2015 and 2016, around thirty percent of asylum applicants in the European Union were children. There has been a six-fold increase in the total number of child asylum applicants in the last six years.* Regardless the country of origin, the number of child asylum applicants in the EU Member States grew between years 2008-2016 (see Tab. 2). On average, 1 in 5 asylum applicants was a child in 2008, while 1 in 3 in 2016.

**Table 2: Child Asylum Applicants from Third Countries**

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Child APs	46 530	62 670	71 395	75 915	92 450	116 820	160 140	384 935	398 110
Percentage share in all APs	20.67	23.75	27.52	24.56	27.57	27.10	25.54	29.19	31.60

Source: Eurostat (2017), own data processing

Age structure of asylum seekers coming from Sub-Saharan Africa differs from the age structure of all asylum applicants. On average, percentage share of SSA's child asylum applicants in all SSA's asylum applicants is lower than the average percentage share is. It has not exceeded 22 % since the year 2011 (see Tab. 3).

**Table 3: Age Structure of Asylum Applicants from SSA's Countries**

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Child APs	13.94	19.41	22.71	16.71	20.14	17.72	16.20	19.08	16.29
Adult APs	86.06	80.59	77.29	83.29	79.86	82.28	83.80	80.92	83.71

Source: Eurostat (2017), own data processing

Deeper analysis (see Tab. 4) reveals that the percentage share of child asylum applicants coming from SSA's countries is lower also when two age sub-groups are observed.

**Table 4: Percentage Share of Child APs from SSA in Comparison to all Third Countries**

	2008	2009	2010	2011	2012	2013	2014	2015	2016
SSA's child asylum applicants (in % of all asylum applicants)									
Age below 14	10.71	12.54	15.59	11.90	14.04	11.96	9.10	9.12	9.08
Age 14-17	3.24	6.88	7.11	4.81	6.10	5.76	7.10	9.97	7.21
Child asylum applicants from all third countries (in % of all asylum applicants)									
Age below 14	15.03	16.70	20.35	17.99	20.79	21.14	18.87	19.41	23.18
Age 14-17	5.64	7.05	7.18	6.58	6.78	5.96	6.67	9.69	8.42
Gaps third countries-SSA (percentage points)									
Age below 14	4.32	4.16	4.75	6.09	6.75	9.18	9.77	10.29	14.10
Age 14-17	2.40	0.18	0.06	1.76	0.69	0.21	-0.43	-0.28	1.21

Source: Eurostat (2017), own data processing

Data reveals only two exceptions – years 2014 and 2015, when percentage share of SSA's child applicants in all asylum applicants in the case of the second sub-group (age 14-17) was higher than the average percentage share, but identified gaps did not exceed 0.5 p.p. However, in absolute terms, the number of SSA's child asylum applicants has been growing since the year 2008 (see Figure 2).

**Figure 2: Age Structure of Asylum Applicants from SSA**

Source: Eurostat (2017), own data processing

Development of the number of child asylum applicants is positively correlated with the development of the number of adult asylum applicants. Coefficient of correlation accounted for 0.96 for the period 2008-2016.

#### 4. Discussion

Because of increased migration flows between developed industrialized countries and developing countries, impressive research attention is paid to the interconnection between migration and development. Migration is not an exogenous variable. It is an integral part of wider social and economic development process and development impacts on migration are also fundamentally heterogeneous (De Hass, 2010). Many research studies provide evidence that international migrants do not come from the poorest and least development countries. Clements (2014) confirms that in the short and medium-term socio-economic development of a country tends to stimulate international migration. Clements continues that emigration generally rises with economic development until countries reach upper-middle income, and only thereafter falls. De Hass (2011) shows that the percentage of people moving abroad is higher in countries with a medium level of human development.

It opens space for discussion if the development cooperation – provided by developed countries to developing ones with the aim to promote their social and economic development - stimulates international migration or if it can solve uncontrolled South-North migration flows. Grege and Logožar (2017) found out that countries receiving higher development aid did not reduce international migration in a greater way than countries, which received less aid.

In the case of child asylum applicants coming to the EU Member States from Sub-Saharan Africa, statement that more migrants come from countries with medium level of development is not confirmed. The largest number of child asylum applicants comes from countries with low level of human development (see Tab. 5). Only Nigeria is - in comparison to other in Tab. 4 mentioned countries – the country with higher level of human development than the SSA's average level.

**Table 5: Main Source SSA's Countries for Child Asylum Applicants Coming to the EU**

Asylum Applicants	Period 2008-2012		Period 2013-2016	
	Country	HDI year 2010	Country	HDI year 2015
Age below 14	Somalia	N/A	Eritrea	0.42 (37)
	Nigeria	0.42 (21)	Somalia	N/A
	Congo DR	0.24 (44)	Nigeria	0.53 (18)
Age 14-17	Somalia	N/A	Eritrea	0.42 (37)
	Guinea	0.34 (32)	Somalia	N/A
	Congo DR	0.24 (44)	Gambia	0.45 (31)

Note: HDI means Human Development Index. Information in brackets refers to the country's rank between 46 SSA countries for which HDI is available.

Source: Eurostat (2017), UN Development Programme (2017), own data processing

Number of child migrants coming to the EU from SSA's countries with high level of human development (Seychelles and Mauritius) or medium level (Botswana, Gabon, South Africa, Cabo Verde, Namibia, Congo, Ivory Coast, Equatorial Guinea, Ghana, Zambia, Sao Tomé and Príncipe, Kenya) do not significantly contribute to the child migration flows between the European Union and Sub-Saharan Africa.

## 5. Conclusion

Between years 2008-2016, the number of migrants coming to Europe has increased. Asylum applicants coming to the EU Member States from Sub-Saharan Africa contributed to this growth less significantly than migrants coming from other third countries did. Their share in total asylum applicants declined in 2015 and 2016. Increase migration of children is the most serious phenomenon connected with current migration flows, because children are generally considered the most vulnerable group of society. Since the year 2008, number of child asylum applicant has increased in the EU Member States dramatically.

General public usually thinks that asylum applicants from SSA's countries has to be considered economic migrants seeking for better living conditions. Economic migration is stimulated by economic and social development in source countries. However, in the case of child migration from Sub-Saharan Africa to the EU data revealed that child asylum applicants came especially from countries with low level of human development affected by political or social insecurity and instability. Therefore, they have to be taken as refugees under international protection. This conclusion opens space for the further research looking for the existing patterns of the relation between international migration and livelihood strategies in SSA's countries with low level of human development.

### **Abstract**

*Emigration from new EU member states in Central and Eastern Europe, especially the Baltic States and the Balkans has been fierce since their admission to the EU. Taking up the case of Bulgaria this paper, the actual situation. Beginning in the 21st century a huge amount of foreign direct investment has flowed into the country. However, it flowed mostly into real estate, finance, services, etc. and did not contribute to creation of employment opportunities so much. Massive outflow of young and educated people from the country is a serious problem. As the EU has given new EU member states only 'free mobility' in respect of labor but failed to create employment opportunity sufficiently in poorer member states its policy has collapsed. This paper argues that more active industrial policy by the Bulgarian government is required.*

**Keywords:** Bulgaria, depopulation, emigration, EU

**JEL Classification:** J61, P51, O52

### **1. Introduction**

People in the EU member states enjoy free mobility of labor, but migration from periphery to the EU's core such as Germany has been overwhelmingly frequent and migration from opposite direction has been less frequent. A population decrease in the Baltic States and the Balkans has been remarkable. The pace of people's outflow has been so rapid in some new EU member states (NMS) that there has been depopulation. Among them, young and educated people, who should shoulder the future development of these countries, have emigrated massively, posing a serious question.

I will discuss the case of Bulgaria. After having grasped the extent of a natural decrease in population and net emigration, I will consider causes of the massive emigration. Then I will briefly discuss emigrants' motivations and the government's countermeasures and conclude.

### **2. Population Dynamics in Bulgaria**

Bulgaria's population, which was 8.82 million in 1990 immediately after the system change, has drastically decreased by 1.6 million to 7.20 million in 2014 within a quarter century (Table 1). It was a very rapid decrease in population. Two factors can be mentioned for the decrease in population: First, the birth rate began to fall short of the death rate in 1990 at the latest (I mention 1990 because only data of every five years is available, but possibly the birth rate might begin to fall short of the death rate in somewhere between 1986 and 1990.). Since then the birth rate has consistently been less than the death rate, and a natural decrease in population has been continuing; Second, the emigration to foreign countries has been exceeding the immigration from foreign countries, and therefore a net outflow of people has been continuing.

**Table 1: Population Dynamics in Bulgaria**

Year	Population	Fertility rate	Birth rate (per 1,000)	Death rate (per 1,000)	Natural increase or decrease (per 1,000)	Migration (net)
1945	6,936,000	3.09	24.1	14.9	9.1	n.a.
1950	7,251,000	2.94	25.2	10.2	15	n.a.
1955	7,541,295	2.53	20.1	9.1	11.1	-23,600
1960	7,866,472	2.3	17.8	8.1	9.7	-8,700

Source: Prepared by the author by combining two tables from the Bulgarian Statistical Institute.

Source: <http://worldometers.infor/world-population/bulgaria-population/>;

[https://en.wikipedia.org/wiki/Demographics\\_of\\_Bulgaria](https://en.wikipedia.org/wiki/Demographics_of_Bulgaria); Original source: <http://www.nsi.bg>

Since the system change the fertility rate continued to decrease in the 1990s. It seems that the phenomenon reflected people's intensifying anxiety about their future in the prolonged transformational recession. The fertility rate decreased to 1.20 in 2000, and then it has recovered to more than 1.5 in 2015, supposedly reflecting an improvement of people's lives.

In 2016 the number of people who emigrated from Bulgaria was 30,570 and the number of people who immigrated into Bulgaria (including both Bulgarians and foreigners) was 21,241, therefore net outflow of people was 9,329 (Table 2). In that year the total population has decreased by 51,991 from the previous year. The net outflow of people does not seem to be a significant factor because it is only about 18% of the total decrease in population. In my interview of September 2017 Dimiter Ialnazov says that the number of people's outflow which the Bulgarian Statistical Bureau announced is smaller than the actual outflow. According to him, there are people who have emigrated without procedures of a change of address. Anyway, looking at only Bulgarians, the difference between immigration (including return immigration) and emigration, i.e. the net people's outflow is 16,541 and contributes to a third of the total decrease in population. This is not a negligible number.

According to Mara and Landesmann (2016), net emigration from Bulgaria to EU-15 for 16 years from 2000 through 2015 is about 400 thousand, but this number does not include people who have emigrated to countries other than EU-15. In addition, there are people who have emigrated to foreign countries before that period. Bakalov and Borisova (2013) estimate that at present expatriate Bulgarians amount to about a million.

According to Mitev and Kovacheva (2014), in the 1990s, especially after the economic crisis in 1996/97 there was an emigration boom due to sudden impoverishment. In the 21st century there have been post-transition emigration flows. Push factors are the continuation of poverty and low living standards, the job losses due to de-industrialization. In addition, young people's willingness to study abroad is mentioned. Let us see the actual situation of Bulgaria's transition.

### 3. The Actual Situation of Transition to a Market Economy in Bulgaria

Taking up Poland as a benchmark of Central Europe, I will compare Bulgaria with it. In Poland the transformational recession was shortest and shallowest, and the economy picked up in 1993. The economy has been continuing to grow steadily without recording negative growth. In the case of Poland, Inward FDI in various area of the economy including manufacturing has led the economic development. In contrast to Poland, the transformational recession has prolonged in Bulgaria. Although there was feeble economic recovery in the mid-1990s, the country experienced the second transformational recession from 1996 through 1997. After that its economy began to grow, but it suffered a major damage by the 2008-2009 global financial crisis, and its GDP declined by 3.5% in 2009. Its economy has been quite vulnerable to changes in external environment.

The World Economy Research Institute at Warsaw School of Economics publishes *Poland Competitiveness Report* every year and indicates to what extent NMSs in Central and Eastern Europe have converged on the average of EU-15. The report compares NMSs by per capita GDP at purchasing power parity with Poland being 100 (p. 20). From here we can find that all NMSs in Central and Eastern Europe have more or less experienced transformational recession but have accomplished economic growth and reduced gaps between them and the average of EU-15. Although most of them (excluding Poland) experienced negative economic growth from 2008 through 2009 (or 2010), they regained economic growth and reduced the gaps. Among them Bulgaria needs special attention. Although the Bulgarian economy exceeds the level of 1989 in absolute term, even in 2015 the country could not reduce the gap between itself and the average of EU-15 that was recorded in 1989, and it is only country which has been rather outdistanced by the average of EU-15.

During the socialist period Bulgaria totally relied on markets of the Soviet Union and COMECON. It has been a predominantly agricultural country with industry being developed to a certain extent. Above all, heavy industry such as steel industry and non-ferrous metallurgy have developed, and their products were mostly exported to the Soviet Union and COMECON countries. After the system change exports to these countries have drastically decreased. Food processing industry and tobacco industry suffered from the loss of markets of the Soviet Union and COMECON. Even if these industries tried to challenge the West European markets they would not be competitive in terms of quality. There seem to be serious problems in agriculture and rural areas in the country.

### 4. Situation in Agriculture and Rural Areas

In the early 1990s the government aimed at creation of market-based agriculture in line with neoliberalism. Privatization was implemented, but the implementation proved more difficult in Bulgaria than other countries in Central and Eastern Europe. Existing Kolkhoz (Soviet collective farm)-type agricultural cooperatives and Sovkhoz (Soviet state agricultural farm)-type agricultural enterprises were dismantled. Most of their equipment was sold. Farmland reform was implemented basically based on the principle of restitution. As a result, descendants of former owners of the farmlands have received the most of lands, but many of them have no experience of agriculture. In Ialnazov's opinion, the restitution of farmland met justice but it was not economically reasonable solution. According to Slavova (2012), as a result of the farmland reform, the ownership structure has been polarized as follows:

- Business-oriented farming – commercially-oriented farms
- Farming for survival – subsistence farms

About 75% of agricultural holdings account for less than 7% of the utilized agricultural areas. They cultivate plots of no more than one hectare. They are doing agricultural production mainly for home consumption. Agricultural productivity is low. The fragmentation of land ownership is a significant barrier to long-term investments in agriculture, and efficient use of agricultural machinery (World Bank, 2010). The agricultural production continued to decline year after year, and in 1996 it decreased to about 62% of the level of 1990. World Bank (2000) mentions the following causes for agricultural production: i) As subsidies were reduced considerably and the purchasing power of farmers fell, the quantity of fertilizer use declined precipitously; ii) Mechanization also declined, although not so dramatically; iii) As a result of privatization, many animals were put in the hands of farmers, but they were ill-equipped to care for animals, resulting in a rapid decrease in animals; iv) Sharp drops in demand for agricultural products due to a decline in inhabitants' purchasing power and disintegration of the traditional trading relations within COMECON as well as the Russian financial crisis in 1998.

As we have seen, the government did not have sensible policies for agriculture and rural areas at that time. In 1997 when Bulgaria was not a member states yet the EU began organizational aid to the country through 'the Special Accession Program for Agriculture and Rural Development (SAPARD). In spite of aid by the EU through SAPARD and Common Agricultural Policy (CAP), however, the Bulgarian agriculture has not begun powerful development yet. During the socialist period Bulgaria served as a food base for the whole COMECON countries. The trade balance in the area of agriculture had been surplus for a long time, but there was a downward trend in the amount of its surplus. Now Bulgaria is a net food-importing country.

Outflow of people, especially young people has been fierce. A natural decrease in population in rural areas has begun as early as the mid-1970s. In 1975 42% of Bulgarians lived in rural areas. At present about two million, i.e. 27.5% of total population live in rural areas, of which about a million are pensioners.

## **5. Admission to the EU and Bulgaria**

The admission to the EU has brought bright prospect and opportunities to the country, consequently increasing funds from the EU and FDI. Christova-Balkanska (2016), Senior Researcher at the Economic Institute of the Bulgarian Academy of Sciences, says that while funds from the EU and FDI play important roles in the conversion of the Bulgarian economy on the EU, both have problems. First, Structural Funds and Cohesion Funds of the EU are expected to contribute to the economic development of less developed member countries. According to her, in practice funds from the EU were not sufficiently effective because Bulgaria has consumed only 19% of the allocated sums in the years 2007-2013. Administrative and judicial officials have been so weak that there have been problems in the process of planning projects and funding, and therefore the absorption rate of the EU funds was quite low (For absorption rate, see Sediva Neckarova and Sedivy [online], 2016). Professor Ialnazov (Kyoto University) points out a problem that funds allocated from the EU have often been pilfered by politicians, bureaucrats and enterprises in the process.

Second, it is the period 2005-2007 that a large amount of FDI has flowed into the country. A significant share of FDI went into non-manufacturing industries (especially, construction, real estate and tourism), which caused consumption-led economic development and an economic bubble. Current account deficit in 2008 recorded 23.1% of GDP (see Table 3). I would like to add that although not included in this table current account deficit in 2007 was approximately 25% of GDP. And then came the Lehman shock in September 2008. As the demand from main

trading partners has decreased sharply the production activities in Bulgaria has decreased correspondingly. Also FDI inflow has decreased sharply. As import has decreased more greatly than export in 2009, trade deficit and current account deficit have decreased to 8.2% and 8.9% of GDP respectively. This trend continued for a while after that.

More than the half of the FDI stocks in the non-financial sector were concentrated in big cities such as Varna, Burgas and Plovdiv and the capital city Sofia. These big cities attracted 80% of the total stock of FDI. A problem is that countryside, especially in the northwestern part of the country has received almost no foreign capital. Christova-Balkanska says, “because FDI are concentrated in big cities, with an available labor force, in smaller towns and villages FDI cannot contribute to overcoming unemployment and to keeping the inhabitants in the places of birth, which undoubtedly affects and increases the intention for emigration of the young generation” (Christova-Balkanska, 2016, p. 59).

Source: For the period 2008-2015, Christova/Balkanska (2016), p. 41; For the period 1995-1997 and the budget balance (the whole period), wiiw, Current Analysis and Forecasts, various issues. Except budget balance, trade balance and current account (which are % of GDP), annual change in %.

As for nominal convergence criteria, as far as declining percentage of price rise (rather deflation in recent years), decreasing budget deficit, declining public debt, etc. are concerned, the country fulfils the criteria. After the global financial crisis, however, the economic growth has been slow. It will be a long way to Bulgaria’s substantial convergence. Albeit declining in recent years, the unemployment rate is still recording a double-digit, working as a push factor for people’s emigration to foreign countries. Austerity which has been strongly recommended by the European Commission and the IMF is restricting the country’s economic development.

## 6. Motivations for Emigration and the Government’s Countermeasures

As for a recent trend in international migration, a study by Vanya Evtimova Ivanova (2012), Assistant Professor at New Bulgarian University, is useful. Based on her study, let us look at the recent trend. According to a survey conducted by the government in 2012, to an inquiry “what was the aim of going abroad”, 81% of the respondents mentioned Education, followed by Family reunification (8%) and Work (8%), Further qualification, fellowship (4%). It seems

that there is a great problem in the educational system in Bulgaria. According to Dimiter Ialnazov, in spite of the fact that the economic structure has been transformed from an economy with priority given to heavy industry in the socialist period into a service-oriented economy, the content of education does not meet requirements of the economy. Therefore, many young people went to universities in advanced countries in Europe and North America. Many parents have been encouraging their children to go abroad for education. According to a survey done at the end of September 2012, 14% of the Bulgarians have the intention to leave the country forever. This is 3% more compared to a similar survey done in November 2009 (Evtimova-Ivanova, 2012). To an inquiry about “Reasons to work abroad” (multiple answers are permissible), “Better professional realization” comes first with 52%, followed by “Better payment” (42%), “Don’t want to live in just one country” (31%), “Like risk and challenges” (29%), etc. Higher wages in EU-15 act as a pull factor.

There have been a substantial number of Bulgarians who have returned home. According to a survey conducted for Bulgarian residents abroad in 2010, Bulgarians who have stayed abroad for 5 years or more occupy 58% of total respondents, 4 years 17%, 3 years 12%, 2 years 10% and one year 4%. 3,518 Bulgarians changed their permanent address from abroad to Bulgaria in 2010. The number of men prevailed (54%). Among reasons for return migration, the most important is the impact of the global economic crisis on Europe and Bulgaria. Highly skilled migrants, who are often young and single migrants, may more easily stay abroad because of their good language skills and ability to quickly find another job. To the inquiry about reasons for return migration (multiple answers are permissible) “Graduated” comes first with 54%, followed by “Did not want to live abroad forever” (46%), “Contribute to a sector in Bulgaria” (40%), “Nostalgia (family and friends)” (31%), “Did not plan to stay longer abroad” (23%), “Interesting job offer in Bulgaria” (21%), “Start my own business” (17%), etc.

The government of Bulgaria have not overlooked people’s outflow and depopulation. Two strategical documents were adopted. National Strategy of the Republic of Bulgaria for Migration and Integration (2008-2015) was adopted in 2008. Then, National Strategy in the Field of Migration, Asylum and Integration (2011-2020) was adopted in early 2011. The core of both documents is to call Bulgarian residents abroad back to their mother country and strengthen the relation with Bulgarian residents abroad (diaspora). The most desirable from the standpoint of the government is that Bulgarian residents abroad will return home, or while staying abroad, making use of their own money, knowledge and network for development of the country. For this purpose, the State Agency for the Bulgarians Abroad (SABA) was established. SABA has created a separate database to collect information about the Bulgarian students abroad. The Ministry of labor and Social Policy (MLPS) held a job fair in Spain for workers who had intentions to return home. Taking into account the fact that the number of emigrants still exceeds the number of return migration, it seems that the government’s policies have not brought sufficient results yet.

## 7. Conclusion

First, Bulgaria’s transition has had serious problem resulting deindustrialization and devastated agriculture. Farmland reform, in particular, after the system change gave the agriculture severe blow. The restitution of farmland to former owners of the farmlands or their descendants was not economically reasonable solution. There emerged the polarization in which along with a small number of large-scale agricultural farm numerous small-scale agricultural farm exist. The government’s impractical policies for agriculture caused a decline in agriculture and distress in rural areas. Many young men flowed out of rural areas to cities and further to foreign countries in quest of jobs. Careful policies to develop rural area will be required.

Second, young people who have educated in cities also could not find enough employment opportunities in the country. The government of Bulgaria has so far been too faithful to neoliberal course. It will be necessary for the government to adopt active industrial policies in order to create employment opportunities.

Third, as the EU has given citizen of NMSs only ‘free mobility of labor’ but failed to create employment opportunities, the EU’s policy has collapsed. In the future it will be necessary for the EU to make step toward fiscal federalism and have an ample budget at the EU level with its own source of revenue enough to support less developed member states. However, in the current situation in which some member states make complaints against the EU budget of only 1% of GDP there is no way other than expecting private funds in richer member states to flow into less developed member states. Indeed, inward FDI is important for less developed member states, but it is insufficient for these member states to rely on inward FDI. It will be necessary to have a mechanism which will induce private funds to manufacturing in less developed member states under the EU’s guarantee. In that sense, ‘European Fund for Strategic Investment’ (EFSI; the so-called Juncker Plan) needs to be developed.

e-mail: pavlina.kozakova@vsb.cz

## **Abstract**

*ESports or electronic sport is not only leisure time or working activity. ESports is a world of paid micro transactions of virtual goods. This contribution explores the shopping mechanism of virtual goods in paid micro transactions in the selected countries of the Europe. Primary online questioning led by author focuses on the personal and psychological factors affecting Czech players as the EU members and Russian players as the non-EU members to buy virtual goods in free-to-play online games. The identification of the significance of the factors is very important for increasing of the motivation to spend money in free-to-play online games. The article is driven to find out the differences between Czech players' perception of the personal and psychological motivators as the EU members and Russian players' perception of the personal and psychological motivators as the non-EU members. A structural equation modelling was used as the research method of analysis. The results confirm that psychological motivators drive virtual goods shopping mechanism of Czech players as the EU members as well as psychological motivators lead Russian players as the non-EU members. The contribution discusses the reasons of similarities.*

**Keywords:** *online games, perception of the EU members, perception of the non-EU members, shopping motivators, structural equation modelling*

**JEL Classification:** *C10, M31, M37*

## **1. Introduction of Topic**

Electronic sport (eSports) has been a growing phenomenon in players and audience over recent years (Llorens, 2017). ESports can be defined as competitive computer gaming (Seo, 2013). It has emerged as an important aspect of virtual-world consumption and the recording of certain eSports events have become worldwide mass events. (Seo, 2013; Llorens, 2017).

The example of an eSports worldwide success is the case of game called League of Legends (LoL) (Llorens, 2017). League of Legends, launched by Riot Games, has one of the biggest-in-the-world player base and the Riot Games executives confirmed that the game has 100 million monthly players. The eSports tournaments and player streams have got massive viewership on Twitch and YouTube (Tassi [online], 2016). Though League of Legends is an online free-to-play game, players spend a lot of money for virtual goods, such as new characters, skins items or map improvements.

The motivation of players to spend money in online free-to-play games is explored in this contribution. This research focuses on shopping mechanism of Czech players as the EU

members and Russian players as the non-EU members. Although these two countries share the same historical features, they are currently developing differently and their membership and non-membership in the European Union is one of the major factors influencing the development of these countries. The prior studies confirm that geographic comparison of consumers' behaviour and perception of different topics is very useful (Velčovská and Hadro, 2018; Pawlasová, 2016; Velčovská and Klapilová Krbová, 2016; Pawlasová, Spáčil and Valečková, 2014a; Pawlasová, Spáčil and Valečková, 2014b).

The aim of this contribution is identifying of the internal factors affecting Czech players as the EU members and Russian players as the non-EU members to buy virtual goods in free-to-play online games. The theory of factors affecting customer behaviour according to Kotler and Armstrong (2008) is applied. Kotler and Armstrong (2008) state consumer's motivation to buy products can be influenced by cultural, social, personal and psychological factors. This research focuses on the personal and psychological characteristics of consumer behaviour because these factors are more internal matters than cultural and social factors. The psychological factors in online consumer behaviour were applied also in Cetinã, Munthiu and Rãdulescu (2012). The area of free time activities was also explored in Rebrošová (2017) where the author focused on motivators of visitors to visit a theatre performance.

## 2. Problem Formulation and Methodology

The online questioning conducted in April 2017 was applied as **the research method**. We measured the respondents' opinions about the statements using only closed questions on a Likert scale of 1 to 5, where 1 corresponded to "I fully disagree" and 5 to "I fully agree" with the statement. The statements measuring personal and psychological factors took the base from Kotler and Armstrong (2008). The population were all online game players of League of Legends in the Czech Republic and Russia. The sample consisted of 292 respondents from the Czech Republic and 1234 respondents from Russia. The detailed structure of respondents is shown in Table 1.

**Table 1: Structure of Czech and Russian Sample of Respondents**

Gender		Age		Income	
<b>Czech sample of respondents (n=292)</b>					
<b>Man</b>	93.9 %	<b>0 – 17</b>	46.3 %	<b>Without any income</b>	25.8 %
<b>Female</b>	6.1 %	<b>18 – 34</b>	51.0 %	<b>With an income</b>	74.1 %
<b>Total</b>	100.0 %	<b>35 – 54</b>	1.1 %	<b>Total</b>	100.0 %
		<b>55+</b>	1.6 %		
		<b>Total</b>	100.0 %		
<b>Russian sample of respondents (n=1234)</b>					
<b>Man</b>	81.0 %	<b>0 – 17</b>	16.8 %	<b>Without any income</b>	40.9 %
<b>Female</b>	19.0 %	<b>18 – 34</b>	82.9 %	<b>With an income</b>	59.1 %
<b>Total</b>	100.0 %	<b>35 – 54</b>	0.2 %	<b>Total</b>	100.0 %
		<b>55+</b>	0.1 %		
		<b>Total</b>	100.0 %		

Source: author's calculations

A method of structural equation modelling (SEM) was applied to **analyse the data**. The purpose of this analysis was the evaluation of the designed model and the quantification of the factors in the designed model of motivation of Czech players as the EU members and Russian players as the non-EU members to buy virtual goods in free-to-play online games. As Ho

(2013) claims, a confirmatory way of testing of validity of the designed theoretical models using SEM is better interpretable and therefore we use this approach. The calculations were conducted in SPSS 20 and SPSS Amos 20 at the significance level of 0.05.

### Structural Equation Modelling

Nachtigall et al. (2003) declare that a general structural model consists of two parts – a *measurement model* and a *structural model*. The relations between the latent variables are measured in a measurement model and the relations between the observed and the latent variables are measured in a structural model. A structural model shows which latent variable is independent and which latent variable is dependent (Urbánek, 2000).

A *measurement model* is algebraically formulated as two systems of equations in matrix form (Urbánek, 2000; de Oña et al., 2013):

$$\vec{x} = \Lambda_x \vec{\xi} + \vec{\delta}, \quad (1)$$

$$\vec{y} = \Lambda_y \vec{\eta} + \vec{\varepsilon} \quad (2)$$

where  $\vec{x}$  is the vector of the indicator for the vector of latent variable  $\vec{\xi}$ ,  $\vec{y}$  is the vector of the indicator for the vector of latent variable  $\vec{\eta}$ ,  $\vec{\xi}$  is the vector for the latent exogenous variable,  $\vec{\eta}$  stands for the vector for the latent endogenous variable,  $\Lambda_x$  and  $\Lambda_y$  stand for the matrixes of the structural coefficients for the relations of variables' vectors  $\vec{x}$  and  $\vec{\xi}$  and variables  $\vec{y}$  and  $\vec{\eta}$  and  $\vec{\delta}$  and  $\vec{\varepsilon}$  stand for the vectors of residual variables for the vectors  $\vec{x}$  and  $\vec{y}$ .

The *model of latent variables* is algebraically formulated as (de Oña et al., 2013):

$$\vec{\eta} = B\vec{\eta} + \Gamma\vec{\xi} + \vec{\zeta} \quad (3)$$

where  $B$  and  $\Gamma$  represent the matrixes of the structural coefficients of the latent endogenous (exogenous) variables and  $\vec{\zeta}$  represents the measurement errors.

The *validity of the designed model* can be defined with multiple chi-squared tests. The CFI and NFI were calculated in this case. The rate of change of a conditional mean is shown as a regression coefficient (Hair et al., 2010). Hendl (2015) claims the relation between the variables is weak if the actual value of standardised regression coefficient is from 0.0 up to 0.3. The relation between the variables is moderate if the actual value of coefficient is from 0.3 up to 0.7, strong if it is from 0.7 up to 0.9 and very strong if it is from 0.9 up to 1.0.

The comparative fit index (CFI) is algebraically formulated as:

$$CFI = \frac{P_N}{P_{N_b}}, \quad (4)$$

where  $P_N$  and  $P_{N_b}$  represent the parameters of noncentrality for the estimated and the basic model. The estimated model represents the tested designed model and the basic model represents the null model in which the latent variables do not correlate. The CFI should be close to 1.000 (Urbánek, 2000).

The normed fit index (NFI) is algebraically formulated as:

$$NFI = 1 - \frac{F}{F_b}, \quad (5)$$

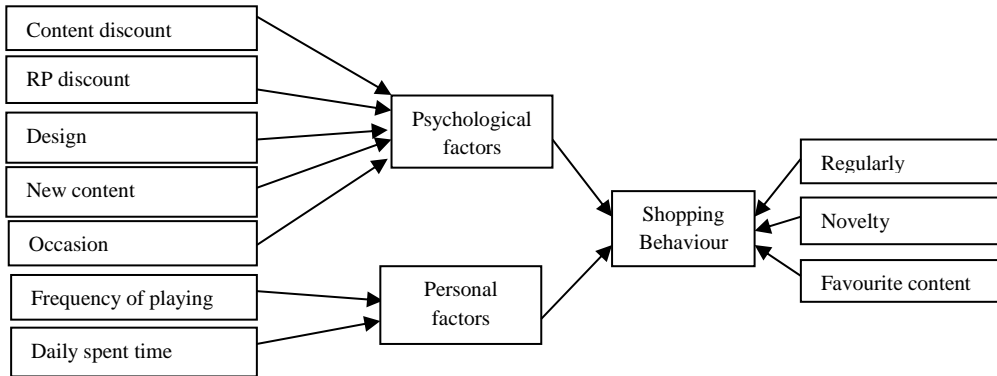

where  $F$  stands for the minimum value of the loss function for the estimated model and  $F_b$  stands for the value of the loss function as the minimum for the basic model (Urbánek, 2000). The NFI should be also close to 1.000 (Hooper et al., 2008).

### 3. Model Analysis and Results

The tested model based on Kotler and Armstrong (2008) combines personal and psychological factors to determine motivation of Czech players as the EU members and Russian players as the non-EU members to buy virtual goods in free-to-play online games. The research model is shown in Figure 1.

**Figure 1: Research Model**

Source: Author modification based on Kotler and Armstrong (2008)

The psychological factors show that customer motivation is influenced by motivation, perception, learning, and beliefs and attitudes (Kotler and Armstrong, 2008). In this research, the psychological factors were measured by the following observed variables:

Content discount	I am encouraged by content discounts to buy content of LoL.,
RP discount	I am encouraged by RP discounts to buy content of LoL.,
Design	I am encouraged by design of content to buy content of LoL.,
New content	I am encouraged by novelty of content to buy content of LoL.,
Occasion	I am motivated by a thematic event to buy the content of LoL.

The personal factors show consumer’s age and life cycle state, occupation, economic situation, lifestyle, personality and self-concept. The personality distinguishes one person from another by individual characters. These personal characters can be self-confidence, adaptability, sociability and dominance (Kotler and Armstrong, 2008). In this research, the personal factors were measured by the following observed variables:

Frequency of playing	I play League of Legends frequently.,
Daily spent time	I play League of Legends many hours per day.

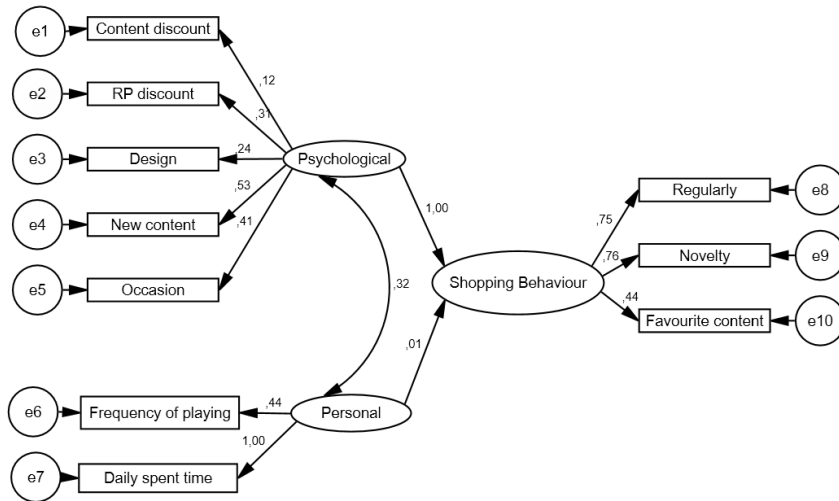

The shopping behaviour was measured by the following observed variables:

Regularly	I buy content of LoL regularly.,
Novelty	As soon as something new in content of the LoL, I buy it.,
Favourite content	I have a favourite champion (or more) and I like to buy something for him.

### 3.1 Validity of the Model for Czech Shopping Behaviour of Virtual Goods in Online Games

The validated model of Czech shopping behaviour of virtual goods in online games is shown in Figure 2.

**Figure 2: The Model of Czech Shopping Behaviour of Virtual Goods in Online Games**

Source: author’s calculations.

According to the analysis of **the measurement model**, all relations between latent and observed variables are statistically significant according to the actual significance levels except the relation between the observed variable *content discount* and the latent variable *Psychological*. Considering the actual values of standardised regression coefficients, there are the strengths of relations between observed variables and the latent variables that are strong and very strong. Specifically the strength of relation between observed variable *daily spent time* and the latent variable *Personal* is very strong and the strengths of relations between observed variables *regularly* and *novelty* and the latent variable *Shopping Behaviour* are strong. The relations between observed variables *occasion*, *RP discount* and *new content* and latent variable *Psychological* are moderate. Also the strength of relation between observed variable *favourite content* and the latent variable *Shopping Behaviour* is moderate.

However, there are also the strengths of relations between observed variables and the latent variables that are weak. Specifically these are the strengths of relations between observed variables *content discount* and *design* and the latent variable *Psychological* and also the strength of relation between observed variable *frequency of playing* and the latent variable *Personal*.

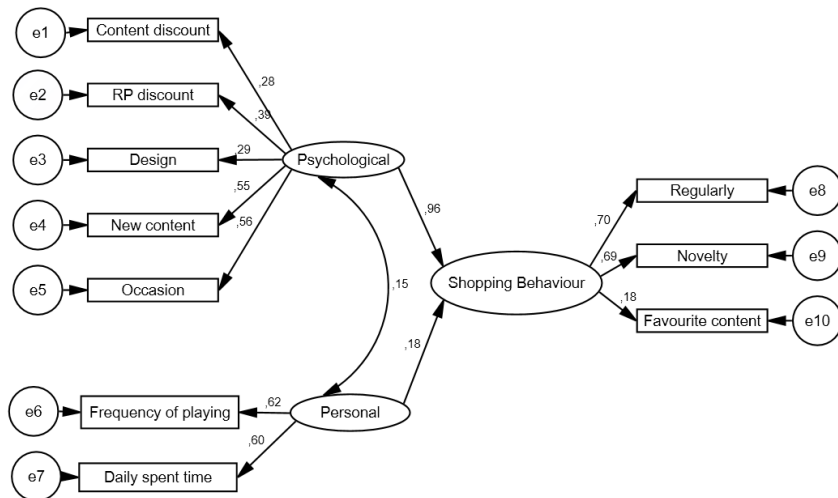

Considering the **model of the latent variables**, the relation between the latent variable *Psychological* and the latent *Shopping Behaviour* is statistically significant but the relation between latent variable *Personal* and latent *Shopping Behaviour* is not statistically significant. According to the actual values of standardised regression coefficients, the impact of the latent variable *Psychological* on the latent variable *Shopping Behaviour* is very strong whereas the impact of the latent variable *Personal* on the latent variable *Shopping Behaviour* is weak.

Considering **Goodness-of-Fit indexes** of the tested model, CFI of this tested model takes value of 0.734 that is a high value. NFI taking value of 0.696 claims that there are possibilities to improve the model and fit the real data more. According to NFI the designed model fits the real data in nearly 70 %.

### 3.2 Validity of the Model for Russian Shopping Behaviour of Virtual Goods in Online Games

The validated model of Russian shopping behaviour of virtual goods in online games is shown in Figure 3.

**Figure 3: The Model of Russian Shopping Behaviour of Virtual Goods in Online Games**

Source: author’s calculations.

According to the analysis of **the measurement model**, all relations between latent and observed variables are statistically significant according to the actual significance levels. Considering the actual values of standardised regression coefficients, the relations between observed variable and latent variable *Personal* are moderately strong. The strengths of relations between observed variables *RP discount*, *new content* and *occasion* and the latent variable *Psychological* are moderate. Also the strengths of relations between observed variables *regularly* and *novelty* and the latent variable *Shopping Behaviour* are moderate.

However, there are also the strengths of relations between observed variables and the latent variables that are weak. Specifically these are the strengths of relations between observed variables *content discount* and *design* and the latent variable *Psychological* and also the strength of relation between observed variable *favourite content* and the latent variable *Shopping Behaviour*.

Considering the **model of the latent variables**, all relations between latent exogenous variables and latent endogenous variable are statistically significant. According to the actual values of standardised regression coefficients, the relation between latent variables *Personal* and *Shopping Behaviour* is weak, whereas the relation between latent variables *Psychological* and *Shopping Behaviour* is very strong.

Considering **Goodness-of-Fit indexes** of the tested model, CFI of this designed model takes value of 0.811 that is a high value. Also NFI taking value of 0.797 claims that there are little possibilities to improve the model and fit the real data more. According to NFI the proposed model fits the real data in 79.7 %.

#### 4. Conclusion

Tassi [online] (2016) states though League of Legends is an online free-to-play game, players spend a lot of money for virtual goods, such as new characters, skins items or map improvements. This study discusses the players' motivation to buy virtual goods in online games. The aim of this contribution is identifying of the psychological and personal factors affecting Czech players as the EU members and Russian players as the non-EU members to buy virtual goods in free-to-play online games according to the theory of factors affecting customer behaviour according to Kotler and Armstrong (2008).

A structural equation modelling was applied and it was found that psychological motivators influence virtual goods shopping mechanism of Czech players as the EU members as well as Russian players as the non-EU members. Although these countries are currently developing differently thanks to membership and non-membership in the EU, this similarity of the results can be described in the 6-D Model according to The Hofstede Centre [online] (2017). This model states that Czechs and Russians are generally not indulgent, it means they have a tendency to cynicism and pessimism, Czech and Russian culture is shown to be pragmatic and Czechs and Russians has a high preference for avoiding uncertainty. On the other hands, the Czech Republic is an individualist society whereas Russia is a collectivist society. Whereas Czech society is a Masculine hierarchical society, Russian society is Feminine very much hierarchical society.

The potential limitations of this conducted research lie in the applying of only personal and psychological factors affecting players' motivation to buy virtual goods in online games. Therefore, it is recommended to apply also cultural and social factors according to Kotler and Armstrong (2008) or identify other factors according to different theories and authors for applying in the future research.

### **Abstract**

*Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data (GDPR) comes into force since 25<sup>th</sup> May 2018. This regulation exchanges the present Act No. 101/2000 Coll. on personal data protection and implements totally new rules for this issue in the EU member states. Many subjects do not realize that the regulation is valid in all member states beginning with an effective date and that it is not the subject of implementation into national legislation. Also this fact is said to be the reason why the GDPR regulation is being discussed but only few subjects makes the needed steps. The aim of this article is to mention and analyze possibilities when the subject can process personal data as well as to show that the only consent is not always the easiest or the most suitable way to process personal data. On the contrary, it is the latest option if the subject does not find any other legal basis to process the data. Subjects' agreement being not properly used is misleading and groundless since the beginning because it can rather make things worse for the controller or processor contrary to assumptions.*

**Keywords:** Consent, Controller, GDPR, Lawfulness of Processing, Processor, Regulation EU

**JEL Classification:** K10, K23, K38

### **1. Introduction**

Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data (hereinafter the “GDPR”) is being valid and comes into force on 25th May 2018. This regulation has been proved by the European Parliament on 14th April 2016 after four-year negotiation and repeals Directive 95/46/EC (General Data Protection Regulation). As for the Czech Republic, it replaces current Act No. 101/2000 Coll. on personal data protection in its big part.

Regulations issued by the European Parliament are effective within the whole EU beginning with the date determined by the European Parliament and it is not necessary to implement them to national laws as it is with directives. Therefore, it is important to refer strictly to GDPR as it is the regulation not the directive. GDPR requires much more demands as it comes to personal data protection, control of the entire process as well as responsibility. Starting with the date when the regulation comes into force, everything has to be harmonized.

Topic of personal data protection by the new GDPR is being discussed in all countries of the European Union. Thus, there are many publications issued dealing with this topic. This article

mentions only small part of them. As it comes to the Czech authors, this issue is being elaborating by e.g. Nulíček et al. (2017) or Nezmar (2017).

The analysis of the authors Tikkinen-Piri, Rohunen, Markkula (2018) is interesting. Those compare the current Data Protection Directive 95/46/EC with the GDPR systematically analyzing their differences. Providing such analysis, they identified and classified the key consequences of the changes and created 12 aspects of these analysis implications and the corresponding guidance on how to prepare for the new requirements. Summarizing view of given topic is mentioned by e.g. Goddard (2017) and specific rights of children in connection with personal data protection are dealt by Lievens and Verdoodt (2017). Additional information as for information safety is described by Hedley and Jacobs (2017) saying that the GDPR is not alone, of course – in the information security space it is accompanied by the Network and Information Security Directive (NISD).

The basic term mingled the entire text of Regulation, the term “personal data” is. This term is protected by the Regulation. Personal data can be primarily defined as all information about identified or identifiable natural person when identifiable person is such person, which can be directly or indirectly identified by the particular identifiers. (Regulation GDPR, art. 4 par. 1)

Besides this fundamental definition, the Regulation determines different categories of personal data, whose legal protection differs. The following categories can be mentioned:

- general personal data – e.g. name, gender, age, birth date, marital status, IP address, photographic data, e-mail address, phone number, identification number in the public register etc.,
- special category of personal data – data about race or ethnical origin, political opinions, religion, philosophy, union membership, health condition, sexual orientation; further, this category involves genetic data, biometric data in case those are processed in order to identify natural person uniquely.

As far as information about crimes and criminal proceedings are concern, approach to that information has been changed. Such information is not being considered delicate but became the separate category and is determined to be processed with a special regime said in art. 10 of GDPR.

It is necessary to point out that protection provided by the Regulation relates to only natural person (not considering whether it is person making business or not). Protection does not touch legal entities although those can also face damage or abuse of their name as well as information can be used without this entities' consent. Legal entities though have to use other options of protection, which the law provides with. Above mentioned natural persons are further marked as the data subjects.

Controller's obligation is to administrate reports on processing, appoint a representative for personal data protection or give the right to data be transferred from one controller to another. The new step is a reporting of infringement of personal data safety to the Office for Personal Data protection.

Each processor will provide the basic analysis in order to achieve a compliance with GDPR. This analysis will consists of several processes: determination of range, comparing analysis, risks analysis, regulations plan, regulations implementation and controlling audit. The aim of this article is to focus on the first point, which is a determination of legislative range and the analysis of conditions, under which the subject is allowed to process personal data. Other aim is to assess whether the consent is the easiest or the most suitable way to process personal data.

## 2. Rules of Personal Data Processing

There are the rules of personal data processing defined in the Regulation art. 5. The entire regulation follows those rules and other regulation has to be in compliance with it. The basic rules are as follows:

- lawfulness, fairness and transparency,
- purpose limitation,
- data minimization,
- accuracy,
- storage limitation,
- integrity and confidentiality,
- accountability (responsibility of the controller for the above mentioned rules observance and their harmonization is meant).

Lawfulness is the most important principle of personal data protection so the authors pay the biggest attention to it. The processing has to be always based on one of legal basis determined in the article 6 of the Regulation. Data can be processed based on the only one reason or they can be combined. Controller can process the data for different purposes but each purpose has to have its legal basis. Such case can occur that the controller would process the personal data for different purposes and each purpose would have different legal basis. Such situation can come when one purpose passes (one legal basis) but the data will be processed for another purpose. Data can change within the time but new can occur as well as pass. The obligation to liquidate personal data comes in the moment the last reason to process personal data ends. Determination of lawfulness is thus the first and significant step because in case the controller does not have at least one legal title to process data then he acts against the law.

### 2.1 Lawfulness of Processing

Lawfulness to process personal data is determined in the article 6 of GDPR and as such means that the controller is allowed to process the data. *“Processing shall be lawful only if and to the extent that at least one of the following applies: (a) the data subject has given consent to the processing of his or her personal data for one or more specific purposes; (b) processing is necessary for the performance of a contract to which the data subject is party or in order to take steps at the request of the data subject prior to entering into a contract; (c) processing is necessary for compliance with a legal obligation to which the controller is subject; (d) processing is necessary in order to protect the vital interests of the data subject or of another natural person; (e) processing is necessary for the performance of a task carried out in the public interest or in the exercise of official authority vested in the controller; (f) processing is necessary for the purposes of the legitimate interests pursued by the controller or by a third party, except where such interests are overridden by the interests or fundamental rights and freedoms of the data subject which require protection of personal data, in particular where the data subject is a child. Point (f) of the first subparagraph shall not apply to processing carried out by public authorities in the performance of their tasks.”* (Regulation GDPR, Article 6).

#### ***Consent to the processing of his or her personal data for one or more specific purposes***

Consent thus is one of legal reasons, based on which the controller can process the personal data. *“Consent of the data subject means any freely given, specific, informed and unambiguous indication of the data subject's wishes by which he or she, by a statement or by a clear affirmative action, signifies agreement to the processing of personal data relating to him or her”* (Regulation GDPR, art. 4, par. 11).

Consent is a legal act, by which the subject allows the controller to process personal data. This consent is subordinated not only to the conditions determined by GDPR but to general conditions of legal acting said in Civil Code (if controller is related to the Czech law). General regulation of contractual and legal representation according to the Civil Code will be applied to the consent granting. (Nulíček et al. 2017). Personal data protection is closely connected with a personality protection as well being regulated by the Civil Code.

GDPR determines clear conditions to express consent to personal data processing. Consent has to be always granted for particular purpose and this purpose has to be clearly said to the subject. *"Consent has to be newly mainly unequivocal, separated from other agreements, has to be actively granted (not by not acting or pre-filled in consent box) and has to be revocable in such easy way as it was granted."* (practical comment GDPR, ASPI, art. 6)

Consent thus has to be distinguishable, distinguished from other facts, to which the subject expresses its opinion. Consent cannot become the part of a contract or trade conditions as it could be so far. At the same time, provision of service or contract conclusion cannot be conditioned by the consent. The subject should not be forced to give the consent. Even the way can be not clear. For example, the employer asks his/her employees for the consent with camera system at work. Employees could be afraid to deny the consent because of employment lose. Data subject has to be allowed to deny the consent as well as to withdraw it any time. To be able to withdraw the consent, the entire process has to be known when granting the consent.

Nevertheless, by Dolejšová (2018), e.g. it will be possible to offer the customers (data subject) some discount or participation in loyalty programme against the e-mail address for sending the newsletter (and thus to obtain the consent with data processing).

Concrete and specific consent means also a pointing the controller, who will be collecting data (or to whom the consent is granted) but it also means possible third parties, which will process the data or whether the data are allowed to be transferred to another subjects.

Current consents remain valid if they match the conditions given in art. 7 of GDPR. It can become the problem for many controllers. Very often, the consents do not match the condition of being distinguishable although they meet any other conditions. At the same time, it would be suitable to verify harmonization with GDPR.

***Processing is necessary for the performance of a contract to which the data subject is party or in order to take steps at the request of the data subject prior to entering into a contract***

As lawfulness itself says, it is situation when the contract with data subject is concluded and personal data controller is bind by some obligations or authorization. It can be such situation when controller concludes a purchase contract with data subject, based on which the controller is obligated to send the purchase subject to the address given by this subject. Thus it is possible to process data given by the subject in order to fulfill this contract (purchase subject sending) without requesting the consent of data subject. In case personal data processing would go beyond the frame of contract, it is necessary to obtain different lawfulness to process data (e.g. consent).

***Processing is necessary for compliance with a legal obligation to which the controller is subject***

Such situation can come when the controller is obligated to process personal data of the subject and this obligation results directly from the law. In such cases, it is also special lawfulness and it is not necessary to have different lawfulness. However, it has to be in compliance with the law, which determines the obligation to process personal data. The controller has to control the scope of requested data in order not to collect more data than a necessary minimum is.

For example, collecting data about employees to fulfill the obligations towards other subjects (health insurance, social welfare, Labour Office etc.) or banks, which have to process data of their clients and thus fulfill the legal obligation resulting from legislation against money laundering (Nulíček, 2017).

***Processing is necessary in order to protect the vital interests of the data subject or of another natural person***

Subject health' protection is considered the important vital interest. This point leads to situation when the institutions of public health protection (hospitals, clinics, doctor's offices) could process the subject's personal data in case of emergency without his/her express consent (mainly because the subject is not able to grant the consent). Thank to such processing, e.g. anamnesis can be checked out in order to decide on further medical treatment etc.

***Processing is necessary for the performance of a task carried out in the public interest or in the exercise of official authority vested in the controller***

This category enables public administration performance towards the subjects in order not to be limited in this performance mainly when personal data processing is considered. In case public administration authorities or other subjects authorized to do so need personal data of the subjects to fulfill their tasks, those are entitled to process the data based on this lawfulness and do not need the consent of the subjects. In case tasks of public administration authority would be delegated to private legal subjects, it will be very difficult to determine whether personal data processing is still the subject of public administration and whether it is different activity of this subject. Determination of public administration becomes an independent category. As Kozieł (2016) shows in the example of public funds, the term public institution is very wide and differently explained for different purposes. Even such situation can occur that internal (domestic) legislation contains different definition compared to European legislation.

***Processing is necessary for the purposes of the legitimate interests pursued by the controller or by a third party, except where such interests are overridden by the interests or fundamental rights and freedoms of the data subject which require protection of personal data, in particular where the data subject is a child***

The question of legitimate interest when processing personal data is such complex that it could be elaborated in separate article. Nevertheless, it can be said shortly that this is sensitive topic. Each case would be the subject of investigation to what extent it is legitimate interest of the controller in relation with personal data protection of the subjects. One of many examples can be mentioned – implementation of the camera system at the controller in order to protect a property of this controller while at the same time personal data of individuals being seen on the camera would be infringed. In such case, it will be necessary to assess whether the controller was authorized to process personal data (to record) of the subjects without their consent even he/she protected his/her property. If conclusion says yes, then the controller processes those data in compliance with legal regulations and disposes of lawfulness by art. 6 let. f) of Regulation.

**Responsibility of Personal Data Controller**

At the same time, GDPR strengthens the principle of responsibility towards the third parties. The controller is the main person responsible for personal data legal processing. It means not only what data will be collected, how and for what purpose based on what lawfulness, how long but it also means thorough data safety in order to guarantee the rights of data subjects. The controller should clearly determine people, who will be responsible for those issues.

Nevertheless, the main person responsible for implementation and management of effective system, collecting and processing of personal data the owners/statutory body/management of organizations will be. (Krügerová, Kozieł, 2017). In addition, in case the controller and processor fulfills at least one condition being determined in art. 7 of GDPR they are obligated to appoint the representative dealing with personal data protection. Stricter demands for personal data protection will not protect us against cyber-crimes but contrary to that, it brings new responsibility and new risks for some segments as well as new opportunities for e.g. insurance market dealing with cyber risks (more detailed Krügerová, 2016). Storing and registering of given consents is connected with it as well.

### 3. Selection of Lawfulness

There are 6 options, based on which personal data can be processed. One of them also the consent is being most likely used the most frequently and, at the same time, bringing the most problems. Data subject should choose such lawfulness, which would reflect the processing purpose as well as relation of data subject and controller. It is always necessary to assess and evaluate all aspects as it comes to data processing. If there cannot be found any other legal basis to process data, then the consent is suitable to be used. Such cases will occur very often when the controller will process some data due to the contract fulfillment or service, i.e. without the consent but based on legal basis. It cannot be excluded in extreme cases though that in practice the controllers will demand the express consent although there will exist other lawfulness to process personal data.

When choosing the consent as the lawfulness, its impact on the rights and freedoms of natural persons becomes an important aspect. Data subjects will gain definitely more rights when data will be processed based on the consent. Also related to data erasure (GDPR uses the term “right to be forgotten”). By Nezmar (2017), it is not appropriate to ask for the consent in case it cannot be offered real selection as for how the data will be used.

Let's apply it on e.g. bank as the controller of personal data. Bank concludes the contract with the client about bank account management; in such case, the bank will be process the data based on this contractual obligation (by art. 6 of GDPR). Further, the bank will process information about its clients to fulfill legal obligation as well as to fulfill legal obligation resulting from legislation dealing with money laundering (by art. 6c of GDPR). Only for the marketing purposes (sending the offers, satisfaction evaluation etc.) the bank uses the consent (by art. 6a of GDPR). If the bank would ask the data subjects for the consent to issue all above mentioned case, this consent would be for the client misleading since the beginning. Data subject would not be able to control its data. If the client would demand the erasure of his/her data, the bank would have to manage the account and thus to process the data and fulfill its legal obligations, too.

The second example the school is. The school processes personal data of teachers, students, students' parents or further legal representatives (e.g. grandparents). Data are processed in the frame of school registers (by art. 6c) or in the frame of Register of associate professors, professors and extraordinary professors (kept by the Ministry). After a child finishes the school, those people have the right to demand the personal data to be erased. Further, the school will follow the art. 6b of GDPR – necessary processing of data resulting from concluded contracts. The school is also related to the processing aiming the school rights protection or its legitimate rights (e.g. as creditor, administration, court, criminal processes recording the bullying at school) (by art. 6d, 6f). The school will also process data when fulfilling the tasks on behalf of public interest or when executing public power, e.g. when processing personal data of applicants during admissions (by art. 6e). The school also needs the consent when it

wants to public the pictures made during the school events or when processing data about the person picking up the child from school or reporting graduates (including their contact data). During all above mentioned acts, personal data are processing. In case the school would not be sure whether it has lawfulness it likely does not have it; thus it should obtain informed consent. As far as the schools is concern, further conditions should be paid attention to as well such as consent being given by the child (more detailed Lievens and Verdoodt, 2017) and processing of specific data categories.

Considering above mentioned examples, the difference can be seen in particular lawfulness and the consent usage for concrete clearly defined purpose, for which any other legal basis cannot be found.

#### **4. Conclusion**

Regulation GDPR brought fundamental news into the treatment of personal data. Nevertheless, if at present time the subject processes the data in accordance with the law on personal data protection, it will not be necessary to step in implemented processes but only new conditions can be taken into consideration. To understand it properly, it has to be understood what the personal data are – e.g. name, surname, any other data enabling to identify concrete person (thus phone number, e-mail address, residential address etc.). As for news in GDPR, obligation of controller to register processing, to appoint the representative for personal data protection or possible right enabling to transfer personal data to another controller. Reporting the cases of personal data safety infringement to the Office for personal data protection is the new step.

The aim of this article was to introduce and analyze options when and under what conditions the subject could process personal data. There exist six options, based on which personal data can be processed and one of them the consent is. The data subject should choose such lawfulness, which reflects the purpose and relation between data subject and controller the most. If obtaining and formulation of the consent were difficult, then the consent would be the most suitable way to process personal data. Contrary to that, it would be the last option if the subject does not find any other legal basis to process data. Not properly used subject's consent is misleading since the beginning and not legitimate in case it can bring the controller or personal data processor to worse situation. Possible generalized consent being obtained by the controller in order to process data for different purposes would be in breach of several provisions of general regulation.

The consent has to be concrete, specific and informed, i.e. the subject has to know for what purpose and in what extent the consent is being given. Everything has to be explained in the understandable way. Not accurate or not understandable consent can be considered invalid. Once the consent was given, it is necessary to up to date it and control whether the purpose or conditions have been not changed within time.

New regulation GDPR brings many changes in approach to personal data protection. Nevertheless, also these changes have to be approached with common sense and detached view. Most of hysteria and panic being seen in media and among non-professional public results from ignorance of new legal regulation. For many acts, within which personal data are processing, there can be 5 other legal bases applied except consent being offered by this new regulation.

It is clear that effect of new regulation will necessarily bring the need to implement changes and new measures at meant subjects. Such situation comes with each new legal regulation. Regulation GDPR is extraordinary by the fact that the range of subjects, which will be influenced by it, is very wide. Above that, if there is a detailed discussion provided in the

Czech Republic, it is more than certain that similar discussions and concerns will be seen in other EU member states because the regulation will valid within the entire EU. Further problems can occur as EU regulations will be translated in not quality way as it was in the past. One version of regulation in the Czech language mutation can differ from the English version although both are obligatory. As time will go on, the practice will show how an implementation of new personal data protection will be dealt with.

### **Abstract**

*European Union Value Added Tax Directive allows the Member States to include into their national legislation the possibility for the creditors to correct the amount of output tax in case that their debtors are in insolvency. The supplier is generally required to include the carried out transaction into revenues and has the obligation to account for relevant output tax in the moment of the chargeable event, regardless of whether the transaction was paid. The special provision of law was introduced into legislation as anti-crisis measure within the European Union. The aim of the paper is to evaluate by using the correlation analysis the interdependencies between selected indicators related to insolvency and the amount of value added tax correction in case of debtors in insolvency proceedings. The results of the analysis showed the most significant dependence between the percentage of receivables for which the correction of the output tax was made from the total value of receivables and the percentage of required tax correction which was actually returned by the debtor to the state budget.*

### **1. Introduction**

The Czech Republic as one of the European Union Member States is obliged to implement the relevant European Directives into national legislation. First of all, focusing on accounting, the national legislation of individual Member States, mainly due to globalization, tends to move closer to International Financial Reporting Standards (IFRS) (Sulik-Gorecka, Strojek-Filus and Maruszewska, 2017) or (Hakalová, Pšenková and Losová, 2014). This initiative of the Member States also relates to the harmonization of accounting legislation within the European Union. One of the European Directives which has recently significantly influenced the accounting legislation of the Member States is Directive 2013/34/EU of the European Parliament and of the Council of 26 June 2013 on the annual financial statements, consolidated financial statements and related reports of certain types of undertakings, amending Directive 2006/43/EC of the European Parliament and of the Council and repealing Council Directives 78/660/EEC and 83/349/EEC. The aim of this Directive is to reduce administrative burden, in particular for small and medium-sized enterprises. For more about small and medium sized companies economy in the European Union see e.g. De Moor, Wiczorek-Kosmala and Blach

(2016) or Tošenovský (2014). Mikušová (2017) also points out, among other things, the administrative burden that reduces the agility of small and medium-sized enterprises.

However, one of the basic accounting rules is still valid, namely that an accounting entity has to include a supply of goods or services into revenues, regardless of whether those supplies were paid by the recipient (Kuznetsova and Kuznetsov, 2017). Between these two time points, the issue of the invoice and its payment, there may actually arise considerable time lag, or the claim may be reimbursed only partially or not to be paid at all. Receivables are currently still quite risky component of assets of an enterprise that has a negative impact on the ability of the company to pay (Bieliková and Paliderová, 2016). The provider of the transaction thus gets into position of the creditor and the recipient into the position of the debtor (Kašík, 2015). Apart from the obligation to include this receivable in the revenues regardless of its payment, there arises another duty for a provider of the transaction, namely the liability to account for relevant value added tax on output at the appropriate rate. Development of value added tax rates within the European Union is analysed e.g. by Šíroky and Maková (2014).

In order not to distort the conditions of the internal market, the harmonization of value added tax within the European Union is on a high level (Schenk, Thuronyi and Cui, 2015). By contrast, the field of direct taxation, which also has a connection with a growing number of European companies, is subject to tax competition (Hakalová, Palochová and Pšenková, 2016). The influence of direct taxes burden and consumer taxes burden on foreign investments includes the study written by Moravec and Kukulová (2014). The rules for application of value added tax within the European Union are governed by the Council Directive 2006/112/EC of 28 November 2006 on the common system of the value added tax (hereinafter referred to as the VAT Directive).

In accordance with Section 90 of this Directive the Member States are allowed to implement the provision to their legislation that enables the creditor to make the correction of output tax in case of transactions remaining totally or partially unpaid. The specific conditions for the implementation of this correction varies from one Member State to another, as the Directive does not specify them exactly. This provision has been implemented into the national legislation of at least thirteen states, namely Belgium, Czech Republic, Denmark, France, Italy, Ireland, Latvia, Luxembourg, Germany, Portugal, Austria, Greece and the United Kingdom (Chamber of Deputies. Parliament of the Czech Republic, 2018).

On the other hand, this provision imposes an obligation for the debtor, or in the conditions of the Czech Republic for the insolvency practitioner, to reduce the right to deduct input tax exercised from this transaction and then pay the tax. Moreover, if the insolvency practitioner of the debtor intentionally did not grant the tax concerned, such behavior would have already shown the features of tax evasion. For more about tax evasion see e.g. Pickhardt and Prinz (2012) or Hashimzade and Epifantseva (2018).

The insolvency law is harmonized within the European Union as well, for more information see McCormack, Keay and Brown (2017). The aspects of insolvency law reform in Italy are included in research carried out by Accettella (2016) and another Italian point of view that is close to the problematics of insolvency bring Florio and Leoni (2017). Nevertheless, the Judgment of the Court of Justice of the European Union in Case C-246/16 Enzo Di Maura v. Agenzia delle Entrate – Direzione Provinciale di Siracusa of 23 November 2017 underlined on the Italian example the need to amend the VAT Directive and establish clear rules for application of valued added tax correction in case of bad debts (CURIA, 2017).

The implementation of this provision into the legislation of the Czech Republic with effect from April 1, 2011 has been accompanied by many interpretative problems from the very

beginning. One of the most pressing issues is whether this provision can be applied to claims that arose prior to the implementation date, or the question of the timing of the claim that arose six months prior to the court's decision about the debtor's bankruptcy. For more about this problematics see Krzikallová, Krajňák and Bařinová (2017).

## 2. Problem Formulation and Methodology

As it have been already mentioned in the introduction, the implementation of the provision allowing correction of the amount of output tax in case of receivables from debtors in insolvency proceedings has brought a number of problems in the Czech Republic and the question is how the relevant legislation can be amended or cancelled, not only in the Czech Republic but also within the European Union. According to the research (Sobotovičová, 2015) carried out among creditors in the Czech Republic, this provision has not been used too much. Another controversy is brought by the thought whether the actual payment of the tax correction to the state budget by the debtor in the insolvency proceedings would occur due to the presumed lack of the debtor's property.

For this reason, the authors decided to carry out a questionnaire research among the insolvency practitioners of the Moravian-Silesian Region to bring the answer to the question of the use of this provision by analysing selected contexts in the conditions of the debtors in the Czech Republic in close connection with the law of the European Union.

### 2.1 Data

The input data for the analysis were obtained from a questionnaire research made among the insolvency practitioners and entities in insolvency proceedings in the Moravian-Silesian Region at the beginning of 2017. According to the insolvency register, there were 513 such administrators in the Czech Republic, including 71 in the Moravian-Silesian Region. The number of entities in insolvency in the Moravian-Silesian Region reached the sum of 199 in 2016. The number of entities in insolvency represents the size of the population in the questionnaire research.

Using the equation (1) the number of respondents is determined so that the data obtained from the questionnaire research are statistically relevant and allow the following analysis,

$$n = \frac{z^2 \times N \times r \times (1-r)}{(d^2 \times N) + (z^2 \times r \times (1-r))} \quad (1)$$

where  $N$  is the size of population,  $z$  the required degree of certainty,  $d$  permissible deviation rate and  $r$  expected deviation rate. For a degree of certainty 0,05 the degree of  $z$  becomes the value of 1,96. The required accuracy defined by (2) must not acquire the value of 0. The expected deviation of population  $r = 0.02$  (according to the International Standard on Auditing 530 Audit Sampling) (Chamber of Auditors of the Czech Republic, 2018). The above mentioned values are determined in accordance with the rules for defining the sample size in auditing tests in accounting. The degree of certainty 0,05 represents a standard level according to Newbold (2013).

$$p = d - r \quad (2)$$

Relationship (2) expresses the required accuracy, which as is clear from the formalization, must not be equal to 0.

By adding into equation (1) the sample size is determined,

$$n = \frac{1,96^2 \times 199 \times 0,02 \times (1-0,02)}{(0,02^2 \times 199) + (1,96^2 \times 0,02 \times 0,98)} = 96,73 = 97$$

The conclusion shows that there is a necessity to address in the questionnaire research a total of 97 respondents - entities in insolvency proceedings.

## 2.2 Methodology

To achieve the objectives of the paper the authors use in this paper the standard positivist economic methodology including analysis, synthesis, deduction, comparison and study of relevant legislative sources. In the field of quantitative methods, they use the methods of correlation analysis. The quantitative methods are used in their research by e.g. Doš and Foltyn-Zarychta (2017), Sucháček, Sed'a, Friedrich and Koutský (2017) or Tošenovský (2016).

The Pearson correlation coefficient  $r$  characterising the strength of dependency between the two characters ( $x$  and  $y$ ) has the form of (3),

$$r = \frac{\sum_{i=1}^n (x_i - \bar{x}) \times (y_i - \bar{y})}{\sqrt{\sum_{i=1}^n (x_i - \bar{x})^2 \times \sum_{i=1}^n (y_i - \bar{y})^2}}, \quad (3)$$

where  $\bar{x}$  and  $\bar{y}$  are sample average (Morris, 2012). If the value  $r$  is close to 0 the considered values are independent from each other. The more the value is closer to 1 the higher is the level of dependence. More about the correlation analysis eg. Jacques (2013) and Barrow (1988).

## 3. Problem Solution

In the questionnaire research, the data were obtained for the purpose of analysis of their interdependencies. The results are shown in Table 1 and Table 2.

The monitored variables included: the amount of corrected VAT (A), the percentage of receivables for which the tax correction was made from the total amount of receivables (B), what percentage of the required tax correction was returned to the state budget (C), actual % of claims incurred during the 6 months prior to the bankruptcy court's decision (D), the actual % of claims that arose in a period earlier than 6 months prior to the bankruptcy court's decision (E) and the average costs of processing the agenda of the amount of the tax correction for one claim (F).

In the first part of the study, the interdependence was verified by the Pearson correlation coefficient  $r$  (3). The results of interdependencies are shown in Table 1.

The results in this table show that the highest dependence is between the proportion of receivables in which there was made the VAT correction and the percentage of required tax correction that was returned to the state budget. This is the only case where there is a strong dependence between the analysed two factors. In all other cases, the values are less than 0.5. Moderately high degree of direct dependence is between the average costs associated with processing of VAT correction for one claim and the amount of tax returned to the state budget. Besides positive dependencies that are significant in the above mentioned cases, there were also found negative dependencies. However, the value of the  $r$  coefficient is not significant.

**Table 1: The Correlation Matrix - r**

Factor		A	B	C	D	E	F
<b>A</b>	R	<b>1</b>	<b>0,176</b>	<b>-0,138</b>	<b>-0,164</b>	<b>0,134</b>	<b>0,191</b>

\*\* . Correlation is significant at the 0.01 level

Source: authors' calculations

The data from the questionnaire research obtained from 97 respondents are, as shown in Table 2, the basis for determining the average value and the median of the surveyed indicators. The average amount of corrected VAT is 312 250 CZK, while the median value is 87 500 CZK. The reason for these differences is the value of receivables, which for some respondents was even in the order of millions CZK.

It is worth noting that the proportion of receivables in which the VAT correction have been made and the percentage of the tax correction returned to the state budget is very low. The above mentioned facts are documented by both factors as average values and medians. There is also a repeated situation where the medians, except for analysed indicator F, are lower than the average values.

**Table 2: The Average Values of Analysed Indicators**

Indicator	Average Value	Median
<b>Amount of VAT Correction (A)</b>	312 250 CZK	87 500 CZK
<b>Proportion of Claims in Which the VAT Correction was Made (B)</b>	15 %	10 %
<b>Percentage Proportion of Tax Returned to the State Budget (C)</b>	12 %	10 %
<b>Actual % of Receivables Incurred during the 6 Months Prior to the Bankruptcy Court's Decision (D)</b>	33 %	18 %
<b>Actual % of Claims that Arose in a Period Earlier than 6 months Prior to the Bankruptcy Court's Decision (E)</b>	46 %	38 %
<b>Average Costs of Processing the Agenda of the Amount of the tax Correction for One Claim (F)</b>	2 689 CZK	3 000 CZK

Source: authors' calculations

The survey also showed that in most cases only a small part of the corrected tax was paid by insolvency practitioner to the state budget. The processing of an agenda connected with correcting the amount of tax from receivables is a financial burden for insolvency practitioners which has a negative impact on the amount of funds paid to creditors in the end. Noteworthy in this case is the fact that the median of the average costs per receivable is higher than the average value.

#### 4. Conclusion

The aim of the paper was to evaluate, by method of correlation analysis, the interdependence among selected indicators related to insolvency and the value added output tax correction in case of debtors in insolvency proceedings. The data were obtained through a questionnaire research carried out in the Czech Republic among insolvency practitioners. Based on the analysis of the data obtained from the questionnaire research it appears that the highest dependence is between the proportion of receivables that were subject to tax correction and the percentage of the tax correction that was returned to the state budget.

European Union law allows, under certain conditions, the creditor to make a correction of the output tax on receivables that have been only partially reimbursed or not paid at all. This tool enabling the creditors to obtain at least a part of the value of the unpaid receivable back should be retained despite the negative impact on the national budgets of the Member States (Krzikallová, Krajňák and Bařinová, 2017). Although the results of the analysis show that the proportion of receivables that were subject to the value added tax correction and the proportion of this tax correction returned to the state budget do not reach significant values, the authors recommend to keep this provision in the Czech Value Added Tax Act, and respectively in other related legislation. However, it is appropriate to establish clearer rules for the correction of the value added tax in output or to provide the measures that would reduce the administrative burden and costs of insolvency proceedings. The European Commission is planning to modify the VAT Directive in connection with the possibility of the output tax correction. Defining the clearer rules should enable the better determination of situation when a claim is actually irrecoverable and when a value added tax correction can be made. The authors in a view of the controversy over the use of this provision in the conditions of the Czech Republic recommend that this legislation should be implemented in such a way that it will actually give certainty when applying this provision both to creditors and debtors and their insolvency practitioners throughout the European Union.

### **Abstract**

*Unemployment is a natural consequence of market economy evolution. It represents cyclical development of the economy, which brings also negative economic and social consequences, therefore one of the goals of social policy is to reduce the number of unemployed people. The aim of this paper is to present an analysis of the current state of unemployment in selected regions of the European Union, namely in the Czech Republic and the Slovak Republic. The paper further focuses on the importance of European social policy and its opportunities to participate in reducing unemployment in the Member States of the European Union - in the Czech Republic and the Slovak Republic. In this contribution, we apply the statistical method to analyze data from the Statistical Office of the Slovak Republic concerning unemployment in Slovakia and, in case of the Czech Republic, we analyze data from the Czech Statistical Office. We compare the structure of job seekers by comparison method.*

**Keywords:** *European regional policy, European Union, member states of the European Union, unemployment*

**JEL Classification:** *J21, J60, R11*

### **1. Introduction**

In the present paper we are dealing with the phenomenon of unemployment. In the first chapter, we focus our attention on the impacts, which unemployment brings with itself. How it affects an unemployed person - job seeker as well as society and the state. The method of document and professional literature studies we apply in this chapter in order to provide well-founded interpretation of the subject matter. The aim of the second chapter is to provide up-to-date and accurate information on the current state of unemployment in the Slovak Republic and the Czech Republic. In the chapter we apply the statistical method and analyze official data obtained from the statistical offices. We identify regions with the highest recorded unemployment rate in Slovakia and the Czech Republic. The third chapter deals with social policy at the European Union level. We apply method of document and professional literature studies, identify the impacts of selected processes at European level to the level of the Member States and we characterize the main causes of high unemployment at the level of the European labor market.

## 2. Consequences of Unemployment

Defining the concept of unemployment is relatively demanding, and several authors present their own definitions. Adamkovičová (2016) defines the term unemployment as follows: *"Unemployment is a socio-economic phenomenon, definition of which is based on the fact that a person who is able to work is discarded out of paid employment, not satisfied with his/her dismissal and looking for a new paid job."* Palcrová and Novák (2016), comment the unemployment rate, which lists the unemployment values: *"In general, the unemployment rate is understood as the portion of unemployed people in gross working population (employed and unemployed)".* Čaplanová and Martinčová (2013) correctly point out that unemployment is natural consequence of the development of market economies linked to globalization of world economy based on free decisions and democracy linked to the need for labor mobility. At the same time, it reflects cyclical development of the economy and can gain uncontrollable proportions. These can bring serious economic and social consequences. Tomanová (2013) identifies problems that unemployment often causes: loss of work habits, social isolation, loss of motivation, family tension, feelings of helplessness, decline in income associated with constraint, depression, alcoholism, drug addiction. Unemployment is loss not just for an unemployed person who loses, among other things, self-confidence and the amount of his/her pension, but the society is also losing because total output is below the potential level.

### 2.1 Impact of the Unemployment Support System in Practice

The governments of the Czech Republic and the Slovak Republic inherited social security system in 1993, which was applied in the former Czechoslovakia. Disintegration of Czechoslovakia had a negative impact on employment in both successor states, especially in 1993 and 1994 (Outlý et al., 2011). During the 1990s, this system was re-adapted and adjusted in both countries in response to the changing economic, political and social conditions of both countries. Importance of the rescue network systems applied in both the Czech Republic and the Slovak Republic fulfills, according to the World Bank Report, two main tasks: *"It provides income for people who are unemployed and whose income falls below the poverty line and aims to motivate these individuals to find employment and gain their own means of subsistence."* (World Bank Report, 2001). *"They are just the social problems that are the subject of our paper, while" social "can be understood in the narrower as well as in the broader sense. In the narrower sense of the word what is meant is the competence of the resort of social affairs, in the broader sense of the word social means the connection to society."* (Bočáková, Kubičková, 2015). Concerning unemployment and rescue network system, it is important to highlight demotivating effects that arise in connection with benefits under the social security system and social assistance and support system scheme. At the same time, we must emphasize that social assistance and support programs play an important role in preventing poverty (Bočáková, 2015). The success of future reforms of social network systems depends primarily on how governments can deal with the question of how to eliminate demotivating effects without jeopardizing the protective dimension of social assistance and support system. Practice shows that demotivating effects are present in both countries, which is reflected in the preference of staying unemployed and receiving social support than active job searching and subsequent entry into employment from the position of registered job seeker. The reform should aim to make employment more attractive than unemployment. However, we would like to point out the negative impacts of possible reduction of social support, which would result in the spread of poverty.

### 3. Current State of Unemployment in the Slovak Republic and the Czech Republic

"Every region is unique and differs from the other by the level of economic development, living standards of its inhabitants, unemployment rate and by employment possibilities. Regional policy is a strategic investment policy which focuses on all regions and cities in the European Union. The aim is to boost economic growth and to improve the quality of people's lives." (Rentková, 2017). The analysis of statistical data from the Statistical Office of the Slovak Republic shows the following findings: Recorded unemployment rate in the whole Slovak Republic reached 5.94% in December 2017. The number of job seekers available has reached 161 915. The number of economically active population was 2 725 838. In terms of regional segmentation, unemployment exceeds 5% in three self-governing regions: Banskobystrický with 8.6%, Prešovský with 9.6% and 9, 9% in Košický region. District segmentation shows that the unemployment rate exceeds 10% in 16 districts. All 16 districts are concentrated in three self-governing regions: Banskobystrický (five districts with unemployment rate above 10%), Prešovský (six districts) and Košický (five districts) (Statistical Office of the Slovak Republic, 2018). Summary of the above data is given in Table 1. From the analysis of the available statistical data of the Czech Statistical Office, we found that the registered unemployment rate reached 3.7% in December 2017, which represents 280,620 job seekers. Unlike in the self-governing regions in Slovakia nor in one of the regions in the Czech Republic, the unemployment rate is higher than 6%. Moravian-Silesian region has the highest rate with 5.77% followed by Ústecký region with 5.39%.

**Table 1: Districts with the Highest Unemployment Rate in the Slovak Republic and the Czech Republic**

the Slovak Republic				the Czech Republic			
No	District	Region	Unemployment rate 12/2017	No	District	Region	Unemployment rate 12/2017
1.	Rimavská Sobota	Banskobystrický	18.4%	1.	Karviná	Moravskoslezský	8.1%
2.	Rožňava	Banskobystrický	16.2%	2.	Most	Ústecký	7.3%

Source: Statistical Office of the Slovak Republic; Czech Statistical Office

Abnormal unemployment rates in member states of European Union are reported for persons with severe disabilities in the long term. In the Slovak Republic, this group of job seekers participates in 4.09% of the total number of registered jobseekers, which represents 6,626 people. In the Czech Republic, the number of people with severe disabilities represents 16.4% of the total number of job seekers. Graduates represent 5.7% of job applicants in the Slovak Republic (9,230 persons), higher portion than in the Czech Republic where graduates account for 4.1% (8,151 persons) of total number of registered jobseekers. In both member states of the European Union, the number of women exceeds the number of men in the applicant's records. In the Slovak Republic it is 53.1% and in the Czech Republic 50.2%.

#### **4. Importance of European Social Policy in Reducing Unemployment in Member States of the European Union**

For the first time, the European social model was used as a concept in the 1980s by the French economist and politician Jacques Delors, who at that time held the post of President of the European Commission. This model should be an alternative to the American market and the individualistic system. It was based on the assumption that economic growth is connected with social wealth and its key attributes include social dialogue, democratic establishment, personal freedom, adequate social protection and equal opportunities for all. Fojtíková and Vahalík (2016) writes: *"Combination of new technologies, social adaptation, trade liberalization and innovation led to intensified economic, social and political interdependence among nations."* According to Jepsen and Pascual, European social model is not just a political concept, it is also an economic concept. Its ambition is to increase the legitimacy of the further economic and political integration of the European Union (2005). According to Beblavý (2012), implementation of European values in the social field should help to create a pan-European consensus at the transnational level.

The European Union had a major impact on employment since its inception, in particular by creating a single labor market. Today, the whole European social policy is under strong pressure from globalization processes. The main contribution to job creation process was the Maastricht Treaty (1992), which created job creation policies as well as convergence criteria (Zeitlin, Trubeck, 2003). Among the priorities of this strategy are: Convergence of employment policies in the European Union, support for increasing the number of quality jobs and improving the labor market structure at national - and subsequently at European level. It is important to recall that the European Union model is composed of three basic elements: a common market, a certain institutional arrangement and so-called balancing measures in the social field. The question remains, what are the priorities of this model, whether the emphasis will be on the common market and free competition or on social values, or on a combination of these priorities (Krebs, 2010). The causes of long-term unemployment at the level of the European labor market were investigated by Palíšková (2014), who identified four key reasons:

- high labor costs - Combined high wages with relatively high labor taxes and high taxations for health and social insurance. This is a fundamental problem linked to the high legal protection of workers and the concept of a European social model;
- technology development - generates structural shifts in the economy, while replacing work with capital, leading to the disappearance of jobs in industry, while the services sector and the quaternary sector do not create enough new jobs in most member states;
- inconsistency between supply and demand on the labor market;
- very low mobility of workers, both inside and outside the EU.

Currently, the unemployment rate among the countries of European Union is the highest in countries of southern Europe: in Greece, 20.9%; in Spain 16.3% and 11.1% in Italy. On the contrary, the lowest unemployment rate is recorded in the Czech Republic, 2.4%. There are eight countries behind the Czech Republic with unemployment rate of less than 5%. These are Malta, Germany, Hungary, Netherlands, Great Britain, Poland and Romania. According to data from November 2017, the unemployment rate in Slovakia reached 7.5% - the 10th highest rate within the European Union (Eurostat, 2018).

## 5. Conclusion

Through the creation of a single labor market, the European Union has made a significant contribution to reducing unemployment in its member states and created a room for increasing labor mobility. Today the European Union is under the pressure of globalization processes and reducing unemployment combined with maintaining its competitive ability in a global environment and needs to find an effective compromise that will continue to expand the social standard of EU citizens on the one hand and social rights and social security won't represent barriers to creating new jobs on the other hand. Unemployment is the object of European Union member states regional policy, in this context Horváth (2003) states: "*The European Union member states are increasingly approaching implementation of the concept of their own regional policy. They seek to reduce the differences in living standards between regions and fight other negative factors, such as high levels of regional unemployment.*". Social entrepreneurship has a great potential to reduce unemployment. We agree with Blaha's opinion that "*The social economy could bring the vanishing values of solidarity and fair distribution of profits and ownership, democratic participation in the functioning of the economy as well as a greater degree of stability and efficiency to the EU. Social entrepreneurship could bring benefits to long-term unemployed and socially marginalized groups.*" (Blaha, 2014).

### **Abstract**

*Brexit is already a fact – the UK shall notify to the withdrawal of their country from all the structures of the EU. The decision of the British voters has a major impact both on the UK, so the development in Europe. However, not only impact decisions, but also the causes of Brexit are many and on both sides of the English Channel. Demarcation of political economy isn't clear-cut – there is a dividing line between politics and economics concept. In the decision of the British played their role to many factors, which can be classified into motto – let's take back control. The analysis of the costs and benefits of Brexit should serve to facilitate the understanding of the further development of the two actors - the UK and the EU. Here I will focus mainly on the economic aspects.*

**Keywords:** *Brexit, causes of Brexit, effects for the UK and EU economic, institutional, political*

**JEL Classification:** *E60, F40, F50, P00*

### **1. Introduction**

The announcement of the referendum by David Cameron turned out to be the opening of Pandora's Box. I do not know whether it was just a surprise or a shock from the result of voting, though so tight. The decision of British voters has far-reaching consequences for more than half a billion EU citizens. What were the reasons for the voters' decision and the consequences of their choice? Is the British voter postmodern? It wants its own identity, defining itself against continental Europe against the EU and its bureaucratic apparatus, but wants its, which other than anywhere else. Britain is something else...

The following article tries to analyse Brexit's input-output using political economy.

### **2. Political Economy as a Theoretical Framework for Reflections on the Brexit**

The discipline of political economy is nothing new under the sun - for the first time this term was used in 1615 by Antoine de Monchrétien. Political economy nowadays examined the relationship between economic theory and practised policy, or the effects of practical political decision (Strange, 1988, p. 19). For political economy, it is crucial to understand how economic, social and political phenomena affect the decisions of people and institutions (Germain, 2014, p. 6). In general, political economy applies the economic methodology to the human decision-making, explains social conduct through the apparatus of the economic instruments. But not only – is the political economy tracking the impact of political decisions on the breadth of the social and economic spectrum, including psychological responses.

Brexit is connected very closely with the European Union's development, with the future of both the EU and UK. European political economy spread broad framework ranging from European integration theory, public choice, comparative politics and policy-making approaches (Talani, 2014, p. 7). The political economy of Brexit is generated by Britain's traditional isolationism, by Britain's non-euro membership while possessing the offshore financial centre (Thompson, 2017, p. 434). The critical political economy on UK side is growing out of fear of a divergent development of views on integration between the mainstream in the UK and the EU. The deepening of the integration steps, the building of a strong institutional apparatus, taking over many powers of national governments, is becoming the new constitutionality of Europe (Gifford, 2016, pp. 780-781) against which the British are opposed and that leads to creation strong Euroscepticism as a base of distinctive British critical political economy.

These definitions of political economy are important for understanding the results of the referendum in the UK in June 2016 about their staying/leaving the European Union.

### **3. Causes of Brexit**

The reasons for the UK voters' decision to leave the EU may vary. I will try to outline the most prominent for the British, although for other Europeans it may not be an adequate decision so important. But they should not ignore the specifics of every nation in the individual EU countries. It is not the goal of examining the differences in elections in the UK, although they have a great deal of value. I'm considering Brexit as a whole.

#### ***3.1 The Identity Problem of the British in the Context of European Integration***

The British public has always been wary of the European continent. Some vigilance of the English towards Europe can be traced back to the 16th century, when institutional changes such as the previous accumulation of capital (Smith, 1776), the religious reform of Henry VIII take place within the Kingdom of England, and the real colonisation of Ireland 1541. Its resources largely generated Super-power's growth of England, hence the detachment from the European mainland. Especially England people have always felt like reformers in the British community - thanks to Protestantism as a state religion since the first half of the 16th century, thanks to the industrial revolution and the maritime success of the Francis Drake of the Elizabethan times, so no one else needed their development. It seems that in Britain this feeling is inherited from generation to generation up to now.

At first, the British did not want to participate in the European integration process at all, only after finding the economic disadvantage of being out in the 1960s, they rethought their attitude. After two unsuccessful attempts to join the EC, they eventually joined in 1973, but two years later the first referendum on British participation in the European integration community took place. The results of this referendum confirmed the original decision and the British decided to stay in the European Community. But "UK never fully embraced the European project" (Geoghegan, 2016, p. 3).

Britain has always been a little bit aside because fears of national identity disruption in the melting pot of European integration have been felt very strongly. After all, the splendid isolation as a concept of the foreign policy of Prime Minister Benjamin Disraeli has been in place since the middle of the 19th century. The accent on strict sovereignty in many aspects of economic, not only security, development has led to the negotiation of many exceptions within European integration. In a nutshell, I will only highlight the most opting regimes - the

exception from the Schengen system, initially the exception from the Charter of Social Rights of Workers and, above all, the opting clause on EMU membership. The last was the objection to the possible extensive interpretation of the Charter of Fundamental Rights when the Lisbon Treaty was approved. Of course, the most visible is the so-called British rebate, which was agreed by Margaret Thatcher in Fontainebleau in 1984, and which would be used by other net payers in the budget, but has always been used only by Britain. And even under the rule of the most pro-European British Prime Minister Tony Blair. For his first government, Gordon Brown, as Treasury Minister, set five conditions, the criteria for the potential accession of the UK to the EMU, all formulated to benefit the UK economy. This was an example of a rational approach to European integration, not just its principle - solidarity. But it is purely an economic approach, not a political one. And it resonates with British interests. "The UK has never been at ease with either its membership of the European Union or the broader idea of European Integration" (Phinnemore, 2016).

### ***3.2 Impacts of the Global Financial Crisis on the British Economy***

The global financial crisis of 2008-2010 has hit hard the British financial sector, and the whole economy and the Bank of England's responded to the crisis by expansionist politics – compared to the ECB in these days. London City, as one of the world's financial centres connected with others, has seen a significant fall. However, the London financial sector represents euro's off-shore centre in Europe, maybe the most important European financial trade. Although the UK is not a member of the EMU, the Euro-zone crisis has undoubtedly impacted on domestic politics and has seen its rise in Euroscepticism (Gifford, 2016, p. 779).

When the financial crisis grew in the Euro-zone crisis, and the economic practices of the southern EU countries were revealed, the British understood this development as the crisis of the whole integration project. The main reason was the non-systemic steps taken by Germany and France, including ECB to save the southern banking sector at the expense of their taxpayers, which is unimaginable for the British. Therefore "the 2008 financial crash and the euro-zone crises put a time-bomb under sustainability of Britain's membership of the EU" (Thompson, 2017, p. 446). The British obviously did not want to pay the bills for the other, because after all David Cameron refused to sign a Fiscal pact commitment fiscal responsibility within the whole EU, not just the EMU at the beginning of the year 2012. Overall, the pressure on narrower monetary and fiscal integration, which has emerged as a result of the crisis, is unacceptable for the British. The development of monetary and, in fact, fiscal consolidation of national policies leading to economic harmonisation and, consequently, to the gradual federalisation of Europe is utterly unimaginable for the British.

The problem has also been the inability to mobilise other non-euro states into the alliance against the German-French tandem towards European integration towards a fiscal union. Of the non-member countries of the EMU, only two countries were the strong negotiating partners within the EU, namely Denmark with the same opting regime as UK, and Sweden. Other EU Member States outside the EMU come from the new member states and are thus significantly weaker negotiating partners. If more than four countries joined the EMU by the start of the crisis, the euro area now includes 19 EU countries out of a total of 28. This has reduced the bargaining position of Britain. After all, another issue between the EU and the UK was a proposal to introduce a financial transaction tax that would hurt the City of London, which Cameron averted but weakened the UK's position within the EU as opposed to Germany, France. The logical response could be to return the check to Britain.

### **3.3 Growing Immigration to the UK, Whether Work or Social**

Immigration to the UK area from other EU's countries, initially mainly from new member states, or later from South Europe, i. e. from economies affected by financial crises – it is the next logical cause of the decision to leave the EU. These are other very important factors deciding the British people about their future in the EU - a feeling of nonconformity, social tension, and the arguments of the nationalists that the foreigners are taking their jobs. The paradox is that in this period the British economy, in any case, not worried about unemployment, on the contrary, the lack of certain professions.

It is true that Britain under the leadership of Tony Blair opened its labour market immediately to the new member countries of the EU in 2004 with the connection of so-called Big-Bang Enlargement of the EU - as one of the three states of the EU. Within the "Blair's" Labour party began to deepen the trench misunderstanding, since the traditional members were expecting more protection of their interests (the government's first priority should be its citizens) contrary to the modernist most of the party professing cosmopolitanism, and the benefits of globalization (Parker, 2017, pp. 479-480). As regards migrants from the southern EU countries, this was mainly due to the collapse of their economies as a result of the global financial crisis of 2008-2010, which has grown in the southern EU countries in the Euro-zone crisis. This, of course, has reinforced the belief of the vast majority of the British that a single currency and a common monetary policy are pointless and harmful. The so-called the European migration crisis, culminating in 2015-2016, only raised the problems. Almost all migrants at that time dreamed of the two final destinations of their emigration - Germany and Britain. The UK has a relatively accommodating migration system from Commonwealth countries, leading to a steady stream of migration from this part of the world. Mass immigration from other countries has led to the doubts of the British about whether greater regulation or liberalism is so typical of the New Labour Party governments.

### **3.4 EU Budget and British Contributions**

The main motto for opponents of European integration was how much the UK contributes to the EU's common budget. Simply put - many. Britain is the second most powerful EU economy, so its contributions to the common budget are very high. Not only did Boris Johnson or Nigel Farage use the numbers in the pre-referendum campaign to prove how "Brussels" slashes Britain and how much money the UK must send to the common budget. Those numbers were not deliberately true but exaggerated. In spite of many warnings by other members of the government or parliament that this was manipulation, Boris Johnson insisted on it-and paid off, for the British obviously believed it. Real numbers are as follows (European Union [online], 2018): British contribution to the EU budget total in 2016: 12.760 billion Euros, or 0.55% of UK GNP; EU spending in the UK total: EUR 7,052 billion, i. e. 0.3% UK GNP, the net costs of membership for the UK amounted to 5,708 billion Euros, it means 0.246% of UK GNP. In contrast, UK public expenditure is more than five times bigger than the EU budget, more precisely 42% of GNP (European Commission [online], 2014). A lot of commotion for nothing? Not quite - if you exaggerate false figures in your favour, and if you claim that this money could be used immediately in problem areas such as health care, then you are guaranteed success. Voters are looking for easy solutions.

Setting the budget for the next period after 2020 is a challenge. How many members of the EU? What about the UK as the second largest contributor? The EU asks for higher payments to the budget due to Brexit, as the failure of the UK contribution could jeopardise the funding of many integration projects. Member States' responses are diverse - ranging from refusing to increase compulsory levies for approval by poorer countries. Eight of the new Member States

(excluding the Baltic States and the Mediterranean island countries) are more likely to increase their contributions. However, there is still a variant that, after Britain's departure from the EU, the UK government will continue to contribute to the EU budget if it wants to keep its firms on the EU's internal market.

#### **4. Effects of Brexit**

The impacts of the British decision to leave are hardly quantifiable, as the UK exit scenario is not known. I'm afraid that even Theresa May does not know exactly what to do with the EU because the mood in the UK is changing. And also, estimates of Brexit's impact on the British economy are being developed, and the cost numbers are very unfavourable, which neither voters, nor the government, nor a general idea.

It is necessary to consider the effects both towards the UK and the EU. I will only focus on the economic impacts.

##### ***4.1 Input-Output Analysis of Brexit for the UK***

The decision of the British voters to leave the EU at a close ratio of 51.9% against 48.1% for their continued existence has far-reaching consequences not only for the whole of Britain and its individual historical countries but of course also for the EU. Statistics are a treacherous methodology - out of five British territories voted for leave two, while Scotland 62 %, Northern Ireland 55.8 %, and Gibraltar 95.9 % of the votes to remain (Phinnemore, 2016; Geoghegan, 2017). The consequences are and will be far-reaching and yet not fully predictable.

##### ***4.1.1 Access to the Internal Market***

Britain only represents partial changes in its participation in the EU internal market, in the sense of excluding those lucrative as financial and legal services, else automotive industry that the UK would manage itself. But the current regime of trade in industrial production would like to leave it in the internal market regime. The European Commission has a different opinion, supported by the supreme representatives of the EU Member States – it couldn't be just about picking cherries from the cake, new relations must be set fairly for both sides - the EU and the UK. The EU has taken a position „no negotiation without notification“, and intends to act on the internal market as a whole. If Theresa May will insist on her, there is a risk of Britain losing all four freedoms of the internal market, which could be a considerable loss for the British economy. While it is true that British exports to the EU have declined, they are still around 45%. For objectivity, it has to be acknowledged that Britain has diversified its exports outside the EU since 2000, not just a referendum. But so are the EU markets vital for Britain. Conversely, the EU needs an extensive and advanced UK market. This is an addictive relationship that is beneficial to both parties and serves as an incentive for further development.

##### ***4.1.2 Labour Markets***

Britain has opened up its labour market to new countries in 2004 not because it feels solidarity but because it had - and still has a great structural disproportion in the labour market. British economies have been sharply developing since Margaret Thatcher, involved in globalisation, lacking many professions, including those highly qualified, such as physicians, nurses, or perhaps their expansion in the financial sector or new technologies.

In addition to the specific professions of a country with a high standard of living and low unemployment, Britain has a shortage of unskilled labour willing to do subordinate, inferior

work. Over the past twenty years, the British economy has been able to absorb an incredible amount of foreign workers who have contributed not only to their own development but also to the growth and stability of the British economy, and have often filled places that have not been among the British. It is, therefore, interesting and even less understandable why the in-work workers have played such an important role in the left campaign, although immigration and labour migration are likely to emerge. The agricultural sector has a special position in labour migration, since it only employs a small percentage of the British population, while the largest share belongs to workers from other EU countries. It is very little paid work that the British do not want to receive. This work is often carried out by students or residents of the eastern EU countries who are willing to go for significantly lower wages. Interestingly, the anti-European campaign objected that migrant take the British job, but not that they are pushing wages down, below the minimum wage...

Employers have warned before the referendum that shrinking from the free movement of people in the internal market will mean a substantial labour shortage for the British economy. These were Brexit's negatives for the British economy; it is upright to mention the pros.

#### *4.1.3 Payments to the Common Budget*

The most strikingly perceived effect of the Brexit will be the absence of contributory obligations in the common EU budget. Given the position of Britain as a clean contributor, it will certainly be very pleasant. Certainly, even in Britain, you can find signboards with the announcement that this project has been co-financed by the EU, but they are far less than in other countries. As has been mentioned above, Britain is more contributing to a common bill than it can draw from it. Therefore, the abolition of this duty is certainly the supposed goal of Brexit.

#### *4.1.4 Less Bureaucracy*

An absolutely indisputable benefit, even for the EU's supporters, must be the abolition of the "Brussels bureaucracy" dictate. And with that, Britain has always had great problems, especially as a country without a written constitution. Although I do not want to question this position, only two things are on the brink: this bureaucracy also helped to create greater transparency for the British, because that "Brussels" is made up of representatives of the member countries; growing institutionalization is also evident to international organizations outside the EU, so the UK will not be able to do it anyway.

### **4.2 Input-Output Analysis of Brexit for the EU**

There is no doubt that the exit of such a strong economy from the Community will damage the whole of the Union's economy. I am afraid that the negative side of the EU outweighs both economic performance and policy-making.

#### *4.2.1 Internal Market*

The left of the British economy and its firms will weaken the performance of the EU's internal market, as London as a financial centre is likely to become the external financial market. This, of course, will increase the cost of trading on the financial markets. Yes, there are certain hopes for a hard Brexit that some of the corporate firms move at least partially to Frankfurt but cannot rely on it. The liberalisation of financial services is closely linked to the movement of capital - it cannot be assumed that there would be any restriction on the part of the EU at a time of virtually free capital flows in a global dimension.

Absolutely limiting the movement of people, as this was one of the demands of Brexit supporters. In this case, the cards are in the hands of the British - they are afraid of their citizens of continental Europe, the British somehow assume that nothing will change for their citizens in the EU.

The issue of the freedom of movement of goods is probably the least problematic since trade liberalisation has been an international trend since 1947. Despite the British thought, whether they want EU customs union or rather trade under WTO rules. However, the loss of the 64 million potential consumer markets is a big and unpleasant change.

#### *4.2.2. Labour Market*

The European Union does not even focus on the labour migration agreement as a guarantee of the rights of workers already living and working in Britain. Theresa May promises to protect those who are already working in the UK but reserves the right to control newcomers. Negotiations on both sides are processing.

#### *4.2.3 Budget Contributions*

It is inconceivable that the departure of Britain will come to the EU as its second largest donor. It is already under discussion how to replace the UK postponement or how it will be addressed. The European Commission is pushing for the UK to contribute to the EU budget even after its eventual departure, at least within the agreed financial perspective in force in 2020. The British side seems to agree. The question, therefore, relates to the post-2020 period - reflections on another form of the budget are already under discussion.

#### *4.2.4 Policy-Making Processes*

Despite many British obstructions and bargaining for their exceptions, in the case of Britain leaving the EU, the European Union will lose a rational member who defends at least partially the full institutionalisation of European integration. It is true that when the British understood that they would not stop further institutionalisation, they focused on negotiating their demands, but in any case, they were an example for other potential opponents of closer integration.

In addition, the British are afraid of too strong a "Europe", meaning Continental Europe and particularly too strong Germany (Kučerová, 2015, p. 147), whose roles are rising alongside the growing problems of the European Union, especially the Euro-zone. The economic and political power of Germany has turned out for most of Britain in the face of both the Euro-zone crisis and the European migration crisis.

## **5. Conclusion**

Brexit means a breakthrough in the development of European integration, is clearly a proof of a spill-back effect, the fatigue of integration. The asymmetry of information has proven to be significant for British voters - many for the UK leaving the EU admit that they did not have enough information and that they chose emotionally rather than pragmatically. The outcome of the referendum itself, the discussion of the new situation and the reflections on the future has serious implications for the development of the participating partners.

Economics policies always measure the costs and benefits of any decision. The political economy of European integration and critical political economy are trying to specify the input-output analysis.

In the discussions and reflections of both parties, possible scenarios for the further setting of mutual relations are discussed. But future models of Britain and the EU will be the subject of further research. One thing is clear - the withdrawal of Britain from the EU will lose both sides. The very close ratio of voting results is reflected in the sharp controversy of the British themselves - "UK cannot expect to abandon membership and simply walk straight into whatever new relationship it wishes to have the EU" (Phinnemore, 2016).

### **Abstract**

*Brexit and new European Union (EU) priorities (e.g. defense policy, climate change) can reduce EU funds by up to €25 billion a year. This depletion may result from a separate budget line for the Eurozone and the future enlargement of EU. As a result, the next budgets of the Common Agricultural Policy (CAP) and cohesion policy may be significantly reduced. The aim of this paper is to identify and discuss selected challenges for the CAP after 2020, both from EU and Polish agriculture. Our eclectic approach is based on methodology for public sector economics, economic analysis of law (EU legal documents). In order to defend the CAP budget rationally, beneficiaries have to find convincing arguments: first, the CAP multiplies European Added Value (EAV). The second one refers to the issues of decentralization and smart coordination of the implementation of the modified CAP. Finally, the third line of defense of the CAP budget relates to the growing riskiness of EU agriculture.*

**Keywords:** CAP budget, Common Agricultural Policy, European Value Added

**JEL Classification:** H25, Q14, Q18

### **1. Introduction**

The Common Agricultural Policy (CAP) as the agricultural policy of European Union (EU) has significantly evolved from its roots created by the Treaty of Rome in 1957. A general trend can be described as a shift from a production-oriented policy to focus on supporting so-called “safety net mechanisms” (inter alia, income support for farmers), “the integration of environmental requirements”, i.e. incentives for the production of public goods (given the sustainability paradigm). It should be underlined that “reinforced support for rural development” has a great environmental and societal importance for rural inhabitants of EU Member States (MS) (European Commission, 2013).

In contrast to national budgets EU budget is oriented to strategic goals that should be in line with Multiannual Financial Framework that provides a longer-term planning horizon and the stability that is needed for investment planning (European Commission, 2018). Brexit and new EU priorities (e.g. defence policy, climate change) can reduce EU funds by up to €25 billion a year (Strupczewski and de Carbonel, 2018). This depletion may result from a separate budget line for the Eurozone and the future enlargement of UE. As a consequence, the next CAP budget and cohesion policy may be significantly reduced. There is a plethora of arguments for the CAP budget, including environmental (Coderoni and Esposti, 2018), political (Di Pascuale et al., 2018) and social issues (Koester and Loy, 2016; Dumitru et al., 2017).

The aim of this paper is to identify and discuss selected challenges for the CAP after 2020, both from EU and Polish agriculture. We employ an eclectic methodological approach. Our theoretical descriptive analyses are based on methodologies for public finance, economics of public sector and economic analysis of law (mainly EU legal documents).

The remainder of this article is as follows. First, we refer to the paradigm of economic value added as an important justification for the CAP budget 2020+. Then, we identify societal and environmental challenges for CAP after 2020, including the issue of decentralization and smart coordination. Finally, we focus on a growing riskiness of EU agriculture as a very significant challenge for new CAP budget. Our article concludes with recommendations.

## 2. European Value Added vs. the CAP Budget

The concept of The European Added Value (EAV) may be treated as additional to the value created by actions of individual EU countries (Gorzalak et al., 2017, p. 4). A relatively high added value created by the EU expenditures is one of key justification for CAP budget (Ferrer and Kaditi, 2008). Nevertheless, the concept of EAV is described as complex. As a result, there are many problems related to a transparent quantification (Molino and Zuleeg, 2011). Figueira (2009) enumerated twelve criteria in four segments ('public sector economics', 'political criteria', 'legal rules', 'fiscal federalism', including subsidiarity and proportionality) that may be used for *ex-ante* analysis for involvement of EU Member States (MS). Vullings et al. (2014) indicated that implementation of societal objectives of EU MS citizen may be regarded as a important dimension of EAV. This may refer to agricultural and rural policy measures of EU. As Matthews convincingly stated, "agricultural conditions within integrating region are likely to be very different, in terms of crop specialisation, land quality, and topography, farm structure, farm income and market orientation (Matthews, 2014, p. 11). As a result, CAP has launched a bundle of flexibility tools in order to 'address specific issues in member states'.

As shown in Table 1, due to the lack of a commonly accepted methodology for estimating EAV, most arguments are presented as qualitative analysis of mechanisms and impacts of individual components on the situation of net contributors to the EU budget.

**Table 1: Components of European Value Added of the CAP from the Polish Perspective**

	<b>Description</b>
<b>Food security</b>	<ul style="list-style-type: none"> <li>a. A potential for increase in production of agricultural commodities and food</li> <li>b. Improving a Polish rank - Global Food Security Index.</li> </ul>
<b>Food safety</b>	Consumers (in the EU-15) of food products from Poland, particularly those with lower incomes, can maintain their living standard.
<b>Multiplier effects</b>	Polish farmers and rural residents, who benefit from support received from net payers to the EU budget, generate demand for foreign investment and consumption. As a result, this stabilises their economic situation.
<b>Providing environmental public goods and reduction of external costs</b>	<ul style="list-style-type: none"> <li>a. Net support for Polish agriculture externally positively influences the situation even in the border zone with Germany.</li> <li>b. Lower pollution of surface waters coming from Polish agriculture affects to some extent the quality of water flowing through the Odra and Nysa Łużycka, as well as the Vistula.</li> <li>c. Environmental well-being as well as the relatively high biodiversity of the rural landscape in Poland.</li> </ul>
<b>Territorial , spatial and social cohesion and labour mobility</b>	<ul style="list-style-type: none"> <li>a. Improvement of technical-production and economic infrastructure in the Polish rural increases its attractiveness for foreign direct investors, who can still benefit from lower wages. To some extent, it positively affects financial capital.</li> <li>b. Transport and logistics costs are decreasing, which gives a impulse for greater efficiency of the EU Single Market.</li> <li>c. Social cohesion strengthens EU's integrity and the acceptance of Community citizens for its reform, prevents uncontrolled depopulation of Polish rural areas and permanent migration from them, also to net payer countries. Workforce from Polish rural areas with better qualifications, cultural and intellectual capital as well as psycho-physical condition positively contributes to the socio-economic development of EU MS.</li> </ul>

### 3. Modern CAP after 2020 vs. Decentralization and Smart Coordination

CAP is one of the oldest and most often reformed of the EU policies. Its objectives are stipulated in the Treaty on the Functioning of the European Union (TFEU) and include, inter alia, increasing agricultural productivity and ensuring a far standard of living for farmers. Yet, at the same time the EU priorities concerning the overall development of the EU are also part of the objectives of the consecutive CAP reforms.

The coming CAP reform is especially difficult as the Brexit most probably results in a lower budgetary allocation for the CAP as well as for the other EU policies. Also the European Commission in its scenarios for the EU finance after 2020 considers higher CAP spending only in one of the five scenarios it prepared (Table 2).

**Table 2: European Commission's Scenarios of the EU Budget after 2020 and their Impact on the CAP**

	<b>General trend and volume</b>	<b>CAP</b>
<b>Scenario 1. Carrying on</b>	Broadly stable Reflects current reform agenda of EU27 Lower relative shares of Cohesion and Agriculture to finance new priorities Higher use of financial instruments and guarantees	Better targeted support for farmers under special constraints (e.g. small farms, mountainous areas and sparsely populated regions) and risk management tools for all farms Investment in rural development (particularly agri-environmental measures)
<b>Scenario 2. Doing less together</b>	Significantly reduced Focus on internal market functioning Amounts for Cohesion and Agriculture significantly reduced Much higher use of financial instruments and guarantees	Support only for farmers under special constraints (e.g. small farms, mountainous areas and sparsely populated regions) Risk management tools for all farms
<b>Scenario 3. Those who want more do more</b>	Broadly stable with a potential increase to cover the areas of joint action Higher use of financial instruments and guarantees	As in Scenario 1
<b>Scenario 4. Radical redesign</b>	Lower Share of Cohesion and Common Agricultural Policy reduced Focus on priorities with very high EU value added Much higher use of financial instruments and guarantees	Reduced direct payments Focus on farmers under special constraints (e.g. small farms, mountainous areas and sparsely populated regions) Agri-environment-climate actions and risk management tools for all farms
<b>Scenario 5. Doing much more together</b>	Significantly increased Significant additional financing of new priorities and external action Higher use of financial instruments and guarantees Increase of own resources ceiling	Higher amount

Source: authors' elaboration based on European Commission (2017b).

As in the previous CAP reform the key issue of the current debate on the CAP is increasing its efficiency. Therefore, according to the EC's communication the CAP must increase the EU added value (European Commission, 2017a). Moreover, it is to support EU priorities such as: growth, jobs, circular economy and digital economy. An important element of the planned

reform is addressing environmental aspects of agricultural activity. The EC named following objectives of the future CAP:

- a. fostering a smart and resilient agricultural sector;
- b. bolstering environmental care and climate action and to contribute to the environmental and climate objectives of the EU;
- c. strengthening the socio-economic fabric of rural areas.

An important role is to be played by research and innovation in order to achieve greater efficiency in the use of natural resources in the agriculture. The EC emphasizes the need to enhance the links between research and agricultural activity to reduce negative impact of farming on the environment, reduce costs and ensure resilience to climate changes.

The role of direct payments, the key instrument of the CAP, is to remain unchanged as they are vital in providing income safety net for farmers. Yet, in order to increase their efficiency it is proposed to make greater use of such mechanisms as compulsory capping of the amount of direct payments received by a farmer, introducing degressive and redistributive payments as well as better targeting direct payments so that they are received only by “genuine farmers”.

To bolster CAP’s environmental care granting of direct payments is to be conditioned to undertaking environmental practices. This means that the so-called greening of direct payments will be continued. Yet, the practices will be defined by member states to take account of specific conditions.

It can be stated that the EC’s communication correctly identified the challenges facing the EU agriculture, however it is not clear that the instruments of the renewed CAP will be effective and efficient as it depends on the details of their design and implementation.

A ‘new delivery model’ of CAP places emphasis on greater subsidiarity. The EC also proposed a new delivery model of the CAP (European Commission, 2017). It is based on a CAP strategic plan that cover the instruments of both CAP pillars. In this new model member states would bear more responsibility for meeting the CAP objectives. The policy will be more result-driven and member states will pursue targets agreed with the EC. This is important from a regional perspective (see: Melecký and Staníčková, 2014).

With the current debate on the CAP reform the problem of the policy’s renationalisation has been evoked. It should be added that Oates (1999) who described and discussed the concept of fiscal federalism convincingly stated that “decentralized levels of government have their *raison d’être* in the provision of goods and services whose consumption is limited to their own jurisdictions” (Oates, 1999, p. 21). Moreover, he referred ‘fiscal federalism’ to the concept of ‘principle of subsidiarity’ that is used by EU regulations. The fear that the increase in the responsibility born by member states will result in the renationalisation of the CAP is expressed by many countries, for example France (Barbière, 2017) and Visegrad countries (Joint Declaration of the Ministers of Agriculture of the Visegrad Group (Czech Republic, Hungary, Poland, Slovakia) and Croatia on the Commission Communication on The Future of Food and Farming). It is already possible to add additional national support to RDPs, but if the possibility is extended to direct payments this can result in different support level among member states which will make the fair competition on the common EU market impossible and thus the Treaty objectives of the CAP will not be realized.

Poland as one of EU MS has dealt with new EU challenges under the CAP, inter alia:

1. Sustainable agriculture and combating/adaptation to climate change.
2. Increase in high-quality employment and stimulation of growth and investment.
3. Economic, social and territorial cohesion.

4. Security and protection of EU citizens.
5. Alleviating globalization effects (including adaptation).

In Polish agriculture and rural areas various projects have been implemented for the few years, which are consistent with ideas of EC Communication devoted to the modern CAP after 2020. Providing adequate funds in the next CAP budget will create real conditions to strengthen aforesaid actions. New initiatives will be an adequate response to the ever-changing global, European and national context for agriculture and rural policy.

#### **4. Growing Riskiness of EU Agriculture as an Important Challenge for CAP 2020+**

Developing a framework for risk management is important for EU agriculture after 2020. The EC emphasizes that the CAP instruments already offer a system of risk management, but sees room for improving it by reducing red tape of using indexes to calculate farm losses. The EC also proposes making greater use of financial instruments in the CAP. They are to be used also as a tool to overcome temporary cash flow shortages. The smart agricultural development in the context of risk management must not ignore the fact that the agricultural production is strictly dependent on the environmental, climatic and market conditions. The EU experts emphasise that the past of the agricultural production, like never before, increasingly dependent on climate change, which aggravate typical agricultural problems such as the strong dependence on weather conditions, price instability, natural disasters or exposure to new diseases. The uncertainty related to the weather, yields, prices, government policies, global markets and other factors affecting agriculture can result in large fluctuations of farm income (O'Donoghue et al., 2016).

The current CAP 2014-2020 notes the role of risk management in shifting, after 2020, to more sustainable agriculture, which, in addition to the environmental, economic and social aspects, guarantees also the provision of public goods. These objectives can be achieved by stabilising income provided by the tools of both the first (direct payments) and the second pillar of the CAP (insurance subsidies, mutual funds, income stabilisation funds). Direct payments are an income support instrument but are commonly considered also as an income stabilisation instrument. The above indicates that direct risk management instruments are found in the second pillar of the CAP and it is assumed that they will form the pillar for the development of farms of the future smart agricultural policy.

Thus, the challenge for the CAP 2020+ will be to strengthen the current risk management tools by improving their functioning. In this context, particular attention is paid to these aspects which may contribute to the smart, sustainable agricultural development such as:

- a. reduction in direct support for the benefit of the risk management development,
- b. reduction in administrative costs and formalities,
- c. support for private management strategies by strengthening farm advice,
- d. adjustment of risk management systems to individual sectors and regions,
- e. development of new financial instruments.

A review of the functioning of existing solutions in the EU countries under the second pillar shows that risk management systems in the EU are currently unused, in particular in terms of income stabilisation. While insurance covering natural risks is well developed in the Member States, mutual funds are practically non-existent (they are present in France, Italy, Hungary and Romania), and there is no clear willingness of the Member States to implement income stabilisation funds (they are present only in Hungary and Italy). Meanwhile, the role that risk management can play in the next perspective of the CAP can be evidenced by the solutions

applied in other countries. For example, the United States gave up direct support for the benefit of the development of risk management instruments (the scope of crop insurance has been extended by a new programme covering the so-called “shallow losses” and the so-called counter-cyclical payments have been introduced (Matthews, 2016). Therefore, in this area it will be necessary to reduce direct support to strengthen the second pillar tools. This need is to be indicated by the studies by Cordier (2015), which show that insurance (basic risk management tool) represents only 1% of the CAP expense structure, safety net activities – 39%, and income support activities as much as 60% of the CAP budget (Cordier, 2015). For comparison, in the United States, the structure of agricultural expenditure is as follows: 60% insurance and 40% safety net (Cordier, 2015). Reducing support in a form of direct payments can make farmers feel more likely to seek other forms of income protection, i.e. risk management.

Another challenge will be thus to reduce the administrative costs and formalities associated with the functioning of the risk management system. In this area, it is proposed to make better use of existing instruments by making them more attractive using e.g. simplified calculations of losses and cost refund options, and even transferring the funds from direct payments to the safety net, which farmers will be able to use in times of market imbalance (Agricultural Markets Task Force, 2016). It is also stressed that the risk management system cannot crowd out private market strategies based on countermeasures or market instruments. A particular problem may be ex-post activities, launched on an ad hoc basis, which limit proactive ex-ante approaches. This can be remedied by limiting ex-post activities to exceptional incidents (Meuwissen et al., 2001). Tangermann (2011) notes that the risk management system should complement existing instruments and methodologies (Tangermann, 2011). It would therefore be advisable to strengthen the transfer of knowledge between farmers and advisory bodies on the methods and way of risk mitigation which could be conveyed in a form of training, courses or workshops. In this area, it may also be necessary to construct a knowledge platform on risk management, which will provide farmers, public authorities and stakeholders with a forum to exchange experiences and best practices in risk management. This solution would significantly match the policy of the smart agricultural development. However, a problem may be the reluctance on the part of farmers to use these types of solutions.

Another challenge in the risk management area will be a need to take into account the diversity of farmers in the EU in terms of area size, cost structure, production or income. There is also a wide diversity of sectors and regions in terms of using market mechanisms. This heterogeneity impedes the design of a uniform risk management system at the EU level and requires a sectoral and territorial approach, as the risk and risk management strategies vary depending on the sector but also among regions. Therefore, the regionalisation of risk management and creation of a suitable framework for it at the sectoral or regional level will be the challenge. This will require access to statistical data which would enable a precise assessment of the risk scale and needs of the sector with regard to public support. On the one hand, the transfer of risk management tools from the EU level to the Member State level could jeopardise the single market (Mahé and Bureau, 2016) and, on the other, it can provide a better adjustment of instruments to the needs of family farms. Moreover, The challenge will also be to seek other financial instruments (loans, guarantees) best matched to the needs and possibilities of farmers that can help overcome temporary deficiencies in current funds as well as would facilitate access to financing for new forms of income protection for farmers. It is also postulated to introduce measures to complement the current set of risk management tools, such as support for reinsurance of mutual funds or various incentives to collect precautionary savings.

To conclude, the main objective of the smart EU risk management policy is to allow farmers to deal with risk so as to stabilise their income. The planned actions will help guarantee safety, reduce social and economic disparities within the agricultural sector of the EU countries, thereby contributing to the more complete sustainable development. The challenges thus faced by the CAP 2020+ as regards risk management will require a comprehensive approach and extensive actions at various levels of management.

## 5. Conclusion

Planning and implementation CAP budget are very important from the perspective of development of EU agriculture. A plethora of strongly developed arguments for supporting the agricultural sectors and rural areas in EU countries refers to environmental, social or political issues. They are based on the concept of the European Added Value. The Polish perspective takes into account especially the significance of food safety, food security and issues related to rural social capital.

Objectives of CAP after 2020, inter alia fostering a smart and resilient agricultural sector; underlining emphasis environmental care and climate action, strengthening the socio-economic fabric of rural areas, will require a different approach to the support system. A 'new delivery model' of CAP that is strongly related to greater subsidiarity is being discussed. In this context, there is room for debate over the problem of the policy's renationalization. It is expected that the new CAP will be more result-driven and EU MS will pursue targets agreed with the EC. This may result in a need for adaptation selected concepts from strategic management to smart and flexible controlling of EU spendings at different decision levels.

Growing riskiness of agriculture as one of major challenges for CAP 2020+ will involve not only actions at the national, regional level (which should relate to catastrophic risk), but above all efficient management of the farm by farmers themselves (in the case of ordinary risk) or the inclusion of financial institutions in the risk management system. Implementing modern risk management tools may significantly development of smart farming in EU countries.

### Abstract

*European valuation standards TEGoVA have conception for valuation of intangible assets and they formed in order to be conform to International valuation standards IVS also in order to reach worldwide consensus in best practices in valuation process. The process of valuation of intangible influences was also surveyed in China, Hong Kong, USA, Canada, Japan, Germany, UK, Poland, Russia and overall in the Europe. Situation in mentioned locations is similar, valuation of intangible influences has not been determined by a concrete list of items and there has not been established concrete clear process. The subject matter of this thesis is a proposal for a method of valuation of intangible effects that will impact assets prices. It deals with proposed procedures for valuation of intangible assets, and definitions of such property. Special effects are in particular name, historical value, design, quality of layout, security aspects, accessibility, conflict groups of inhabitants in or near the property, location, provenience and other.*

**Keywords:** European integration, goodwill, intangible assets, market value, tangible assets

**JEL Classification:** M21, M29, M31

### 1. Introduction

Valuation of intangible assets in the European Union include certain specifics compared to cost assets (Brachmann 1993, Eurostat 1998-2016). The specifics should be considered in the methodology and in final price (Seabrooke, Kent, Hwee 2004). There exists a basic consensus in the way of tangible assets evaluation, in the case of intangible assets there is not. Aim is to introduce the scientific public with a different view on the essence of valuation (Shetty 1995). New software is designed for asset valuation using the methods of cost, yield and comparative value with the special feature that allows the division of assets, including real estate on tangible and intangible parts. The software calculates enter information separately goodwill or badwill (Kulil 2015).

### 2. Problem Formulation and Methodology

Goodwill is in the European Union an economic term denoting the difference between the market value of the company and sub-stance price, less any liabilities. Indicates a value, intangible assets such as customer relationships, reputation (Horne 1989). Reflects market position, quality and especially tradition. Goodwill can distinguish two ways, on the goodwill of the original and secondary. Initial goodwill to create their own company's business activities, but not in the accounts of a company recognized because it is not reliably measurable (ČSÚ Praha 1993-2016). Secondary acquires goodwill on the acquisition of another company. Badwill is negative goodwill.

### 2.1 Model and Data

Software can use appraisers and forensic experts in the field of economics, valuation, which the program will be free to download. The software is available on the website of the Institute of Electronic Appraisal of the Faculty of Economics at the Technical University of Ostrava, <http://www.ekf.vsb.cz/k166/cs/> (Kulil 2015). See Figure 1 for details.

**Figure 1: Development of Marketability in Period 1997 – 2016 (Example of Coefficients of Marketability Kp)**

Source: marketability coefficients according to records of the Ministry of Finance of the Czech Republics

Here we see the automatically generated price perspective of the asset for the future at annual intervals up to 2055, when the market value of this example is estimated at the selling rate (coefficient of marketability) of 1.40 against the cost-determined price – price of substance.

### 3. Problem Solution

Following procedure for valuation of goodwill and badwill type of assets of enterprises resulting from mentioned model approaches appears as the most objective. Enterprise assets will be evaluated by comparative, yield and cost method. The price will be adjusted in each used method according to an influence of special effects, which means good or bad reputation and according to other special effects which influence usual market price. Other evaluated intangible assets of an enterprise (except goodwill) are included in the price if they really exist.

### 3.1 The Cost Value of Estate Valuation in the European Union

In order to calculate the current value of listed historical buildings the author recommends to count significantly higher lifespan than in the case of unprotected buildings. Other proposed life span would probably not normally be less than the age of the main volumes of construction.

- The cost of major structures - indicating processor (price regulation, budget, historic price index and other).
- Cost value of other buildings, technologies and landscaping - will insert.
- The cost of permanent growth - indicating processor.
- The price of land price map or a comparison of average quality - indicating processor.
- Current price structures in total will be calculated automatically.
- Cost value of land and vegetation in total will be calculated automatically.
- Coefficient of marketability  $K_p$  (KP) state statistical processor based on the price determined by the current price regulation or like estimate. For detail also see table no. 1
- Graf history years 1997 - 2016 and give the processor price by historical data or according to valuator data estimate. For subsequent years, according to statistical data indicate ČSÚ, Eurostat, US data.
- The development trend for the next 40 years the program generates automatically based on the logarithmic regression curve. See Figure 1 for details.

**Table 1: List of Groups and Items of Special Intangible Effects**

<i>Nr.</i>	<i>Intangible pricing influences by modifying <math>K_p</math> per item with detailed list itemization</i>	<i>Recommended range %</i>
1.	Location favorableness in the locality compared to the average of the locality	From -10 % to +10 %
2.	Estate name, prestigiosness, dominance	From -10 % to +10 %
3.	Historical value, cost of preservation of monuments	From -10 % to +10 %
4.	Architectonic rendering, the quality of disposition, view	From -10 % to +10 %
5.	Safety, users' privacy, conflict inhabitants in the surroundings	From -70 % to +10 %
6.	Danger of floods, landslides, damage from transport, bad smells, air pollution	From -10 % to +10 %
7.	Dangerous disposition and harmful material, radon	From -10 % to 0 %
8.	Transport accessibility with respect to the average standard in the surroundings	From -10 % to +10 %
9.	Impact of terraced housing, a building inside a row or at its end	From -10 % to 0 %
10.	Pricing perspective of estate and other influences	From -70 % to +10 %

Source: author's calculations

The processor in the European Union will complement estimation of the percentage, and only if different from the current market situation. Span adjustment is recommended. Total intangible special effects with real estate above the threshold [%] are calculated automatically, including cost price, including land and vegetation to intangible property (Kulil 2014).

### **3.2 Yield Valuation**

Long historical period of market economy showed that the property purchase in order to ensure a reasonable profit (under the condition of proper management) is worth. This means that the yield value should theoretically be in the performing companies and real estate standardly higher than the cost price (after redundant assets deduction). In practice, cost value is often higher, because there is usually a large surplus of production resources and real estate, they are in an inefficient structure and there may be a negative intangibles (badwill).

- Option is set to eternal annuity; the process can be changed for different ways of calculating the yield value.
- Complete up net annual revenue of buildings, including land and forests, assets.
- The rate of capitalization for standard conventional property - indicate the processor.
- The rate for capitalization of intangible property, including the effects will be calculated automatically as a deduction from recalculation or capitalization rates mentioned in the previous item by the coefficient sales centesimal degree - as an expression of risk premiums or deductions.
- Yield value:  $\text{Net income} / \text{capitalization rate} [\%]$  - calculates automatically.

### **3.3 Comparative Valuation**

The comparative value should be determined as the median of Gaussian curve of statistical evaluation of individual prices which are compared. For the calculation of the comparative value it is necessary to consider the fact that every property is different, there are always differences and exactly the same comparative representatives cannot be found. Therefore, the comparative value is only one of the several methods - the pillars for the determination of market prices.

- Comparison value separately calculates and give the property a normal average numerical value.
- Comparison value, including intangible effects of excess is calculated automatically by the coefficient of marketability of the cost method.

### **3.4 The Market Value of Property**

In the European Union is calculated automatically as the weighted average cost, revenue, and by comparison, the ratio in the formula determines the processor. It can be added to the formula, the value of 0.0 to reset some of the methods of valuation. Since the market price should be deducted from the value of easements.

### **3.5 Price of Goodwill**

Goodwill or badwill as a summary of specific intangible impacts on the market price is calculated as the difference between the market value of the property and its cost price. This rule applies generally to movable property, immovable property and businesses. Plots of land

price is represented by all rights related to human activities on a land including construction and construction rights. Plot of land is to full extend intangible asset only of goodwill type.

- Coefficient of intangible assets ( $KP$ ) is the share price of market value and the prices of cost value.
- When the value  $KP$  is greater than 1.00 with, a total is goodwill.
- At values less than 1.00  $KP$ , a total is badwill.
- Estimated price perspective - complete processor awards: stagnation (moderate or fast) decline, growth.

#### 4. New Findings and Special Influences Valuation

Following procedure for valuation of goodwill and badwill type of assets of enterprises resulting from mentioned model approaches appears as the most objective. The amount of goodwill ( $GW$ ) or badwill ( $BW$ ), is the difference market price ( $CO$ ) and cost price ( $CC$ ) as:

$$GW(BW) = CO - CC. \quad (1)$$

The market value  $CO$  is determined by multiplying the cost value  $CC$  (replacement cost less depreciation, or material value) by marketability coefficient  $KP$  according to the relationship

$$CO = CC \times KP, \quad (2)$$

it follows that

$$KP = CO / CC. \quad (3)$$

The marketability coefficient is defined as the ratio between the average actual sales values achieved and the average cost prices of a comparable type of things at the particular time and location.

##### 4.1 Market Value $CO$

According to cost, yield and comparative valuation mentioned in previous parts there will be realized an appraisal of market value (International Valuation Standards Committee 2017, Czech Act on Property Valuation No. 151/1997 Coll.). The amount of price of special influences – goodwill and badwill – will be the difference between market value of property and cost price without  $KP$  (cost price  $CC$ ). Amount of harm in connection with the easement will be counted as standard yield method and subtracted from the market value of the property. The maximum discount is not determined. The net income may refer to an optimistic economic situation and the possibility of smooth application of the income valuation framework (Růžicková 2013).

##### 4.2 Coefficient of an Intangible Asset

We have the concept of marketability coefficient  $KP$  or  $Kp$ , in German-speaking countries a similar term market hopefulness is used (Ross, Brachmann, Holzner 1993). Its fundamental as an index for determining the degree of special influences - intangible assets ( $NM$ ) in a positive or negative amount towards the current price ( $CC$ ) and usual market price - value of assets ( $CO$ ) as a whole is not obvious.

$$CO = CC + NM. \quad (4)$$

Coefficient of an intangible asset ( $K_{NM}$ ) appears to be more accurate term. An intangible character of valued property results from the mentioned term. And it shall not be determined as the estimated generally not well understood constant, which an expert established. This coefficient can be expressed by the following formula:

For real estate

$$\text{KNM} = (\text{CC} + \text{NM}) / \text{CC}. \quad (5)$$

For movables

$$\text{KNM} = (\text{CC} + \text{NM}) / \text{CC}. \quad (6)$$

For enterprises from the material substance (*S*)

$$\text{KNM} = (\text{S} + \text{NM}) / \text{S}. \quad (7)$$

### 4.3 New Methodology

Separate system of valuation tangible and intangible assets for the European Union was worked out (European Valuation Standards 2016). For the field of special influences there were proposed and defined apposite terms goodwill and badwill for valuation analogically according to the terms used by economists and appraisal experts while appraising enterprises (Kulil 2015). Character and fundamental of marketability coefficients KP are clarified from the point of view of their relationship to tangible and intangible assets. Ten main areas and hundred items of intangible influences affecting estate price are complexly defined. The use of a unit of valuation capacity provides a signal of the quality of an asset (Fishman, Parker 2015).

Author created a software NEMO-RATUS 2017 for practical use in the European Union. Proposed procedures in the whole extend of valuation including table analysis of proposed special influences for estate with logarithmic regression and including intangible assets into cost, yield, comparative and market price are applied in the computer system.

Market price of property is automatically divided into tangible and intangible part. This is basic duality (Kumar 2018). For more details see <http://www.ekf.vsb.cz/k166/cs/>. Proposed procedures and detailed listing of special influences represent a comprehensive, practical and unequivocal support for the valuation practice of experts.

## 5. Conclusion

Aim of the paper was to work out a proposal for valuation of special influences in the European Union, that have an impact on estate price. Controllable procedures for the valuation of intangible assets were proposed. System of valuation with direct implementation in cost, yield and comparative methods from which we can estimate the market value was proposed. In case of estate special influences are defined mostly as good or bad name of locality real estate, historical value, design, quality of layout, safety aspects, transport accessibility, conflict inhabitants in the surroundings, influence of terraced house, other influences and price perspective. Terms goodwill (GW) in case of positive impact and badwill (BW) in case of negative impact were defined for each surveyed special influence.

Proposed methodology negative is subjective approach of an expert while valuating intangible assets, each expert can work out valuation with a different result. It is not possible to avoid expert's personal view. Disproportion among individual experts valuating by market price will appear also in the future. These differences can only be reduced by accepting unified methodology such as proposed in this monograph.

Future research will therefore focus on the clarification of procedures and a detailed validation of recommended tariffs for fixed assets.

### **Abstract**

*In this paper, I will critically assess the work of the Court of Justice of the EU in its important role as a sole authority on the interpretation of the EU law. The substance of the paper deals with the case law concerning jurisdictional rules contained in the Brussels Ibis Regulation for disputes arising out of consumer contracts concluded online. For the development of the internal market and economic integration of the EU, it is essential to safeguard rights of weaker parties (consumers) in small-amount, cross-border, everyday transactions. The interpretation is crucial for terms “consumer”, “consumer contract” and “directing of activities”. The Court of Justice had opportunities to be innovative in this regard and to create a new jurisprudence for the online environment. My research question in this paper is whether the Court went too far and effectively diminished the legal certainty and predictability for application of relevant jurisdictional rules for disputes arising out of consumer contracts in the Brussels Ibis Regulation.*

**Keywords:** Court of Justice of the EU, directing of activities, internet, online consumer contracts

**JEL Classification:** K12, K15, K41

### **1. Introduction**

Because of the economic integration and globalization, the world is interconnected. It is a reality of our everyday life to live our lives on the internet. We share our lives on online social platforms and engage in commercial transactions online (Kyselovská, 2014a, p. 22). Due to ubiquitous character of online activity, it is relatively easy to conclude a contract with international element (Kyselovská, 2017, p. 78). Many of online transactions are concluded to satisfy one's personal needs. Therefore, they can be qualified as consumer contracts. For effective functioning of the internal market and consumer behavior in the European context, it is necessary to ensure consumer's rights and access to effective justice. In cases of contractual disputes arising out of small-amount, cross-border, everyday transactions, the consumer is more vulnerable. Online activities and information are globally assessable; it may be difficult to delimit access to online offers (Maunsbach, 2017, p. 83). However, there are still some mandatory requirements regarding information that must be provided in the case of goods and services offered online.

Jurisdictional rules for disputes arising out of consumer contracts with cross-border element are regulated in the Regulation (EU) No 1215/2012 of the European Parliament and of the Council of 17 December 2012 on jurisdiction and the recognition and enforcement of judgments in civil and commercial matters (hereinafter referred to as Brussels Ibis Regulation)

(Drličková, 2014; Kyselovská, 2014). The substance of the paper deals with the case law of the Court of Justice of the European Union (hereinafter referred to as Court of Justice) concerning jurisdiction in online consumer contracts rules and its critical analysis.

## 2. Problem Formulation and Methodology

The jurisdictional rules for disputes arising out of the consumer contracts are contained in Articles 17, 18 and 19 of the Brussels Ibis Regulation. For the correct and proper application of these rules, it is necessary to interpret, *inter alia*, terms “consumer”, “consumer contract” and “directing of activities”. All these terms must be interpreted autonomously.

For the concept of “consumer”, it is necessary to establish interpretation that will not be too wide, nor too narrow. The EU law protects not only a “passive” consumer, but also an “active” consumer. In this paper, I will analyze a Court of Justice’s jurisprudence regarding the scope of the protection and the problem when a consumer is “too well informed” and *de facto* a professional in his field. For the “directing of activities”, it is crucial to establish the scope and conditions to determine whether a foreign professional is via his website targeting, i.e. directing his activities, to consumers in other states. The problem with the determination is that in the online, fast changing and developing environment, the presumptions and technological standards may change very quickly, thus the law is one step behind.

The sole interpreter of the EU law is the Court of Justice of the European Union. The Court had opportunities to be innovative in this regard and to create a new jurisprudence for the online environment; online consumer contracts in particular.

Therefore, my research question in this paper is *whether the Court went too far and effectively diminished the legal certainty and predictability for application of relevant jurisdictional rules for disputes arising out of consumer contracts in the Brussels Ibis Regulation.*

Methodology in this paper is based on analysis (of relevant legal rules and case law) and synthesis of acquired information. From the analysis of individual cases, I will induce general observations and conclusions.

## 3. Problem Analysis and Solution

In this part, I will analyze case law of the Court of Justice of the EU concerning interpretation of terms “consumer” and “consumer contracts” (sub-chapter 3.1) and “directing of activities” (sub-chapter 3.2).

### 3.1 Consumer and Consumer Contract under the Brussels Ibis Regulation

Article 17 Para 1 Brussels Ibis Regulation contains personal and material scope of the special rules: “*In matters relating to a contract concluded by a person, the consumer, for a purpose which can be regarded as being outside his trade or profession, jurisdiction shall be determined by this Section [...].*” Recently, the Court of Justice had the opportunity to interpret the term “consumer” for persons active on social media platforms in judgment of the Court (Third Chamber) of 25 January 2018 Maximilian Schrems v Facebook Ireland Limited, Case C-498/16 (hereinafter referred to as C-498/16 Maximilian Schrems).

Mr. Schrems, an Austria citizen, has been litigating against Facebook since 2011, when he submitted complaints to the Irish Data Protection Commissioner. In his complaints, he contested the way in which Facebook uses personal data of its users. His following complaint

in 2013 led to the annulment of the “Safe Harbour” framework between the US and the EU (Polčák, Svantesson, 2017, pp. 212-213).

This case, C-498/16 Maximilian Schrems, is unrelated to the aforementioned proceedings. Mr. Schrems has used Facebook since 2008. In the beginning, he created a Facebook account under false name only for his personal use. However, during his time on Facebook, Mr. Schrems built a reputation as a privacy activist, published two books, gave lectures and founded a non-profit organization that uses court litigation to enforce privacy and data protection laws in the European Union. In 2011, Mr. Schrems created a Facebook page to inform about his activities.

In 2014, Mr. Schrems decided to bring a “class action” against Facebook for violations of privacy and data protection laws. Around 25.000 Facebook users from all over the world assigned their claims to him. Nevertheless, only eight claims including Mr. Schrems’s Facebook account and Facebook page formed the object of these proceedings. The seven claims were from Facebook users from Austria, other EU Member States and India. Mr. Schrems brought his claim to the courts of his domicile in Vienna, Austria. Mr. Schrems argued, that as consumer, he can rely on provisions for special jurisdiction in Article 18 Para 1 Brussels Ibis Regulation: “A consumer may bring proceedings against the other party to a contract either in the courts of the Member State in which that party is domiciled or, regardless of the domicile of the other party, in the courts for the place where the consumer is domiciled.”

The proceedings raised two preliminary questions, which were referred by the Austrian Oberster Gerichtshof to the Court of Justice. The first question asked, if Mr. Schrems could be considered a consumer in the sense of Article 17 Para 1 Brussels Ibis Regulation, despite his professional interest in the claims. In other words, whether a person can become a professional litigant in consumer matters and still be in a need of special consumer protection. The second preliminary question concerned international jurisdiction for disputes arising out of consumer contract where claims have been assigned. In other words, whether Mr. Schrems can rely on the special protective provisions in Article 18 Para 1 Brussels Ibis Regulation regarding claims that have been assigned to him by other consumers domiciled in the same Member State, another Member States and a non-member State.

The Court of Justice answered the first preliminary question in positive, adopting quite flexible and nuanced approach to the issue. The Court of Justice followed the Advocate General’s Opinion and previous case law. The assessment of whether a person is a “consumer” does not depend on their subjective qualities but on the position of the person in a particular contract (Kyselovská, 2014, pp. 274-277); such contract must have been concluded for purpose of satisfying an individual’s own needs and for private consumption (Kyselovská, 2014, pp. 274-277). A contract that has been concluded for a purpose that is partly private and partly professional, the professional part of it must be “so slight as to be marginal” for the contract to be considered to be consumer contract (Kyselovská, 2014, pp. 277-280).

For the first preliminary question, the Court of Justice was faced with two aspects of the “consumer” definition. Firstly, whether the status of consumer can change over time with regard to the same contractual relationship (**Opinion of Advocate General Bobek [online]**, § 7). Secondly, with the concept of consumer in the context of social media, because Facebook, in particular, presents great challenges to the traditional definition of a consumer (**Opinion of Advocate General Bobek [online]**, § 27). The Court of Justice decided that “a user of a [digital social media network like Facebook] may, in bringing an action, rely on his status as a consumer if the predominately non-professional use of those services, for which the applicant initially concluded a contract, has not subsequently become predominately professional” (C-498/16 Maximilian Schrems, § 38). The Court of Justice had than to decide whether this was case of Mr. Schrems, who initially entered into contract with Facebook for personal purposes,

but later developed a professional activity involving, inter alia, actions and lectures against Facebook. According to the Court of Justice, “neither the expertise which that person may acquire in the field covered by those services nor his assurances given for the purpose of representing the rights and interests of the users of those services can deprive him of the status of a “consumer” within the meaning of the Article [17 Para 1 Brussels Ibis Regulation]” (C-498/16 Maximilian Schrems, § 39). Interpretation to the contrary “would have the effect of preventing an effective defense of the rights that consumers enjoy in relation to their contractual partners who are traders or professional, including those rights which relate to the protection of their personal data” (C-498/16 Maximilian Schrems, § 40). The Court of Justice linked its interpretation to the objective of ensuring a high level of consumer protection in Article 169 of the Treaty of the EU (C-498/16 Maximilian Schrems, § 40).

For interpretation of “consumer” and “consumer contract”, the Court of Justice did not follow up on the distinction between Mr. Schrems private Facebook account and “profile” and his allegedly professional Facebook “page”, as Advocate General thoroughly distinguished in his Opinion (**Opinion of Advocate General Bobek [online]**, § 44-50). Therefore, the decision of the Court could be the same even if Mr. Schrems joined Facebook within the sole purpose of enforcing his claims. Although the interpretation of the Court of Justice is flexible, but still within the frame of consumer protection aims, it does not, in my opinion, cares to the problems created by the increasingly wide range one may enjoy using social media platforms. These issues remain, for the time being, without answer.

In addition, for the second preliminary question, international jurisdiction for assigned claims, the Court of Justice followed its established case law. The special jurisdictional rules apply only to consumer who is party to the consumer contract in question (Kyselovská, 2014, pp. 281-284; Kyselovská, 2014, pp. 143-145). The assignment of claims cannot, in itself, have an impact on the international jurisdiction under the Brussels Ibis Regulation (C-498/16 Maximilian Schrems, § 48). This interpretation could, however, exclude the consolidation of claims of other Austrian consumers in the same court. This stems from Article 18 Para 1 Brussels Ibis Regulation, which does contain rule of international jurisdiction and determines local jurisdiction. The Advocate General proposed, in this regard, that an additional forum in which consumer claims could be brought could be created under national law (**Opinion of Advocate General Bobek [online]**, § 117). Still, plaintiffs can use the jurisdictional rule in Article 18 Para 1 Brussels Ibis Regulation and bring all claims in the Member State of the defendant’s domicile, and the respective national procedural laws will decide on whether the claims can be consolidated.

In conclusion, the Court of Justice ruled that “activities of publishing books, lecturing, operating websites, fundraising and being assigned the claims of numerous consumers for the purpose of their enforcement do not entail the loss of a private Facebook account user’s status as a consumer within the meaning of [Article 17 Para 1 Brussels Ibis Regulation]” (C-498/16 Maximilian Schrems, § 41). Moreover, Article 18 Para 1 Brussels Ibis Regulation must be interpreted as meaning that “it does not apply to proceedings brought by a consumer for the purpose of asserting, in the courts of the place where he is domiciled, not only his own claims, but also claims assigned by other consumers domiciled in the same Member State, in other Member States or in non- member countries” (C-498/16 Maximilian Schrems, § 49).

### **3.2 Direction of Activities**

Article 17 Para 1 Brussels Ibis Regulation regulates jurisdiction for disputes arising out of three distinct types of consumer contracts: a) contract for the sale of goods on instalment credit terms; b) contract for a loan repayable by instalments or other type of credit for sale of goods;

and c) “other” contracts, if the professional directs his activities to the Member State of consumer’s domicile.

The condition based on “directing of activities” was introduced into the Brussels regime because of the growing number of online consumer contracts (Rožehnalová et.al., 2013, p. 265). In 2009, the Court of Justice delivered its landmark decision in *Peter Pammer v Reederei Karl Schlüter GmbH & Co. KG* (C-585/08) and *Hotel Alpenhof GesmbH v Oliver Heller* (C-144/09), joined cases C-585/08 and C-144/09 where the meaning of “directing of activities” was interpreted for the first time (hereinafter referred to as joined cases Pammer, Alpenhof).

This case dealt with two similar situations. In the C-585 Pammer case, an Austrian consumer argued jurisdiction in Austria in a dispute with a German professional that had allegedly directed its activities to Austria. In the C-144/09 Alpenhof case, a professional in Austria argued jurisdiction in Austria in dispute with a German consumer, who contested jurisdiction of Austria courts due to his position as consumer and the fact, that the Austrian professional directed its activities to Germany. Both cases dealt with the question how Article 17 Para 1 c) and the prerequisite “directing of activities” should be interpreted in relation to online activities (Kyselovská, 2017).

The Court of Justice stated that the mere accessibility of the professional’s website in the Member State of consumer’s domicile is not sufficient to establish “directing of activities” (joined cases Pammer, Alpenhof, § 94). The prerequisite is satisfied if it is apparent from the professional’s overall website activity; it is for the national courts to assess fulfilment of this condition (joined cases Pammer, Alpenhof, § 93). Moreover, the Court of Justice created a non-exhaustive list of criteria that may be evidence in support of a finding that a professional’s activity is directed to the Member State of consumer’s domicile. The list contains matters as evidence of prior international trade, use of language or currency, the use of country specific top-level domain, marketing activities etc. These criteria must be assessed in every case. From this list, the Court of Justice also differentiates “patent evidence” matters (Maunsbach, 2017, p. 83), such as if it is mentioned on the professional’s website that he is offering its goods or services to the Member State of the consumer or if the professional has had expenditure for marketing activities in such Member State (joined cases Pammer, Alpenhof, §§ 81-83).

In 2012, resp. 2013, the Court of Justice further specified the conditions for “directing of activities”. In judgment of the Court (Fourth Chamber) of 6 September 2012 *Daniela Mühlleitner v Ahmad Yusufi, Wadat Yusufi*, Case C-190/11 the Court decided, that Article 17 Para 1 Brussels Ibis Regulation does not require for the contract between consumer and the professional to be concluded at a distance. In judgment of the Court (Third Chamber) of 17 October 2013 *Lokman Emrek v Vlado Sabranovic*, Case C-218/12 the Court stated that the aforementioned provision does not even require the existence of a causal link between the means employed to direct the commercial activity to the Member State of consumer’s domicile. However, the existence of such of a causal link could constitute evidence of the connection between the contract and such activity. In other words, consumer can be more active and travel abroad, to another Member State, to conclude a consumer contract; it does have to be concluded from consumer’s home. Furthermore, the consumer could not even be aware that the foreign trader, whose goods he wants to buy, has any website. The consumer can be informed about such offer by his friends, and still be regarded as consumer entering into consumer contract under Article 17 Para 1 Brussels Ibis Regulation.

The decision in joined cases Pammer, Alpenhof immediately attracted some criticism (Bogdan, 2011). Despite the aim for uniform approach to the EU law, it is for the national courts to determine whether the professional directed its activities to the Member State of consumer’s domicile. As some argued: “One wonders of reference back to the national court

will provide a consistent approach to the interpretation of “Europeanised” conflicts rules whilst at the same time observing developments towards the maximalisation of consumer protection. If there was ever a connecting factor that merited an autonomous interpretation from the CJEU, the connecting factor “directing of activities” qualified as such” (Gillies, 2011, p. 563). According to other critics of this decision, it will have an important long-term impact on cross-border transactions within the EU and could have possible deterrent effect; therefore, a “dis-targeting” approach should have been adopted (Svantesson, 2011, p. 302; Svantesson, 2016a, pp. 599-601). There are no fully accurate technological means determining the geographical location of a person that attempts to access a certain website (Svantesson, 2012; Svantesson, 2017, pp. 201-213). However, the accuracy of geo-location technologies is still increasing and might an instrument for professionals to take steps to avoid certain states that is fora with “unfavorable” national laws (Trimble, 2012; Cleynebreugel, 2016).

#### 4. Conclusion

The research question in this paper was *whether the Court went too far and effectively diminished the legal certainty and predictability for application of relevant jurisdictional rules for disputes arising out of consumer contracts in the Brussels Ibis Regulation*. The research question was partly confirmed.

The Court of Justice has a crucial role in creating the framework for protection of consumers within the EU. In the judgment C-498/16 Maximilian Schrems, the Court of Justice applied a rather flexible interpretation of Article 17 Para 1 Brussels Ibis Regulation. The decision allowed for changes of circumstances to be taken into account. It also distinguished the right to enforce consumer rights from other types of professional activities. At the same time, the Court of Justice applied more strict interpretation of Article 18 Para 1 Brussels Ibis Regulation. It limited its application only to individual consumers as parties to consumer contracts, thus excluding “class actions”, i.e. the possibility of other consumers to assign their claims to one consumer who is domiciled in a more favorable forum. The judgment C-498/16 Maximilian Schrems is fully in accordance with the previous case law, yet allowing adapting to specific situation on the internet, thus upholding the *legal certainty and predictability for application of relevant jurisdictional rules for disputes arising out of consumer contracts in the Brussels Ibis Regulation*.

In the joined cases Pammer, Alpenhof, the Court of Justice adopted also a more flexible approach that is attentive to specific Internet-related circumstances. However, it did not create a uniform definition of “directing of activities”, which should create challenges to the Europeanization of private international rules within the EU. Moreover, in judgments C-190/11 Daniela Mühleitner and C-218/12 Lokman Emrek, the Court of Justice widened the scope of the “directing of activities” to the extent that, for the foreign professional, **it could diminish** *legal certainty and predictability for application of relevant jurisdictional rules for disputes arising out of consumer contracts in the Brussels Ibis Regulation*.

### **Abstract**

*This paper is devoted to an analysis of Visegrad Group (V4) countries' positions on China's New Silk Road project. Reflection on the EU and V4 perceptions of PRC on the background of discourse about One Belt and One Road (OBOR) follows. The aim of the paper is to give insights into the degree of engagement of the EU and V4 countries. Since the New Silk Road initiative emerged in China's strategic communication with the EU in 2013, there has been a general shift towards China in Eurasian and world affairs. Perhaps not many results of OBOR are currently visible in the whole EU, however China's low-key but gradual progress in OBOR implementation in different Eurasian regions shapes the future of EU. Will it bring economic cooperation, understanding or diplomatic repercussions and security questions? This paper argues for multifactorial engagement EU strategy to OBOR, and for a more active approach the Visegrad Group toward China, bridging EU-China communication.*

**Keywords:** China, cooperation, European Union, New Silk Road, Visegrad Group politics

**JEL Classification:** F15, P52, O57

### **1. Introduction**

The European Union (EU) and People's Republic of China (PRC), although separated from each other by some 4500 kilometers of Eurasian landmass, are economically among the most important regional actors in Eurasia in the past decade. The distance, which in the ancient times, the travelers and traders had to overcome along sidewalks of the ancient Silk Road from the Chinese city of Xi'An, for months via Central Asia and Persia to Levanta and Venice; can be overcome today in a half-day long flight, or in 2 weeks on railways from East Asia to Europe. The area between the two regions is where the future of Eurasia is being re-conceptualized in all complexities.

Currently there are three most relevant integration projects in Eurasia. The EU, the Eurasian Economic Union (EAEU) and One Belt One Road (OBOR) labelled often as the New Silk Road (Bond, 2017). With OBOR, China has introduced the most ambitious plan for inter-regional economic integration in the last half century. It comes as a positive impulse in times of environmental, humanitarian and security questions encompassing corners of Eurasia. The OBOR builds on an ambitious vision of bridging the continents of Asia, Europe and Africa. While the New Silk Road contributes to China's soft power, it also brings some problematic questions. Although OBOR is purely economic and infrastructural, non-military in essence,

some see worries in a long term. Even though its nature is non-coercive, some sense potential for aggregating wealth and power over time from various regions as Eurasia will become more China-centric (Freeman, 2017). Also in a more realist view, territorial scope of New Silk Road runs across unstable regions or some countries at odds with Europe.

The topic of New Silk Road project to integrate the Far East with Europe over Eurasian landmass into an infrastructural network takes attention in academia. Despite domestic problems, China has emerged as one of major actors in foreign direct investments (FDI) and PRC has been competing with the USA, EU and Japan with own developmental schemes for Africa, Asia and South America. As for Asia, the OBOR project is to generate economic integration across the corners of Eurasia. While China's global financial role will be shaped along this China-led trans-Asian economic integration, the EU's position appears to be not so flexible to better response to quickly changing Eurasian integration schemes. Overcoming interests often give threats, as well as opportunities.

European integration and Asian integration dynamics shape the future of the EU and its Member States. With externalities in limited scale, this dynamic also determines future roles of the Visegrad Group (or Visegrad Four, V4). The V4 is the platform of quadrilateral cooperation among Czechia, Hungary, Poland and Slovakia, all the EU member states. Together with Latvia, Lithuania and Estonia, the V4 countries are part of cooperation platform the China + 16 Central and Eastern European countries (CEEC), abbreviated as "China + 16".

The main aim of this paper is to reflect on perspectives of EU-China cooperation and position of Visegrad Group in the China's project - One Belt One Road (OBOR), stemming on perspectives of political geography (e.g. Kofroň 2017). The paper briefly describes EU's views, V4 countries' perception of PRC and possible expectations from the New Silk Road. Then the paper reflects on the positions of V4 countries – the EU Member States that constitute four member states in the China's 1 + 16 platform. The paper aims to shed more light about the discourse on China and the New Silk Road Economic Belt from the view of the EU and V4. The paper strives to answer questions, to what extent the V4 can learn from China-EU cooperation? What roles the V4 countries as the EU Member States are expected in the New Silk Road? What are the positions of V4 countries in China's 1 + 16 platform? Why the EU should implement multifactorial strategy towards the New Silk Road? This paper argues for attention to China's initiative in order to find positive externalities for the EU and the V4 and the Baltic states overlapping the EU and the China + 16 platform.

## **2. China-EU Relations Towards 2020**

While the Europe is currently the most prosperous region in the world, China's economic transformation is a huge success in the global economy since China became a member state of the World Trade Organization (WTO) in 2001 (see e.g. Fojtíková, 2012). The China's Gross Domestic Product (GDP) has increased from 54 trillion in 2013 to 87 trillion CNY in 2018 by the average economic growth of 7.1 percent. Impressive emergence of the world's largest middle class, eradication of poverty, gradual natural protection implementation or investments in education are few of many achievements China has scored in (China Daily, 2018), including renewables.

Economic success is a starting viewpoint for a more international leadership. While China has been assertive in East and South China Seas, the EU has been struggling passively with hard security situation along shaken regions of the Maghreb and Middle East, and Ukraine. European and Asian security dynamics have become interwoven into a more tighten security regional super-complex (Buzan, Weaver, 2003). Beijing has become a driving factor behind

tangible economic and infrastructural, institutional and international integrative forces in Eurasia.

The topic on EU-China strategic relationship was explored by Smith (2016) who stressed a ‘*negotiated order*’ and ‘*management of cooperation and competition in sectoral and institutional contexts*’ as factors. In 2016, fifteen years after China entered the World Trade Organization in 2001, the EU adopted a new strategy on PRC towards 2021, reflecting the transformative patterns from China’s economic success in the world. Since the Investment Agreement in place from 2013, the EU-China 2020 Strategic Agenda for Cooperation puts the EU-China Investment Agreement central for development of EU’s long-term bilateral relations with the PRC. (European Commission, 2018). While the estimated trade between the EU and China reaches often over 1 billion EURO per day, in past 30 years the European-Chinese trade has increased by over 40 times (Jitaru and Popescu, 2017). The EU-China trade volume hit 520.75 billion USD in 2015 while the EU’s gross exports to China reached 9.5 percent of the EU’s gross exports and imports from China reached 20.3 percent of the EU’s gross imports (Gang, 2017).

Even though China’s economic growth has slowed down under 7% in 2017, the EU was struggling with a more modest economic growth. In the most economically developed parts of the Western and Northern Europe, the growth is smaller often only above 1 percent, while in the converging Central European the EU Member States recent growth overcame 3 percent (e.g. Czechia, Poland, Slovakia) in the Visegrad Group. Central European countries have been striving to catch-up with the EU average economic development, and all achieved some satisfactory results, (see e.g. Staníčková, 2015 or Melecký and Skokan, 2011). The V4 region has become one the EU’s motors in sub-regional economic growth.

In the past decade EU, V4 and China were dealing with various domestic challenges. As elsewhere described (Jitaru and Popescu, 2017), democratic system of the EU has reached “international identity” but also was suffering from asymmetric challenges such as impacts of illegal economic migration, wave of political populism, changing global natural environment and securitization. V4 countries were at odds with different views on some of listed issues vis-à-vis other Member States for which V4 earned also criticism. As for PRC, the Chinese government presented a successful example of economic transformation, stability and prosperity to the Chinese people, though some asymmetric problems still exist, including environmental issues, risks of domestic political isolationism, or relative excessive securitization in Asia.

Maher (2016) urges for the EU’s need for a new conceptual framework on China policy, following his criticism of the EU comprehensive strategic partnership with China from 2003 seeing it as shallow and limited only to trade, often uneven and debatable. With regard the V4 countries within the EU, some dynamics are visible thanks to increased multi-sectoral cooperation with China after 2013, including people-to-people exchange enabled due to newly open flight connections and increasing potential of the freight exchange from China to the EU. There were also ideological views reflected also in V4 context, yet without any tangible results (e.g. discourse on possible Chinese participation in the project of Danube-Oder canal in Czechia).

Gabriel and Schmelcher (2017) addressed scenarios for China-EU relations urging the EU to create better climate for future shaping of EU-Chinese relations. China is seen as politically and economically strengthened vis-a-vis the EU, while the EU remains the most stable and prosperous region of the Eurasian continent. The US factor remains the main determinant of EU-China relations. The technological progress is as a key area for the EU, in which it is possible to flexibly deal with EU-China-US trilateral dynamics (Gabriel, Schmelcher, 2017).

In the EU's contemporary dialogue with China there are some areas of criticism that cover different issues such as human rights, capitalist economy model, anti-dumping duties, cybersecurity or international issues, to mention some. Having different opinions however is not a hindrance to communicate about what can be done for better understanding and friendship. There are many areas to EU-China mutual interests such as recognition, trade, prosperity and stability, people-to-people exchange and multi-cultural cooperation, addressing environmental challenges or security questions (criminality and terrorism), and promotion of peace and understanding, to name some. Though the contemporary EU-China's relations are focused on win-win cooperation, some see the lack of real mutual gain (Maher, 2016). What signals bring the New Silk Road to Europe in this regard towards 2020?

### **3. The New Silk Road and European Union**

The geography of China's One Belt One Road (OBOR) is composed of two inter-regional economic-infrastructure belts. The territorial economic belt across Eurasian continent is conceptualized in the China's New Silk Road Economic Belt project. The 21<sup>st</sup> Century Maritime Silk Road project encompasses belt stretching from South East Asia across Indian Ocean towards East Africa. OBOR addresses an area of the population of almost 4.5 billion with economic output of over \$21 trillion (Freeman, 2017). By connecting the Pacific with the Indian and Atlantic Oceans, and with stretching economic integrative belt across Central Asia to Europe, China aspires to become a central actor to Eurasian affairs. With global center of economic activity in Asia-Pacific area, China would integrate the region concentrating 70% of population and 75% of energy reserves (Freeman, 2017).

Overcoming distance over territories updates to a traditional view on territorial importance of routes in comparison to maritime routes. The Trans-Caspian International Transport Route is 6500 km long corridor. Next corridor project was inaugurated in 2017 – the Baku-Tbilisi-Kars (BTK) Railway via Azerbaijan, Georgia, and Turkey with China-EU passenger and freight connections. Chinese transportation projects are of vital interests to landlocked countries of Central Asia and the South Caucasus (Shahbazov, 2018). From China's city of Urumqi to Europe it is expected to cut the transportation time from 60 days by sea to 14 and less days by rail.

Trans-Eurasian networks of connections are expected to be more stable. They will strongly improve connectivity of landlocked countries, assigning them new economic roles and enable them access to resources. For faster data exchanges across Eurasia the investors are willing to invest in the "high frequency trading" – the automated financial computer instruments that will innovate EU – China trade (Freeman, 2017). A new integration system will arise. Elements of territorial infrastructural links with Europe consist of railways and highways, and the technosphere of pipelines, power grids, fiber optic cables, air and sea ports. These elements will regionally generate economic opportunities at real market requirements with institutional facilities (Freeman, 2017).

China's economic growth has not bridged the growing domestic provincial inequalities yet, even though many efforts were conducted in Central and Western China. How come Beijing struggles with domestic economic integration while trying to succeed abroad? (Freeman, 2017). Investments in Eurasian infrastructure generates access to markets and resources, making productive use of China's overcapacity, stabilizing employment and contributing to foreign trade with new outlets for foreign exchange reserves. China creates channels to outsource industrial overcapacity across Central and Northern corridors of the New Silk Road (Freeman, 2017). Work on these projects will be conducted mainly by Chinese firms through state-owned enterprises (SOE).

Chinese government announced investments of over 100 billion USD for infrastructural projects within the OBOR. In contrast to the USA, some EU Member States joined the Asian Infrastructure and Investment Bank. Fourteen EU Member States<sup>8</sup> out from twenty-eight countries decided to join this China's development bank initiative. From the V4 only Hungary and Poland proceeded. Asian infrastructural development is expected to foster EU-China financial and monetary cooperation that contributes to the stabilization of EUR and the internationalization of RMB (Gang, 2017). There are many perspective areas for cooperation in this area.

In the field of EU-China cooperation on regional economic integration, China learns from the EU's experience in cohesiveness policy making. Perspectives of EU-China cooperation in regional policy include promotion of the development of urbanization and coordination of urban and rural interaction, a stable financial background for regional policy, increasing regional cooperation, improvement of regional policy implementation, analysis and studying increase of the regional cooperation with the EU. The limitations of the European model on the Chinese regional policy include different geographic scope and institutional difference. China is not yet prepared for absorption of the EU funds (e.g. lacking on transparency, subsidiarity experience, etc.) (Minarčíková, 2016). It is questionable to what extent the EU can contribute to conceptualization of the New Silk Road given rich integration experience, but it is the field where the EU can share best practices in common EU-China interests, including democratic and liberal regimes that interact with the system and regime of Chinese characteristics.

#### **4. The Visegrad Group on the New Silk Road**

China's economic diplomacy for the New Silk Road combines capital and soft power approach. Looking at China's geography for the sixteen Central and Eastern European countries, the V4 region is strategically located between the Baltics (Baltic states + Belarus) in the North and the Balkans (and Greece) in the South. Chinese influence on the Western Balkans is seen contradictory. Beijing seems to benefit from EU-led convergence towards political stability (to implement economic agenda), whilst Chinese activities may result in a divergence from the EU criteria and an undermining of EU membership prospects for the recipients (Lagazzi and Vít, 2017).

Within the China's 1 + 16 platform, the regional V4 trade with China makes  $\frac{3}{4}$  of the total trade of the member CEEC with China. The China's 1 + 16 CEEC platform has deepened its institutional anchorage across the 16 CEEC including V4 countries. The format 1+16 has been incorporated to OBOR institutional strategy and mentioned in the 12<sup>th</sup> and 13<sup>th</sup> five-year plans. CEEC shows no additional intra-structuralizing of regional scope of CEEC currently (Fürst, 2016). With its relative openness it may be addressed with CEEC co-initiatives.

There has been an increase of interest about China in individual partner countries within the V4 after 2010. How China is perceived by Czech, Hungarian and Slovak media was analysed in the 'influence' project on 1257 contributions in media for Czechia, 3921 for Hungary and 2603 for Slovakia in total (2017). The results show that image of China in Czechia remains mostly negative, stereotyped and polarized, being rather a domain of politics than public. In Hungary, China discourse is strongly politized and monotonous, dealing often with materialist

---

<sup>8</sup> Austria, Denmark, Finland, France, Germany, Hungary, Ireland, Italy, Malta, Netherlands, Poland, Portugal, Spain, Sweden. Other countries from Europe include Iceland, Luxembourg, Norway, Switzerland, United Kingdom.

themes. In contrast, Slovak discourse on China is typically mostly neutral but pro-bilaterally limited.

With regards to East Asia in general, Visegrad Group as a unified regional partnership has a practical sense in approaching China in trade and investments in a co-operative matter (Laš, 2017). One example is Southeast Asia at China's southern borders. The EU and ASEAN are complementary natural trading partners that share a suitable business environment (Vahalík, 2014). Cluster organizations of the V4 countries started to seek common market opportunities in ASEAN after the year 2010. Creation of sector-specific clusters of key industries in individual V4 countries was aimed at development small-medium enterprises, which potential was to be exploited and increased. While the V4 is an informal group based on non-legally binding political proclamations, the ASEAN countries have regional institutions based on multilateral treaties (Marušiak, 2015), and prefer to approach foreign partners as representatives of a region too. Common V4 strategy to ASEAN countries emerged from practical reasons, such as co-location of consular activities in different ASEAN states (National Cluster Association, 2014). Leading clusters were merged into a branding group of selected representatives from mechanical engineering (Czechia), furniture industry (Hungary), telecommunications (Poland) and automotive industry (Slovakia). It was expected that a common V4 approach would score.

The V4 should consider mutual coordinative approach to build stronger market power and broking position with the EU in coordinated cooperation on the New Silk Road (Kopecký, Lidl, Rezková, Vondrážka, 2016). As V4 experience in cluster cooperation shows on the ASEAN approach, mutual approach to complex East Asian business and cultural environment is crucial. The Western EU Member States however expressed some concerns over the China + 16 CEEC cooperation, worries from exercising influence in possibly risky strategic choices of EU Member States that could harm the unity of the EU, though China's investments in the region are small comparing to promising outlook (Turcsanyi, 2017). While China used to be a relatively small investor in the V4 region comparing to Japan, Korea and Taiwan from East Asia, with the 1 + 16 platform China's engagement increased and initiatives are worth to recognize China as a constructive partner with inspiring vision.

## 5. Conclusion

Comparing to Japan, South Korea and Taiwan, recent engagement of PRC in the V4 region is still modest in the mode to catch up in investments and exchange with other EU East Asian partners. China is well recognized as a partner in the EU and in the world. Many positive effects of this are visible in recent cooperation initiatives that culminate in the New Silk Road initiative. For the V4 countries as the EU Member States it means closer engagement and coordination with surrounding regions in building bilateral and multilateral relations with China.

The Visegrad countries in the China's 1 + 16 cooperation platform have economic potential and geographic position for New Silk Road functions. Their positive performance being the EU Member States gives them competitive advantage in the EU production standards and markets as well. V4 may become an intersection for EU-China's cooperation. V4 however lacks on unified strategic reference framework within EU-China cooperation.

What is the degree of EU-V4 engagement in the New Silk Road? While the EU appears to cautiously observe the initiative, there are many European states quite open to this cooperation, and join the Asian Infrastructure and Investment Bank (AIIB). Czechia, Hungary, Poland and Slovakia as members of the China + 16 CEEC cooperation platform share advantageous

features for cooperation with China. The Balkans' function is a future transit exchange route from the Greek port of Piraeus closer to Western Europe. The Baltics in cooperation with Finland will play constructive roles in logistic hubs for China in the EU, and project of Ice Silk Road via Arctic routes may add to the importance of such development. V4 as a region of the population over 60 million can play key roles but these have to be conceptualized. V4 countries engagement has been rather fragmented in cooperation initiatives. Another topic for V4 – China recognition is possible common engagement in the AIIB, as Hungary and Poland took their active parts in it.

The Visegrad Group has options to co-develop cooperation of the EU part in the New Silk Road, but a travel map for EU-V4-Baltic states is lacking. This can be achieved by V4 cooperation with other EU Member States of Estonia, Lithuania and Latvia present in the China 1+16 CEEC, at the level of discussion at the institutional level of the EU to identify a multifactorial strategy to the New Silk Road. This strategy would seek responses to functional sectoral differences to boost cooperation that could co-match China-EU common expectations.

Within the V4, individual countries are engaged in cooperation and trade with China in different sectors and areas. It will be useful for the EU to help the Visegrad Group to coordinate differences and co-develop functions of China's project schemes. This will assign the V4 region within the EU new roles that are expected to contrIBUTE to economic growth, stability and trade, as well as will generate new geography of economic integration with innovative potential. On the other hand, it will be necessary for China to keep trying to meet the EU's expectation in transparency and standardization. Cooperation of China-EU is in the interest of international community. By decreasing regional inequalities in often ideologically alienated countries of Eurasia, based on international peace, law and understanding, the EU, V4 and China can contribute to better future in general.

## **Abstract**

*The financial situation of local government units is reflected in their investment and development capacity. Due to limited financial resources, they have to turn to repayable sources of funding in order to meet the co-financing requirement. This may lead to destabilisation in securing repayable sources of funding for investments and limited absorption of EU funds. The aim of the paper is to evaluate the level of indebtedness of local government units in Poland in the context of the absorption of European Funds for investments. The paper is theoretical and empirical in character. The theoretical part was based on study of the literature, which involved collection, specification and characterisation of data. Based on the information gathered in the theoretical part, the empirical part was completed in order to achieve the objective of the paper. The research results indicate that in the current financing period (2014-2020) municipal debt is a significant barrier to securing EU funding for public investments.*

**Keywords:** barrier, community, debt, European Union funds, investment.

**JEL Classification:** H40, H72, O52

## **1. Introduction**

Since its integration with EU structures, Poland has seen significant changes, particularly in the area of investment activity undertaken by local governments. This is because a chance appeared to secure EU funding as part of implemented instruments of regional policy. In terms of the total amount of EU funds, in both the last and current programming period, Poland was the largest beneficiary among Eastern European EU member states. Between 2007 and 2013, it received over 67 billion EUR, and in the 2014-2020 budget period the allocation exceeded 77 billion EUR (Medve-Bálint, Bohle, 2016; Dellmuth, 2011; Mynarzova, Kana, Okręglička, 2016).

Implementation of investment projects, including those co-financed with EU funds, requires significant financial participation by local government units, which often exceeds their budgetary capabilities (Mohl and Hagen, 2010). In such situations, they have to rely on repayable sources of funding, i.e. loans, or, in the case of some local governments, issue municipal bonds. All these measures lead to increased debt.

The aim of this article is to evaluate the level of indebtedness of local government units in Poland in the context of the absorption of European Funds for investments.

## 2. Problem Formulation and Methodology

Absorption capacity is the extent to which a country is able to effectively and efficiently spend money from EU funds, and is expressed in percentage of the total allocation. Experts indicate a relationship between absorption and three main indicators: macroeconomic potential (in relation to the gross domestic product of a country); financial capacity, i.e. the ability to co-finance the EU-supported programmes and projects; and administrative capacity, i.e. the ability of central and local authorities to manage EU programmes and projects (Katsarova [online], 2013; Bachtler and Ferry, 2015).

### 2.1 Theoretical Background

Polish publications distinguish three groups of factors facilitating efficient absorption of EU funds by local government units in Poland:

1. factors related to the overall financial situation of local government units, which is measured by their ability to provide sufficient own funds for implementation of investment projects (own financial contribution),
2. factors connected with creation of an appropriate, coordinated system of long-term strategies and plans, especially a relationship between material and financial planning,
3. factors connected with the functioning of the institutional absorption system, which is based on relevant laws on the implementation of regional development policy and connected with an efficient system of financial flows.

Further, it should be stressed that support funds are paid out as reimbursement of the expenditure incurred earlier, therefore local government units have to raise the total capital necessary to finance investment expenditure (Kornberger-Sokołowska [online]; Jurewicz, 2016; Ławińska, 2016).

The European Commission established that the factors that had delayed absorption of funds in the 2007-2013 period included: the late start of programmes due to the extension of the previous period, an underlying lack of (or even decline in) administrative capacity, the challenges in preparing major infrastructure projects and obtaining Commission's approval, changes in EU legislation, inconsistent political ownership (changes in national and regional governments, changes to institutions) and the effects of national sectoral reforms (Katsarova [online], 2013).

The indebtedness of local government units is affected by economic and political factors as well as legal regulations (Rivenbark, Roenigk and Allison 2010). The causes of the increase in the deficit and debt of local governments include, among other things (Parlińska, 2014, pp. 191-192; Korombel, 2012; Poniatowicz, 2010, p. 38; Korolewska, Marchewka-Bartkowiak, 2011):

- decrease in own revenue due to the economic crisis,
- higher expenditure dynamics compared to revenue dynamics,
- mobilisation of public investments co-financed with EU funds,
- exhausting the possibilities of incurring debt on the terms applicable until the end of 2013 and concerns about the loss of credit capacity after new limits on indebtedness of local government units come into force.

Local government units have a statutory right to incur liabilities. However, in order to prevent excessive indebtedness of local government units in Poland, debt limits were introduced. At first, they were uniform for all units (until 2013), and later individualised (since 2014). Since 2014, the only limit on the debt incurred by a local government unit is individual debt ratio

(Polish: IWZ). The principle of determining the IWZ ratio was laid out in the Act on public finance (2009). The formula for calculating the ratio (IWZ) is as follows:

$$\left(\frac{R+O}{D}\right)_n \leq \frac{1}{3} \cdot \left( \frac{Db_{n-1}+Sm_{n-1}-Wb_{n-1}}{D_{n-1}} + \frac{Db_{n-2}+Sm_{n-2}-Wb_{n-2}}{D_{n-2}} + \frac{Db_{n-3}+Sm_{n-3}-Wb_{n-3}}{D_{n-3}} \right) \quad (1)$$

where:

R - the total amount, as planned for the budget year, of credit and loan payments and redemption of securities intended for financing the planned budget deficit, repaying prior liabilities, providing advance funds to secure financing of activities from the EU budget, and financing investment projects;

O - interests on credits and loans took out to cover the temporary budget deficit throughout the year, finance the planned budget deficit, repay prior liabilities, provide advance funds to secure financing of the activities from the EU budget and to finance investment projects, as well as interests and discount on securities issued for the above purposes and for repayment of the amounts resulting from provided sureties and guarantees;

D - overall budget revenue in a given budget year;

Db - current revenue;

Sm - revenue from the sale of assets;

Wb - current expenditure;

n - budget year for which the ratio is established;

n-1 – the year preceding the budget year for which the ratio is established;

n-2 – the year preceding the budget year by two years;

n-3 – the year preceding the budget year by three years.

The individual debt ratio (IWZ) states that in a given budget year the ratio of the value of the liabilities to be repaid (along with the costs of their servicing) to overall budget revenue of a local government unit cannot exceed the arithmetical mean for the relations, as calculated for the last three years, of its current revenue increased by revenue from the sale of assets and decreased by current expenditure to overall budget revenue. For each local government unit, the calculation of the individual ratio is based on budget execution data for the last two years and on planned values from the year preceding the year for which the ratio is calculated (Korolewska, Marchewka-Bartkowiak, 2011).

According to local authorities, the new ratio is in many cases very restrictive. It may limit the absorption of EU funds in the current financial perspective (2014-2020). This applies to many local government units with strong economic potential (Sierak [online], 2016). G. Medve-Bálint and D. Bohle (2016) conducted studies on the relationship between the level of debt in gminas and the utilisation of EU funds in Poland and in Hungary. The results of their empirical analyses confirmed that the indebtedness of gminas in Poland was correlated with the amount of EU funds obtained by them. More precisely, the bigger the difference between total costs of a project and the total funding, the bigger the level of debt of a given gmina.

## 2.2 Methodology

The research covered local government units taken together as well as their categories, i.e. gminas, cities with poviat rights, poviats and voivodeships. In order to achieve the research aim, the following research questions have been formulated:

- What is the legal restraint on the indebtedness of local government units in Poland?
- What is the level and dynamics of changes in the budget deficit of local government units?

- What is the amount and structure of the debt of local government units, both the total debt and the debt of different categories of such units?

The paper is theoretical and empirical in character. The theoretical part was based on study of the literature, which involved collection, specification and characterisation of data. The information and data on the subject addressed in the paper was derived from the literature and existing legal regulations. Based on the information gathered in the theoretical part, the empirical part was completed in order to achieve the objective of the paper and answer the research questions.

The empirical material used to conduct the analyses was obtained from databases of the Ministry of Finance and showed the different parameters of the economic situation of local government units. Another important source of information was the resources of the Polish Central Statistical Office (GUS). They were used to assess the level of absorption of structural funds by local government units. The temporal scope of the analyses was limited to the current period of programming EU funds so as to comply with the principle of data comparability and accessibility. The subjects of the analyses were all local government units in Poland. For assessment of the results obtained, the method of temporal and spatial statistical comparisons was used.

The research period covers the years 2014-2016. For 2017, only selected data on the indebtedness of local government units was available, covering only the first three quarters. The data was presented in nominal values.

### 3. Problem Solution

The level of indebtedness of local government units is affected not only by the debt incurred in previous years, but also by the current level of budget revenue and expenditure. The result (deficit or surplus) of local government units in Poland in the 2014-2016 period is presented in table 1.

**Table 1: The Overall Result of Local Government Units in Poland Between 2014 and 2016 (in thousand PLN)**

Specification	2014	2015	2016
Gminas	-521,164	1,722,862	3,619,754
Poviats	-1,495	237,369	647,743
Cities with poviat rights	-1,401,594	735,936	2,478,630
Voivodeships	-492,709	-92,518	888,245
<b>Local government units – in total</b>	<b>-2,416,962</b>	<b>2,603,649</b>	<b>7,634,372</b>

Source: own study based on Report on public budget execution: Information on the execution of budgets of local government units (for the years: 2014, 2015 and 2016); Ministry of Finance (online, 2018)

In 2014, the budgets of local government units recorded an overall deficit of 2,416,962 thousand PLN. In 2014, 48.3% of local government units recorded a deficit of 6,072,675 thousand PLN, whereas 51.7% of them recorded a surplus of 3,655,713 thousand PLN. In 2015, budgets of as many as 71.5% of local government units showed a budget surplus. An upward trend was also observed in 2016, when 80% of local government units recorded a budget surplus of 8,682,820 thousand PLN in total, whereas 20% of units showed a budget deficit of 1 048 448 thousand PLN.

Liabilities of local government units by debt instruments in the 2014-2017 period are compared in table 2.

**Table 2: Liabilities of Local Government Units by Debt Instruments (in thousand PLN) in the 2014-2016 Period and in the Third Quarter of 2017**

Specification	2014	2015	2016	2017 (III quarter)
Securities	4,267,830	4,157,881	4,272,684	4,324,293
Credits and loans	67,628,939	67,328,762	64,653,237	61,742,066
Mature liabilities	213,102	148,037	94,013	80,157
<b>Liabilities of local government units in total</b>	<b>72,109,871</b>	<b>71,634,680</b>	<b>69,019,934</b>	<b>66,146,516</b>

Source: own study based on Report on public budget execution: Information on the execution of budgets of local government units (for the years: 2014, 2015 and 2016); Ministry of Finance (online, 2018)

According to data of the Ministry of Finance (online, 2018), in 2014 nominal total liabilities of local government units increased by 4.3% compared to 2013. At the same time, it should be stressed that in 2014 only liabilities related to credits and loans increased (by 6.5%), whereas the other debt instruments were lower than in 2013. In the overall structure of liabilities of local government units in 2014, credits and loans accounted for the biggest share (93.8%), recording an increase by 2.0 percentage points compared to the previous year.

In 2015, overall liabilities of local government units by debt instruments (compared to 2014) were lower by 0.7%. In the structure of overall liabilities of local government units in 2015, credits and loans accounted for the biggest share (94%), an increase by 0.2 percentage points compared to the previous year.

In the structure of overall liabilities of local government units in 2016, credits and loans accounted for the biggest share (94.7%), a decrease by 0.3 percentage points compared to the previous year. In 2016, the indebtedness of all the categories of local government units was lower than the indebtedness at the end of 2015.

Credits and loans for implementation of programmes and projects partially financed with EU funds in the different categories of local government units in the 2014-2016 period are compared in table 3.

**Table 3: Local Government Units' Liabilities Related to Credits and Loans for Implementation of Programmes and Projects Partially Financed with EU Funds (in thousand PLN) in the 2014-2016 Period**

Specification	2014	2015	2016
Gminas	2,327,675	1,797,507	1,326,496
Poviats	177,620	177,711	158,152
Cities with poviat rights	5,999,107	4,250,558	2,100,587
Voivodeships	718,437	617,160	641,995
<b>Local government units in total</b>	<b>9,222,839</b>	<b>6,842,936</b>	<b>4,227,231</b>

Source: own study based on Report on public budget execution: Information on the execution of budgets of local government units (for the years: 2014, 2015 and 2016); Ministry of Finance (online, 2018)

The data presented in table 3 shows that in the research period cities with poviats rights accounted for the biggest share (in %) in local government units' overall credits and loans taken out for implementation of EU-funded programmes and projects (annual average of 59%). The second biggest share in this type of indebtedness was recorded by gminas (annual average of 27.6%), followed by voivodeships (annual average of 10.7%) and poviats (2.7%).

Data of the Ministry of Finance (online, 2018) shows that in 2014 the debt incurred in voivodeships for the implementation of EU-funded projects increased by 87.8% compared to 2013, whereas in the remaining categories of local government units it was lower than in 2013. In 2015, in all categories of local government units, the debt incurred for the implementation of EU programmes and projects was lower than in 2014, whereas in 2016 it accounted for 6.1% of the debt of local government units and was 38.2% lower than in 2015. Only in voivodeships the debt incurred for the implementation of EU-funded projects was higher than the figure at the end of 2015.

As from 1 January 2014, an individual debt ratio for local government units is applicable in Poland. Table 4 presents the number and share (in %) of local government units in the different groups that did not comply with the individual debt ratio.

**Table 4: The Number and Share (in %) of Local government Units in the Different Groups that Did Not Comply with the Individual Debt Ratio in the 2014-2016 Period**

Specification	2014		2015		2016	
	number	%	number	%	number	%
Gminas	47	1.9	57	2.4	33	1.4
Poviats	16	5.1	20	6.4	14	4.5
Cities with poviat rights	1	1.5	1	1.5	1	1.5
Voivodeships	0	0	0	0	0	0
<b>Local government units in total</b>	<b>64</b>	<b>2.3</b>	<b>78</b>	<b>2.8</b>	<b>48</b>	<b>1.7</b>

Source: own study based on Report on public budget execution: Information on the execution of budgets of local government units (for the years: 2014, 2015 and 2016); Ministry of Finance (online, 2018)

Information from the Ministry of Finance (online, 2018) shows that:

- in 2014, 28 units were requested to develop a resolution programme, whereas 64 units (i.e. 2.3% of all local government units) did not comply with the individual debt repayment ratio,
- in 2015, 31 units were requested to develop a resolution programme, whereas 78 units (i.e. 2.8% of all local government units) did not comply with the individual debt repayment ratio,
- in 2016, 31 units were requested to develop a resolution programme, whereas 48 units (i.e. 1.7% of all local government units) did not comply with the individual debt repayment ratio.

It is important to add that the Act on public finance envisages the possibility of providing assistance in the form of a loan from the state budget to local government units which are in a difficult financial situation. Detailed principles for granting a loan from the state budget were specified in art. 224 of the Act on public finance: "a local government unit can be granted a loan from the state budget if the local government unit is implementing or undertakes the implementation of a resolution programme, and analysis of the resolution programme shows that the situation of such a unit is highly likely to improve, the unit will perform its statutory

tasks more effectively and fulfil the principles concerning the balancing of current expenditure and the individual debt ratio by the end of the year in which the deadline for the loan repayment passes, and it will repay the loan along with the interests."

To date, this form of support has been used by 34 local government units, with 3, 2 and 5 local governments receiving a loan in 2014, 2015 and 2016 respectively. As of 31 December 2016, 24 local government units have to repay loans from the state budget.

To assess the extent to which EU funds were absorbed, a per capita rate of secured EU funding can be used. Table 5 presents the amount of EU funds (in PLN) per inhabitant secured by all local government units in Poland for the implementation of projects and programmes in the research period.

**Table 5: EU Funds (in PLN) Per Inhabitant Secured by All Local Government Units in Poland in the 2014-2016 Period**

Specification	2014	2015	2016
Local government units in total	36.80	46.30	28.10

Source: own study based on GUS (online, 2018)

In order to assess the level of the indicator presented in table 5, it is necessary to look at the data from previous years (GUS [online], 2018). Since 2010, the amounts of EU funds per inhabitant secured by all local government units in Poland were 46.20 PLN, 46.40 PLN, 43.90 PLN and 39.00 PLN in 2010, 2011, 2012 and 2013 respectively. The most dynamic increase in the amount of per capita funds obtained from the EU was recorded in 2012, followed by a slow-down in the upward trend. The indicator had the lowest value in 2016.

Investment projects co-financed with EU funds which are implemented by local government units require own financial contribution. Within the meaning of the regulations in force, the funds as part of own financial contribution can be public revenue and earnings. As far as the former are concerned, local government units can use public levies and transfers from the state budget or other local government units, e.g. targeted subsidies for investments. The latter mainly include financial flows, which result in liabilities incurred by a local government unit (credits and loans and issued securities). There is no aggregated data on the detailed structure (sources) of financing own financial contribution. I. Musiałkowska and M. Wiśniewski (2017) point out a strong increase in the amount of the country's own financial contribution since 2014. This amount remains stable (at 3-4.5 billion PLN annually).

#### 4. Conclusion

Based on the analyses presented in the paper it is not possible to state univocally whether the change in local government units' potential for contracting debt was connected with the use of EU funds. At the same time, no definite conclusion can be made as to the relationship between the rate of absorption of EU funds by local government units and individual debt ratios. The existence of new limits on incurring debt may limit future absorption capacity of local governments. This may be especially the case with the most active gminas which incurred liabilities for implementation of EU-funded investments. The necessity to repay credits will reduce their potential for undertaking, executing and financing new investment projects. There is also a concern of the so-called debt roll-over, i.e. incurring new liabilities to repay the previous ones, which contrary to what is widely believed is not uncommon. Incurring new debt to repay the existing debt is a serious problem, and its scale is significantly increasing.

Since Poland was incorporated into the structures of united Europe, local government units have become the biggest beneficiaries of EU assistance, with their dynamically increasing debt incurred mainly for implementation of EU-funded investment projects. The success of Polish local governments in using these funds in both previous programming periods should not disguise increasing absorption problems. With the existing legal regulations, gminas' increasing debt made it more and more difficult to obtain repayable credits, which may significantly limit further investment activity.

For local government units, securing and effectively absorbing EU structural funds is on the one hand a significant organisational and financial challenge, while on the other hand – a chance for boosting development processes. Thus, applications for new EU-funded projects will require accumulation of a sufficient pool of own revenue or skilful management of debt.

Of course, this study does not constitute a comprehensive proposal to resolve emerging dilemmas and doubts. The author hopes that the text can be an inspiration for further research into issues related to the co-financing of public investment by EU funds. Undoubtedly, further research should be carried out. Research into the diversification of debt refinancing from various perspectives, for example due to the level of wealth of local government units, may be extremely interesting.

### **Abstract**

*The risk of running a business in EU is a stable element of the functioning of each kind of enterprise. It applies to both enterprises operating independently on EU market and those that conduct cooperation within clusters. The cooperation strategy opens up new horizons for the enterprises that cooperate in achieving competitive advantage. The main aim of the paper is to present the areas of risk connected with engagement in cluster cooperation by mature enterprises from selected EU countries. The questionnaire survey was conducted in 2016 on a group of 114 Polish and Slovak enterprises. The research group consists of mature enterprises that operate on the market for more than 10 years, are characterized by a stable increase in revenues and financial liquidity, and therefore have a determined market position. Mature companies have features that allow them to manage risk efficiently, and from the other side, they have experience in different forms of cooperation with stakeholders. The study uses statistical methods that allow to analyze the level and type of business risk of mature enterprises in the SME sector in selected EU countries.*

**Keywords:** cluster cooperation, EU, mature companies, risk in SME sector

**JEL Classification:** G32, M21, C38, P13

### **1. Introduction**

Cluster policy in the European Union is one of the directions of boosting competitiveness of Europe. It is a strategic priority of the European Commission, which is implemented in all member states and involves creation of appropriate conditions for the development of innovations and entrepreneurship through supporting and developing the concept of cluster cooperation (Frankowska, Myszak, Jedliński, 2016; Havierniková, Kordoš, Vojtovič, 2016). By participating in these types of initiatives, individual enterprises can become more competitive, and enterprises participating in cluster cooperation can achieve greater benefits compared to individual organisations. This is because the characteristic feature, and the main benefit of clusters, is access to much more resources (Porter, 1998). However, cluster initiatives not only ensure advantage to individual enterprises, a region or country, but they are

also one of the factors contributing to overall improvement of the quality of business environment (Matveev et al., 2016; Staničková, 2014).

Clusters have become an inseparable part of economic growth and strategy for building EU member states. As publications show, an environment for cluster policy has been created in Poland and Slovakia, however it is worth finding out how potential participants of these networks assess the risk of participation in this type of cooperation.

The main aim of the paper is to present the areas of risk connected with engagement in cluster cooperation by mature enterprises from selected EU countries. Inferences were made based on the findings of own survey research conducted in 2016 on a group of mature enterprises carrying on business activity in Poland and those carrying on business activity in Slovakia.

## **2. Literature Review – Risk and Cooperation of Enterprises**

Management of enterprises involves decisions in the conditions of uncertainty, taking into account the risk connected with carrying on business activity (Myšková, Doupalova, 2015; Ławińska, 2016). Effectiveness of activities and management of an enterprise depend on the ability to predict, readiness for changes, speed of reaction to changes, and the ability to take advantage of emerging chances. Thus, risk management is a precondition for an enterprise's survival and success (Lemańska-Majdzik, Ivanová, 2017). There are a number of factors that impact the activity of an enterprise, determining risk management in line with the key processes and goals of an enterprise. They include: strategic risk management, operational risk management, financial and credit risk management, market risk management and project risk management (Havierníková, Okręglicka, Klučka, 2016, pp. 103-109). Risk management practice and risk management procedures create specific actions that determine decision-making and strategies in an enterprise, such as: creation of organisational elements and communication in risk management, development of organisational culture as a factor supporting risk that becomes a source of an organisation's competitive advantage or establishment of mechanisms and systems of early warning about negative consequences of risky activities (Klučka, 2010, p. 33). Risk management is a process that constantly monitors risk during running the business activity of a company and supports managers in decision-making with regard to the order of priority actions that have to be taken in order to implement the adopted strategy in a given business environment (Lemańska-Majdzik, Ivanová, 2017). Risk is an inseparable element of every economic activity. Risk taking and competitive actions are important elements of entrepreneurship orientation which have a significant impact on management of small and medium-sized enterprises (Ključnikov, Belás, Smrčka, 2016). Risk is defined as a possibility of the occurrence of an event which can have a negative or positive impact on the goals adopted in an organisation (Korombel, 2012). Risk can have a dangerous impact on a business process (Marhavišas, Koulouriotis, 2012). As was noticed by Kin (2014), it cannot be completely eliminated in the process of the functioning of a company. Even with an effective system of risk management, risk will not disappear. It is however possible to effectively manage a company in order to positively impact the aspect of coping with risk. Studies reveal that most micro-, small and medium-sized enterprises notice the existence of risk in economic activity, with Slovak entrepreneurs showing higher level of risk awareness compared with Polish ones (Okręglicka, Havierníková, 2017).

One of the characteristic features impacting efficient management of an enterprise is company maturity, which enables improvement of an organisation's abilities (Hammer, 2007), including better performance of processes in an organisation. A stable increase in revenues or high financial liquidity, which are typical of mature companies that have not recorded decreases yet (Mohr, pp. 25-26), allow companies to achieve a market position and impact their competitive

advantage. Mature enterprises, apart from financial stabilisation or capabilities of risk compensation, are characterised by experience which determines implementation of goals and projects (Fang, David, 2015).

A company's competitive position may also be strengthened through participation in international cooperation. Cooperation allows enterprises to achieve better effects of their activity, thanks to increasing the potential of organisations, as well as improving the functioning of cooperating companies. This type of activities enable enterprises to improve their competitive positions compared to the other enterprises in the sector (Tomski, 2011). It also allows participants to achieve goals that are not available for independent individual enterprises. According to Child and Faulkner (1998), achievement of market success is preceded in this case by mutual trust between cooperating partners and adoption of a common strategy of action for an organisation. An effect of cluster activities can be new employment opportunities, new products and services, new companies, new research and development projects, new patents and other issues connected with economic development and market competition (Štverková, Mynarzová, 2017). Diatczyk (2012, p. 40) stresses that the main advantages of the functioning as part of clusters also include, among other things, reduction of the risk level connected with business activity, which is important from the perspective of conducting business activity and competitive markets.

Clusters are a phenomenon that is a product of market needs, therefore cluster cooperation among enterprises has a positive impact not only on the effectiveness of the activities of the cooperating organisations themselves, but also on the development of regions through making cooperation and knowledge transfer more common among local entrepreneurs (Hiroyuki, Nishimura, 2015; Casanueva, Castro, Galán, 2013). Moreover, clusters have a positive impact on structural changes, economic situation, including the level of innovativeness and increase in a region's entrepreneurship as well as better use of the innovation potential of small and medium-sized enterprises. Further, well-functioning clusters reduce the gap between industry and scientific environment (Matveev et al., 2016; Frankowska, Myszak, Jedliński, 2016). Burrus et al. (2018) stress that cooperating enterprises (symbiotic relationship between enterprises) that innovate maximise profits and meet expectations of their customers, become more confident about future expectations and, at the same time, significantly lower the risk connected with running business activity.

### **3. The Mature Companies in the Cluster Cooperation**

According to Piątkowski (2015), participation in clusters enables entrepreneurial processes, which as a consequence enables achievement of a bigger competitive advantage over enterprises which do not cooperate in the cluster initiative. It is particularly important for smaller companies, which have much less resources or limited access to new markets. It turns out that cooperation and at the same time competition among the enterprises in a cluster is a desirable mechanism for improving competitiveness of EU countries.

#### **3.1 Methodology**

The main aim of the paper is to present the areas of risk connected with engagement in cluster cooperation by mature enterprises from selected EU countries. Survey research was conducted in 2016 in Poland and Slovakia among entrepreneurs who know the principle of risk management and cluster cooperation, and declare maturity of their companies. For the purpose of the survey, mature enterprises are regarded as those that declare a good market

position, stable increase in revenue, high financial liquidity, regular profits and have been conducting economic activity for over 10 years.

During selection of enterprises for the research, judgemental sampling was used. As a result, 114 enterprises were surveyed: 75 Polish and 39 Slovak mature companies from the SME sector.

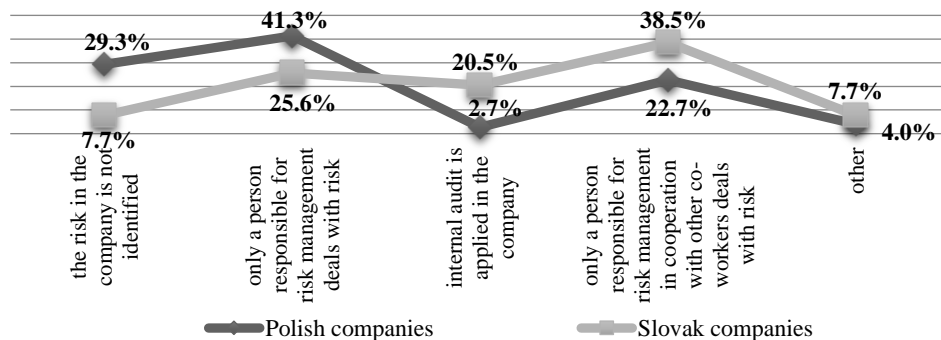

The research tool was a survey questionnaire with close-ended questions divided into three parts covering the main research problem. Participants of the research were entrepreneurs owners of the enterprises surveyed or main managers of companies. For the purpose of this paper, only a selected research area related with risk perception in the aspect of enterprises' engagement in cluster cooperation was analysed.

During analysis of data collected in two selected EU countries, descriptive statistics and non-parametric correlations between variables using 5-point Likert scale were used based on the software *STATISTICA 12.5 PL*.

### 3.2 Own Research Results

The Polish and Slovak mature enterprises surveyed declared that in their company risk is most often identified by a person responsible for that area (respectively 41.3% and 25.6% responses) and by a team of employees responsible for risk management in an enterprise (respectively 22.7% and 38.5% responses). Only 3% of Polish and as many as 20.5% of Slovak enterprises declared that an external audit is used in their companies in the process of risk identification and management. Worryingly, almost 30% of the Polish enterprises surveyed do not identify risk in the company (Figure 1). Risk of a company's business activity is, as the research shows, better recognised by Slovak companies, as demonstrated by entrepreneurs' declarations.

**Figure 1. Ways of Risk Identification in Polish and Slovak Mature Companies**

Source: own elaboration

Based on the research, it is possible to indicate selected risk areas connected with enterprises' engagement in cluster cooperation, where the risk level is the highest according to respondents. The Polish enterprises surveyed indicated risks connected with market competition, loss in the number of customers, company location, quality, and employees' qualifications and skills. As for the Slovak enterprises surveyed, engagement in a cluster initiative is usually connected with higher risk in the case of loss of part of customers, market competition, cooperation with business partners, quality and taxation of economic activity (Table 1).

Source: own work

In the survey, Polish enterprises included 26 micro-companies, 33 small companies and 16 medium-sized enterprises, whereas Slovak ones included 16 micro-companies, 15 small companies and 8 medium-sized enterprises. Risk of cluster activity depends, among other things, on the industry in which companies operate, therefore it is worth indicating that the enterprises surveyed were mainly engaged in trade (41% of responses) or were industrial companies (over 26% of responses).

**Table 2: Gamma Correlation Between the Size of an Enterprise and Risk in Selected Areas in Connection with Participation in a Cluster**

Source: own work

Statistical analysis has shown that there is a positive statistical relationship ( $p\text{-value} < 0.05$ ) in both the groups analysed between the selected risk areas and the size of an enterprise. It has been found out that in the group of Polish enterprises concerns about growing risk connected with participation in a cluster initiative increase with an increase in the number of employees in an enterprise. The bigger the company, the higher the perceived risk in the area of competition ( $\gamma=0.29748$ ), attracting partners ( $\gamma=0.39581$ ), infrastructure ( $\gamma=0.31684$ ), availability of raw materials ( $\gamma=0.33608$ ), transportation and warehousing ( $\gamma=0.29891$ ), access to machines and equipment ( $\gamma=0.30866$ ) and production ( $\gamma=0.27538$ ), an enterprise's life cycle ( $\gamma=0.36657$ ), and staff-related risk ( $\gamma=0.23393$ ). In the group of Slovak enterprises, concerns about growing risk connected with participation in a cluster initiative increase with an increase in the number of employees in the following risk areas: attracting partners ( $\gamma=0.07179$ ), availability of raw materials ( $\gamma=0.14356$ ) and machines and equipment ( $\gamma=0.30189$ ), and human factor related risk ( $\gamma=0.14425$ ) (Table 2).

#### 4. Conclusion

The research conducted on a group of Polish and Slovak mature enterprises in 2016 enabled identification of the areas of risk connected with engagement in a cluster initiative. Although the research covered mature enterprises with market experience, concerns about participation in cluster cooperation were indicated in both the groups surveyed. In the selected EU countries, entrepreneurs indicated similar areas of risk in connection with their engagement in a cluster initiative, however in Slovakia the level of this risk, according to those surveyed, is higher. The analysis has also shown a positive statistical relationship, which indicates that in selected areas the risk increases as the number of employees in the analysed enterprises in Poland and Slovakia increases.

The novelty in the research is, according to the authors, comparing the level of risk in selected areas in connection with engagement in cluster initiatives in two EU countries, in a group of mature enterprises that have been existing on the market for at least 10 years and declare stable revenue and a good competitive position.

The limitations of the research are relatively small research groups in selected EU countries. According to the authors, it is worth undertaking representative research in the future, including in other EU countries. Comparison of the collected findings may help indicate recommendation for the future cluster policy in the EU which is a priority for boosting competitiveness of Europe.

### **Abstract**

*Governments around the world are recognizing the power of the use of information and communication technologies (ICT), the utilization of digitized inter-connective communication systems linking governmental organizations and its stakeholders. European Union's member countries have gone a long journey in this area in the last two decades. One of the consequences of the implementation of ICT in public administration is also the restriction of the public official's discretion, thus also reduction of corruption in the public sector. This paper is focus on the potential impact of e-Government on the level of corruption in the European Union's member countries. Specifically, this paper examines the impact of the use of ICT represented by the E-government Development Index on the evaluation of the level of corruption in the public sector represented by the Corruption Perception Index in 28 member countries of the European Union.*

**Keywords:** *corruption, e-Government, e-Governance, e-service, European Union, public administration, public services*

**JEL Classification:** *H00, H11, H41, F60*

### **1. Introduction**

Impact, especially of bureaucratic corruption, on the economic performance of countries has been a favourite topic of numerous studies and debates for decades. The strong interaction between politicians, officials and businessmen, aiming to obtain illegal economic rents from public activities characterizes in many countries the decision-making process on public investment and reduces their economic performance. According to numerous studies (Jain, 2001; Kimbro, 2002; Kim, 2007), corruption has exactly quantifiable negative impact on economic efficiency and economic growth of the state.

A feasible way to reduce corruption, especially in the public sector, may be reducing the interactions between officials and the public. This can be achieved by means of e-government. E-government can ensure not only providing more information to the public, but also remove the discretion of public officials (Mistry, 2012; Mistry, Jalal, 2012; Seo, Mehedi, 2016). European Union countries are very positively evaluated in terms of the implementation of information and communication technologies (ICT) in the field of public administration in recent times (United Nations, 2016).

The aim of this paper is to prove or disprove the relationship between the level of corruption and the degree of utilization of e-government in the European Union's member countries. The paper observes the relationship between changes in the use of e-government and changes in the level of corruption in European countries during the period from 2003 to 2016.

### ***1.1 Restriction of Corruption Through the Implementation of Information and Communication Technologies in the Field of Public Administration***

Transparency International (2016), international non-profit organization which function is to map the status of corruption and to contribute actively with its operation to corruption limitation, defines corruption similarly as „*misuse of a public function for the purpose of private enrichment*“.

The corruption is often called as a „sand in wheels“ of economies because of its negative economic consequences. The negative effects of corruption on foreign investment are shown by Shleifer and Vishny (1993). In addition, corruption increases transaction costs, impedes the development of a market economy, undermines the system of free markets by increasing the degree of uncertainty and reduces government revenues while raising its spending (Rose-Ackerman, Palifka 2016). Corruption leads also to a misallocation of resources, particularly when the investment of public funds and approval of private investments are decided not on the basis of economic or social value of a project, but rather on the potential revenue that public officials may expect to receive from their decisions (Jain, 2001).

Some studies identified the potential role of E-government in reducing corruption. E-government eliminates the scope for bribing by elimination of intermediary services and it allows for citizens to arrange their transactions by themselves (Singh, G. et al., 2010). Researches carried out that factors supporting corrupt practices in public administration officials, such as monopoly power, discretionary powers or lack of accountability are mitigated by the existence of a functioning legal system and greater transparency (Mistry, 2012). These studies agree that the increased use of E-government can weaken the factors causing corruption and result in a reduction of monopoly power by officials and ultimately lead to greater transparency in public administration functions (Kim, 2007; Mistry, 2012). Mentioned authors in principle agree that an important role in the anti-corruption strategies of individual states play is by providing easy access to information for all citizens through the use of e-government approaches and initiatives. This may result in greater transparency, which limits the possibility of a public official to accept or even demand a bribe.

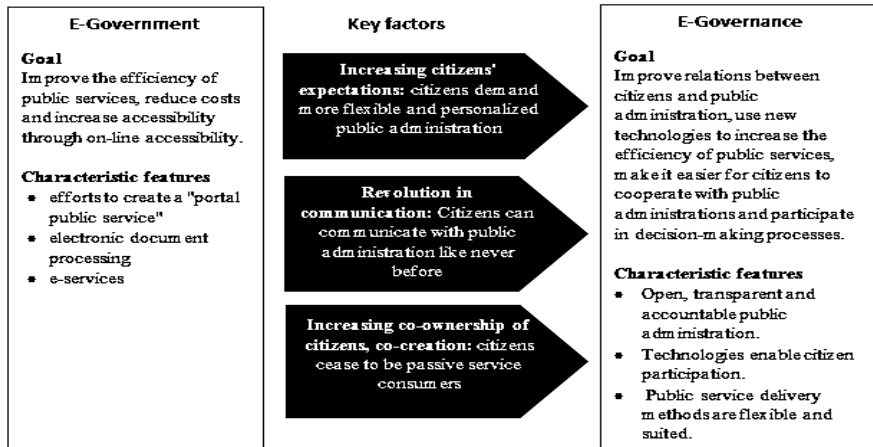

#### ***1.1.1 The Transition from the e-Government to the e-Governance***

A massive use of ICT in public administration, public administration and communication with citizens has taken place over the last two decades not just in Europe. This is reflected in the way of how public services are provided. The United Kingdom, Netherlands, Estonia or the northern European countries have long been striving for the widest possible expansion of digital public services. Estonia is a well-known pioneer in e-elections. The way to use the electoral process with a digital ID chip is being used by Estonia till today. Some countries use ICT "only" to raise awareness of their citizens or deliver better quality public services. However, some countries are even further and thanks to ICT are their citizens directly involved in decision-making and control processes of public administration. Therefore, it is possible to distinguish the concepts of e-Government and e-Governance.

The concept of ***e-Government*** could be define as the use of ICT by public institutions to ensure the exchange of information with citizens, private organizations and other public institutions in order to increase the efficiency of the internal functioning and to provide fast, affordable and quality services (Lidinský, 2008). It should be added that ICT can significantly improve the quality of public services provided. The provided e-service is provided with the help of technology, the contact between the customer and the public administration is not face to face, the e-service is self-service, and there is no need for another person to perform the service. The

**e-Governance** approach means the use of ICT in public administration to improve the awareness and quality of public services by involving citizens in decision-making processes and by creating more responsible, transparent and efficient government (Budd, Harris, 2009). E-Governance is focused on democratic processes. The government as a co-ordinating body operates in a democratic system and citizens and other subjects follow their own interests and express their views in a formal system based on democratic principles. The schema of transition from e-Government to e-Governance with the fundamental characteristics and goals of each approach is depicted on the Figure 1.

**Figure 1: The Transition from e-Government to e-Governance**

Source: own elaboration

European countries are developing a series of e-Government and e-Governance initiatives to develop public administration. E-Government initiatives support the delivery of e-services, e-Governments are geared towards the development of democratic dialogue between the government and the public, businesses and non-governmental organizations. Over the last decade, large EU funds have been devoted to e-Gov- projects, but many of these projects have been implemented only partially or not at all. Examples of the most common barriers to the practice of e-Gov- ideas are financial barriers, digital gaps, high IT access costs, insufficient IT education of inhabitants, information labyrinth or fear of data misuse (Oakley, 2002).

## 2. Problem Formulation and Methodology

In order to verify the existence of a relationship between the utilization rate of e-Government and level of Corruption, established indexes will be analyzed. Specifically, the E-government Development Index and Corruption Perception Index will be used. Analyzed time series is the period from 2003 to 2016. This is the longest time series, which could be analyzed. Year 2003 was the first and 2016 was the last year of calculation of the E-government Development Index, the indicator of the level of E-government in a country.

### 2.1 Model and Data

**The Corruption Perception Index (CPI)** has been published by Transparency International (TI) since 1995. It is an index that is based on corruption perceptions of respondents, which are domestic and foreign entrepreneurs, analysts and representatives of the professional public

in the evaluated countries. As a result, the CPI takes values in the interval from 0 to 100, where 0 is highly corrupt country and value of 100 indicates a country without corruption. The sample of examined countries is changed over time. For example, the index of 1995 included 41 countries, and in the last survey in 2016, there were already 176 countries evaluated (Transparency International, 2003, 2016).

**The E-Government Development Index (EGDI)** is used to estimate the level of E-government in a country. This measurement is based on a survey compiled in cooperation between United Nation's Department of Economic and Social Affairs and Civic Resource Group, consulting firm providing technology solutions in the field of E-government. The EGDI reflects how a country uses an information technology to promote access and inclusion of her inhabitants. EGDI has been published since 2003 and takes values in the interval  $<0; 1>$ , where 1 represents the high level of usage of E-government and a value of 0 means a low rate of application of E-government in public administration. Of the 193 countries surveyed in 2016, the United Kingdom, followed by Australia and Korea, ranked first in the last rank of the EGDI. There are significant differences in average EGDI values across continents. The lowest value for the long-term is the average of the countries of the African continent (0.2882), while the highest is the average value of European countries (0.7241) (United Nations, 2003, 2016).

Verification of the relationship between E-government and corruption will be carried out by using a simple linear regression analysis and correlation coefficient. Correlations between defined variables will be verified by the value of the Spearman correlation coefficient ("the correlation coefficient"). The calculation of the correlation coefficient will be conducted by using statistical software STATISTICA, version 1.10. The significance level established for the correlation analysis is 0,05. The null hypothesis defines that the monitored variables are not in correlative relationship. Verification of this hypothesis is based on the subsequent comparison of the level of significance with a value (called p-value) which statistical software generates. Then we can also determine how tight the mutual correlation between the variables is. The correlation coefficient takes values between -1 and 1, inclusive. Values of the correlation coefficient close to value of -1, respectively 1, can describe a very strong mutual correlation relationship between the observed variables. It is also possible to distinguish the positive correlation relationship (or direct relationship) that occurs when the value of the correlation coefficient becomes positive. Or otherwise, we can specify a negative correlation relationship (or indirect relationship). First will be investigated relationship exists between EGDI and CPI in two-time periods (i.e. 2003-2016). Subsequently, analysis of whether there is a relationship between change in EGDI and change in CPI during the mentioned period will be done.

The following regression function was used to verify the relationship between the CPI and the EGDI. The function is based on the least squares method (Freund, Mohr, Wilson, 2010):

$$y = \alpha + \beta * x + \varepsilon \quad (1)$$

The parameter  $x$  denotes the independent variable, in this case the use of E-government (index EGDI) and the parameter  $y$  denotes the dependent variable, i.e. the level of corruption (CPI). The parameter  $\alpha$  determines the distance of intersection of the regression line with the y-axis (the value of the regression function for  $x = 0$ ). The parameter  $\beta$  is called the regression coefficient and shows the variation of the dependent variable value when the value of the independent variable changes. The symbol  $\varepsilon$  is the residual variance, which is a graphical representation of the distance of points from the regression line.

### 3. Problem Solution

Correlation coefficients for the variables are shown in the Table 1. The values identified using Statistica as statistically significant, are highlighted in bold. A positive correlation relationship was found among the variables CPI and EGDI in both years. There is a relationship between corruption and using E-government methods in the analyzed countries.

**Table 1: Correlation Matrix**

Variable	EGDI 2003	EGDI 2016	% change EGDI	CPI2003	CPI2016	% change CPI
<b>EGDI2003</b>	1,000000	<b>0,892045</b>	<b>-0,671026</b>	<b>0,861866</b>	<b>0,863523</b>	<b>-0,534131</b>
<b>EGDI2016</b>	<b>0,892045</b>	1,000000	-0,270675	<b>0,807577</b>	<b>0,796980</b>	<b>-0,541352</b>
<b>% change EGDI</b>	<b>-0,671026</b>	-0,270675	1,000000	<b>-0,511973</b>	<b>-0,528950</b>	0,255819
<b>CPI2003</b>	<b>0,861866</b>	<b>0,807577</b>	<b>-0,511973</b>	1,000000	<b>0,901920</b>	<b>-0,735140</b>
<b>CPI2016</b>	<b>0,863523</b>	<b>0,796980</b>	<b>-0,528950</b>	<b>0,901920</b>	1,000000	<b>-0,389711</b>
<b>% change CPI</b>	<b>-0,534131</b>	<b>-0,541352</b>	0,255819	<b>-0,735140</b>	<b>-0,389711</b>	1,000000

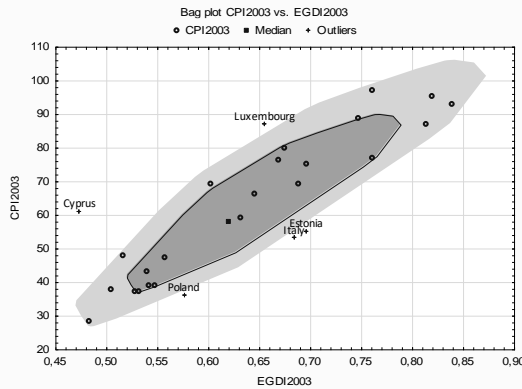

Source: own elaboration according to Transparency International (2003, 2016), United Nations (2003, 2016)

Bag plot was used for graphical interpretation of the examined variables. It is a generalized two-dimensional graph, which serves the graphic interpretation of statistical data. Points in the graph represent a combination of dependent and independent variables of individual countries. Dark -blue area (i.e. Bag) contains 50% of surveyed countries (between the first and third quartile) and dark- blue square represents the median value of the examined countries. Light blue exterior bag contains other rated states that achieved different values than countries in the dark blue field, but are not outliers. Outside of this area there are outliers that are shown in the chart with small stars. Bag plot also shows other characteristics of data displayed as the country's position within the evaluated countries, as well as the relationship between the evaluated variables indicated by the orientation of the bag (positive slope of bag indicates a positive relationship between the evaluated variables and negative slope of bag suggests the negative relationship).

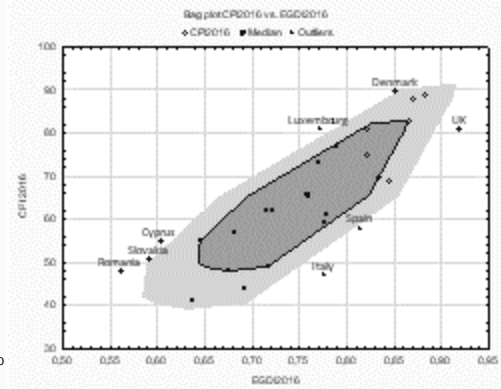

Figure 1 shows bag plot of EU countries that use the data from 2003. On the x-axis there is the EGDI in 2003 and on the y-axis, there is the CPI in 2003. As mentioned earlier, higher values of the EGDI indicate better readiness to use IT technology in the field of public administration and higher CPI values indicate less corruption in the country. Slope of the bag plot confirms the positive relationship between analysed variables. The year 2003 showed the impact of E-government at the level of corruption of evaluated countries. The bag plot illustrates several outliers of remote countries that are out of the evaluation of others in terms of the use of E-government or the assessment of the extent of corruption. There is not any significant separation of any country from others despite of the occurrence of several outlying values.

Figure 2 shows the same bag plot using data of 2016. Bag plot values achieved a positive slope again, which confirms the positive relationship between the variables also for year 2016. There are again some outliers that are identified in terms of the extent of corruption and the level of E-government differs from other countries in its group. For example in previous text already mentioned United Kingdom, which has the highest ranking of EGDI 2016 of all 193 evaluated countries.

**Figure 2: Bag Plot 2003**

**Figure 3: Bag Plot 2016**

Source: own elaboration according to Transparency International (2003, 2016), United Nations (2003, 2016)

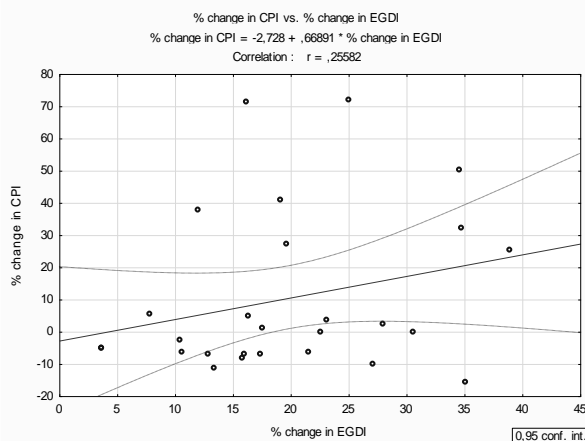

Lithuania recorded the most significant progress in the use of E-government in public administration in the reporting period. In the analysed years, Lithuania reached the level of the index EGDI 0,557 in 2003 and 0,775 in 2016, which means an increase of 39% in the level of usage of E-government in the country. In that country also the level of corruption was decreased by more than 25%. Also Croatia achieved a significantly better evaluation in EGDI in 2016. This country reached almost 35% improvement in the level of usage of E-government and level of corruption decreased by 32 % as well. Therefore it is possible to observe the same direction of the development of the examined variables in analysed period in many EU member states. But it is worth to mention that CPI 2016 index ratings in some countries are worse, despite the positive development of the EGDI 2016 index. Thus, increased use of ICT has not led to a reduction in corruption rates in all countries. As already mentioned above, corruption is a complex issue, and its causes vary considerably in the countries of origin.

We can use the following regression model to estimate changes in the rates of induced change in E-government in the country (Freund, Mohr, Wilson, 2010):

$$\Delta\text{Corruption} = \alpha + \beta * \Delta\text{E-government} + \varepsilon \tag{2}$$

Where  $\Delta\text{Corruption}$  is the change of the Corruption Perception Index between 2003 and 2016, and  $\Delta\text{E-government}$  is the change of the E-government Development Index in the same period.

Figure 3 is focused on how changes in the EGDI may affect changes in the CPI. Figure 3 shows the percentage change in the EGDI between 2003 and 2016 on the horizontal axis and the percentage change in the CPI between 2003 and 2016 on the vertical axis. This graph shows the evolution of the CPI and the EGDI during the sampling period. The linear regression line shows that not all countries with raised value of the EGDI recorded also simultaneously decrease of corruption. However, the linear regression line still has a slightly positive slope. It can be concluded that at constant conditions and other variables results with a one percent change in the index EGDI nearly 0.67% change in the CPI countries occurs in analysed period. In other words, improvement in the assessment of E-government in the country by 1%, leded to the improvement of corruption in the country by almost 0.67 % in analysed group of countries.

**Figure 4: Linear Regression Model for Variables Change in Years 2003-2016**

Source: own elaboration according to Transparency International (2003, 2016), United Nations (2003, 2016)

#### 4. Conclusion

The goal of this paper was to examine the existence of relationship between the corruption and usage of ICT and find an answer for the question, if changes in the utilization of these technologies lead to changes in the level of corruption in the EU member countries. For verification of this relationship, defined hypothesis which truth was confirmed by empirical models were stated. The positive impact of the E-government in reducing corruption in most of the countries was confirmed by using correlation and regression analysis. It has been shown that 1% percent increase in the index EGDI in the period of 2003-2016 caused the reduction of corruption (increase the value of the CPI) by 0.67 % in EU member countries.

It is necessary mention that the positive effect of E-government was not proved in all EU countries. This finding just supports the well-known fact that there are many possible roots of corruption. The corruption occurs in various areas of public administration and takes numerous forms. For this reason, e-Government is not a panacea for fighting corruption, which would be effective in all countries. It is also not possible to generalize the results of this paper for other periods and other groups of countries. The findings from the analysis, however, confirm the conclusions of numerous studies and consider the e-Government as a tool for reducing corrupt behaviour of officials in the public sector also in EU countries.

### **Abstract**

*Based on the results of the UK referendum about the abundance of the United Kingdom of Great Britain and Northern Ireland in the European Union, the Article 50 of the Treaty of Lisbon was activated, and a two-year transition period was started during which the UK and the European Union must agree on the country's departure conditions. In view of the high degree of economic integration among the Member States of the Union, the negotiations will concern highly integrated areas of cooperation, notably the degree of preservation of the four freedoms within the single market. The interests of both sides vary from one point to another; the most questions relate to the issue of free movement of labor and the free movement of goods. The negotiation can result in the three variants of exit: 1. without agreement, 2. with partially satisfactory terms for both parties and 3. with agreement that will meet the expectations of both parties. The most likely the exit will be with a partial agreement, and we cannot exclude that expectations of both will not be fulfilled. In every case we can expect the economic loses on both parts. We cannot exclude the possibility of another referendum too. In this paper we will try to answer these open issues.*

**Keywords:** *Brexit, economic integration, single market*

**JEL Classification:** *F13, F14, O52*

### **1. Introduction**

In 1955, the United Kingdom of Great Britain and Northern Ireland rejected the proposal of the six western European states to join them and create a European Economic Community (EEC) with them. In the late 1950s and early 1960s, the political and economic position of the United Kingdom in the world began to weaken. One factor in this process was the isolation of the British economy from the market of the EEC Member States. In the early 1970s, the British Isles succeeded in joining the European Communities. From the beginning, however, this membership was accompanied by a number of exceptions - a 12-year transitional period in opening the British agricultural production market to continental Europe products, after the 12-year transitional period, again the exemption in the form of the British rebate, the exemption from the obligation to adopt the euro (opt-out) and to integrate into economic and monetary union in the future, exemption from participation in the Schengen area, etc. Despite the concessions, the United Kingdom, even after 43 years of EU membership, saw more disadvantages than the benefits of its economic integration under the current EU-28.

The aim of the article I to analyze some issues regarding the withdrawal of the United Kingdom of Great Britain and Northern Ireland from the European Union. The article is structured into

4 parts: introduction, literature review, discussion and conclusion. We use general scientific methods of description (literature review), analysis (discussion) and synthesis (conclusion).

## 2. Review of the Literature

The issue of a Member State leaving the European Union is unique in the history of Western European integration. Even though some other Member States sometimes contemplate such a potential option. The European Union has so far resolved the question of extending the membership to the new Member States seven times. The issue of the UK leaving the EU is addressed by many theoretical economists and representatives of economic practice. From scientific articles, we mention Catherine Offord (2017), Lenka Fojtková (2016), Alison Young (2016), Karl J. P. Smith (2016) and many other foreign, Czech and Slovak authors.

## 3. Discussion

The results of the referendum of July 23<sup>rd</sup>, 2016 on the United Kingdom's withdrawal from the European Union are evidence that even many concessions from complying with the rules of the European Union have not been sufficient for the United Kingdom to remain in the European Union. British voters have decided that their country will leave the EU-28. The United Kingdom, as the first Member State of the EU, has activated Article 50 of the Lisbon Treaty (Lisbon Treaty, 2018). Historically, the European Union will deal with the first withdrawal of one of the Member States, while it has addressed seven times the enlargement of the EU by the new Member States by 2013. Representatives of the most important British political parties have long criticized the functioning of the European Union. Nigel Farage, UKIP Chairman, has called for a second referendum on UK membership in the European Union (Bienkov, 2018). Likewise, Jeremy Corbyn, Chairman of the Labor Party (Pack, 2018). After announcing the results of the referendum, British Prime Minister David Cameron resigned to his post as the initiator of the referendum (Stewart, H. et al., 2016). Nevertheless, even in early 2018, prominent UK political leaders called on a second referendum to reverse the decision of British citizens to leave the EU-28. Designated Prime Minister Theresa May took a clear position on the results of the referendum: "Brexit means Brexit. And we want it to be a success" (Cowburn, 2016). The House of Commons voted for the law to start the process of the United Kingdom's withdrawal from the EU (Twitter, 2017). Theresa May's official letter from March 29<sup>th</sup>, 2017, announced to the European Union that the United Kingdom would begin the process of negotiating a withdrawal from the European Union (TVNOVINY.SK, 2017). The transition period for the United Kingdom's withdrawal process will end on December 31<sup>st</sup>, 2020 (Aktuality.sk., 2018).

The European Union, headed by EU chief negotiator Michel Barnier, has prepared a 120-page draft document on the Brexit withdrawal process (Hoslet, 2018).

Representatives of the European Union and the United Kingdom must agree on the conditions of UK withdrawal from the European Union. Three key areas represent disputed points in the negotiations - issues relating to the rights of the citizens of the European Union in the United Kingdom following its withdrawal from the Union, but also the rights of the citizens of the United Kingdom in the EU-27, the financial settlement of British commitments to the European Union, and the issue of the future border regime between Ireland and Northern Ireland.

In the issue of financial compensation for UK membership, the European Union claims a sum of 40-55 billion EUR, while the United Kingdom values its commitments by nearly half the

amount (Amadeo, 2018). In this context, the term for the United Kingdom's withdrawal - hard Brexit - began to be used informally, which should mean the UK withdrawal without paying its financial commitments to the EU or the withdrawal without agreement between the two parties for further cooperation.

The question of workers' migration from the European Union following the withdrawal of the United Kingdom from the European Union is another controversial issue. Restricting migration to the UK labor market or changing the status of workers from the Member States of the Union following their entry into the labor market is the subject of negotiations with representatives of the countries most represented on the UK labor market (Vargas-Silva, 2016). These include the Slovak Republic and Poland. There are 3 million citizens from the EU Member States in the United Kingdom's labor market. It will be necessary to resolve the issue of citizens' standing on both sides, including the position of British citizens in the EU-27 labor market. D'Angelo and Kofman (2018) also address the issue of the future status of the EU citizens in the United Kingdom.

Another issue is the functioning of the United Kingdom in the single EU market after December 31<sup>st</sup>, 2020. The single market, completed on January 31<sup>st</sup>, 1993, is a major success of economic integration. The four freedoms are one of the gains in the process of deepening economic integration between the Member States of the European Union, which is a major factor in their economic prosperity. From March 29<sup>th</sup>, 2019 to December 31<sup>st</sup>, 2020, a transition period will apply in the EU-UK relations. During this period, citizens and businesses will be able to reconcile their relationships within the EU single market or the UK market (BBC News, 2018b). From March 2019, tariffs, non-tariff and administrative barriers may be introduced when goods cross the border between the United Kingdom and the European Union, i.e. between France and Ireland. The creation of long lines at customs frontiers, which will complicate and increase the price of exchange of goods and services, is unacceptable for entrepreneurs and traders. Brakman, Garretsen and Kohl (2018) analyze the impacts of Brexit on international trade. They confirm substantial negative trade effects for the EU, UK, and major economies around the world. Dhingra et al. (2018) summarize the findings of research related to the UK's role in global economy, and the consequences of Brexit for UK trade, investment and living standards.

The United Kingdom wants to preserve three freedoms for its successful future development, namely the free movement of goods, services and capital. The question of the free movement of labor is proposed to be abolished. Another issue is resolving the border between the Republic of Ireland as the remaining Member State of the European Union and Northern Ireland, where the United Kingdom refuses to build a so-called fixed boundary (BBC News, 2017). The European Union believes after the UK's withdrawal from the EU, a classic customs and border regime must be built at the UK-Irish border.

#### **4. Conclusion**

The functioning of the European Union brings benefits and disadvantages to its Member States. Countries with a smaller economic potential can only successfully develop in the globalized world within the larger integration groupings unless they are specifically endowed with natural resources (Norway) or their historical economic development allows them a high degree of formal autonomy (Switzerland). However, a country with such great economic potential as the United Kingdom, can afford to risk and leave the EU-28, although the UK economy, without the connection to the EU market, will probably lose many possibilities for exchanging goods and services. Before the UK referendum, asking British citizens whether to remain in or leave the European Union, the EU Member States were willing to approach almost

any conditions for UK to remain part of the EU-28. The results of the referendum were an unfortunate surprise for all the EU Member States and probably for the UK itself. Despite the outcome of the referendum, and the opening of talks on UK withdrawal as of March 29<sup>th</sup>, 2019, the European Council President Donald Tusk has told British citizens that if they think the Brexit over, the Union will take them back (BBC News, 2018a). Once the transition period has elapsed, the United Kingdom may again apply for membership in the European Union by activating Article 49 of the Lisbon Treaty (Lisbon Treaty, 2018). I want to join Per Wijkman's opinion, which assesses UK's withdrawal from the EU as a loss to both sides (Wijkman, 2017).

## European Integration and Reporting Requirements of Companies in the Slovak Republic

**Kornélia Lovciová<sup>1</sup>, Renáta Pakšiová<sup>2</sup>**

University of Economics in Bratislava<sup>1,2</sup>

Faculty of Economic Informatics, Department of Accounting and Auditing

e-mail: lovciova@gmail.com<sup>1</sup>, renata.paksiova@euba.sk<sup>2</sup>

### **Abstract**

*The establishment of the European Union by the signing of the Maastricht Treaty signified the deepening of European integration. The first steps led to the implementation of a common foreign and security policy, cooperation between the individual states of the European Union, and harmonization of economic legislative norms. Cooperation between the individual states of the EU has required an introduction of uniform rules for the member states. Even in the field of accounting, an introduction of uniform disclosure requirements for companies in the EU countries, including the Slovak Republic, has become an important step. In addition to the requirements for the qualitative nature of the published information on companies in the Slovak Republic, emphasis is also placed on the principles of European integration aimed at sustainable development, which requires socially responsible entrepreneurship in companies as one of its building blocks. The importance of this topic lies in the growing importance of publishing high-quality information about Slovak companies on the basis of the principles of European integration.*

**Keywords:** *corporation responsibility, disclosure of information, European integration, sustainable development*

**JEL Classification:** *D21, K32, M14, M40, M41*

### **1. Introduction**

The formation of the European Union (EU) by signing the Maastricht Treaty has advanced the European integration process. The principles of European integration are the core values of the EU based on respect for human dignity, liberty, democracy, equality, rule of law, and human rights, including minorities. EU cooperation and the achievement of financial, social, cultural, and political goals of the EU are built on the principles of the EU (Turečková and Nevima, 2016). Principles of European integration aimed at sustainable development requires socially responsible entrepreneurship as one of its supporting elements with regard to individual businesses and the achievement of the EU goals. The principles based on the concept of sustainable development can be - in other words - characterized as a targeted process affecting cultural, social, economic, and environmental aspects of life aimed at reaching and maintaining an effective community that satisfies all the needs of people while protecting the environmental and reducing adverse environmental impacts threatening the quality of natural resources for the future generations. The concept also changes the way we evaluate and assess business conduct within the community.

Companies shall now publish not only their financial information but information on their non-financial situation as well. The EU is aware of the requirement to disclose essential business

information - financial or other - and therefore it introduces uniform rules for all Member States to adhere to. The introduction of uniform reporting requirements - based on the ideas of European integration - became an important element of the accounting system of the companies operating in the Slovak Republic.

## **2. Problem Formulation and Methodology**

This Article is aimed at analyzing reporting requirements of the companies operating in the Slovak Republic based on the principles of European integration. The analysis is based and follows available editorial sources and applicable legislation. Background information is derived from the analysis of qualitative reporting characteristics in the annual report pursuant to the Slovak legislation, i.e. Act 431/2002 Coll., Accounting, as amended (Accounting Act). Non-financial information is related to corporate social responsibility, as one of the core values of the sustainable development, this Article drafts general information disclosure / reporting procedures and sets a framework for companies to align with.

## **3. Problem Solution**

All areas of social responsibility - as a prerequisite for sustainable development - provides specific information associated with business conduct. One of the essential accounting duty is to incorporate this information and process it to a usable form in order to meet the information needs of all stakeholders. The ability to perform this duty is one of the core requirements to assess qualitative characteristics of information. Companies with high CSR standards have the opportunity to submit non-financial information in the form of an annual report. Information presented in the annual report is effective, if it is useful in a decision making process. The effectiveness of information presented in the annual report is material, if its disclosure or omission in the annual report could affect the judgment or decision of any stakeholder. Information assessed in terms of materiality must be comprehensible, comparable, and reliable. (Accounting Act, 2017) Non-financial information may require the same qualitative characteristics as financial information. Bočková (2015) explores the issue of R&D expenditures in the business sector of performance and she hit the disparity in reporting which does not allow their comparison.

Cooperation of individual Member States of the EU in meeting the EU's goals and objectives requires a harmonization of legal standards to reduce the number of differences and irregularities of legislations and inconsistency of the terminology, and it focuses on the adherence to the reporting principles of key information in terms of the Scope of Directive 2013/34/EU of the European Parliament and of the Council of 26 June 2013 on the annual financial statements, consolidated financial statements and related reports of certain types of undertakings, amending Directive 2006/43/EC of the European Parliament and of the Council and repealing Council Directives 78/660/EEC and 83/349/EEC, as amended (Directive 2013/34/EU), presentation (Pakšiová, Janhuba, 2012). Its amendment, Directive 2014/95/EU of the European Parliament and of the Council of 22 October 2014 amending Directive 2013/34/EU as regards non-financial reporting and diversity information by certain large undertakings and groups (Directive 2014/95/EU), lays emphasis on the importance of information. The aim of Directive 2014/95/EU is to improve the consistency and comparability of financial information throughout the EU by including non-financial statements in the annual reports of selected companies.

Companies in the SR do not submit non-financial CSR related statements, but they include this information in the annual report. EU Commission has published Guidelines on non-

financial reporting (European Commission, 2017) pursuant to Directive 2014/95/EU. Its purpose is to facilitate and make the process of reporting high-quality, relevant, useful, uniform, and comparable non-financial information easier (Staničková, 2016). Non-financial information disclosure requirements applies to several large corporations with more than 500 employees, since its application to small companies may burden them with unreasonable costs, which outweigh the benefits of such disclosure. Companies are required to report relevant and useful information necessary to understand their development, conduct, position, and impact.

Reporting of non-financial information applies to certain public-interest entities and not all large enterprises pursuant to the Accounting Act. Public-interest entities (“PIE”) include banks, office of a foreign bank, fund management company, office of a fund management company, insurance company, Slovak Insurance Office, pension management company, supplementary pension company, Stock Exchange, office of an insurance company from another Member State, office of a foreign insurance company, office of a reinsurance company from another Member State, office of a foreign reinsurance company, and any company that meets at least two of the conditions below for at least two consecutive accounting periods (Accounting Act, 2017):

- a) total amount of the assets over € 170,000,000 (i.e. the sum in the balance sheet in valuation not including any provisions);
- b) net turnover over € 170,000,000;
- c) average number of employees in a single accounting period over 2,000.

PIE except of the National Bank of Slovakia, whose average number of employees exceeded 500 employees in a single accounting period - shall also include information on the development, conduct, position, and impact related to the CSR in its annual report. Further information disclosed by PIEs in the annual report shall relate to the description of the business model, description and results of the CSR policy, and material non-financial information regarding business conduct in all relevant areas. In the context of the CSR, companies shall provide description of all main risks that could have adverse consequences, as well as description of business relations, products, and services of the company and the management and assessment thereof.

Disclosure of non-financial information in the PIE’s annual report does not need to be based solely on the Accounting Act. On the contrary, the Accounting Act allows companies to report non-financial information on the basis of the European Union framework or other international framework governing the reporting of non-financial information, if it gives specific references to the aforementioned. Pursuant to Amendment 2014/95/EU, companies may follow national frameworks, European Union frameworks - such as EMAS (Environmental Management and Audit Scheme) - or international frameworks, such as the United Nations Global Compact, Guiding Principles on Business and Human Rights Implementing the United Nations „Protect, Respect and Remedy Framework”, Organization for Economic Cooperation and Development (OECD), ISO 26000 International Organization for Standardization, Tripartite Declaration on Principles on Multinational Enterprises and Social Policy, Global GRI Reporting Initiative, or other frameworks recognized internationally.

The term „Corporate Social Responsibility” was introduced by the European Commission formally in the Green Paper on Promoting a European Framework for Corporate Social Responsibility, with the following statement: „Based on the CSR concept, companies voluntarily decide to contribute to a more just society and cleaner environment.” (The Green Paper [on-line], 2001). Transposing Directive 2013/34/EU and Amendment 2014/95/EU thereto into the Slovak legislation, the voluntary reporting of non-financial information of certain enterprises have changed into a statutory obligation pursuant to the Accounting Act.

Companies may present their CSR-related achievements by creating and publishing CSR reports. Currently active CSR concept is being pursued by large national and multinational companies in the Slovak Republic, which are profitable and can easily implement CSR in their businesses. Small businesses must face the challenges of insufficient financial resources and poor availability of information, which means that the companies are not inclined to invest resources in areas that are not necessary to set and run a successful enterprise short-term or when they do not see the importance of the application thereof to their benefit. Companies have different opinion on the application of the CSR concept, however, the following opinion of M. Herrmann (2007) could be the motto to introduce the CSR concept: „The fundamental attribute of competitiveness using conventional tools is increasingly difficult to find and the CSR aspect brings forth new opportunities”.

Any statements and reports shall include the definition of stakeholders thereto, since the interests of stakeholders are essential for different decision making processes, including issues linked to the liability of executives and managers (Cvik & MacGregor Pelikánová, 2016) and their business judgment in competition and other matters (MacGregor Pelikánová, 2017). Failure to identify or cooperate with stakeholders leads to the disclosure of information that is useless or inefficient for any and all stakeholders. On the other hand, cooperation leads to the effectiveness of information reported. It may also ignite the need for further training. Stakeholder management is basically a management of relationships. (Friedman, Miles, 2002) It is based on the idea that businesses should formulate and implement processes that meet the interests of all stakeholders to the business. This requires an active management and integration of stakeholders' interest into the corporate strategy and operations. (Moratis, Brandt, 2017)

Companies face growing demands for wider reporting and greater transparency from investors, government agencies, or other stakeholders. This poses a challenge for businesses to report information that meets the qualitative requirements. The organization whose task is to collect daily inquires and challenges in the area of reporting, transparency, audit, taxes, and sustainable development management and to compile reporting guidelines, is now called Accountancy Europe, which has changed its name from the Federation of Accountants (FEE) during the celebration of its 30th anniversary. Accountancy Europe is involved in various European projects on direct taxes, value added taxes, introduction of euro, or introduction of the new Statutory Audit Directive. Accounting experts contribute to the production of high-quality reports and statements and effective management of the business by securing a flow of effective information between the management, board of directors, state authorities, and other stakeholders that is necessary to support the management of sustainable growth and development as part of the system of audits and internal control. Accountancy Europe finds a significant growth of non-financial reporting initiatives and frameworks, and therefore - in its „Non-Financial Reporting Initiatives and Frameworks Coordination” guidelines - it calls for a higher standardization and harmonization and a creation of a comprehensive uniform reporting framework on the principles of transparency and truthfulness. Accountancy Europe brings together 51 expert organizations from 37 countries that represent millions of experts in the field of accounting, auditing, and economic advisory services. Of these, there are 45 full members, 5 associate members, and 1 correspondent member. The Council of Accountancy Europe has 12 members from 11 countries and is chaired by the president elected for a two-year term. Core actions of all 51 members is to send experts to cooperate with specialist groups across Europe to participate in European projects and challenges. Only expert accounting organizations of high standards and reputation may apply for membership. Individual accountants cannot become members. Expert accounting organizations may apply for three

different types of membership, full /associate/ correspondent. Each type of membership has different competencies and responsibilities as listed in Table 1.

**Table 1: Types of Membership**

**Table 2: Accounting Act (Act 431/2002 Coll) and Directive 2013/34/EU Comparison - Form and Content of Non-Financial Reporting**

<b>Act 431/2002 Coll</b>	<b>Directive 2013/34/EU</b>
<p>Section 20 (9) Public-Interest Entity, except for the National Bank of Slovakia, whose average number of employees in a single accounting period exceeded 500 employees, shall report non-financial information in its annual report related to the development, conduct, position, and impact of the entity on the environmental, social, and employment area, information related to the respecting of human rights, and anti-corruption information (hereinafter the „Corporate Social Responsibility” or „CSR”), stating in particular:</p> <p>a) brief description of the business model;  b) description and results of the policy applied in the Corporate Social Responsibility area;  c) description of the main CSR risks that may have adverse impacts, and - if applicable - the description of any and all business relations, products, and services of the company along with the management and assessment thereof;  d) key non-financial business information of the entity by its activities</p>	<p>Art. 19 (1) Large enterprises - that meet the requirements of the Public-Interest Entity and exceeded 500 employees for a single accounting period - shall report non-financial information containing information required to understand the development, conduct, position, and impact of the entity on the environmental, social, and employment area, information related to the respecting of human rights, and anti-corruption information, including:</p> <p>a) brief description of the business model;  b) description of CSR policies established by the entity, including due diligence procedures applied thereto;  c) consequences of individual policies;  d) main CSR risks that may have adverse impacts, and - if applicable and appropriate - the description of any and all business relations, products, and services of the company along with the management and assessment thereof;  d) key non-financial business information of the entity by its activities.</p>

Source: Act 420/2002 Coll., Accounting, as amended, Directive 2013/34/EU, as amended.

Following the transposition of Directive 2014/95/EU into the national legislation of the EU Member States as well as the SR, questions arise related the information disclosure and reporting. As a result of these questions and challenges, CSR and Global Initiative Reporting in cooperation with Accountancy Europe produced a project aimed at monitoring impacts of Directive 2014/95/EU on enterprises, collecting information on the local implementation of Directive 2014/95/EU, understanding the direction of the direction in this regard, and providing communication related to non-financial reporting across the EU. (Accountancy Europe [online], 2017) Growing expectations of stakeholders towards non-financial reporting and recent legislative requirements in the EU create external pressure on the companies to submit non-financial information as part of their conduct.

Table 2 shows the comparison of basic provisions related to the form and content of non-financial reporting in the SR pursuant to the Accounting Act 431/2002 Coll., as amended, with effect from 1 January 2017 and pursuant to Directive 2013/34/EU, as amended.

#### **4. Conclusion**

Principles of European integration form core values of the European Union serving as basis for cooperation of individual Member States of the EU and achievement of goals of sustainable development. Principles of European integration have also been reflected in reporting and accounting procedures. Companies in the SR have the opportunity to report business information in their annual reports. Information is efficient if it serves its purpose for all stakeholders thereto. Pursuant to the Accounting Act, information's efficiency is assessed in terms of materiality, and information must be clear, comparable, and reliable. Non-financial information may require the same qualitative characteristics as financial information. Within the context of sustainable growth and the general goals of European integration, businesses should submit business performance measurable and comparable within the EU. However, information efficiency is hindered currently as a result of the inconsistency of reporting procedures. In order to increase the relevance of the information and to provide for a comparability of information, European Parliament and the Council introduce a new rule to produce non-financial report as a separate document or part of the annual report, thus harmonizing the information submitted therein. The Commission of the European Union has published Guidelines on non-financial reporting in order to facilitate the reporting of high-quality, relevant, useful, consistent, and comparable non-financial information. Reporting of non-financial information does not need to be based solely on the Accounting Act. Companies may report non-financial information on the basis of the European Union framework or other international framework governing the reporting of non-financial information, if it gives specific references to the aforementioned. Companies face growing demands for wider reporting and greater transparency from investors, government agencies, or other stakeholders. Any statements and reports shall include the definition of stakeholders thereto, since the interests of stakeholders are essential for different decision making processes. Accountancy Europe helps to create frameworks for high-quality information reporting based on the principles of European integration, which represents experts in the field of accounting, auditing, tax, and other advisory services. It calls for a higher level of standardization and creation of an extensive reporting framework system based on best practice. As a result of these questions and challenges, CSR and Global Initiative Reporting in cooperation with Accountancy Europe produced a project aimed at monitoring impacts of Directive 2014/95/EU on enterprises, collecting information on the local implementation of Directive 2014/95/EU. New space opens up for deeper research in order to develop harmonized and unified business reporting rules and procedures. High-quality reporting of financial and non-financial

information is a prerequisite for maintaining a sustainable growth, as one of the core objectives of the European Union.

### **Abstract**

*This article begins with an introduction to globalization. The globalization of the financial markets and the factors which caused it are subsequently characterized. This characterization includes the identification of both the positive and negative effects of financial globalization. A significant part of the article deals with the specific manifestations of globalization in the European financial market, in particular with respect to the banking market in the Czech Republic. The findings prove the undeniable impact and implications the globalization processes has had on the Czech financial market. This is evidenced by the intensity of the global competition in the form of the number of banking institutions linked by capital to foreign countries and which offer global financial products. These actors on the Czech banking market are a key object of study for the author and significantly contribute to the article's outcomes. The author analyses the progression of the banks since 2000 in terms of European integration.*

**Keywords:** bank, European banking sector, European Union, financial globalization

**JEL Classification:** E52, F65, G21

### **1. Introduction**

Globalization, as a rule, we understand the linking of the world into one big society. Globalization is characterized as spontaneous, mainly the economic process. Experts consider economy as one of the main driving forces of the globalization (Vítek, 2001). "Globalization is a process of integration of the society to a higher level of geographical ranking, than it was in earlier stages of development of the society. The globalization process is natural, inevitable and up to a point predictable. Similar shifts had also occurred in the past – from local to regional level, the regional level of the national one. The driving force is the globalization of economic activities, which links the production and markets of different countries, through trade in goods and services, the movement of capital and information, and interconnected network of ownership and control of multinational companies." (Sýkora, 2000, p. 59). Economic globalization shifts the organization and integration of the systems of production and consumption, shifts from the national to the global level or, rather, to add global levels of organization and integration to existing national, regional and local systems, including the vertical link. The term globalization indicates a shift trend in the geographical scale of economic integration. Globalization processes cannot be regarded as uniquely positive or negative – logically, globalization brings both opportunities and risks. A linkage of the contemporary world has visible consequences -- the country economy, which has managed to participate in the world economy, is growing faster. Conversely, a country outside the globalization process usually lags behind economically.

## 2. Problem Formulation and Methodology

A research problem of this paper is to identify the positive and negative effects of globalization of the financial market and to determine the degree of globalization in the banking sector in the Czech Republic. The information on the globalization of financial markets comes primarily from secondary sources. In terms of the scientific methods used, an analysis and subsequent synthesis was carried out of information specifically relating to the Czech Republic. Journals and articles served as an information source for the clarification of the concept of financial globalization and for examining the impact of globalization on financial markets. In order to identify the global competitors that are active on the Czech banking market, Internet published databases of financial institutions were employed.

### 2.1 Model and Data

“A key feature of financial services liberalization is the increasing presence of foreign banks in a nation.” (Ghosh, 2016, p. 1) Therefore, you can assume that the consequences of globalization are also in the banking sector in Central Europe, the representative of the Czech banking sector is as well. The aim of the following identification and analysis of banking institutions operating on the Czech financial market in the downstream section of the article is to prove their international to global dimension arising out of capital links with foreign countries. The Czech banking sector is characterized by a relatively strong competition of banking institutions, as it was apparent in the collection of secondary information.

The following table No. 1 shows the development of the number of banks operating in the Czech Republic (without the Czech National Bank, which the Ministry of Finance of the CR and the Czech National Bank resources have reported separately) in the years 2000 until 2017.

**Table 1: The Number of Banks Operating in the Czech Republic in the Years 2000 Until 2017**

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010
Number	40	38	37	35	35	36	37	37	37	39	41

Year	2011	2012	2013	2014	2015	2016	2017
Number	44	43	44	45	46	45	45

Source: Ministerstvo financí ČR (2017), Česká národní banka (2018)

The forecast of the number of banks on the following periods may be established on the basis of statistical averaging methods. Representatives for the calculation of the mean are the arithmetic mean, mode and median. A very convenient method for practically prognostication is treated as exponential smoothing (Hart, Rašner and Lukoszová, 2012).

The formula for the plain arithmetic mean:

$$\bar{x} = 1/n \sum_{i=1}^n x_i \quad (1)$$

The mode is the value that occurs most frequently in the statistical data file. The median is the value which divides the range in ascending sorted the results into two equal halves. If a file has an even number of elements, usually the median indicates that the arithmetic mean of the values in the places  $n/2$  and  $n/2+1$ . This is the mean value for the interval.

The formula for the calculation using Brown method of the exponential levelling:

$$P_n = (1 - \frac{1}{n}) \cdot P_{n-1} + \frac{1}{n} \cdot p_n \tag{2}$$

$P_n$ ...value for a period 1 until n

n...number of periods

$p_n$ ...value for the last period

From information on the number of foreign-owned banks to calculate the degree of internationalization of the banks according to a simple formula:

$$I_i = \frac{Bz}{Bc} \tag{3}$$

$I_i$ ...internationalization rate

Bz...number of banks in foreign ownership

Bc...total number of banks

Internationalization is considered as the megatrend of business, which is a consequence of the globalisation (Pražská and Jindra, 2012).

### 2.2 Model Calibration

The following Figure 1 represents a model of the number of banks development in the Czech Republic

**Figure 1: Development of the Number of Banks in the Czech Republic Within 2000-2017**

Source: Own by Ministerstvo financí ČR (2017), Česká národní banka (2018)

The simple arithmetic average of the number of banks is calculated from the formula (1):  $(40+38+37+35+35+36+37+37+37+39+41+44+43+44+45+46+45+45)/18 = 40.22$  banks.

The mode for the number of banks for the period within 2000-2017 is the most frequently occurring value of this time series. The value of 37 banks in time series shows the absolute frequency of 4, so it is a modulus of the values of the monitored time series. The value of 45 then the absolute frequency is 3. However, it is the last value of the reference period; the last published data about the number of banks comes from the November of 2017. The trend of the last period is of highest importance for the prognosis.

Average value or median is the middle value of the statistical set. The median is the number separating the higher half of the sorted data (or data file) from the lower half. The median is the second quartile (Q2), 5. Deciles and 50. Percentile. The calculation of the median from the interval from 35 to 46 banks is therefore 39.50.

The estimated value of the year 2018 calculated by Brown exponential levelling method is determined by the formula (2):

$$P_n = \left(1 - \frac{1}{18}\right) \cdot 45 + \frac{1}{18} \cdot 45 = \mathbf{45 \text{ banks}}$$

Globalization of financial markets is due to two main factors: the first is the liberalization of world trade and foreign exchange regimes, and the second one is financial innovation. Liberalization of world trade and foreign exchange regimes removes institutional barriers of trade and capital flows. Financial innovation is largely raised and supported by the development of telecommunication and innovative technologies. Financial globalization relates to financial intermediation and it is linked to it, inter alia, the issue of the stability of the financial systems of the individual countries, integration groupings or currency areas. Financial globalization has its own driving incentives and it is also autonomously operating factor that significantly affects the economies of virtually all countries of the world by that exchange rates of national currencies are continuously enshrine in global financial markets. Financial globalization may, in addition to its positive effects, exacerbate the progression and amplify the impacts of the risks that are inherent to trade the financial markets. The information thus indirectly shows the growing importance and the importance of the management of market risks by banks and other financial institutions, in particular from the perspective of currencies and areas where signs of instability can spread and underscore the importance of such institutionalized supervision over the financial risks (Erbenová, 2005). Financial globalization has significant benefits in the form of release of capital flows and the development of derivative trades (examples of derivatives are futures, options and swaps), which helps to reconcile the worldwide a supply and a demand of financing of the national debt and also a demand from large companies. Globalized markets also contribute to a more efficient allocation of financial capital on a global scale and expand the possibilities for financial risk management by the way of diversification and hedging. The removal of institutional barriers strengthens competition and improves the range of financial products and services. It benefits all clients of financial institutions. International capital markets at the same time also provide investment opportunities for small investors from different countries of the world, in particular through collective investment undertakings. The globalization of financial markets has also its shady sites which include inter alia, the fact that amplifies the potential for multiplication of financial risks (Rogoff, 2007). It can also speed up the transfer of the crisis across the state borders as well as to countries with healthy macroeconomic policies and to deepen of the fluctuations of the global economic cycle, as we were, indeed, seen in the period around the year 2010. This can lead to destabilization of the local financial system and severely damage of economic growth. Therefore, in the context of the growing financial globalization, the stability of the financial system has become a priority on the agenda of central banks and international financial institutions. Financial globalization is caused by the operation of foreign exchange markets and the European market for financial services. Its importance to our economy is due to the fact that it occurs to the operation and the settlement a decisive part of the turnover of our foreign trade and also the investors from the developed countries of the European Union directly or indirectly control a crucial part of the assets of the banking sector, that is the basis of the financial system of the country. This strengthens the financial stability of the Czech Republic and allows for the supervision of the Czech financial system. The central

actors in the financial market are financial institutions that create an integrated financial system. The financial system is a structured space in any economy, in which financial services are implemented. So it is that also in the case of the financial market of the European Union and, indeed, the Czech Republic. The Central Bank supervises on the stability of the financial market (as well as the financial system) (Kurka and Paříková, 2014).

### 3. Problem Solution

The analysis of secondary sources of information indicates that the financial market in the Czech Republic is operated and in the following year will be probably operated 45 banks and branches of foreign banks, which offer their clients through the globalized processes of global products adapted to local conditions of economy. The banking sector in the Czech Republic is therefore considered to be stabilized. Apart from them, the Czech National Bank permanently performs the function of the central bank. Out of 45 banking institutions and branches (listed in Table 1) acting on the territory of the Czech Republic is based on the currently published information 91.11%, in the absolute number of 41 banks, as a part of some of the financial groups having their registered office abroad. Banks, including branches of foreign banks and their capital or geographical links with foreign countries demonstrates the following Attachment 1: Banks operating on the market of the Czech Republic and their links with foreign countries.

The information referred to in the present article is so documented indisputable influence of globalization and the globalization processes on the banking sector in the Czech Republic.

### 4. Conclusion

Financial globalization has also benefits on the Central European market in the form of release of capital flows and the development of derivative trades. Globalized markets are contributing to a more efficient allocation of financial capital on a global scale and expand the possibilities for financial risk management. The removal of institutional barriers strengthens competition and improves the range of financial products and services. On the other hand the globalization of financial markets has weak sides too, it belongs on the contrary fact that amplifies the potential for multiplication of financial risks. It can also speed up the transfer of the crisis across the border of the countries. This can lead to destabilization of the local financial system and severely damage of economic growth.

The transition economies of Central Europe to market conditions are an important prerequisite for the changes in the banking systems in those countries. The globalization of the banking sector and its privatization by foreign capital, as well as adapting to the conditions of the European Union and the growing competition from non-banking entities, force bank to look for relatively new approaches in all fields of their activities. (Čepelová, Polouček, 2003)

In relatively stabilized banking sector in the Czech Republic (Juřík, 2011); there are till 1 January 2018 in addition to the Czech National Bank, 2 more banks directly in the ownership of the Czech Republic. The Czech Export Bank and the Českomoravská záruční a rozvojová banka. Czech owners then have 2 banks: Bank Creditas and Fio Bank. The remaining banks, listed in Table 1, are the banks based abroad, owned by a foreign person or foreign-owned financial group, and the branches of foreign banks. 24.44% (11 of the banks), almost one quarter of the banks operating on the Czech territory, have its registered office outside the territory of the European Union.

These institutions are trying to offer to their clients a wide range of global competitive financial products (loans, mortgages, savings accounts, time deposits, union trusts, insurance, etc.). However, foreign banks face many informational bottlenecks that hinder them from lending to a large majority of potential client-base in host markets (Gosh, 2017).

## **Cultural Distance Inside European Union – Czech Republic and Poland**

**Petr Lůžek**

VŠB – Technical University of Ostrava  
Faculty of Economics, Marketing and business  
Sokolská třída 33, Ostrava, 702 00  
Czech Republic  
e-mail: Petr.luzek@vsb.cz

### **Abstract**

*To be neighbours by borders and to be in European Union does not necessary means to share the same values and to have a positive image about the other country and their products. Paper answers questions about semi-globalization based on Ghemawat's Framework. This paper targets the cultural distance and its impact on the consumer behaviour in two selected countries among European Union. The aim of this paper is to define consumer groups by their cultural distance to the other country. Online survey was completed by 154 Polish residents and by 271 Czech residents. This data has been examined by cluster analysis to define groups by their cultural distance. Through this analysis we can define certain groups of citizens based on their cultural distance.*

**Keywords:** cluster analysis, cultural distance, Czech Republic, European Union, Poland

**JEL Classification:** C38, F50, M31

### **1. Introduction**

Czech Republic and Poland has always been close, either by distance, or by common history. Now they are both in European Union, which they joined at the same time 1st of May 2004. By this date, their mutual and other exporting performance has increased (Gilbert and Muchová, 2018). But that is only one of many similarities. Despite having similar culture in national export field, consumer view can be different. Paper focuses on dividing Czech and Polish consumer into clusters based on their cultural distance to the other country. Especially it focuses on the approach which citizens from both countries have, measured by their engagement with the other country. In introduction author is describing the cultural differences and similarities in between both countries and the aim of this paper, followed by basic description of cultural distance in general.

Looking at the cultural differences, Hofstede is describing the differences in six different categories (power distance, individualism, masculinity, uncertainty avoidance, long term orientation and indulgence). The categories with the biggest differences are uncertainty avoidance and in the long term orientation. Czech citizens are more oriented into the long term than Polish citizens. By description on Hofstede explains this as a pragmatic sign of a country, meaning the Czech citizens know, that truth is really about context, time and situation. Also Czech citizens have lower risk tolerance (lower uncertainty avoidance) than Polish citizens. It means that Czech citizens are more for following the rules, even if the rules are set wrong. Rest of the dimensions are almost similar, with the maximum difference at 10 % (Hofstede Insights [online], 2017). Last thing can be the similarity in Generation's Y usage of cell phones (Valečková, 2016).

It has been proved that having common borders and similar history doesn't necessary mean having the same approach in consumer behaviour. As an example can be used the relationship between Czech Republic and Slovakia. By being one country for almost a hundred years and later splitting into two different countries in 1993, Czech and Slovak citizens could have the same behaviour signs. But there are some differences, for example in online behaviour (Pawlasová, 2016).

Same values can be found in national security perception, expressed by not only being in the European Union, but also be part of NATO (Græger, 2016). Both countries also belong into Visegrad Group, often called Visegrad four, or by shortcut V4. It is proven, that international business relations in between those four countries (Czech Republic, Slovakia, Austria and Poland) have been improved by becoming this group and in comparison with new incomers into EU are those countries vastly ahead, for example in manufacturing cooperation (Langbein, 2014). In between the similar signs between Czech Republic and Poland can be also included the most registered marks of quality in Visegrad Group (Velčovská and Sadílek, 2014).

Aim of this paper is to define groups of customers in the relation to the other analysed country. Theoretical foundation is based on CAGE framework, which is used to compare whole countries (Ghemawat, 2001). Excluding the Cultural distance and transforming it into consumer's perspective provided key data for this paper.

Cultural distance has been introduced in many economic and social spheres, mostly in business perspective. Based on Hofstede papers many authors used cultural distance to measure part of a relationship between two countries and its presumption into future business. The construction of cultural distance seems like an easy solution of how to bypass the complexity of variety of differences in national culture (Shenkar, 2012).

## **2. Problem Formulation and Methodology**

In this chapter are information about data collection methodology and about methods for analysing data.

### **2.1 Data Collection**

Approach to the other country can be described by many ways. Based on CAGE framework author made a questionnaire which measures the cultural relationship of a customer and the other country. Data and further research are focused on the attitudes and the statements of Czech and Polish citizens. Those two countries are compared by having the same statements and their four-point scale agreement.

Research analysis is based on primary data that are quantitative. This data was obtained by electronic questionnaire in both countries and in their native language. Polish questionnaire was translated by native Polish citizen and then was reviewed by two independent Polish citizens for a complete certainty and flawlessness. Both of those questionnaires were alpha tested for an assurance of basic understanding.

Questionnaire had demographic questions about respondent's age and gender. The rest of a data consist from a five individual statements rated on four-point scale of how much the respond agrees with each statement. The interval was chosen with regard to the used methods (factor analysis and cluster analysis).

The statements are:

- I do watch Polish/Czech television.
- I do listen to Polish/Czech radio.

- I do like Polish/Czech language.
- I'm interested in Polish/Czech history.
- I go to Czech Republic/Poland to no-shopping trip/vacation.

## 2.2 Data Analysis Method

Research data was obtained by interrogation and has a quantitative character. For fulfilling the aim of this paper author is using factor analysis and cluster analysis. Factor analysis is used to reduce the amount of previously mentioned statements. The new created factors are used as variables in cluster analysis. Cluster analysis is used for designing clusters of citizens from both countries. For factor analysis rotation author is using Varimax method. Those new factors were created using Kaiser's rule (Eigenvalue rules). This rule is for making sure that the number of new factors explains a sufficient amount of variability. Factor scores are created by regression and they are necessary for further cluster analysis.

Factor analysis is being used to reduce the amount of statements for further use of new data. Data are being transformed from large variation of variables into meaningful smaller sets. Factor analysis is broad-spectral tool in marketing, which can be applied in many fields, such as product research, segmentation, pricing and advertising studies etc (Malhotra, Birks and Willis, 2012).

Factor analysis has similar approach as multiple regression analysis. Factor analysis model can be represented by following equation:

$$X_i = A_{i1}F_1 + A_{i2}F_2 + A_{i3}F_3 + \dots + A_{im}F_m + V_iU_i \quad (1)$$

where,  $X_i$  =  $i$ th standardised variable

$A_{ij}$  = standardised multiple regression coefficient of variable  $i$  on common factor  $j$

$F$  = common factor

$V_i$  = standardized regression coefficient of variable  $i$  on unique factor  $i$

$U_i$  = the unique factor for variable  $i$

$m$  = number of common factors (Malhotra, Birks and Willis, 2012).

Cluster analysis is being used to classify objects or cases into comparatively homogenous groups/segments. Clustering procedures are divided into hierarchical or non-hierarchical. Hierarchical clustering can be characterised by the development of hierarchy structure (treelike structure). Non-hierarchical methods are mostly referred to k-means (which are classified as sequential threshold, parallel threshold and optimising partitioning) (Malhotra, Birks and Willis, 2012).

The next step of analysis is to create a typology of the Czech and Polish citizens (by using cluster analysis). Those types of citizens were created from the factor score. Unique typologies were created by using hierarchical cluster methods (Ward's method and Squared Euclidean distance).

By using Pearson's chi-squared test, author can describe dependency of opinions by the gender. Chi-square test is serving as a goodness-of-fit and a common contingency table tool (Hendl, 2006).

Data were put into Microsoft Office Excel, adjusted and then put into IBM SPSS Statistics 25 for proceed with analyses. All testing was performed at the 5% significance level.

### 3. Problem Solution

Analysis of data was made for Czech Republic and for Poland separately. Results of an analysis are presented in chapters 3.1 (Czech Republic) and in chapter 3.2 (Poland). Chapters include a design of typology for each researched country. Typology proposals are described at the end of a chapter (3.3).

#### 3.1 Czech Republic

This chapter is divided into reduction of factors and typology of citizens. Both of those results are shown on tables calculated by author.

##### 3.1.1 Reduction of Factors

Research included statements, here presented as factors. Dimensional reduction was made to reduce the number of factors. It was made by using factor analysis, extraction by principal components method, rotation Varimax. New factors were made by using Kaiser’s rule (Eigenvalue rule of value greater than one). Factor scores were made by using regression.

Table 1 contain information about Kaiser-Meyer-Olkin (KMO) measure. Coefficient has value 0.635. That proves that data are suitable for processing by factor analysis. It confirms the Bartlett’s test of sphericity. Signification is less than 0.05.

**Table 1: KMO and Bartlett’s Test – Czech Republic**

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.635
Bartlett's Test of Sphericity	Approx. Chi-Square	217.326
	df	10
	Sig.	.000

Source: author’s calculations

Result of a factor analysis brought two new factors. It was made by Kaiser’s rule. Two new factors explain 64.9 % of total variance.

**Table 2: Rotated Component Matrix – Czech Republic**

	Component	
	1	2
S2	.910	
S1	.858	.221
S5		.760
S3	.247	.712
S4	.230	.650

Source: author’s calculations

First factor include personal interest in Polish television and radio. The second factor include travelling, the pleasure from Polish language and interest in Polish history. For the exact results see Table 2. Created factor values are being used as input variables for a typology (specific results in Table 3 under 3.1.2 Typology of citizens in Czech Republic related to polish culture).

### 3.1.2 Typology of Citizens in Czech Republic Related to Polish Culture

Hierarchical cluster analysis was made to determine the right amount of clusters. This was made by using a Ward's method and interval measure, specifically Squared Euclidean distance. By using these methods was decided to create four clusters of citizens, although there is significant imbalance in number of citizens in some clusters.

Clusters were named by the types of answers as follows: the Polish supporter, the Self-harmer, the Hater and the Unhappy traveller. There are 6.3 % of polish supporters, 0.4 % of self-harmers, 42.5 % of haters and 50.8 % of unhappy travellers. Average responses for each statements questions are shown in Table 3.

**Table 3: Attitudes to Poland by Typology – Czech Republic**

Clusters	S1	S2	S3	S4	S5
Polish supporter	2.27	2.47	1.60	1.73	1.27
Self-harmer	1.00	1.00	4.00	3.00	4.00
Hater	3.93	3.98	3.32	2.92	2.69
Unhappy traveller	3.83	3.98	2.31	2.32	1.26
Total	3.76	3.88	2.70	2.54	1.88

Source: author's calculations

Cluster called Polish supporter can be described as a people, who do like polish culture, are watching TV and listening to radio, strongly agreed to liking Polish language, are interested in polish national history and they often go to Poland to no-shopping vacations. The second cluster, Self-harmer, describes a person who is watching polish TV and listens to polish radio, despite they do not like the language, show not much of an interest in Polish history and do not go to Poland for a trip or vacation. As can be seen in Table 3, exact values are indicating that there are not many citizens, who belong into second cluster. Into third cluster called Hater belong citizens, who do not like almost everything about Poland. They do not watch Polish TV, do not listen to Polish radio, do not much like the language, are not interested into history and do not go to Poland for vacation or trip. The last and the biggest cluster called Unhappy traveller describes citizens, who do not watch Polish TV and do not listen to polish radio, are not much of fans to polish language or history, but they often go to Poland for a trip or vacation. There is no statistical significance between typology and age or gender. This shows that culture distance is not dependent and it is clearly a personal thing. Crosstabs for typology and gender is shown in Table 4. There can be seen, that the inside of clusters are almost evenly distributed between male and females. In Self-harmer cluster is only one citizen.

**Table 4: Typology of Citizens by Gender – Czech Republic**

	Gender		Total
	Male	Female	
Polish supporter	8.2 %	4.6 %	6.3 %
Self-harmer	0.9 %	0 %	0.4 %
Hater	40.0 %	44.6 %	42.5 %
Unhappy traveller	50.9 %	50.8 %	50.8 %

Source: author's calculations

### 3.2 Poland

This chapter describes the results of research in Poland. Subsection shows outputs of factor analysis and description of typology of citizens in Poland.

#### 3.2.1 Reduction of Factors

Research included same five statements as in Czech Republic. As in research in Czech Republic author used dimensional reduction to reduce the amount of statements into less factors, extraction by principal components method, rotation Varimax. These new factors were made by using Kaiser's rule (Eigenvalue rule greater than one). Scores of factors were made by using regression, same as in Czech Republic.

Coefficient Kaiser-Meyer-Olkin (KMO) has value 0.672. That value proves that data are also suitable for processing by factor analysis. It confirms the Bartlett's test of sphericity. Signification is less than 0.05. Those results can be seen in Table 5.

**Table 5: KMO and Bartlett's Test – Poland**

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.672
Bartlett's Test of Sphericity	Approx. Chi-Square	75.960
	df	10
	Sig.	.000

Source: author's calculations

The inclusion of issues into the two new factors can be seen in Table 6 in rotated component matrix.

**Table 6: Rotated Component Matrix – Poland**

	Component	
	1	2
S2	.862	
S1	.842	.163
S5		.773
S3	.270	.635
S4		.620

Source: author's calculations

#### 3.2.2 Typology of Citizens in Poland Related to Czech Culture

The determination of number of cluster was made by hierarchical clustering, Ward's method and interval measure (Squared Euclidean distance). By using these methods author is describing three cluster of citizens.

The new clusters were named after agreement values with stated statements. New clusters are named: the Good neighbour, the Hater and the Traveller. There are 13.1 % of good neighbours, 35.3 % of haters and 51.6 % of travellers. Average responses are shown in Table 7.

**Table 7: Attitudes to Czech Republic by Typology – Poland**

Cluster types	S1	S2	S3	S4	S5
Good neighbour	2.55	2.30	2.25	2.60	1.45
Hater	3.96	3.83	2.85	2.85	2.48
Traveller	3.73	3.80	2.03	2.20	1.10
Total	3.66	3.61	2.35	2.48	1.63

Source: author's calculations

Good neighbours are those citizens, who are sort of interested in the other country, in this case Czech Republic. They do sometime watch Czech TV or listen to Czech radio, but it is not that often. Also, they are little bit interested in our history and appreciate our language, but they do not love it. It can be said that they do go to Czech Republic to vacations. Haters, based on the definition of a word, do not really like Czech language, they certainly do not watch Czech TV or listen to Czech radio. They are right in the middle of going or not going onto vacation in Czech Republic. Travellers can be quite often seen in Czech Republic on the vacation and they show some interest in Czech history and language. But they do not watch Czech TV and do not listen to Czech radio.

Like with Czech citizens there is no statistical significance between typology and age or gender. Crosstabs for gender and answer typology is shown in Table 8. There are more men in cluster Good neighbour and in cluster Traveller. In cluster of Haters there are evenly distributed men and women.

**Table 8: Typology of Citizens by Gender – Poland**

	Gender		Total
	Male	Female	
Good neighbour	14.0 %	11.9 %	13.1 %
Hater	31.4 %	40.3 %	35.3 %
Traveller	54.7 %	47.8 %	51.6 %

Source: author's calculations

### 3.3 Comparison of Czech Republic and Poland

The last subsection of paper compare the attitudes based on cultural distance in Czech Republic and Poland. For this purpose author is using t-test for independent groups (Czech Republic and Poland). This testing is carried out at the 5% significance level.

Same variances are in those statements: (1) I do like Polish/Czech language and (2) I'm interested in Polish/Czech history.

Same variances are not in those statements: (1) I do watch Polish/Czech television, (2) I do listen to Polish/Czech radio and (3) I go to Czech Republic/Poland to no-shopping trip/vacation.

Next step of t-test is testing of means. In those attitudes respondents from Poland and from Czech Republic have different approach (explained by means): (1) I do listen to Polish/Czech radio (Sig. 0.000), (2) I do like Polish/Czech language (Sig. 0.000) and (3) I go to Czech Republic/Poland to no-shopping trip/vacation (Sig. 0.018).

The average values for each statements are shown in Table 9. Highlighted cells are those, which have differences in between countries.

**Table 9: Compared Means by Countries**

Country	S1	S2	S3	S4	S5
Czech Republic	3.76	3.88	2.70	2.54	1.88
Poland	3.66	3.61	2.35	2.48	1.63
Total	3.72	3.77	2.56	2.52	1.78

Source: author's calculations

#### 4. Conclusion

The aim of this paper was to define consumer groups by their cultural distance to the other country. Based on their answers in questionnaire author worked with quantitative data. The questionnaire was published online and the data were collected via those questionnaires. Typology of consumers was based on statements about culture of the second country. There were five statements: I do watch Polish/Czech television, I do listen to Polish/Czech radio, I do like Polish/Czech language, I'm interested in Polish/Czech history, and I go to Czech Republic/Poland to no-shopping trip/vacation.

Respondents from Czech Republic were divided into four clusters: Polish supporter, Self-harmer, Hater Unhappy traveller. Most of them (50.8 %) are unhappy travellers, followed by haters (42.5 %). Unhappy travellers are citizens, who do not watch Polish TV and do not listen to polish radio, are not much of fans to polish language or history, but they often go to Poland for a trip or vacation.

Respondents from Poland were divided into three clusters: Good neighbour, Hater and Traveller. Most of them (51.6 %) are Travellers. Travellers can be quite often seen in Czech Republic on the vacation and they show some interest in Czech history and language. But they do not watch Czech TV and do not listen to Czech radio.

Cultural distance is a thing in both countries and it would be good to cooperate for erasing the Hater clusters and transforming them into something more positive and common.

Future research could contain more countries, or go deeper into cultural distance. Another point of view could be achieved from different questionnaire and different analysing methods, for example structural equation modelling.

### **Abstract**

*During a historic UN Summit in 2015, the 17 Sustainable Development Goals (SDGs) of the 2030 Agenda for Sustainable Development (SDG) was adopted and, along with the one decade Europe 2020 strategy, became a target setting for the current EU. Interestingly, SDG 9 deals with Industry, innovation and infrastructure and calls for the fostering of innovation. The EU translates it into a demand for an increase in R&D while observing the R&D to GDP ratio – Gross domestic expenditure on research and development (GERD) index, the DESI index and European patent application for inventions. But are these goals real, legitimate, effective and efficient? Is fostering innovation a myth or reality in the EU in 2018? A law, economic and IT overview suggests that modern European integration and the single internal market with the expected vigorous and fair competition, employing modern IP, can hardly be imposed from above. The fostering of innovation demands a bottom-up and multi-stakeholder approach and a humble admission that both criteria and targets set by the EU are at least partly futile vis-à-vis the much needed fostering of innovation.*

**Keywords:** Europe 2020, innovation, sustainable development

**JEL Classification:** F63, K20, O31, O32

### **1. Introduction**

During a historic UN Summit in September 2015, the Resolution Transforming our world: the 2030 Agenda for Sustainable development (Agenda 2030) with its 17 Sustainable Development Goals (SDGs) and 169 associated targets was adopted by world leaders (UN, 2015). In January 2016, these SDGs became universally applicable in order to mobilize efforts and stimulate action towards them for the next 15 years. Since they are not legally binding per se, the states and other subjects of International law are expected to establish and employ appropriate national legal and order measures assisting in their achievement, i.e. it is well recognized that each country has the primary responsibility for its own development. SDG 9 means to build resilient infrastructures, promote inclusive and sustainable industrialization and foster innovation (SDG 9). Agenda 2030 explicitly includes within the SDG 9, the building of infrastructure to support economic development, promotion of inclusive and sustainable industrialization, increase of access of SMEs to resources and enhancement of scientific research with upgrades of technological capabilities in all countries, including the increase of the information systems and information technologies (“IS/IT”) and affordable access to the Internet (Turečková, 2016). Indeed, our post-modern global society depends upon the use of IS/IT and is marked by digitalization, aggressive competition and economic and other crises (MacGregor Pelikánová, 2013). Innovation has become an integral part of policies to promote growth, but the public financial support for (private) R&D is constrained by limited public budgets and other public factors (Blind et al., 2017). Empirical studies find that innovation activity leading to practical results came often from the private sector and tend to increase with

the size of firm (Damijan et al., 2017), a similar trend applies to the standards in Corporate Social Responsibility (“CSR”) (Adámek, 2016). The concept of economic and political integration with the dominance of technocratic over political institutions (Lianos, 2010) with the intensification of the supranational approach over the intergovernmental approach have formed both the current EU, EU law and EU decade strategies. The internal single market with the famous four freedoms is at the heart of the EU (MacGregor Pelikánová, 2017) and The EU strategy for 2000-2010 aka the “Lisbon Strategy” or “Lisbon Agenda 2000” set the highly ambitious strategic goal “to become the most competitive and dynamic knowledge-based economy in the world, capable of sustainable economic growth by 2010”. Under the auspices of the Lisbon Strategy, the EU planned on catching up and even passing the high rate of economic growth in the US (Balcerzak, 2015). Soon, it became clear that this was an unrealistic ‘mission impossible’ and the shift of the blame for that to the new accessing EU members (Wanilin, 2006) is neither fully correct nor in compliance with the EU fundamental principles. The destiny of the Lisbon Strategy was sealed by the set of crises of 2007 and 2008. The European Commission got the message and took over from the European Council the preparation of the strategy for a new decade, 2010-2020, which should have more realistic and rather IS/IT suitable goals, while paying special attention to the boost and use of innovations. On March 3, 2010, the European Commission issued the COM(2010) 2020 final Communication Europe 2020 – A strategy for smart, sustainable and inclusive growth AKA “Europe 2020” with three mutually reinforcing priorities – smart, sustainable and inclusive growth, translated into five headline targets and seven flagship initiatives. Europe 2020 is a product of a time when the European economy faced crises and post-crisis issues and the economic indicators were back to 1990s levels (Çolak & Ege, 2013). Europe 2020 attempts to address two methods of economic growth through innovation – technological competitiveness and growth accumulated by cost competitiveness (Terzić, 2017). The technological progress and innovation implemented into new technologies should be outputs of effective synergy about how Europe 2020 can act as symbiotic parallel along with the EU Competition policy (Kordoš, 2016). Hence, the first priority of Europe 2020, smart growth, requires the development of knowledge and innovation and their business use and is quantified by the target demanding that 3% of the EU’s GDP be invested in R&D. In 2010, the R&D spending in the EU reached only 2% of GDP, while the rate in the US was 2.6% and in Japan 3.4% so the European Commission implied that without an increase in this respect, the EU would sink to the second, or even lower, rank of the global order (Walburn, 2010). Agenda 2030 with the SDG 9 reacts to this pragmatic economic fear regarding the decrease of the global competitiveness of the EU as well as the sustainability and social dimension (Pakšiová, 2016). Innovation and the use of IS/IT are key areas for the European Cohesion Policy (Billon, 2017) and the SDG 9 became fully embraced by the EU, which recently issued Sustainable development in the EU – Monitoring report on progress towards the SDGs in an EU context (“Monitoring report 2017”) covering all 17 SDGs (Eurostat, 2017). This leads to the questioning of the innovation setting, namely whether the EU truly fosters innovation in 2018. What can be implied from the set legal, political and economic framework and the dynamic results of the amount of spending, as compared to the GDP, for the R&D - the GERD index? What do other indicators suggest, such as the DESI index or the data of the European Patent Office (“EPO”)? Do we have a futile, ineffective and inefficient or a real, effective, efficient, fostering of innovation? Is the fostering of innovation a myth or reality in the EU in 2018? A law, economic and IT overview suggests that modern European integration and the single internal market with the expected vigorous and fair competition employing modern IP can hardly be imposed from above. The fostering of innovation demands a bottom-up and multi-stakeholder approach and a humble admission that both criteria and targets set by the EU are at least partly futile vis-à-vis the fostering of innovation.

## 2. Problem Formulation and Methodology

Both Agenda 2030 and Europe 2020, are declared as fostering innovation. The EU, via Europe 2020, translates it into a demand for an increase in R&D, while observing the R&D v GDP ratio (GERD) index (Nevima & Kiszová, 2013). However, is the wording and spirit of Europe 2020 materialized in real life? Is it real, legitimate, effective and efficient for the EU top institutions to set such a priority, targets and flagship initiatives? Can, and does, the EU select and employ conceptually right, i.e. effective, and appropriately operating towards set goals, in short, efficient, methods in this respect? What are the results? Is fostering innovation a myth or reality in the EU in 2018? A scientific and academic assessment of SDG 9, in particular the fostering of innovation by the EU in 2018, requires an open minded selection and search of multidisciplinary primary and secondary sources from jurisdictions. The cross-disciplinary nature suggests that the data yielded by the indicated search is to be processed by Meta-Analysis (Silverman, 2013), while confronting the hard mathematical data offered by Eurostat and summarized by GERD index, DESI index and the indicative numbers of IP assets represented by European patent applications with the proclamations of the Agenda 2030 and goals of Europe 2020. GERD reflects the investment's commitment to the R&D in co-relation to the GDP, while the DESI index is a composite Digital Economy and Society Index (DESI) that summarizes some 30 relevant indicators on Europe's digital performance and tracks the evolution of EU Member States, across five main dimensions: Connectivity (25%), Human Capital (25%), Use of Internet (15%), Integration of Digital Technology (20%), and Digital Public Services (15%). The GERD index investment commitment and the DESI index digitalization use have to be appreciated in the context of innovations reaching the perhaps highest protection status – patents. The holistic perception and critical Meta-Analysis (Silverman, 2013) of the quantitative and qualitative data and methods, including confronting achieved results, with deductive and inductive aspects of legal thinking (Matejka, 2013) and interpretation of legal and political texts, offers a unique, both argumentative and axiomatic, context leading to Socratic questioning (Areeda, 1996) A law, economic and IT overview boosted by the data demonstrates the limits of the 'from the above' imposed fostering innovation in the not so harmonized EU, since cultural differences and diverse private investment in R&D readiness points to the EU of many faces, speeds and Intellectual property ("IP") commitment.

## 3. Problem Solution

Addressing the presented burning questions about the reality or fiction of the fostering innovation in the EU demands, based on the above presented contextual summary, calls for three key analyses of the SDG 9 - the evolution of the GDP v. R&D ratio – GERD index (3.1), the DESI index (3.2) and IP assets - EPO patent applications (3.3).

### ***3.1 Fostering Innovation by the R&D Spending (GERD Index) – Myth or Reality?***

It is suggested that R&D is the key variable explaining innovation (Billon, 2017) and Europe 2020 determined that the R&D spending in the EU in 2010 in the amount of only 2% of the GDP is way behind the ratio of the EU's competitors on the global market and that the EU target to be reached in 2020 is 3%, otherwise the competitiveness of the EU and EU businesses will be severely, if not irreversibly, jeopardized. The overview of the dynamics of the evolution of the GERD during the first 6 years of the Europe 2020 is instructive. Since data for 2010 does not yet reflect Europe 2020 and data for 2016 is not fully available, the dynamic observation targets the years 2011, 2013 and 2015, see Table 1.

**Table 1: R&D v. GDP (%), GERD Index, in the EU and Selected EU Member States in 2011-2015**

	2011	2013	2015	Comment
<b>EU</b>	1.97	2.02	2.04	Minimal growth
<b>Belgium</b>	2.16	2.33	2.47	Growth progress
<b>Bulgaria</b>	0.53	0.63	0.96	Growth progress
<b>Czech Republic</b>	1.56	1.90	1.93	Growth progress
<b>Denmark</b>	2.94	2.97	2.96	Stagnation
<b>Germany</b>	2.80	2.82	2.92	Slow growth
<b>Greece</b>	0.67	0.81	0.97	Progressive growth
<b>Spain</b>	1.33	1.27	1.22	Slow decrease
<b>France</b>	2.19	2.24	2.27	Slow growth
<b>Italy</b>	1.21	1.31	1.34	Slow growth
<b>Finland</b>	3.64	3.29	2.90	Decline, but mtg target
<b>Sweden</b>	3.25	3.31	3.27	Stagnant, but mtg target
<b>United Kingdom</b>	1.67	1.65	1.67	Stagnation

Source: prepared by the author based on Eurostat data (Eurostat, 2018)

Since in 2015, the GERD of the USA was 2.79%, of Japan 3.4% and of South Korea 4.29% (Eurostat, 2018), then Europe 2020 seems to have selected an effective target of the GERD of 3%. At the same time, it is highly questionable how realistic and efficient is it. According to one of the 7 flagship initiatives of the Europe 2020, the aim is to re-focus R&D and innovation policy on the challenges facing our society, the Commission has to launch and complete various programs while EU member states should reform national R&D and innovation systems and prioritise knowledge expenditure, namely promote greater private R&D investments. In the light of sustainability and inclusion, it is of a high concern that basically each EU member state slowly oscillates around its amount of GERD and there is neither a generally increasing trend nor a unification trend. Unless the EU rejects the indicative value of GERD for the innovation fostering, the semi-conclusion emerges that innovation fostering in the EU, while considering the investment aspect, is a myth. Even, it can be argued, that this myth is caused by a misunderstanding of the EU competencies and capacities, i.e. Europe 2020 endeavours towards SDG 9 are not succeeding due to the lack of the *de iure* and *de facto* power of the EU and EU institutions powers (Pasimeni & Pasimeni, 2016) and generally legality in this respect. Based on the GERD dynamics, Europe 2020 aims vainly to increase the EU's innovation drive and global competitiveness (Erixon, 2010). However, the expenditure on R&D cannot be treated mechanically as a guaranty of building and fostering innovation (Balcerzak, 2015). Also, the public and private R&D investments are complementary rather than substituting (Hammadou, 2014) and the role of involvement of the educational system and academia is not be underestimated, instead the awareness needs to be increased (Staničková, 2016). There is a competence deficit and the GERD 3% issues are merely arbitrary and incidental indicators and that instead the fostering innovation reality of the EU should be measured based on true outcomes, and not on the money invested and spent pursuant to the EU command, namely on digitalization and IP protected assets.

### **3.2 Fostering Innovation by the Digitalization (DESI Index) – Myth or Reality?**

The DESI index testifies about advanced digital economies, which is perceived as highly needed for an IS/IT success and competitive advantage in the global marketplace. Since

Europe 2020 explicitly deals with the single internal Digital market, and one of its seven flagship initiatives is the digital agenda for Union, it can be well argued that fostering innovation in the EU pursuant to Agenda 2030 and Europe 2020, especially vis-à-vis the SDG, has to be reflected by the DESI index and the EU member state's ranking.

**Table 2: DESI Rating of the EU and Selected EU Member States in 2017**

DESI index	Over 0,6	0,5-06	0,4-0,5	0,3-0,4
States	DK, FI, SE, NL, LU	BE, UK, IE, EE, AT, DE, ES, PT	CZ, SK, HU, PL, IT	EL, BG, RO

Source: prepared by the author based on DESI index charts and information (EC, 2017)

The DESI scores presented in Table 2 represent a wide diversity between EU member states, but does not provide a great deal of information about fostering innovation. However, this can be achieved by an analysis of each of the 5 main dimensions. Firstly, in re connectivity, the best is NL, LU and BE, and the weakest BG and PL, while in general the number of high-speed connections reaches 75%. Secondly, for Human capital – digital skills, DK, LU, FI, SW, NL excel, while BG, EL, IT fail. Although 79% of Europeans go online at least once per week, 44% of Europeans still do not have basic digital skills. Thirdly, regarding the use of the Internet by citizens, the highest activities go to DK, SW, LU and LU and, again, lagging way behind is RO, BG and IT. Interestingly, 70% of Internet users read news online, 66% shop online, 59% do e-banking. Fourthly, regarding the integration of Digital Technology by businesses, the best results are achieved in DK and FI, while bringing up the rear are RO, PL and BG. Although European businesses are increasingly adopting digital technologies, such as the use of a business software for electronic information sharing (from 26% in 2013 to 36% of enterprises in 2015), sending electronic invoices (from 11% in 2014 to 18% of enterprises in 2016) or using social media to engage with customers and partners (from 14% in 2013 to 20% of enterprises in 2016), these results are not impressive. Even worse is the extremely low level and slow growth of the e-commerce by SMEs going from 15% in 2014 to 17% of SMEs in 2016. Fifth, regarding digital public services, the best in e-government and related services are EE, FI and NL, the worst RO, HU and HR. In general, the availability of online e-public services went from 75% in 2014 to 82% in 2016, but their real use reached only slightly over 30% (EC, 2017). Well, the EU member states and their subjects follow different legal, cultural, and other traditions (MacGregor Pelikánová et al., 2017) and share a diverse attitude to the IS/IT. The message about the Digitalization and DESI adds to the already identified insufficient investment in innovation (see GERD index) the grim results about the transposition and implementation of innovation in the IS/IT environment in the current society. This lends credence in re a deep problem of the EU and Europe 2020, and especially the fact that SMEs, instead of becoming more competitive thanks to innovations, are actually weakly involved in digitalization. Nevertheless, it can still be argued that the Agenda 2030 and Europe 2020 are leading to an effective and efficient fostering in the EU, due to the fact that many vibrant and competitive advantage generating IP assets are produced and benefit by the law protection. Is this truth or wishful thinking?

### **3.3 EPO IP Assets as the Evidence About Fostering Innovation– Myth or Reality?**

Monitoring the report 2017, reflecting the meeting of goals set by Europe 2020 and Agenda 2030, addresses the SDG 9 while using the above discussed GERD index, the employment in the IS/IT sector and the number of R&D personnel with, as yet, inconclusive data, and the number of patent applications to the EPO (Eurostat, 2017). Well, fostering innovation should

lead to positive IP outcomes, i.e. IP protected assets and innovation are often matched by an actual invention, and the best evidence and protection for an invention is a granted patent. Hence, it seems appropriate to measure the EU's fostering of innovation by the number of inventions for which a patent was granted. Therefore, it is definitely relevant to consider the data on patent applications to the European patent office, namely the number of patent applications filed with the EPO in general and by EU member states.

**Table 3: Total Number of Patent Applications (in Thousands) to the EPO in 2011-2014**

Year	2011	2012	2013	2014	Comment
<b>Patent applications</b>	57.5	56.8	56.7	56.7	

Source: prepared by the author based on Monitoring report 2017 (Eurostat, 2017)

The number of patent applications by EU subjects to the EPO has been stagnating, while the GERD index and DESI index have been going up. It must be emphasized that subjects from the EU member states with the highest GERD had the highest number of patent applications per capita (Eurostat, 2017). To reach a deeper understanding of this, the number of patent applications filed in 2011-2014 needs to be broken down by the EU member states of these applicants, and confronted with the number of granted patents in 2016. This time gap was selected based on the experience that the EPO patent proceedings often last 2-5 years, i.e. the EPO granted patents in 2016 based on applications filed generally in 2011-2014.

**Table 4: Number of Patent Applications and Granted Patents by EPO by Selected EU Member States**

Patent applications per state and year	2011	2012	2013	2014	Comment – 2016 granted patents
<b>Belgium</b>	2014	1886	1882	1927	1114
<b>Bulgaria</b>	16	13	23	34	11
<b>Czech Republic</b>	162	140	151	167	95
<b>Denmark</b>	1782	1605	1942	1983	1033
<b>Germany</b>	26202	27249	26510	25633	18728
<b>Greece</b>	78	79	68	95	39
<b>Spain</b>	1404	1544	1504	1471	752
<b>France</b>	9617	9897	9835	10614	7032
<b>Italy</b>	3970	3744	3706	3649	3207
<b>Finland</b>	1548	1851	1894	2482	1081
<b>Sweden</b>	3638	3518	3674	3873	2661
<b>United Kingdom</b>	4746	4716	4587	4764	2931

Source: prepared by the author based on EPO data (EPO, 2018)

This leads to a logical conclusion that EU member states which spend more on R&D, as witnessed by the GERD index, generally benefit by a more developed and wider spread digitalization, as witnessed by the DESI index, and have subjects which generate more EPO applications and even granted patents. However, some limitations need to be presented. First, the eagerness to file an application with the EPO does not always mirror the well supported and fostered innovation drive. It is more reliable to consider only the successful applications, i.e. patents granted by the EPO. Second, a patent is not always the preferred method and instrument for IP protection and SMEs often use business secrets, contracts, unfair competition and other regimes. Third, patented innovations which do not manage to pass the Rubicon and

became employed in praxis could hardly be considered as a demonstration of effective and efficient innovation fostering. Fourth, there are as well other patents to be obtained, i.e. there is a choice between national, regional and international patents and so the EPO is not the only institution granting valuable patents with a possible scope of use in the EU. Last, and perhaps most importantly, the IS/IT sphere is very different and distant from traditional industrialization. Computer programs, software and other instruments and platforms to be used by post-modern society in the global environment are excluded from patent protection and instead are a subject matter of copyright and other law mechanisms.

#### 4. Conclusion

Pursuant to Europe 2020, Agenda 2030 and other strong strategic and/or legal documents, the EU takes seriously SDG 9 and hence has taken since 2010 a very strong commitment to support effective and efficient fostering innovation. However the official data provided by the EU, such as the GERD index, DESI index and EPO application and patent numbers show a very different picture. The post-Lisbon EU and its internal signal market desperately need a vigorous and fair competition employing modern IP assets, which are outcomes of effective and efficient fostering innovations. However, all plans and goals set by the EU and its top institutions in this respect do not lead to such a result. The differences between EU member states remain and EU member states appearing as champions of fostering innovation have reached such results rather thanks to the long ongoing bottom-up, multi-stakeholder and national approach. Germany and the Northern states do better in all accounts vis-à-vis innovation fostering than other EU member states. The differences between EU member states show no signs of diminishing and the indexes and data about the fostering innovation trends are not unanimously going up. It appears that proclamations and declarations of the EU are mere wishes for the setting and imposing, but they lack both the competence and capacity. Fostering innovation was and remains in hands of the EU member states or more specifically in the hands of Europeans. All stakeholders, including the EU, EU key institutions and EU leaders, have to humbly accept that even the best meant requirements and targets set by the EU are at least partly futile vis-à-vis the much needed fostering of innovation, that the endorsed indexes are merely indicative and that fostering innovation is a complex process needed to be done while taking an open-minded and bottom-up approach. The EU should implement policies on organizational and institutional improvements and incentives for stimulating inter-organizational collaborations, i.e. promote open-minded institutional efficiency, reduction of institutional barriers (De Noni et al., 2018), industry 4.0 trend and the involvement of businesses, including SMEs. Regarding fostering innovation (and not only about that), the EU should be the facilitator, not the directive organizer. So far, fostering innovation in the EU and the related discussions are oscillating between chimerical myths of the all knowing and ordering EU and pragmatic reality and this is hardly reconcilable with the Europe 2020 proclaimed smart, sustainable and inclusive growth.

### **Abstract**

*The agri-food trade of Hungary with the EU has increased since the accession. The goal of paper is to examine the competitiveness of the Hungarian agri-food product groups on the EU market. The data came from the COMEXT database of the European Commission, regarding the period between 2004 and 2016. To evaluate the competitiveness of agri-food product groups the price–quality method was chosen. Two of the Hungarian agri-food product groups were part of the successful quality competition segment that is meat and meat preparations as well as sugar, sugar preparations. Successful price competition segment encompassed the group of cereals and cereal preparations. The trade with EU highlights a problem that the proportion of raw materials and low added-value products in the Hungarian agri-food export are high. We create jobs abroad, not at home. The export should be improved by producing own-brand food products with high added value. Governmental interventions have also a key role in the enhancement of competitiveness.*

**Keywords:** added-value, agri-food trade, competitiveness, EU market

**JEL Classification:** F14, L16, Q17

### **1. Introduction**

The agri-food industry is an important economic sector of the Hungary with great traditions. Due to the favourable natural endowments the country is capable of producing food products with excellent quality valuable for the market and competitive in foreign markets (Magda, 2008). In general, the accession had a positive impact on the Hungarian agri-food sector. It resulted in a consolidation of production, higher current prices, higher export and import quantities, and especially higher farmers' incomes (Csáki and Jámbor, 2009; Potori et al., 2014). Hungary's joining to the European Union has brought a lot of advantages. In the case of foreign agricultural trade the possibility of expansion has opened after the integration, and so would be able to build and stabilise new trading relations (Vásáry and Vasa, 2015). The 2004 accession reduced the barriers to bilateral trade with the EU Member States. The EU membership itself allowed the free movement of goods within the new Member States where the framework conditions for trade are determined by the Common Commercial Policy of the EU. (Vásáry et al., 2012; Fojtiková, 2014; Constantinovits and Sipos, 2016).

The Hungarian agri-food export has increased since the accession to the EU with the exception of the year 2009. This paper focused on the development of agri-food trade between Hungary and the EU since 2004. In the article the European Union (EU) means all the members including the new ones. Other goal of paper was to evaluate the competitiveness of the Hungarian agri-food product groups on the market of the European Union. The agri-food trade with EU has increased dynamically, however, the analysis points out the problems of the Hungarian agri-food trade.

## 2. The State of the Hungarian Food Industry

The food industry proved to be a big loser of EU accession. The output of food industry declined by more than 20% since 2004. Currently, it is the third largest sector within the processing industry, which aptly indicates its importance. The production value of the food business amounted 9 billion euro in 2017. The dominant branch of the food industry is the food production with 84% share. Besides, the beverage production has a share 15% percent and tobacco production has a share 1% in the food output. Approximately, 60% of the food sales are domestic and 40% are exported. The proportion of employees in the Hungarian food industry is stable compared to the national economy and accounts for about 140,000 people. (Hungarian Statistical Office 2017) The main characteristics of the food industry are shown in Table 1.

**Table 1: The State of the Agri-Food Sector in the Hungarian Economy**

year	Food industry			Food. Beverages and Tobacco			Consumer price index (previous year = 100%)	
	In employment (%)	in GDP (%)	investment (%)	in Consumption (%)	in Export (%)	Trade balance (million €)	Food	Total
2004	3.6	2.4	3.7	26.1	6.0	888	106.5	106.8
2005	3.6	2.3	3.6	25.1	5.8	728	102.5	103.6
2006	3.6	2.2	3.1	25.8	5.5	808	107.7	103.9
2007	3.4	2.0	3.2	24.2	6.3	1435	111.5	108.0
2008	3.3	1.9	2.5	27.1	6.7	1487	110.2	106.1
2009	3.5	2.2	2.5	28.0	7.2	1226	104.4	104.2
2010	3.5	2.0	3.0	27.5	6.9	1685	103.2	104.9

Source: based on the data of Hungarian Statistical Office 2017

The agribusiness have a more important role in the national economy than agriculture and food industry together. Agricultural economy involves not only agriculture, forestry, and fishing, but also food processing as well, while agribusiness includes all activities that come before or follow agricultural processes. The food industry has a share of about 2% in the GDP. The agriculture and other activities (artificial fertilizer and pesticide production, agricultural

machinery and component production and distribution, as well as agricultural trade, transportation, education, research, etc.) represent another 12% in the GDP thus agribusiness has a share of about 14% in the GDP. (Hungarian Statistical Office 2017)

### 3. Material and Methods

The data of analysis come from the database of the European Commission (in COMEXT system) regarding the period between 2004 and 2016. Trade flows are aggregated according to the product groups (main groups of SITC classification) and according to the partners (Hungary, European Union). In our survey “agri-food product group” refers to food and live animals; beverages and tobacco (SITC 0 and 1).

The term competitiveness is commonly used in the economic research and also in public debate. Competitiveness can be defined as the ability to face competition and to be successful. Competitiveness would then be the ability to sell products that meet demand requirements (price, quality, quantity) and, ensure profits over time that enable the firm to thrive. Competitiveness is a relative measure. It is, however, a broad concept and there is no agreement on how to define it, nor how to measure it precisely. (Latruffe, 2010) The competitiveness of estimation results show that the connection between quality and agri-food export performance clearly depends on the product category and country (but not on the period) and differs, but not in all cases, according to the export destination. (Fischer, 2007)

To evaluate the competitive positions of Hungarian agri-food product groups on EU market we chose the price–quality method. This concept, was developed by Aiginger (1997, 1998) to evaluate whether the external performance of a given country depends on price competitiveness or non-price competitiveness. Bojnec and Fertő (2008) combined export-to-import unit values and trade balance by product for assessing price competition and product quality in trade. Application of the two variables allows us to categorize the product groups into four segments:

Category 1 - Unsuccessful quality competition. Trade deficit is achieved at higher export price than import price.

Category 2 - Successful quality competition. Trade surplus is achieved at higher export price than import price.

Category 3 - Unsuccessful price competition. Trade deficit is achieved at lower export price than import price.

Category 4 - Successful price competition. Trade surplus is achieved at lower export price than import price. The essence of the method is shown in Table 2.

**Table 2: Competitiveness Matrix**

Relation between export unit value and import unit value	Trade balance	
	$X_j < M_j$ (trade deficit)	$X_j > M_i$ (trade surplus)
$UV^x > UV^m$	unsuccessful quality competition (1)	successful quality competition (2)
$UV^x < UV^m$	unsuccessful price competition (3)	successful price competition (4)

Source: own elaboration based on Poór (2010)

where  $X_j$  means export of a given group,  $M_j$  means import a given group; the  $UV^x$  is the export unit value and the  $UV^m$  is the import unit value. It should be noticed that the term „quality” does not mean quality in technological terms, but in economic term as higher price is assumed to reflect higher quality.

#### 4. Results and Discussion

The European Union is a very important exporter and importer of agri-food products in the world (its share in global trade in food amounts to 41%), and about 72% of the value of trade of the EU agri-food sector takes place as part of intra-EU trade (Figiel et. al., 2014). The development of degree of openness of Hungary (and the Visegrad4 countries as well) has been increasing since the change of regime. (Majerová and Nevima, 2014). The Hungarian agri-food export has increased since the accession to the EU with the exception of the year 2009. While the value of Hungarian agri-food export was 2.7 billion euro in 2004, Figure 1 shows an increase to 6.6 billion euro by 2016. However, the dynamism of the growth rate weakened in 2012 and it has been stagnating ever since. A similar trend can be seen on the import side. The import of agri-food products has been also increasing, in such rate like the export. In the year of the EU accession the value of Hungarian agri-food import was 1.8 billion euro then it increased almost two and a half times and in 2016 it amounted to 4.6 billion euro. On this basis the entire agri-food trade balance rose from 880 million euro (2004) to 2.05 billion euro (2016). Another important fact is that 84% of the agri-food trade are now completed in the European Union. After the accession the Hungarian agricultural trade increasingly shifted towards the European Union but the EU membership had no impact on the product structure (Jámbor and Vásáry, 2014). (Figure 1.)

**Figure 1: The Development of Hungary's Food Trade with EU (2004-2016)**

Source: own edition on the basis of Eurostat data, 2017

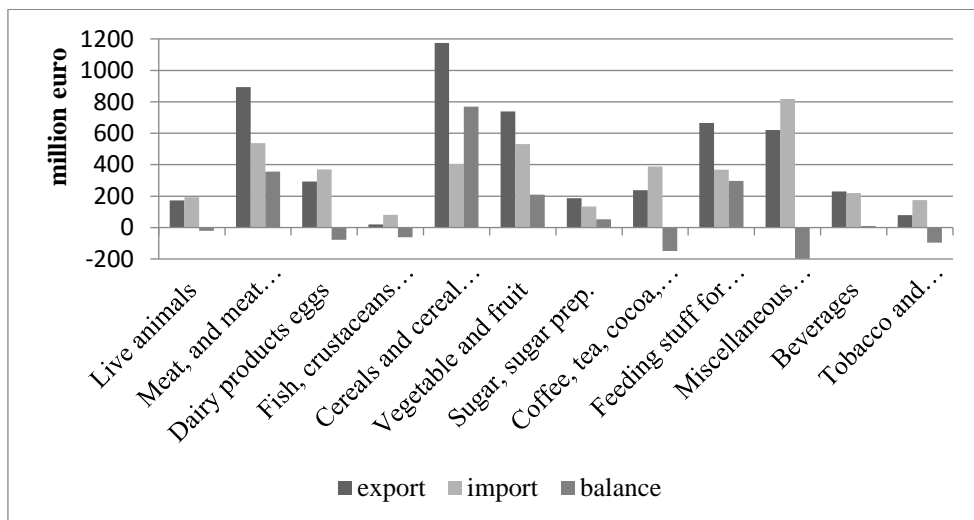

Hungary was one of the countries that could maintain a positive balance of foreign trade throughout the whole period. (Rajcániová, 2012) However, agricultural trade with the EU grew much more dynamically than Hungary's total trade with the EU or the total agricultural trade of Hungary (Hegedűs and Kiss, 2014). The increasing of food trade since 2004 on the market

of EU is not only a Hungarian phenomenon, several other postcommunist European countries (eg. Poland) have also increased the food trade (Firlej et al., 2017).

The export of agri-food goods is dominated by a small number of products, the import is concentrated to a lesser extent. The five greatest commodity groups – cereals and cereal preparations; meat and meat preparations; vegetables and fruit; feeding stuff for animal as well as miscellaneous edible products and preparation – contributed by 77 percent to the total agri-food export.

The five agri-food product groups with the greatest import values - miscellaneous edible products and preparation; meat and meat preparations; vegetables and fruit; cereals and cereal preparations as well as coffee, tea, cocoa and spices – represented 63% of the total agri-food import in 2017. The balance trade of cereals and cereal preparations (+770 million euro); the group of meat and meat preparations (+356 million euro); the feeding stuff for animal products (+297 million euro) as well as vegetables and fruit (208 million euro) with European Union is positive. The balance is negative in the case of miscellaneous edible products and preparation (-198 million euro); coffee, tea, cocoa (-149 million euro); tobacco and tobacco manufactures (96 million euro) and dairy products (-77 million euro). (Figure 2.)

**Figure 2: The State of Agri-Food Trade Between Hungary and the European Union by Product Groups (2016)**

## 5. Evaluation of Competitiveness

The main source of the increase in Hungarian food industry exports to the analysed markets is the general increase of the imports there. (Juhász and Wagner, 2013) We can state that only a few Hungarian agri-food product groups were competitive on the market of the European Union. Two Hungarian products groups belonged to the successful quality competition segment (2). These are the meat and meat preparations; sugar, sugar preparation and honey. It means that export quantities of products exceeded the import quantities despite higher unit values in exports than in imports. Between 2004 and 2014 the group of live animals was also part of this segment, but then it proved to be unsuccessful quality competitive. Successful

price competition segment (4) encompassed two product groups, that is cereals and cereal preparation as well as vegetable and fruit in the period 2007 and 2016 (except the year 2009 and 2012). It means that the Hungarian positive trade balance is achieved with lower export price than import price. Two Hungarian product groups belonged to the unsuccessful quality competition segment (1). These are coffee, tea, cocoa, spices and the miscellaneous edible products and preparation in the second period (2010-2016). These groups showed negative trade deficit with higher unit values in exports than in imports. The unsuccessful price competition segment (3) contained the dairy products eggs (since 2008) and the fish, crustaceans molluscs preparation (since 2010). In this case the Hungarian negative agri-food trade balance is achieved with lower export price than import price. (Table 3.)

**Table 3: Competitiveness Matrix of the Hungarian Agri-food Product Groups on the Market of European Union in 2004-2016**

HS	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
00	2	2	2	2	2	2	2	2	2	2	2	1	1
01	2	2	2	2	2	2	2	2	2	2	2	2	2
02	1	4	4	4	3	3	3	3	3	3	3	3	3
03	1	1	1	3	1	1	3	3	3	3	3	3	3
04	2	4	4	4	4	4	4	4	4	4	4	4	4
05	2	4	2	4	4	2	4	4	2	4	4	4	4
06	2	2	2	2	2	2	2	2	2	2	2	2	2
07	1	1	1	1	2	2	1	1	1	1	1	1	1
08	2	2	1	1	1	2	1	2	2	2	4	4	4
09	1	2	4	2	2	2	1	1	1	1	1	1	1
11	1	3	3	1	3	3	4	2	4	2	2	2	4
12	1	2	3	3	3	2	1	1	1	2	1	1	1

00 Live animals, 01 Meat, and meat preparation, 02 Dairy products eggs, 03 Fish, crustaceans molluscs preparation, 04 Cereals and cereal preparation, 05 Vegetable and fruit, 06 Sugar, sugar preparation and honey, 07 Coffee, tea, cocoa, spices, 08 Feeding stuff for animals, 09 Miscellaneous edible products and preparation, 11 Beverages, 12 Tobacco and tobacco manufactures

Source: Own calculation based on European Commission COMEXT database

In case of three product groups the competitiveness exactly cannot be detected. These are feeding stuff for animals; tobacco and tobacco manufactures as well as beverages.

## 6. Conclusion

One of the consequences of the growth in Hungarian agri-food exports is that Hungary has become highly dependent on the EU as an export market. The leading role of cereals is evident as Hungary is traditionally a country where maize, wheat, barley, sunflower and oilseed rape production exceeds domestic demand. The Hungarian animal stock decreased and the oilseed area increased as a result of the expansion of the EU biofuel industry. The major role of meat in Hungarian exports has been taken over by cereals. On the basis of price-quality method two Hungarian agri-food product groups were part of the successful quality competition segment, that is meat and meat preparations as well as sugar, sugar preparations. Successful price

competition segment encompassed the group of cereals and cereal preparations. Analysing the agri-food trade between Hungary and EU since accession we can conclude that there is a lot to do to improve the competitiveness of Hungarian agri-foods. The trade with European Union highlights a problem that concerning different product groups the proportion of raw materials in our food export is high, while we import agri-food products of high added-value. We create jobs abroad, not at home. The export should be improved by producing own-brand food products with high added value. Governmental interventions (e.g. in improving the labour market situation of the sector) have a key role in the enhancement of competitiveness. Besides, the governmental policies should promote the small and medium-sized Hungarian businesses to produce more quality competitive products.

### **Abstract**

*The issue of migration and migration policy has recently been a topic of concern not only among experts but also in the media. It should be noted here that the issue of migration and migration policy is by no means a new topic, but its importance is compounded by recent migratory events in some European countries. Similarly, in many cases, this issue is used in a negative way by political actors within the states of Europe, but also by political actors as Members of European Parliament. In general, it can be said that these facts degrade the migration itself, or weaken the positive features and benefits useful in the globalization world. In this context, our contribution is focusing on the current trends in migration within selected countries. Contribution is also aimed at the key attributes of migration policy dominating across the European Union. We are looking for answers to questions related to the importance of migration policy in contemporary modern and democratic countries.*

**Keywords:** migration, migration policy, public policy

**JEL Classification:** Q15, J48, J18, J24, J61

### **Introduction**

Migration is currently a phenomenon that due to the latest events has become a subject of interest not only for political representatives but also the media. These are ultimately responsible for the transmission of information related to migration and migration policy of nation states and they contribute to the variety of opinions, interest groups, political subjects as well as individuals on this relatively sensitive issue. Here it's however important to emphasize that migration and migration policy are in no way new subjects, on the contrary, they are subjects that have been present in political research for a few decades. Naturally, with different intensity and results. The current migration trends and the migration policy of nation states in Europe is impossible to judge without having knowledge of some of the developmental trajectories of the history of migration itself. In the context of this paper therefore the basic migration trends in the European sphere that have taken place primarily in the second half of the 20<sup>th</sup> century, will be considered, since precisely these ones significantly determine the direction of migration-political current nation states of Europe. Generally we can therefore state that the rapid economic growth in democratic countries of Western Europe after the Second World War and the subsequent economic problems at the beginning of the 70's are the common denominator of trends in the sphere of migration policy of the majority of countries of the European continent. (Štefančík, 2011)

## **2. Problem Formulation and Methodology**

The attention of political entities, the professional and wide public in matters of migration and migration policy of nation states is also given by the European Union. In this context we will, in the following sentences, deal with migration trends and migration policy in selected European countries. In this context we focus our attention on the state as they are Slovakia, Czech Republic, Hungary, Austria and Switzerland. From a methodological perspective we will base ourselves on the set of the following methods: method of qualitative assessment of collected data, based mainly on the subjective view of the author on the information and assessed based on an interdisciplinary approach to the said issue. The comparative method- in it the subjective views of the author on the said issue are compared with the already existing information. The method of synthesis- we use it mainly as a generic scientific method in connecting different findings that present only a part of the overall problem, into one explanatory whole. In synthesis then mutually important connections are observed which ultimately helps to discover internal patterns of functioning of the development of the phenomenon or the object in question. It's therefore an approach where conclusions are formulated based on previous findings. Here it's important to note that analysis and synthesis are contradictory ways of research, but in real life they are mutually and significantly compatible. Due to this reason they are called analytical-synthetic approaches since synthesis in many cases isn't possible without analysis as well as the other way round.

## **3. Problem Solution**

The Second World War significantly affected international migration. Generally we can say that this was more or less done negatively. Due to the events of the war people were forced to leave their homes and move to safer locations. In many cases there was also forced relocation of the population as directed by the state authorities, also because of the post-war situation in Europe.

In a similar spirit to that of the post-war migration was the migration that we could call, according to Münz's template, as colonial, or postcolonial migration. (Münz, 1997) Because of the end of the Second World War and also because of the weakening of former colonial powers, over 7 000 000 originally European citizens returned to Europe. They were mostly former members of the colonial government, the army and their family members. The worsening life conditions, political and ethnical conflicts forced the citizens of former colonies to also seek shelter in European countries such as Great Britain, France, Benelux countries, Italy, Portugal, Spain and many others. (Currel, 2004)

A significantly different type of migration was labour migration. It became an indispensable part of economic policies of the war-destroyed European countries. Political representatives were forced to deal with the issue of insufficient work capacities through the so-called open migration policy. This was generally based on recruiting cheap labor from economically and socially less developed countries. Members of these countries were willing to work for a relatively low wage which resulted in the native residents gradually losing interest in working in certain fields of national economy. The instruments for achieving this goal were various types of benefits (e.g. providing accommodation etc.). (Santel, 1995) The following table illustrates the estimated migration between the east and west after World War II:

**Table 1: Migration Between East and West 1945-1950**

Country of origin	Destination	Number
Poland (including former regions that belonged to Germany)	GDR, (mainly) FRG	7 000 000
Former Czechoslovakia	GDR, FRG, Austria	3 200 000
Parts of the former Soviet Union (Russia, Belorussia, Ukraine, Baltic countries)	GDR, (mainly) FRG	1 500 000
Hungary	GDR, FRG, Austria	225 000
Former Yugoslavia	GDR, FRG, Austria	360 000
Parts of the former Yugoslavia (nowadays Croatia, Montenegro, Slovenia)	Italy	200 000
Slovakia, Rumania, former Yugoslavia	Hungary	315 000
Hungary	Slovakia	73 000
Part of the former Soviet Union (current Russia)	Finland	400 000
Parts of the former Soviet Union (presently Belorussia, Latvia, Ukraine)	Poland	1 496 000
Former Yugoslavia	Part of the former Soviet Union (current Ukraine)	50 000
Part of the former Soviet union (current Ukraine)	Former Czechoslovakia	42 000
Germany, Austria (displaced persons, prisoners of war)	Poland, former Czechoslovakia	4 700 000
Together:		20 100 000

Source: (Fassmann, Münz, 1996)

A partial turn in the migration policy of Europe occurred in the 70's. This change mainly reacted to the situation in the world economy. The oil crisis showed multiple countries that the dependence on importing energy supplies is very treacherous. In this context oil became a significant political and economic weapon. Because of the recession in world economy, unemployment in European countries began to increase. Countries tried to lessen the consequences of this crisis by restricting the migration flows. It's important to note that despite the precautions the countries didn't manage to stop labor migration, but maybe to identify it's slowing down. Changes in migration policy occurred also in the context of changes in the social and political order in multiple countries of the former Soviet Union and a little while later also with the broadening of the European Union with states such as Austria, Sweden, Finland and Estonia, Lithuania, Latvia, Poland, the Czech republic, Hungary, the Slovak republic, Slovenia, Malta, Cyprus, but also Rumania and Bulgaria. (Horváth, 2016) It's important to remind that the European migration policy itself had in the context of the realities mentioned above, multiple phases:

- 1957 – 1990 coordination of policies of member states
- 1990 – 1999 cooperation with governments of member states
- Od 1999 – communitarisation of significant spheres of migration policy

These phases can be also divided based on the nature of the migration waves as follows:

- 1950 – 1980 – economic migration phase, the so-called Gastarbeitermodell
- 1980 – 1990 – forced migration phase (refugees, for example from the former Yugoslavia)
- From 1990 till today – mixed migration phase. (Hoesch, 2018)

Nowadays we can look at migration and migration policy from different angles. One of them is viewing migration from the perspective of the safety of the domestic state. In this context even the political parties view the issue of migration in European countries differently and with differing intensity. In the case of the Slovak Republic it can be said that migration and migration policy was never the number one in political discussions. The reason is also the fact that after 1989, thus after changes in the social system, compared to other European countries, foreign migration presented a negligible part. (Vašečka, 2009) This situation didn't change significantly even after the entry of the Slovak Republic into the European Union. From that moment on the number of foreigners legally residing in our country grew four times higher. Generally we can therefore state that the Slovak Republic is not becoming a target place for foreigners, but more of a transit country. (Zorkóciová, Ďuranová, 2016) It's however important to turn our attention also to the other side of the coin, to the migration of domestic citizens abroad. This has to do with labor migration. Because of low wages and a relatively high tax system, Slovaks are forced to leave their families and look for work abroad. Despite the fact that this reality is alarming, the attention given to this by political elite and professionals is negligible. In the last period we've witnessed that the labor market, despite the relatively low number of unemployment, needs the income of foreign work force especially in fields that require low-qualified work force. (Gut'an, 2012) We can therefore expect that with the influx of foreign work force, the demand for greater attention to migration and migration policy will be demanded from political representatives and the professional as well as the general public.

In the case of the Czech Republic the situation was similar to that of Slovakia, however with different results. The Czech Republic before 1989 was also a relatively closed country from the viewpoint of migration. We describe it as relative, since migration occurred with friendly countries (Cuba, Vietnam, Poland, Russia etc.) After 1989 the situation changed drastically on both sides. Because of economic reasons, part of the Czech population made use of the possibility to travel for work abroad. It's important to state that in relation to labor migration the highest percentage was found in citizens of the Slovak Republic, but a few years later they were replaced by the citizens of the Ukraine, followed by Vietnam, Russia and Poland. After the entry of the Czech Republic into the European Union, the country became part of the states with the highest rising number of migrants on the European continent. This increasing trend slowed down in 2008 which was ultimately caused by the economic crisis. Looking at the political parties and their election programs, one can state that political representatives take this issue seriously on all of its levels. One could also say that the recent presidential elections were held partially in the spirit of migration and the migration policy of the state. (Ministerstvo vnitra ČR, 2018)

Based on the statistics published in 2010, the population of Hungary is the most reserved among all countries of the European Union with regard to migrants. They even doubt the thesis that migrants are an important part of the economy of the country. This trend can be identified also presently, since Hungary approaches the subject of migration from a significantly pragmatic approach. The opinions of political parties in relation to migrants from the third world countries are especially negative. The current government is also equally critical. One of the representatives recently stated that there's a close link between migration and terror or that immigration is a safety risk for every European country. Here we can see a strict view of political representatives of the state to the issue of migration. Despite the significant critique

of this approach from some international NGOs and part of the representatives of the European Union, we can identify similar opinions in the eyes of the public. These are highly determined also by the constantly prolonged crisis state in the country that in case of need enables the government to include the army in helping the police with the protection of borders or other activities related to incoming migrants. (Cabinet Office of the Prime Minister, 2018)

Expressed in percentages, Switzerland is a country with the long-term highest number of foreigners in Europe. Contrary to other western European countries, Switzerland was confronted with immigration before the Second World War. During the war, thanks to the favorable political conditions, it provided shelter to many refugees of a Jewish origin as well as the capital that not only they, but also the former political elites of European states sent here. Despite the historically determined migrant traditions, similarly to the case of other western European countries, Switzerland as well dealt with a lack of workforce in certain fields of national economy by inviting foreigners. Even though the economic migrant in the context of the rotation principle was to remain in Switzerland only for a certain period of time after which he was to return to his domestic country, Switzerland didn't manage to stop the gradual rise of immigrants. The subject of migration and integration of foreigners is a regular component of the programmer theses of political parties, especially with regards to elections to the legislative bodies. (Machyniak, Štěpák, Švikruha, 2011) It's important to note that the anti-immigration policy is considered to be one of the key factors of the election fight between political parties. It's no different to the society itself, since a few years ago the building of mosques was prohibited and later it also turned against the suggestion to create primary schools for the Muslim community. Based on the latest published statistics in the field of migration, over 15 000 Italians, 14 500 Germans, 12 800 Portuguese, 6000 French, 5 200 Kosovans, 4 000 Spanish, 3 300 Serbians, 3 300 Turks live in the Swiss confederation. Most of the migrants come from the European continent and the number of members of third world countries has an annual slightly decreasing tendency. (Staatssekretariat für Migration, 2018)

Migration and migration policy have for quite a few years been an important topic of election and political parties. It's important to note that the radicalization of some originally moderate opinions has been occurring. The tendency of strongly nationalist-oriented political subjects making use of a majorly populist rhetoric, similarly as in Europe, is also present in Austria. The majority of the political parties are aware of the fact that Austria is a migrant country and that it will ultimately not function without laboring migrants. In this context the rationally-thinking political parties are more concerned with choosing the suitable and acceptable migrants. That means, those that are ready to learn the language of the host country and last but not least, to respect the domestic and European legal tradition. According to the statistics published so far there's about 186 000 Germans, 120 000 Serbians, 117 000 Turks, 102 000 Rumanians, 95 000 citizens of Bosnia and Hercegovina, 77 000 Hungarians, 76 000 Croatians, 62 000 Polish, 48 000 Syrians, 46 000 Afghani living in Austria. From this we can see that the population consists of a great variety of people, and the majority of them come to Austria because of new work opportunities. (Statistic Austria, 2018)

#### **4. Conclusion**

The issue of migration and migration policy itself has recently been a topic of concern among political representatives as well as the media that want to initiate a social discussion concerning this topic, or the change of the political orientation for nation states. Migration is constantly talked about as being a safety threat not only for nation states but for Europe as such. It should be noted here that the borders of Europe in the case of migration present a relative term. In the case of recent migration it has to do with the (non)acceptation of cultures that are traditionally

distant from the European culture. Migration undoubtedly brings about also the phenomenon of multiculturalism, the policy of which so far hasn't brought the desired fruits. Despite this, the situation on the European labor market will require in the future a coordinated migration policy based on rational needs of European states. From this perspective migration has a crucial impact on the structure of society. In case of an original country it presents an outflow, in many cases of important labor force, and for the receiving country there's an influx of new workers. (Antalová, 2016) In this context, from an economic point of view, it would be a clear advantage. However despite this, some authors claim that this doesn't have to be necessarily true or that when making statements of this type we should be particularly cautious. They claim that it's inappropriate and especially not responsible to waste our own human resources. We should be more willing instead to requalify people. (Colemann, 1992) Naturally this is only possible if the economy in the country has a long-term economic growth. As a conclusion we could state that nowadays European countries are standing on the crossroads and the next steps done in the sphere of migration policy will show the nature of Europe in the years to follow.

### **Abstract**

*High competitiveness of the economies of the Member States, economic, social and territorial cohesion and sustained convergence of the economic performances of the Member States are among the EU's basic economic objectives. Many Member States achieve these objectives, but some Member States have failed to do so for a long time. Despite the successes and benefits of the EU internal market and common policies, the existence of the monetary union and the coordination of Member States' economic policies, despite the positive economic effects of European integration, economic and social differences between some EU Member States and the rest of the EU persist or even grow for a long time. Also, the levels of competitiveness remain very different between EU Member States. The gap between the most and the least competitive EU countries persists or even increases for a long time. Economic convergence is therefore not a general phenomenon across the EU. This has its consequences in terms of weakening EU cohesion and emergence of disintegration tendencies in some EU countries.*

**Keywords:** cohesion, competitiveness, convergence, European Union, integration

**JEL Classification:** F15, F32, F36, F42, O47

### **1. High Competitiveness and Sustained Convergence as the EU's Goals**

The Treaty on European Union and the Treaty on the Functioning of the European Union as well as EU legal acts are basically formulated to support the process of deepening European integration. At the same time, the EU Treaties and EU legal acts set out and support such economic objectives and measures that should lead to high competitiveness of the economies of the Member States, economic, social and territorial cohesion and sustained convergence of the economic performances of the Member States.

Article 1 of the Treaty on European Union states that this Treaty marks a new stage in the process of creating an ever closer union among the peoples of Europe. Article 3 of the Treaty on European Union sets out the economic objectives of the EU, particularly balanced economic growth, price stability, full employment, high competitiveness of economies and economic, social and territorial cohesion, and declares the euro as the single currency of the EU.

The basic objectives of the European Union are dealt with in more detail in the Treaty on the Functioning of the European Union. According to Article 119 of the Treaty on the Functioning of the European Union, the economic policy in the EU is based on the close coordination of Member States' economic policies and on the definition of common objectives. Article 121 of the Treaty on the Functioning of the European Union calls for the coherence of Member States' economic policies with the broad economic policy guidelines of the EU and for the sustained convergence of the economic performances of the EU Member States.

The essential components of the EU's economic architecture are the internal market ensuring the free movement of goods, services, persons and capital between all Member States and the monetary union – the euro area – operating nowadays with 19 member countries, inter alia to complement the internal market and further improve its functioning. The internal market is complemented by common policies designed to ensure the same or similar conditions for all Member States and all entities within the internal market as well as to reduce economic and social differences between the Member States. The monetary union is complemented by the mechanisms for coordination of Member States' economic policies.

Despite the deepening of integration of the EU Member States, despite the pursuit of objectives such as high competitiveness and sustained economic convergence, despite the successes and benefits of the EU internal market and common policies, despite the positive economic effects of European integration, economic and social differences between some EU Member States and the rest of the EU persist or even grow for a long time. Also, the levels of competitiveness remain very different between EU Member States. For example, Kouba, Mádr, Nerudová and Rozmahel (2016, pp. 65–66) argue that “Europe is still too heterogeneous and it will remain so in future, simply because of the fact that people in Ireland, Hungary, Portugal or Sweden are different, have a distinct mentality, culture, traditions, social relations and ways of thinking”. This creates a clear contradiction between the vision of the ever closer Union and the persisting economic and social differences between many EU Member States.

## **2. Relevant Indicators, Data and Methodology**

In the following analysis, we will show the long-term existence of a group of EU Member States with high economic levels and high competitiveness and, on the contrary, a group of EU Member States whose economic and competitive levels are lagging behind the best EU countries and remain unchanged or even worsen for a long time. We will use an international comparison of the development of three indicators in the long term. This comparison will be made for all 28 EU Member States and some non-EU countries.

First, we will compare competitiveness of economies. We will use the Global Competitiveness Index, designed and published by the World Economic Forum (WEF) in its publication *The Global Competitiveness Report*. It is one of the most well-known and most respected countries' competitiveness rankings. This competitiveness assessment evaluates about 140 countries on the basis of 114 criteria. We will compare the ranking of the EU Member States and other selected countries according to the Global Competitiveness Index in 2005–2018.

Competitiveness of the EU Member States and other selected countries will be further evaluated on the basis of the current account balance, expressed as % of GDP, in 2007–2016. Simply put, with the growing competitiveness of the country, its current account balance is improving. The most competitive countries usually have high current account surpluses, the least competitive countries have high current account deficits. However, this does not apply under all conditions. For example, in countries experiencing a severe economic recession, demand reductions may cause a significant drop in imports and, therefore, an improvement of the current account balance, but which does not automatically indicate an improvement of competitiveness of the country.

The convergence of the economic performances of the EU Member States and other selected countries will be monitored through the development of the gross domestic product per capita in PPS in 2007–2016. The values of this indicator are expressed as % of the EU average, the EU average is set to equal 100%.

### 3. Competitiveness and Convergence in the EU – Results and Impacts

First, we will answer the question of whether the European Union and its Member States have highly competitive economies. The ranking of the EU Member States and other selected countries in the Global Competitiveness Index in 2005–2018 is shown in Table 1. It is clear that high competitiveness of the EU economy as a whole cannot be said. There are significant differences in the levels of competitiveness of the economies of individual EU Member States.

Source: Eurostat (2018); IMF (2017)

Five old EU Member States (the Netherlands, Germany, Sweden, the United Kingdom and Finland) have been among the ten most competitive countries in the world for a long time. Six old EU Member States (Denmark, Austria, Luxembourg, Belgium, France and Ireland) are among the countries with a high level of competitiveness that have been ranked 12<sup>th</sup>–25<sup>th</sup>. Below them, Estonia and Czech Republic have been ranked approximately 30<sup>th</sup>.

The least competitive EU Member States are Latvia, Slovakia, Hungary, Cyprus, Romania, Croatia and Greece. These worst-ranked EU countries do not show a general tendency to improve their rankings. Their rankings mostly remain unchanged or even worsen for a long time. For example, when comparing competitiveness in 2005–2006 and 2017–2018, the

rankings of Slovakia worsened from 36<sup>th</sup> to 59<sup>th</sup>, of Hungary from 35<sup>th</sup> to 60<sup>th</sup>, of Cyprus from 41<sup>st</sup> to 64<sup>th</sup> and of Greece from 47<sup>th</sup> to 87<sup>th</sup>.

Table 2 shows the development of the current account balance in 2007–2016. In 2016, the Netherlands and Germany had the highest current account surpluses among the EU countries, namely 8.5% of GDP and 8.2% of GDP, respectively. At the same time, the Netherlands and Germany are the two most competitive EU countries according to the Global Competitiveness Index, as we have mentioned above. High current account surpluses were also in Denmark, Malta, Hungary, Bulgaria, Slovenia, Luxembourg, Sweden and Ireland in 2016. Sweden, Denmark and Luxembourg are also highly competitive countries according to the Global Competitiveness Index. On the other hand, Poland, France, Greece, Lithuania, Finland, Slovakia, Romania, Cyprus and the United Kingdom had the current account deficits in 2016. At the same time, Slovakia, Cyprus, Romania and Greece are among the least competitive EU countries according to the Global Competitiveness Index.

The Czech Republic had the current account surplus of 1.1% of GDP in 2016. Switzerland is the country outside the EU and the most competitive country in the world according to the Global Competitiveness Index. It has also better current account balance than any EU Member State – namely the surplus of 10.5% of GDP in 2016.

The differences in the levels of the current account balance between the EU countries decreased during the period 2007–2016, mainly due to the reduction or elimination of the initially very large current account deficits in a number of the EU Member States. On the contrary, some EU countries (Belgium, Finland or the United Kingdom) faced deterioration of their current account balances. Despite these developments, the differences between the EU countries remain significant.

The development of the gross domestic product per capita in PPS in 2007–2016 is shown in Table 3. It is clear that the differences in the levels of GDP per capita in PPS between the EU Member States are significant. In 2016, Luxembourg had the highest economic level in the European Union, with GDP per capita at 258% of the EU average. On the contrary, Bulgaria had the lowest GDP per capita among the EU countries, namely 49% of the EU average, i.e. more than five times lower than Luxembourg.

The other countries of the European Union were between these two extreme values. Ten of them (Ireland, the Netherlands, Austria, Denmark, Sweden, Germany, Belgium, Finland, the United Kingdom and France) had GDP per capita higher than the EU average in 2016, while the remaining EU countries had GDP per capita below the EU average. In 2016, the Czech Republic was ranked 15<sup>th</sup> out of 28 EU Member States, with GDP per capita at 88% of the EU average.

Importantly, in 2007–2016 there was no general convergence of the economic levels of the EU Member States. In the monitored period, GDP per capita in some Member States approached the EU average, but in other Member States it dropped deeper below the EU average. A significant improvement of GDP per capita and its approach to the EU average was achieved in the most of the new EU Member States (Malta, Czech Republic, Slovakia, Estonia, Lithuania, Latvia, Poland, Hungary, Romania and Bulgaria) in 2007–2016. GDP per capita in the Czech Republic increased from 82% to 88% of the EU average in 2007–2016. GDP per capita of several old EU Member States has also increased significantly.

The largest worsening of GDP per capita was noticed in some euro area countries affected by the debt crisis or by a longer economic recession or stagnation. In 2007–2016, in relation to the EU average, GDP per capita in Spain fell from 103% to 92%, in Portugal from 81% to 77%, in Cyprus from 104% to 83%, in Greece from 93% to 68%, in Finland from 119% to

109%, in France from 108% to 104%, in Italy from 107% to 97%, and in Slovenia from 87% to 83%.

Source: Eurostat (2017)

These divergence tendencies among the old EU Member States (EU-15) are also confirmed by previous analyses. According to Kulhánek (2014, p. 404), “Spain demonstrated a successful development of GDP per capita up to 2007 and it reached a level of 93.5% of the EU-15. In the case of Greece the only successful development was recorded in the period 2000–2004 and Portugal came very slightly closer to a level of the EU-15 during the reporting period 1995–2010. Since 2009, the level of GDP per capita in the latter three countries in relation to the

EU-15 average has been decreasing and these economies are diverging.” Also according to Kulhánek (2012, p. 170), “from the analysis of convergence of the EU-15 countries we can draw conclusions about some divergence tendencies”.

For comparison, let’s also mention the economic levels of some countries outside the European Union. In 2016, Switzerland had GDP per capita at 161% of the EU average, Norway at 148% of the EU average, the United States at 145% of the EU average and Japan at 107% of the EU average.

#### **4. Conclusion**

High competitiveness of the economies of the Member States, economic, social and territorial cohesion and sustained convergence of the economic performances of the Member States are among the EU’s basic economic objectives. Many Member States achieve these objectives, but some Member States have failed to do so for a long time. Despite the successes and benefits of the EU internal market and common policies, the existence of the monetary union and the coordination of Member States’ economic policies, despite the positive economic effects of European integration, economic and social differences between some EU Member States and the rest of the EU persist or even grow for a long time.

The most of the new EU Member States evince gradual improvement and convergence of their economic indicators to the EU average or to the most developed EU Member States. This concerns, for example, the development of GDP per capita in PPS or of the current account balance. This positive convergence trend is also noticed in the Czech Republic.

Of course, the pace of convergence varies from country to country. In all new Member States, the current account balance has improved significantly in the last ten years. Ten new Member States have noticed convergence of their GDP per capita in PPS to the EU average in the last ten years, but three new Member States (Cyprus, Slovenia and Croatia) have faced divergence.

The most of the old EU Member States maintain the positive development of monitored economic indicators, but some of them face unfavourable developments. France, Greece and the United Kingdom have failed to break out of long-term current account deficits, the Finnish current account has flipped from the surplus to the deficit in the last ten years. During the last decade, in relation to the EU average, GDP per capita in PPS declined significantly in six old Member States, namely in Greece, Spain, Portugal, Italy, Finland and France.

A differentiated picture of the EU Member States is also provided by the Global Competitiveness Index, designed and published by the World Economic Forum. This does not indicate high competitiveness of the economy of the European Union as a whole. The levels of competitiveness remain very different between EU Member States. Only a few EU Member States have highly competitive economies, while other EU countries have lower competitiveness. The gap between the most and the least competitive EU countries persists or even increases for a long time.

While the economic effects of European integration are largely appreciated, it must be borne in mind that the persisting differences in competitiveness and economic levels between EU countries, the slow pace of convergence and, in some cases, ongoing divergence weaken EU cohesion and contribute to critical attitudes towards European integration and to emergence of disintegration tendencies in some EU countries.

Economic convergence is not a general phenomenon across the EU. As Bąba (2016, p. 43) concludes in his analysis, “a worrying thing, which can be noticed as the final outcome of this

analysis, is the formation of so-called “two-speed Europe”, when it comes to levels of socio-economic development, consisting of a) poorer East and South and b) richer North and West”. The contradiction between the vision of the ever closer Union and the long-lasting economic and social differences between many EU Member States may be one of the main factors and risks of the future development of the European Union.

## What is the Current State of the EU, or we Can Expect a New Federation of the United States of Europe?

**Florian Margan**

### **Abstract**

*We are in a crisis of economic, financial, migration and political, that is obvious. People lose confidence in European integration because they have failed to honor promises of peace, security and prosperity. We are confronted with problems growing debt of Spain and Greece, as well as the problems of Italian banks and political risks, including Brexit. What can we expect from the EU and the Eurozone in the future? Proposal of multi-speed Europe or deeper integration of the EU? In all areas of economic and political, such as the Federation of the Union, or the new Organization of the States of Europe? Will a new framework of constitutional rules and a new draft constitutional treaty be needed? These are questions that I would like to answer in this paper.*

**Keywords:** EU, Eurozone, the new federation of United States of Europe

**JEL Classification:** F00, F10, F15

### **1. Introduction**

The EU and the Eurozone are doing well. The states have recovered from the financial crisis, which struck ten years ago, and the country's economy EU shows continued growth. But, the new economic crisis is practically in front of the door, we just do not realize it and we do not see the signs that lead to it. Some examples of the expected economic crisis in EU in 2018/19 in a possible connection with the economic situation in the US for example:

- Strong overvaluation of the US stock exchange. The US stock market is extremely overvalued, and with it, other stock exchanges are also going to get along with it. According to investors, the values should be reduced by approximately 50 % and strong self-confidence of financiers. But there is little indication that the economy is rushing into the crisis, and the brokers begin to get rid of the commodities. But such a massive sale will result in a drop in exchange rates that have an impact on the stock market.
- The problem of investors. Their activity is declining and falls into passivity when investors buy only shares that are growing. This, however, leads to a worsening of the overvaluation of the stock exchange.
- Indications of the approaching crisis in the finances themselves. But there may be a phase when money is not available and payments start to defer.
- Interest rates. The FED and the ECB also announced their increase, which cannot be done without significant changes in stock market values. However, confidence in monetary policy in the Eurozone will fall.

- The problem of extreme indebtedness of individual countries. Current debt reaches 325 % of the world's GDP and, according to the IMF, despite the record low interest rates in the US and the EU, every tenth company is able to repay its debts.
- The issue of a political event. Migration crisis continues in Europe and Brexit is approaching.
- A steadily rising economy that will soon stop. Employee salaries are under pressure, owners do not have the means to pay for employees, and this does not seem to improve.

Apple, Alphabet, Amazon, Facebook and Microsoft. It is also the largest tug of the American stock exchange. Although it has contributed roughly 50 % to the current economic growth. We are talking only about five companies, which make up 0.2 % of all listed companies (D. Satler, 2018). And while these five companies are concentrating profits, the rest is in danger of falling. Many investors now buy and sell for debt. Securities lending thus reached a record high. Companies themselves rely on low-interest loans and, on the other hand, their investors also trade in debt.

## **2. What Can we Expect from the EU and Eurozone in Future?**

The current world as well the EU, are so complex that is very difficult to achieve reliable prediction results, even if thorough analysis is conducted. The strategy of 'buy and hold', negative interest rates, Forex price regulation and the functioning of central banks, these are all very complicated topics. Is the goal of economists nowadays to arrive at one comprehensive approach to economics? In my opinion, this is not possible. Economics is immensely broad and with current specialization of economic theorists, it is not realistic. There is no doubt that we live in times of global financial and economic change, the European currency cannot be maintained in the long run (P. Fontaine: 2014), and we have a problem with Brexit and the EU budget. Stability, growth and well-being in the whole Europe is a slogan of the EU policy. A well-functioning economic and currency union and a strong and stable euro are the basic stones of the EU economy that provide grounds for growth (EC: 2013, p.26). I'm afraid we're getting away from those policies.

In the last few years, Central and Eastern Europe have been facing increasingly more severe economic difficulties. Those, in the end, threaten the political progress achieved by ex-communist countries in the past decades and also lead to the doubts regarding the benefits of the EU membership. Over the last decade, economic growth potential in the region has dropped to half. A strong outflow of qualified labour is becoming an increasingly more severe hindrance to economic growth. Due to growing problems, governments of some countries question the benefits of European integration, characterised by drastic cuts in social spending (IMF, [online] 2017).

The whole Europe has been through a decade of crises and economic weaknesses, which slowed down or even stopped the process of economic convergence between the Western and Eastern parts of the continent. In a number of countries this raises the question whether painful economic and political reforms have been meaningful. In the foreseeable future, existing problems are going to become more severe, as during the time of the fall of communist regimes, the region benefited from an exceptionally favourable economic situation in the world; but this is hardly going to repeat. The main problem of the region is the outflow of qualified workers to Western Europe. IMF estimates that over the last decade, approximately 20 million people have left the countries of Central and Eastern Europe; this is about 5 – 6 % of their population. A half of Hungarian and a quarter of Polish firms complain about the

shortage of experienced workers, which undermines their production and slows down investment. Slovenian as well as Czech firms also complain about the lack of people to hire. Those who leave to work abroad are for example drivers, doctors, nurses and others.

In my opinion, the basis of the EU future is ‘White paper on the future of Europe’, which was introduced by Jean-Claude Juncker (EC) on 1<sup>st</sup> March 2017. The document containing five scenarios of future development is meant to start a debate between politicians and citizens about the further functioning of European institutions (EU Office, 2017, n.163, [online] 2017). The scenarios just as I see it may be next:

- **To continue the current trend.** This would mean the deepening of single and digital market and the cooperation in the area of security. Border checks and other policy areas would still remain within the hands of national governments. In essence, this would mean speeding up the so-called Bratislava process, which the EU leaders already agreed on in September 2016.
- **Reducing the EU to a mere single market.** Security, defence, or the solution of migration crisis would be fully within the competence of national governments. However, the Commission does not support this approach, as it could lead to obstacles in common decision making. According the Juncker, the Union would react to challenges even less efficiently and would not be able to fulfil the expectations of a number of countries and their citizens. The EU might even lose influence on the world affairs.
- **The concept of multispeed Europe**, in which the member states would be able to choose the areas of policies that would be integrated more quickly. However, I would point out that the resulting system might be overly complicated.
- The 27 might decide for a **smaller number of areas in which common approach will be applied.** The main principle of the fourth option is to promise less and do less, but more efficiently. The EU would concentrate on those areas, in which its citizens have the biggest requirements. We are thus talking about security, the fight against terrorism and the support of innovations and trade.
- The last vision relies on the proposal of Euro MP Guy Verhofstadt (ALDE) for **deeper EU integration in all policy areas.** By the federalization of the Union, or the United States of Europe (USE), European institutions would be able to react more efficiently and faster to challenges such as migration, security and economic crises. Among others, the scenario includes the establishment of the defence union and the creation of the posts of the mister of foreign affairs and the minister of finance. The main problem is the transfer of sovereignty from national governments, which is difficult to accept for both, country-level politicians as well as a number of the EU citizens.

For the EU to move forward, the French president Macron (December 2017) proposed future acceptance of European budget, minister of finance for Eurozone, Eurozone parliament, and the creation of the USE. Macron wants the creation of common Eurozone budget, the existence of the common minister of finance (Jan Macháčka, 2017, [online] 2017), and especially common bonds, which is the biggest problem. Through common money, the EU is going to be inconspicuously pushed in the creation of one big super state. And, in the preparation stage, a lot of people are not even going to understand this. All countries are going to borrow at the same high rate for their operations: An overdebted country is going to borrow under the same conditions as Germany with the best rating. This is as if you offer a new interest-free loan to an overdebted person. What is this person going to do? They are either going to save or borrow even more, as they have always lived on debt. Macron is actually starting pan-European credit

spiral guaranteed by Germany. On the other hand, German ministry of finance has created a plan how to transform the Eurozone firewall, meaning European Stabilization Mechanism (ESM), into a fully fledged European Monetary Fund (EMF). The key idea are semi-automatic rules which would lead to the restructuring of sovereign debt of the assistance recipients. Monetary fund would provide assistance and then it would take the money back by 'stripping' private creditors.

European Commission (EC) wants neither Eurozone budget, nor Eurozone minister of finance. And against, this stand European ministers of finance, who have swept from the table all reform proposals, both, from Macron, and from the EC. German proposals are not acceptable for the French and Italians. The French proposals are not acceptable for the EC and the EC proposal is unacceptable for everybody, as is the idea of Martin Schulz regarding the United States of Europe. In this situation, is any reform of the EU ever going to happen? If so, it is not going to be through a normal political process, but only as a consequence of some other crisis, which is going to endanger the wealth of Northern states. But it is true that Macron understands the term 'more Europe' as, for example, banking union (BU). In the general sense, this means: unified banking supervision, unified crises resolution and common deposit insurance.

In the background of this requirement is the unceasing fear of over-debtedness of the South of Europe. The fact that some people think that the Greek debt has been solved does not yet mean it has. Paris and Berlin are well aware that Eurozone is still divided into overdebted South and rich North, which is not a good foundation for a political union. Debt crisis in the South still smoulders. That is why there are thoughts of transforming 'Euro-firewall', the mechanism, due to which Slovak government fell a few years ago, from European Stabilization Mechanism (ESM) into European Monetary Fund (EMF). That is why France is suddenly so much interested that the whole of the EU, including PL, CR, RO, HU, BG, pays by Euro. That is why sudden threats that those who are not in the core of the EU will be met by a disaster because somebody must actually pay for the EMF and the more countries participate, the lesser expenses for France (Saxo Bank, 2017,[online] 2017).

Originally, the EU had two temporary funds for crisis assistance. When it showed that the debt of the South of Europe cannot be solved quickly, the EU has created a permanent ESM fund. And now, it wants to bloat this fund so that it plays similar role to that of the IMF in developing countries. EMF is supposed to be controlled directly by the European Parliament (EP). So, more institutions, more bureaucrats, even bigger budget and even less transparent supervision, because when something is not run by an individual, but several hundred of retired European politicians who are now members of the EP, nobody effectively bears direct responsibility.

Through this all, we are in fact just getting ready to transfer the debts of the South of Europe to the whole Europe, including the Czech Republic. European rulers have finally understood that the problem of South European debt is not temporary, but a chronic disease. Nowadays, despite all efforts, the proportion of Greek debt against GDP is even higher than before crisis. And that is despite the fact that partial debt cancellation has been provided to Greece. In other countries, it is similar. The debt has only been shifted in time. What was supposed to be paid off in the near future is supposedly going to be paid off in a more distant future, when the current rulers will no longer be alive (Pikora, 2018, [online]) supposedly. In reality, it is a public secret that the debt has already become unpayable. That is why I understand French-German push for the EU integration, which is, however, going to trigger a reaction. Leaders of Central and Eastern European countries are going to exercise resistance against the French-German idea to create common European Ministry of Finance and Defence and Schulz (SPD) is dreaming of the creation of the United States of Europe (USE). In my opinion, this is the

beginning. Countries, which will be interested to share his vision of European future, could, according to him, create a group dedicated to the ‘reconstitution’ of Europe, or the USE. According to Macron, in the future EU, i.e. USE, which will go through renaissance and which will be simpler, Great Britain is going to have its place again, even though it decided to leave the EU in 2017.

### 3. What is the Current Condition of the EU, or, What Can we Expect from a New Future Federation of the United States of Europe?

We need “more Europe”! The question is what mins “more Europe”? Does the EU want the creation of the common Eurozone budget? It wants the common minister of finance and it especially wants common bonds. As mentioned above, common money (€), is gradually going to lead to the creation of one big superstate, which many do not quite understand. Cost-benefit analysis shows that such Europe (USE) would be more competitive, but only if all the EU member states were part of Eurozone!

In 2017, the GDP of countries using Euro increased by 2.5 %. The economy of Eurozone thus registered the highest speed of economic growth in the last ten years, as a quick estimate published by Eurostat statistical office suggests. In 2016, the GDP grew by 1.7 %. In 2017, Eurozone economic expansion surpassed that of the USA, whose economy grew by 2.3 %.

According to the AP agency, favourable data regarding the evolution of economy in 2017 provide clear evidence that Eurozone has been able to exit a protracted debt crisis, which previously caused worries about the survival of the single currency. In 2016, the share of the hypothetical USE with the payment currency of Euro in the world GDP would have been 22.38 % (If we subtract the Eurozone countries, the other EU countries have only 5.67 % world GDP). This is one of the reasons why we need all EU countries in the Eurozone. Thus, the USE would have been an important player in the de-globalized world, together with the USA (24.56 %) and China (14.76 %); the three economic superpowers combined representing 61.72 % of the world GDP (Figure No.1).

Figure 1: Share of Eurozone and All EU States in Total World GDP (1990–2016, %)

Source: World Bank, 2017

**Figure 2: Government Debt to GDP 2016 in %**

Source: Eurostat 2017, FM, 2018

Public debt in the Eurozone is on average higher than in countries outside the Eurozone. In the Eurozone, public debt is on average 79.4%. In EU countries, which are not in the Eurozone, only 53.99% (see Figure No.2).

QE – loose policy is convenient for indebted people and countries, especially in the South of Europe. In December 2017, the inflation rate in Eurozone was only 1.1 %. For this year, the ECB expects the inflation rate of 1.7 %. In Eurozone, the inflation is difficult to raise to the average of 2%, which was the role of QE. QE is only effective if printed money gets into circulation in real economy of Eurozone, which is not happening (see Figure No.3).

**Figure 3: EU and Eurozone Inflation (VI/2017)**

Source: Eurostat VIII/2017

In December 2017, the core inflation, which reflects the real inflationary pressures while not considering food and energy prices, stagnated at 0.9 %! In January 2018 it stood at 1.3 % in Eurozone (Eurostat, 2018). Thus, it is significantly below expectations. Nevertheless, the opinion that in 2018/19 inflationary pressures are going to increase seems to be gaining more support among central bankers. Unfortunately, the world is complex and one swallow does not make a summer. In May 2018, a concrete proposal for the multi-annual financial framework for the period of 2021-2027 is supposed to be presented. According to Juncker, everything should be agreed in spring 2019, meaning it would be before the next European Parliament elections (Euroactiv, 2017, [online] 2018).

The policy of zero interest rates together with the increasing inflation is destructive for German savers, but the total indebtedness in Eurozone decreased in 2016, trend, which also continued in 2017 due to quantitative easing (QE). At the beginning of December 2016, the ECB

extended the programme of bond purchase by nine months – until the end of 2017. At the same time, the ECB also decided to reduce monthly volume of bond purchases from the current € 60 billion to € 30 billion since April 2018. The ECB target for the annual inflation rate in Eurozone is just under 2 %. This development reflects the diminishing influence of a sharp oil price decrease. In the next few months, the inflation rate in Germany will probably achieve the ECB's target rate.

Expansive monetary policy leads to the record increase of indebtedness and discourages governments from structural reforms. The world can still feel the effects of the recent financial crisis and the possibility of further shocks cannot be eliminated. The volume of the world public and private debt has reached historical peaks and it is necessary to start decreasing it. We need to abandon the current monetary policy in time and return back to more normal environment. Federal reserves of Germany have already started the process, however, it is not so in the EU. Or does the EU have the plan how the USE will react?

It is going to be necessary to introduce the envisaged capital markets union. Otherwise, the Eurozone and the EU, or newly established USE, will have to solve technical problems with a weak common, but not single, currency on their own. The problem of Eurozone is structural. Eurozone is not competitive, there is little investment, the trust of firms and as well as households in future economic development stays low. The only thing the ECB can do is to provide common government policies with time for ideas. Some basic ideas regarding the establishment of the USE could be:

- For the years of 2018/19 there is the necessity to invest in infrastructure within the frame of increasing productivity. For the beginning, it would be advisable to prudently invest in infrastructure so that productivity that will translate into improved living standard can be increased.
- Eurozone needs the capacity to ensure sensible and coordinated anti-cyclical fiscal policy reaction in case of another recession. In the next recession to come, there will be little space for aggressive monetary easing and there will be the need for a fiscal authority, which would, in case of a serious drop, increase expenses.
- An initiative with the purpose of strengthening legal state should be proposed (Press, 2017, [online] 2018). However, this does not necessarily mean the creation of the USE.
- QE – In my opinion, quantitative easing of the ECB will end by 31st December 2018. I am convinced that the ECB is going to announce the end bond of purchase no sooner than in September or at the end of summer 2018 or the purchase is still going to continue.
- The increase of interest rates is then estimated for 2019.

In 2018, the rate of growth in Eurozone will be similar to that in 2017, since there is no reason to expect a significant slow-down. Unlike in the previous years, the highest risk of growth lies outside the EU borders, especially in China and the USA. Nevertheless, the reforms of monetary union and labour market in Italy are necessary (Elčić, 2018 [online] 2018). And what is the position of the Visegrad four countries? Czech, Poland, Hungary and Slovakia want strong Europe, which they see as the union of independent states, rather than as the USE. The prime ministers of the Visegrad Four countries agreed on this view in a panel discussion held on 26.1.2018 in Budapest (Novinky, 2018 [online]).

- Under the frame of the continuous strengthening of the EU democracy, the EC must present a proposal for the creation of the post of permanent and accountable European minister of economy and finance, the initiative for the strengthening of the subsidiarity

and proportionality principles and the communication on the improvement of the efficiency of the EU presidency.

- The need to create the space for their own fiscal policy in Eurozone or the USE before the next recession. In my opinion, it is necessary to prepare for the next recession by the creation of an anticyclical fund.
- Unified banking supervision and unified resolution of banking crises along with common deposit insurance.
- European budget and the minister of economy and finance for Eurozone and the parliament for Eurozone, which will be the base for the creation of the USE.

### ***3.1 The Constitutional Drafting: Lessons and Frameworks***

The member states nowadays need the EU more than ever before; and the EU has never been more dependent on the support of its member states. The decisive actions need to be taken – a new constitutional process and a new draft constitution of the EU is needed. We thus envision the beginning of a new constitution drafting process at the academic level. Lessons may be considered from the founding fathers of the US Constitution and the US Supreme Court; the founding fathers of the European Community and the EU; the Court of Justice of the EU. Robert Badinter's *Une Constitution Europeene* (2002); EU founding Treaties; draft Treaty for the EU Constitution and EU Charter of Fundamental Rights. The following issues and tasks may be envisioned related for example to:

- **Self-determination** - The rights of European people and nations to self-determination: rules for the transfer, withdrawal, and separation of sovereign powers among peoples, national Member states and the EU; dualism of the electorates of member nation states and the electorate of the EU.
- **Markets and finance** - Economic, fiscal and financial integration: the three freedoms and common monetary system.
- **Democracy** - Democratic legitimacy and accountability of political actors: electoral system; division of powers among Parliament, Cabinet and Judiciary; the rule of law; the inalienable Solange powers of member nation states.
- **Government** - Sovereign powers of the EU: legal protection and judicial system; protection of outer borders and law enforcement system; defense system and military forces; security and intelligence system; foreign relations and international representation.
- **Balanced union** - EU specific integration: balancing and inclusion of responsible governments, free markets and civil societies on local, regional, national, and the Union levels.

**New area of exclusive competence** was added – that of the control of external borders of the Union's inner area of freedom and security. Competencies in the areas of foreign affairs, security and defense were elevated to the Union's explicit shared competencies where the EU exerts sovereign rights conferred on its federal level by the Member states. The structure and competencies of legislative institutions are reduced to the bi-cameral Parliament, which is substituting the present institutions of the European Council, Council and Parliament.

Functions of the present Commission are transferred to the executive branch, represented by the monocratic body of the President, to be elected by the direct vote of the EU citizens, or, alternatively, by members of national Parliaments. Thus powers of the hardly effective

Commission composed of 27 members, everyone representing one of the Member States, are conferred on the President, following the US example.

I think that we in EU need the decisive actions to be taken – a new constitutional process and a new draft constitution of the EU is needed. Because we see today the some following issues and tasks may be envisioned related to:

- the new peaks of the 2015-18 waves of migrants across mostly undefended outer borders of the Schengen-area exposed profound weakness of existing Schengen and Dublin mechanisms, and thereby of the key features of European Union's constitutional status of a state, i.e., a federal state, a federation of state, or the Union,
- Will Dublin 2 accepted in Goteborg - Sweden (XII/2017) to solve all of the problems of Dublin 1? This will show the future, but there are still unresolved issues.

I'm sure it will be necessary to reform the EU monetary union and also labour market for example in Italy or Spain's growing debt including Greece. Recovery is going to continue thanks to quantitative easing and low ECB interest rates, increasing domestic demand, and especially due to investments, which are expected to accelerate in 2018. According to a majority of economists, quantitative easing of the ECB will end by 31st December 2018. The most common estimate says that interest rates will increase in 2019, or possibly as late as 2020! Bankers expect the improvement of the situation in Eurozone especially due to the deepening of the monetary union, as advocated by Macron. According to bankers, it is necessary to prepare for the next recession by the creation of an anti-cyclical fund. Eurozone needs the capacity to ensure sensible and coordinated anti-cyclical fiscal reaction during the next recession. In the next recession, there will be little space for aggressive monetary easing and there will also be the need for a fiscal authority that would be able to increase expenses in case of a significant drop. Or we can have three causes (B. Kuras, 2008), and the first is the illusion of what we understand, what is happening, and therefore we are able to predict. Unfortunately, I think it does not apply in EU economic policy (Brexit, emigrants, boundaries, etc.) because we are not able to predict what we want. The biggest concern I have from that idea did not win introduce a Europe-wide tax that would have a hole at the British posts healed. It's a step in the sausage method of trying to establish USE.

For the years 2018/19, it is necessary to invest in infrastructure under the frame of increasing productivity. Unregulated capital flows may destabilize the economies of the EU member states and deepening social inequality may have negative effect on growth since new economic paradigm for global era has not yet come to existence. In the existing vacuum, protectionism, anti-trade populism, and non-liberal, often xenophobic, nationalism are gaining grounds. These are further fed by the fear of wage stagnation, unemployment caused by new technologies along with the future fourth technology revolution, and increasing uncertainty.

#### **4. Conclusion**

We cannot expect that the EU and Eurozone will be able to get out of economic-financial crisis in the near future. The EU would have to move from simple dependence on outsourcing to the autonomy of more mature development, sophisticated division of labour and optimum structure. So, simple financial stimulus is no more going to suffice. The problem is structural, Eurozone is not competitive, there is no investment, the trust of firms and households in future economic development remains low. These are issues that cannot be solved by deflation. Qualitative transformation is necessary. QE, which effectively stimulated economic growth in the USA as it operated through capital markets, does not work in Europe. And how will Europe cope with the fourth technology revolution?

For more optimistic Eurozone and EU perspectives, is the acceptance of the USE in the EP and the EU member states parliaments going to be enough? I do not think this is just a dream of a few statesmen. However, before the creation of the USE is approved, much time is going to pass. It is not going to be easy, because the EU is not unified. Moreover, long-term political procedures, which must be approved by the parliaments of all EU member states, exist. This does not make the issue any easier. Is this utopia of Napoleon Bonaparte in the past, and Macron or Martin Schulz (former EP President) at present going to be realized?

According to my opinion, the USE might become reality. But it is going to take years; the USE may not be finalized in 2025, but much later, maybe. This is the reason why nowadays, no real conditions for the creation of the USE exists. However, this is still something we may consider for future and we are not far from reality. This is one of the ways that the EU stays together.

## Mahoran Migrants, Second-Class Citizens?

**Solange Maslowski**

### **Abstract**

*While the citizenship of the European Union encompasses a great diversity of citizens (workers/inactive, continental/outermost), practices show that not all EU citizens benefitting from the fundamental right of freedom of movement are on the same footing. The paper's aim is to better understand the phenomena of failure of integration of Mahoran people residing in Réunion island. It will raise up the question of complaints of local population viewing Mahoran as abusers of rights (benefit tourism) or as a potential threat to public policy. As local discrimination towards Mahoran is very similar to that of EU citizens from Roma origin on the European continent, the paper will first compare these two categories of migrants. It will investigate then the accuracy of their being considered as second-class migrants. Finally, it will question the practical openness and adaptability of the right of freedom of movement of persons to specific EU citizens with visible cultural and physical differences as Mahoran and Roma migrants.*

**Keywords:** *freedom of movement, Mahoran, migration, outermost regions, Roma, union citizenship*

**JEL Classification:** *K3, P16, I30, J60, J70*

### **1. Introduction**

European citizenship comprises different categories of citizens including continental EU citizens and Outermost EU citizens. The latter are citizens of the Outermost Regions of the European Union, which are islands or archipelagos in the Caribbean (Guadeloupe, Martinique, Saint-Martin), Atlantic (Canaries, Madeira and the Azores) and the Indian Ocean (Réunion, Mayotte), except for Guyana, which is a small enclave in the Amazon region. These remoted regions are regulated by Articles 355 and 349 TFEU. Despite of their geographical distance from the European continent, the Outermost regions are full part of the EU and their citizens are full EU citizens. Therefore, Outermost regions must apply EU law and outermost citizens can enjoy EU fundamental rights. There are a few derogations to this general rule like, for example, the exclusion of Outermost regions from the Schengen area. Indeed, the insularity of these outermost regions combined to their geographical position justify the maintenance of control at their borders in the name of security requirements and of migration control (Lamblin Gourdin, 2016). In practise, it means that French citizens (from continental France or other French outermost regions), citizens from the other Member States of the EU or third-country nationals have to be controlled by local police at their arrival in Réunion island. Actually, outermost regions of the EU are representing the external borders of the European Union outside the European continent in the Indian Ocean but also in other places where the Outermost regions are present.

Nevertheless, inhabitants from the Outermost regions of the EU are populations with ethnical and cultural characteristics different from the population of continental EU territory (Ziller, 2012). Additionally, they often suffer from lower employment rates and from low education levels than the EU continental average. That is why incoming migration, especially of poorer foreign populations, is likely to cause fear among the native-born Outermost citizens.

The present article will focus on one category of EU Outermost citizen, the Mahoran population (from Mayotte island in the Indian ocean) migrating to another Outermost region, Réunion island. Generally speaking, this movement of population concerns the migration of EU citizens between two EU Outermost regions. But as both Outermost regions are French oversea departments, it must be considered legally as French internal migration regardless of the thousands of kilometres of sea separating both Outermost regions. Despite of its purely legal national dimension, this migration remains, for the migrants, difficult as there is a big cultural gap between Réunion island and Mayotte, a gap much deeper than between France and Belgium, for example.

The Mahoran citizens, who are migrating to Réunion island to flee poverty, are not welcomed by local population viewing them as abusers of rights (social/benefit tourists) or as a potential threat to public order (trouble-makers). Strangely, these French citizens are less appreciated than third-country migrants like Malagasy and Mauritian or EU citizens from continental Europe. Local discrimination towards Mahoran is very similar to that of Union citizens from Roma origin on the European continent, who are sometimes called second-class European Union citizens referring to their difficulties to enjoy fully their rights deriving from EU citizenship (Lhernoud, 2011). Shall we call also Mahoran, second-class EU citizens i.e. as persons whose rights and opportunities are treated as less important than those of other? This statement would require studying Mahoran's migration to EU continental Europe. As the article is focusing on Réunion island as the receiving country, a more appropriate question would be: Are Mahoran who are using their right to move to another French Outermost region Second-class French citizens? Whether second-class EU citizens or second-class French citizens, it is obvious that the situation of Mahoran is very similar to that of EU citizens from Roma origin.

The first part of the article will deal with a comprehensive comparison of both categories of migrants including common characteristics and distinctions. The second part will consider the qualification of second-class citizens for both types of migrants.

## **2. Mahoran and Roma Migrants Between Similarities and Distinctions**

At first sight, Mahoran and Roma migrants have a lot in common as their integration into the host society is visibly encountering the same difficulties. But what distinguishes them is obviously their legal status, generating different rights.

### **2.1 Common Characteristics**

The laborious integration of Roma and Mahoran migrants into their host country highlights some common characteristics that can explain the challenge of migrants with specific features. These common characteristics which are mainly of social, economic, cultural and physical nature are accompanied by a rejection of the local population.

### *2.1.1 Social and Economic Characteristics*

Mahoran and Roma migrants present many common characteristics, especially social and economic, that explain their need to migrate elsewhere. Both Mahoran and Roma migrants are leaving their country of origin mainly to run away from extreme poverty. In the case of Roma migrants, there are also fleeing local discrimination in the home country as a minority (FRA, 2009). This is not the case for Mahoran citizens leaving Mayotte as they constitute most of the population of Mayotte.

Both categories of migrants are mainly economically inactive migrants moving in search of a job in the host country. A great part of these economically inactive migrants is non-self-sufficient. Their situation of poverty in the receiving country leads them to be accommodated in social housing, unhealthy or illegal housing or ghettos, which makes their integration into the host society harder. Their lack of financial resources also makes them dependant on social and medical assistance, when it is available to them. Indeed, access to social assistance remains, in most Member States, far from being unconditional and so accessible to only a few (Minderhoud, 2009). Moreover, the extreme poverty which characterizes many of Europe's Roma communities is now being used against them to justify measures of expulsions (O'Nion, 2011).

These migrants are also often composed of the weakest part of the population, mainly poor women and children in search of better life and education. They usually have a low education level and poor language skills, which also does not facilitate their integration.

### *2.1.2 Cultural and Physical Characteristics*

While their social and economic characteristics are often independent of their will, Mahoran and Roma migrants are very attached to their own cultural and physical characteristics that they exhibit voluntarily.

First, both Mahoran and Roma migrants represent visible minorities that can be easily distinguished from the local population of the host country. Their visibility is due partly to their physical characteristics, which differ from most of population. They might have a darker colour of skin or specific African traits and so on. These differences are accentuated by the way they clothe themselves with traditional clothes or make-up. These two categories of migrants don't try to blend in with the local population and prefer to keep their traditions. They are also visible by their extreme poverty leading them either to beg on the streets, to wear poor and old quality clothes and to live in unhealthy accommodations.

The second cultural characteristic that distinguishes Roma and Mahoran migrants from the local population is their living in a kind of parallel society into the host country. This compromises a lot their integration. Why? Certainly because of their strong cultural habits, their attachment to their traditions, their extreme poverty and their unwillingness to assimilate totally to local population. Part of the Roma migrants have also nomadic habits, which scare the host society.

### *2.1.3 Negative Perception by Local Population*

What reassembles Mahoran and Roma migrant is also their negative perception by the local population of the receiving country. Indeed, they are often accused of benefit tourism and of unwillingness to search for a job.

They are also accused of threat to public policy (begging, prostitution, unhealthiest, theft, destruction of public property). They are viewed as trouble-makers rising local violence. This

negative perception has led, for example, several Western European States to depict Roma migrants collectively as security threats, whose presence has the potential to undermine the established, settled way of life (O’Nions, 2011). It also leads very often to racism and discrimination towards these two categories of migrants.

## ***2.2 Distinctions***

Despite of their numerous common characteristics, Mahoran migrating to Réunion Island and EU citizens from Roma origin migrating to other Member States of the EU are different on a certain number of points. Their main difference relies upon the type of migration involved, State internal migration versus EU internal migration, which involves different rights.

### ***2.2.1 The Receiving Country***

Mahoran moving to Réunion Island remain on the French territory and therefore are subject to French internal law. The host Member State is just a part of the territory of the country of origin. Nevertheless, regarding the general principle of prohibition of discrimination, local authorities in Réunion island are not allowed to favor French migrants from continental France or from other French outermost regions like Mayotte over citizens from other Member States. Of course, this statement does not apply to specific rights linked to French citizenship like the right to vote at national elections (Ziller, 2005). Mahoran migrants in Réunion island should be treated equally to other EU citizens migrants, at least.

EU Roma migrants moving to the territory of another Member State are using their fundamental right of freedom of movement of persons and therefore are subject to EU law, especially to Directive 2004/38/EC relative au droit des citoyens de l’Union et des membres de leurs familles de circuler et de séjourner librement sur le territoire des États membres.

### ***2.2.2 The Scope of Rights***

As French citizens, Mahoran migrating to Réunion Island benefit from total equality of treatment with the local population. They have total access to social assistance, social housing and medical care. On the other way, EU citizens from Roma origin are rarely benefiting from equality of treatment with nationals of their host country. Only those who are working are equal according to Article 24 (Directive 2004/38/EC). Economically inactive migrants have conditional residence rights and limited access to social assistance. Indeed, stays for more than three months require self-sufficiency (sufficient resources for themselves and their family members not to become a burden on the social assistance system) and a comprehensive sickness insurance cover according to Article 7 of Directive 2004/38/EC. Article 24 of the Citizenship Directive only provides access to social assistance to economically inactive migrants who are self-sufficient and stay for more than three months into the host country or are permanent residents. Obviously, there is a very difficult access to social assistance for economically inactive EU citizens from Roma origin, who don’t fulfil, most of the time, the legal conditions of Article 24.

The second important distinction concerns the right of residence. Mahoran benefit from a total freedom of movement while migrating to Réunion island. They can enter freely the territory of Réunion island and the length of their stay is not conditioned by their self-sufficiency. Similarly, they can’t be expelled from Réunion island as a State can’t expel its own citizens. On the other side, EU Roma migrants have to fulfil the conditions of Directive 2004/38/EC regarding entry and residential rights. Those who don’t respect these conditions can be expelled from the host country. Many EU citizens from Roma origin have been expelled on

the grounds of threat to public policy or security (Articles 27 and 28 of Directive 2004/38/EC), abuse of rights (Article 35 Directive 2004/38/EC) or unreasonable burden on the social security system of the receiving country (Article 14 of Directive 2004/38/EC). This was, for example, the case of the French massive expulsion of Roma migrants in 2010 leading the former Vice-President of the European Commission, Viviane Reading, to compare it to deportations from the Second World war. In fact, the right of freedom of movement, in practise, truly only exists for some (Gehring, 2013).

### **3. Are Mahoran and Roma Migrants Second-class EU Citizens?**

A citizen can be considered as a second-class citizen as far as its rights and opportunities are given or treated as less important than those of other citizens. This lower enjoyment of rights can be prescribed by the law as, for example, economically inactive EU migrants are legally disadvantaged in comparison to migrant workers, according to EU law. But it can also derive from an unjust implementation of rights by local authorities. Secondly, the categorization of ‘second-class’ citizen often refers to the discrimination of a certain category of population, treated differently from other categories. Thirdly, Mahoran and Roma citizens can be viewed as Second-class migrants because of their otherness highlighted by their visible poverty and cultural and physical characteristics.

#### ***3.1 First/Second Class Citizen Definition Deriving from Residential and Social Rights***

The Citizenship of the EU which was introduced by the Maastricht treaty in 1992 confer to the nationals of the Member States of the EU a certain number of rights that are quoted into Articles 20 and 21 TFEU and developed by the Court of Justice of the Union. As a Citizenship shared by all Europeans, complementing and not replacing national citizenships, EU Citizenship embodies shared rights and values as well as the rich diversity of a Union of different nationalities and languages (European Commission, 2017).

The first right mentioned by Article 20 is the right to freedom of movement. Freedom of movement of persons’ objective is ultimately equality of treatment between EU migrants and nationals of the host Member State. This aim has not been reached yet and some categories of migrants remain more equal than others, even if all of them represent a privileged category of migrants in comparison to third-country migrants. Current situation attributes total equality of treatment only for migrant workers who can be therefore considered as first-class Union citizens. Economically inactive migrants benefit from a differential treatment, limiting their residential rights and access to social assistance. They can be therefore considered as second-class Union citizens.

#### ***3.2 First/Second-Class Citizen Definition Deriving from Discrimination***

The aim of non-discrimination law is to allow all individuals an equal and fair prospect to access opportunities available in a society. First, it stipulates that those individuals who are in similar situations should receive similar treatment and not be treated less favourably simply because of a particular ‘protected’ characteristic that they possess. This is known as ‘direct’ discrimination. Additionally, it adds that those individuals who are in different situations should receive different treatment to the extent that this is needed to allow them to enjoy particular opportunities on the same basis as others (FRA-ECHR, 2011).

Discrimination on ethnical grounds is prohibited by numerous European legal instruments like articles 2 et 3 TEU and Articles 10 and 19 TFEU. Similarly, the Article 14 of the European Convention on Human Rights prohibits discrimination on the grounds of national or social

origin, association with a national minority, property, birth or other status. Article 21-1 of the EU Charter on Fundamental Rights states that Any discrimination based on any ground such as race, colour, ethnic or social origin, genetic features, language, religion or belief, political or any other opinion, membership of a national minority, property, birth, disability, age or sexual orientation shall be prohibited. Secondary law also protects against discrimination of an ethnical group with Council Directive 2000/43/EC of 29 June 2000 implementing the principle of equal treatment between persons irrespective of racial or ethnic origin.

Despite this legal arsenal, the practise shows that discrimination towards Mahoran and Rom is still a current and living problem. Both Mahoran and Roma migrants are not welcome into their receiving country and are considered as suffering from discrimination. They are discriminated at different levels as the behaviour of discrimination can come from the local natives of the hosting country themselves or from local authorities. Discrimination makes their integration, their access to work and to self-sufficiency very difficult and sometimes impossible.

Indeed, most of the EU citizens from Roma origin migrating western are economically inactive and therefore fulfil all the criteria to be qualified as “second-class Union citizen” (Lhernoud, 2011) or “unwanted foreigners”, “not true nationals” of EU Member States (Carrera, 2013) or “abnormal EU citizens”, “non-modern” (Carrera, 2014). A report from the European Union Agency for Fundamental Rights from 2009, The situation of Roma EU citizens moving to and settling in other EU Member States, clearly shows that poverty and racism are the main factors, which push the Roma to leave their country of origin (FRA, 2010).

After some scandals concerning non-lawful expulsions of EU citizens from Roma origin from certain Member States, the EU has undertaken positive measures to fight discrimination against this minority. Unfortunately, despite of all these efforts, both on EU and national levels (European Commission, 2011), NGOs are still denouncing the existence of strong discrimination against Roma migrants. Moreover, these positive measures aimed to reequilibrate the position of Roma migrants don't always serve their interests as it underlines their “otherness” while they should be considered as any EU citizen using its fundamental right of freedom of movement.

As far as Mahoran are concerned, the qualification of second-class French citizens is more appropriate in the context of an internal French migration between two French outermost regions. The absence of an EU element involving a migration between two different Member States excludes their reliance upon EU law and their potential use of the provisions of Directive 2004/38/EC.

### ***3.3 First/Second-Class Citizen Definition Deriving from Otherness***

Otherness, being different from the mainstream of migrants also lead migrants to a second-class category. Mahoran and Roma migrants as visible minorities are treated differently by local authorities and population. This is obvious in Réunion island where the “worse” is expected from this category of migrants. Even third-country migrants are better welcome. This is also the case of Roma migrants on continental Europe. Discriminatory treatment of EU Roma citizens having exercised their freedom to move has been legitimised because of their “nomadic” and abnormal behaviours, and due to their “lack of integration” into the mainstream nation and the cohesiveness of society in their countries of origin. Priorities has been therefore granted to the re-integration of EU Roma citizens in Romania and Bulgaria as a way to prevent them from re-exercising their freedom to move and discourage their “undesired form of cross-border nomadism” (Carrera, 2014).

#### 4. Conclusion

Mahoran moving to Réunion Island and EU citizens from Roma origin moving to another Member States are two categories of EU migrants using their right to move. The first category moves within the context of a State internal migration (despite of the 1435 kms separating the two islands) and the second category moves within the context of EU internal migration. Mahoran migrants are more privileged because they benefit from total freedom of movement and equal treatment with the nationals of the host State, but it does not help! Both categories are facing the same difficulty of integration into the host society.

It seems that, in terms of integration, strong poverty and strong visible cultural differences might penalize so much a migrant that the host society is forgetting about his/her privileged citizenship and treats him/her worse than a third-country migrant. This is the case of Mahoran migrants who are less welcome than Malagasy or Mauritian migrants while they just represent 20% of foreigners, Malagasy representing 55 %. Some studies have proved that this lack of integration into a multicultural society like Réunion is due to the feeling of Réunionese people that people from Mayotte are just benefit tourists. Similarly, Roma migrants are often worse treated than third-country migrants who are less visible and also viewed as benefit tourists.

The openness of host societies to ethnically different and visible migrants would require a more tolerant, opened and solidarity European society. Two obstacles are at stake, the openness and the acceptance of visible poor migrants and of visible ethnical differences. The existence of a very small number of abusers of rights or of threats to public policy or security among the migrants should not penalize the biggest part of migrants, who are moving in search of a better life. As the 2017 EU Citizenship report quotes, Union citizenship also means benefiting from equal treatment and sharing in a system of common values which the Union upholds, including respect for human dignity, equality and human rights, and inclusion, tolerance and respect for diversity (FRA, 2009). The case of Reunion island considered as a multicultural and multi-religion society shows that the main problem might be the extreme poverty of the migrants. Ethnical, cultural and physical differences are better accepted in the cases of self-sufficient migrants. The latter are supposed not to abuse their rights and not to bring violence into the host society. It would also require a better communication of the EU values, priorities and goals to all the EU citizens and a constructive dialogue regarding the acceptance of otherness of EU migrants (Mienkowska-Norkiene, 2016).

### **Abstract**

*Institutions such as universities and research centers create knowledge or "technological infrastructure" of European cities. In this context, support for science and research is particularly important. It is precisely the results and level of science and research in individual countries that are, to a great extent, perhaps best described by the maturity of society, as is the competitiveness in the knowledge-oriented economy. The level of statehood in the field of science and research is also characterized by the position of national universities and universities in the world and Europe as such. An important role in this respect is played by innovation. Innovations drive the current globalised world and the sphere of education presents no exception. Role of schools, and in the presented theses especially role of universities, is therefore to motivate students to creativity and innovations via new methods and technologies, which provide them sufficient space for their own growth and further career development. The aim of this article is to analyse a set of texts dealing with the issue of innovations in European education, e. g. with methods of e-learning, micro-learning, MOOC (Massive Open Online Courses), PLE (Personal Learning Environment) etc., as well as the changes occurring in the field of higher education.*

**Keywords:** E-learning, European education, higher education in EU, innovation in education

**JEL Classification:** I21, I23, I25

### **1. Introduction**

Governments in general can help to open systems to innovation as they can create an environment of friendly innovation that encourages transformational ideas and fosters innovation within the system as well as creating opportunities for an influx of external innovation. In addition, governments can help strengthen professional autonomy and collaborative culture where great ideas are shared and redefined. Governments can help turn big ideas into reality providing access to funding and non-financial support to kick-start these ideas. Last but not least, governments can build incentives and signals that enhance visibility and demand after that, what really works. However, government activity has its limits. Silicon Valley works because government has created conditions for innovation and not because the government is doing innovation itself. Similarly, governments cannot innovate in school classes. One thing about innovations in education must be therefore clear - teachers, schools and local governments should not only be involved in the implementation of educational changes but should play a central role in their creation. These actors need to have detailed knowledge of what works if they are to become effective innovators.

## **2. General Characteristics of Higher Education in the 21st Century**

The education of the 21st century is largely different from its form in the previous century. The role of fixed institutions in providing higher education to the masses is immensely dominant, as they represent a great tradition of public education that has its roots in ancient times. However, as the world cope with globalization, international cooperation, outsourcing and digitization, some traditional institutions are struggling to maintain their leadership position in the 21st century. These institutions are forced to share their privileged access to a new generation of students with another powerful force - the Internet. Taking into account the recent growth of numerous e-learning courses specifically designed to work with distance learning and out-of-class work, traditional institutions must find a way to provide autonomous students, demonstrating the vision of free and accessible education to all as well as to maintain their valuable brand, coupled with elite capabilities and the unique expertise they provide.

While some of the concerned institutions have moved on to become universities of applied science and research, others discuss possibilities of shortening a 3-year bachelor's program or a combination of higher education and university in the form of a more efficient and less time-consuming institution responding to the requirements of the young generation of future students, as well as labor market requirements. In addition to the changes that take place at universities, substantial growth has been demonstrated in external education that is capable of functioning and delivering information at a fraction of traditional education costs and produces good results, creating a new kind of higher education within an existing system. Distance learning, covering everything from virtual universities to online courses, aims to democratize access to education (Kay, Cohen, 2012). By complying with a service requirement that effectively combines experts with their respective audiences, distance institutions basically ignore the relative distance and other barriers of the real world in the process, and thus create a movement of great importance for future education.

Currently, the rhetoric surrounding higher education institutions and the role of teachers in the teaching and learning process is sometimes extremely negative. Some aspects of criticism, such as criticism of lack of individual approach or excess of theoretical knowledge at the expense of practical, directed at schools and teachers, can be properly justified. The need for a more comprehensive solution remains legitimate, as solid higher education institutions remain a predominant force in obtaining a degree. However, how much the Internet can change, in relation to the broad-spectrum trend of relying on virtual connections and resources found on the Internet, no one can predict yet.

According to the UNESCO Statistical Institute, adult literacy is close to 98% in the developed regions of Central Asia, Europe and North America, whereas the average literacy rate is around 60% in the regions of Africa and South Asia. Despite the fact that numbers in developing countries, in the region of South and West Asia, have experienced a significant growth in literacy levels where it rose from 43% in 1991 to nearly 70% in 2015 (VanTassel-Baska, Little, 2016). The global trend of increasing literacy among adults leads to more specific types of literacy that help in other aspects of people's lives, such as financial literacy or digital literacy. According to the OECD, computer and information literacy is the ability of an individual to use a computer to explore, create and communicate for effective participation at home, at school, at work, or in a society. Two main factors of digital competence are subsequently described as collecting and managing information, which also includes the location and evaluation of information and the production and exchange of information that includes online security (Shavinina, 2013).

We live in a society that is heavily dependent on the exchange of different types of information on the Internet and where the total number of global IP traffic reached 1 billion gigabits per

month in 2016, a five-fold increase over the last 5 years (OECD, 2016). Enhancing digital literacy across age, social status and socio-cultural barriers is a very important factor in any thorough education policy. By providing the above mentioned skills to people, we will enable them to actively seek information, learn and evaluate independently. Globalization brings with it many threats, including attacks on personal security. After the nineteenth-century preoccupation with industrialization and the twentieth-century focus on modernization and development, the discourse on globalization has taken on the contemporary role of describing in a singular term the master pattern of recent and ongoing societal developments coupled with the sustainable development and growth (Bílý, Horváthová, 2016). Freedom of consciousness also empowers groups for which the traditional education system is either inappropriate, inaccessible or often simply unavailable. Freedom and relative availability of Internet connectivity equips new students with great power and previously unimaginable opportunities.

### **3. New Trends in 21st Century Learning**

#### ***3.1 PLE - Personal Learning Environment***

PLE is a place where students can not only acquire, improve and select educational content, but also choose tools that are key to their intentions, create their own individual learning portals, tag content, or sign in to resource sites where they find regular information on selected topics. Web 2.0 allows the transition from classical learning management systems (one-for-all, principle-based) to a personalized learning environment (by principle, one for me) that make up many parts, snippets and fractions or collections of tools and services, which are further constructed into individual and / or a shared country of knowledge, experience and contacts. PLEs are integrated systems consisting of a number of Web 2.0 elements, for example blogs, wiki systems, RSS readers, social networks, aggregators, educational content resources, etc. Payne(2009) defines PLE as "systems that help an educating student:

- Set Educational Goals;
- Manage the content and process of education;
- Communicate with other students during the learning process. "

PLE is a very subjective phenomenon, each individual adjusts his / her PLE to his / her taste and therefore a great degree of personalization is used. There is no precise definition of what PLE should look like, what it should contain, or how to illustrate it graphically. Most often, however, diagrams are dialed to include everything the student encompasses in their learning environment. It mainly includes non-formal and informal learning elements. PLEs are dynamic structures that change over time. Every component grows because our educational needs change. When compiling, it begins with a few components that, in the course of education, grow into the form of learning networks. However, it is always necessary to assume that each PLE has its educational goal. It does not matter what proportion of professional and personal interests we choose and what PLE components we choose. The learner becomes the curator of the educational content, transforms the acquired information into his / her knowledge and skills, cooperates with other students in the network - learning does not occur in the vacuum but requires collaborative cooperation and mutual sharing among PLE members (Kay & Cohen, 2012). Of course, PLE should be developed regularly, including adjustments to the diagram itself, which the student creates himself.

One of the typical representatives of educational entities in PLE is also the social media, which form an integral part of our personal, working and educational environment, meaning it has inherently become part of a modern society. Through social media we communicate with

friends, liaise contacts with business partners, watch current events in the world or in the field that interests us, connect with communities that share a common goal, work through social media remotely, share personal and working content, build through them our personal and corporate brand, communicating through them with our customers, often forming a filter for the content we consume, serving as a marketing tool, or a place where employees meet their employers, reflecting our personal and working lives, we spend on them hours for fun, fulfillment, personal development or the development of our knowledge and skills. With the massive growth of mobile devices, social media are becoming accessible at all times (Edquist, 2013). Every day we consume Facebook statuses, browse new LinkedIn profiles, entertain ourselves by browsing images on Pinterest or watch links to interesting and less interesting Twitter content. The need to write to someone, to call or to meet personally is replaced by the opportunity to get in touch with everyone and arrange by talking through social media.

Besides the sphere of entertainment and work, the social media also penetrate the area of education, where they play an increasingly important role. Social media offer a variety of opportunities to learn, acquire new information and change them to specific knowledge and skills. With technology and the Internet available from virtually every smartphone or tablet, individuals can always have their PLEs, including social media. Social media can be used by students for their education through a variety of tools for a variety of purposes, Facebook for communicating with friends or community, Delicious as a bookmarking system for links that they do not want to lose, Twitter as a micro-blogging service that constantly provides up-to-date information, Google Docs for collaborative work, YouTube for video training (YouTube has a separate section YouTube Education where you can find videos for educational purposes), and on the way to school or work, individuals can listen to podcasts and audiobooks (VanTassel-Baska, Little, 2016). In addition, students can be in contact with lecturers from online classroom through webinars (such as MasterClass) and hangouts or via Skype. Statistics show that there is only on Facebook 1.15 billion people, more than a billion on Google+ and Twitter has 550 million active users. Every 2 seconds a new user will join LinkedIn. There are every minute 24 new video uploads to YouTube and 2 billion of videos are viewed daily (Karyotaris, Moustakis, 2014). There are several benefits that speak for the inclusion of social media in their learning process such as the student can get into the community of the same-minded people, get support, feedback, advice and new information from people within the chosen social media. This environment promotes common learning and collaboration, information exchange, ideas and examples of good practices. Social media cross borders, are independent of culture, nationality, gender, skin color, which is their clear advantage. Anyone can use them for their intellectual enrichment, mentoring, contacts around the world, for up-to-date information, and the development of skills for the 21st century.

### ***3.2 MOOC - Massive Open Online Courses***

Stephen Downes and George Siemens came with the concept of MOOC in 2008 (World Economic Forum, 2014). This phenomenon promised further progress in network learning and was considered as an ecosystem of connectivism. MOOC is considered to be the last stage of development in education. MOOC company recorded the biggest boom in 2012 when the New York Times tagged the year 2012 as a year of MOOC. Horizon prognosed them with another significant increase for 2013, which really happened as the world, and schools and individuals began to discover the benefits of this new approach to education (VanTassel-Baska, Little, 2016). Great universities like Harvard, Stanford, MIT or Berkeley provide their education through online courses. Large players in this area have become Coursera, Udacity or EDX, with courses being attended by thousands of students from all over the world (Ács, 2015). The biggest advantage is obvious, as the world's best universities are available free of charge for

everyone via the internet. Those who would not otherwise be educated have the opportunity to listen to the lectures of the best professors from around the world. Therefore, the MOOC is an ideal tool for those who want to learn effectively.

MOOC offers an alternative to traditional formal/school education. Everyone can improve their knowledge and skills with the intention of increasing the chances of employment in the labor market. However, the 2014 Horizon report reflects the concerns that have arisen during the short "trial" period of the MOOC (Redmond, Lock, Danaher, 2015). Horizon mentions the low percentage of those who actually finish the courses (5-16%) and the fact that more work is needed to be done on cooperation and interaction of courses. Year 2013 is considered as the year in which MOOC "returned to the ground". In addition, there is an increased effort to formalize MOOC courses, that is, to introduce a credit system for passing the course as if a person would be a student at school, as demonstrated by the University of Colorado or the San Jose State University. MOOC have become the most discussed topics in the field of educational alternatives. Sebastian Thrun, one of the MOOC's pioneers, adds that it is essential to focus on greater involvement of the human factor in the course (World Economic Forum, 2014). People who take part in an on-line course have the opportunity to meet their colleagues in offline world. Coursera therefore establishes so-called Learning hubs, where students can meet their lecturers. The way the chosen course is run is more or less similar to all available courses. A potential user arrives at one of the learning platforms, chooses the course that interests him the most (or chooses a few courses), finds out more about the courses, what the course conditions are, what is the time grant, when the course starts, and then enters the course. During the course, a user will gain access to curriculums and teaching materials, which are mostly in the form of video and textual support. Student passes course lessons, each week a new lesson is available (Redmond, Lock, Danaher, 2015). The user continuously works on tasks, discusses in discussion forums with other course participants, completes tests and quizzes until the course ends. Most often, the course ends with a bigger test or a task if the student completed everything according to the given conditions, and at the end of the course he / she obtains a certificate of completion of the course or a certificate of the acquired knowledge. This is a standard course that can vary on different platforms, for example, in terms of course length, types of educational objects, course prices, and so on.

### ***3.3 Collaborative Learning***

Collaborative learning is a situation where two or more people are learning together and trying to learn something new. Internet and technology make it possible for us to learn with others in a global collaborative space outside the educational structures that have been the norm for centuries. New structures are located in an area where people can learn independently, the only question remains whether or not they can do it effectively. As it has been mentioned above, theory, which deals with common learning within social networks, is called connectivism. Downes and Siemens have pointed out that being a member of the online network, communicating with others, and filtering information and ideas that others produce, produces knowledge and expand educational horizons (Knox, 2016). Connectivity implies the active involvement of people in communication with others, instead of transferring knowledge from teacher to student. It also changes the role of the teacher because students have the opportunity to move from the environment in which the education is managed to the environment where they can run it themselves or in collaboration with other students on the network. A typical representative of collaborative learning is participation in the MOOC course, where participants have the opportunity to work on common tasks, projects, discuss together, advise each other on the problems, work on the taught topics, and formalities of the course in one

place, regardless of the location of their stay and the cultural background, from which they originate (Porter, 2015).

### **3.4 Microlearning / Micro-courses**

In response to the significant dropout of students enrolled in the online / MOOC courses, microlearning is used during the course. Microlearning is a learning where the studied subject is divided into small learning areas sometimes referred to as "knowledge-nuggets." Micro-courses are courses that do not require too much time for the student to complete a motivated course. The whole course takes about 1 hour, with individual lessons only a few minutes long, typically around 5-7mins (Knox, 2016). Individual lessons are small units of knowledge that the student can pay required attention. At the end of the course, students will feel more delightful than during typical course and are more likely to continue with the course. The question is how these lessons can be fill with enough content to add some value to a student. As an argument for micro-courses, we can state that they can be compiled individually from different courses to suit the student. An extensive database of knowledge is built on which the student can learn and compiled their course. If a student does not find a micro-course on the topic he / she wants to study, the quest can be originated, so someone can prepare such a course for him/her. There is, therefore, a sharing of knowledge in the community of people who have a common interest in the self-learning process. Micro-courses are available on the web via mobile apps too, especially for anyone who decides to use or create the micro-course, so he/she has everything they need: an application for creating a record, the Internet for its transmission and sharing. Micro-courses are available free of charge or for a fee, for example, for extended lessons, for accompanying material or for additional lessons beyond those introductory, and so on. Micro-courses can be used by individuals as well as by companies, in the event for example that its employees will record their know-how in this way, and then companies can create knowledge databases that will serve them for internal trainings, an internal wiki system, and so on (Redmond, Lock, Danaher, 2015). Micro-learning can take various forms, such as reading text, email or SMS, listening to podcasts, watching videos, memorizing vocabularies, phrases, and more.

### **3.5 Mobile Education**

Mobile technologies allow users to tailor their educational activities as never before. The development of an ever faster Internet connection and the ever-improving technological advances have resulted in the development of non-formal education, but also offer the challenges of formal education. In addition, it requires individual work of the individual when completing specific learning activities. It becomes part of a PLE of an individual, which can include, for example, micro-courses, curriculum of web content, communication with the group in collaborative learning, sharing, engaging in educational games, watching videos, storing content in cloud repositories (e.g. Dropbox) or complex systems (e.g. Evernote), managing everyday tasks (e.g. via Wunderlist) and more (Porter, 2015). In addition to the educational content itself, mobile applications offer methods to record or manage their educational backups. In one device, the user has a personal learning environment, control and self-management tools, and progress monitoring.

With the arrival of smartphones, tablets and e-readers, reading books, news and articles, watching videos, listening to podcasts, studying languages, social networking, just-in-time learning, BYOD (bring-your-own-device) at the schools, etc., has become easier. Thus, individual education has arrived to its simplest form so far. Examples of the use of tablets in teaching include, for example, Stanford Medical University, where new iPads are given to

newcomers to explore how they are used by students. For the time being, tablets seem to be a great helper for taking notes during lectures and, in particular, for quick access to information that students need to find out during their lessons. The tablet has become much more popular than a classic laptop. The enormous boom in mobile learning is experienced by the regions of Africa and the Middle East where the use of this type of education is growing, especially among companies that educate their employees. For example, India has expressed its preference to learn 86% of employees through mobile devices. According to Brandon Hall research, which deals with mobile education, 73% of organizations already use mobile education devices (Knox, 2016).

### **3.6 Adaptive Learning**

Despite the fact that thanks to new technologies substantial changes have been made, for example, in the sphere of trade, industry or the economy, the education remains the same, with exception of few bold efforts, as in the last century. On the other hand, big data, content portals, millions of blogs or e-book libraries hide a valuable source of information relevant to education. Adaptive Learning Platforms help you find, mark and organize study material, evaluate and deliver individual learning items, and use data mining to deliver optimized learning content to teach individuals every day. One of these platforms is Knewton, which is specific in its breadth and depth of educational content. Adaptive learning makes content dynamic and interactive, covering the most of the student's needs. The platform monitors how students interact with the system, evaluates the vast amount of information that a student produces during the learning process, and through interacting with content items in a communication with teachers and other students (Karyotakis, Moustakis, 2014). It can evaluate the current student knowledge and to determine what educational activities will bring the student the most benefits.

Adaptive learning can be integrated in the educational activities by both individuals and schools as its use allows teachers to be more concentrated on individual students, to solve specific problems with them, and to continuously direct them in what they should learn. Student and teacher each receive information to help them achieve better results and to improve overall. Main protagonists of platforms for adaptive learning are Knewton, Khan Academy and Udacity. Adaptive systems create an ideal tool for use in overturned classes. Knewton is based on a sophisticated, intelligent algorithm that can evaluate learners needs, give him the right resources to learn, recommend an online course or offer a learning path. It works with big data and data mining, making customizable and tailored content available for each student. For example, it is delivered to online courses as a system that personalizes the learning process of their users (Knox, 2016). Teachers perceive what parts of the substance they are teaching make the student biggest problems, and they can help him/her to understand these parts, and vice versa, students see what makes them the biggest problems and to what they should return.

## **4. Conclusion**

Individual education takes place only after leaving education institutions, interacting with the work environment and taking into account the demands that contemporary society and employers require. Research of Microsoft Partner in Learning Research (MPIL) is evidence of this phenomenon as it focuses on defining the relationship between 21st century's abilities and quality of work and life after school. Up to 59% of respondents argued that most of the skills necessary for their current work were obtained after school. Gallup's research was conducted

using 1 014 interviews with respondents aged 18-35. Students and workers were among the respondents. Research has shown that respondents prefer outdoor activities than classroom classes. 59% of people said that most of what they use in their present work was taught outside school [14]. It was clear from the results that the development of skills for the 21st century in the last year of study has a positive correlation with the perceived quality of work later in life. Those who have worked to acquire skills for the 21st century perceive the quality of their work twice as better as those who did not work on the skills for the 21st century.

The sooner the students will be educated and improved in their 21st century skills, the better opportunities they find on the labor market. The goal of public administration and, in particular, educational institutions is precisely to improve the quality of life for citizens while respecting the principles of sustainable development while at the same time increasing the performance and quality of public services provided. Thus, human resources are the central bearers of values, know-how, creativity, innovation, and therefore the knowledge and skills necessary and appropriate to the current requirements of the 21st century (Jankurová, Masár, Jankelová, 2017). The years of membership in the EU has taught us that European cooperation in the area of education and professional training must not focus only on reaching a certain percentage of people with university education but must lead to ensuring the sufficient quality of education and employability of graduates on the labour market (Göttlichová, Soukalová, 2014). It is also necessary to realize that in today's globalized society "one of the core virtues of global citizenship is a commitment to protect, uphold and educate the cultural diversity of the global commonwealth" (Huang, 2017). One of the features of education in the 21st century is therefore the ability to constantly learn, to respond to changes and to have an overview of 21st century skills. A true leader of 21st century is not only characterized by his personality traits and characteristics or their power position, but mainly by their knowledge and skills (Jankurová, Ljudvigová, Gubová, 2017). Due to the definition of new elements of current leadership in enterprises, also new leadership requirements need to be identified and educated (Ljudvigová, 2017).

Self-training thus becomes a tool to allow people to update their knowledge and skills and to remain competitive in the current global economy. In addition, people try to educate on their own, in the way that suits them the most, the things that matter most to them. It is natural that they want to use the conveniences of the Internet and the ever-evolving technology. Whether knowingly or unwittingly they create their own personal learning environment (PLE), which add structure to their world of learning. The most diverse group of factors that influence the development of domestic investment funds are the socio-psychological factors. Due to the complexity of investment products such as funds, investment funds, level of education and knowledge of financial markets and entities operating on it can affect the development of the size of the demand for asset management services, and consequently the size of the investment funds market (Mentel, Horváthová, 2016).

### **Abstract**

*Over the last decade, interest in project management has grown considerably. Yet, while project management experiences a boom, gloom and doom, performance often plague projects. Project performance relies on different dimensions of project management. Not only do practitioners realize that projects are “cool” yet complex to manage but they often discover that the “governing authority law” has struck again, and, thus, that projects are often over budget, over time, over and over again or worse, that projects fail to deliver on their immediate objectives or their strategic goals. The actual architecture of the project management in the EU offers a wide range of funding opportunities. However, funding is often not used effectively or it may be denied due to poor planning and implementation. Although numerous programmes and initiatives show different features, the development and implementation of projects in practice follows common EU rules. The main aim of the paper is to present the practises, especially in the EU programming period 2014–2020, which responds to international project management approach.*

**Keywords:** *EU Funds, International Project Management, Project Cycle Management, PMBOK, PMI*

**JEL Classification:** *O10, O22, O52, R58*

### **1. Introduction**

Project management success is extremely interesting topic from scientific, as well as practical point of view. Namely, different models of project management success emerged through history, indicating the level of thoughts considering management of project successful. Importance of project management also confirms the fact that the global need for skilled project managers is being raised by many institutions and organizations working within European institutional structures. Over the past half century, the European Union (EU) has been successful in securing high and rising living standards for their citizens. However, it is currently facing critical economic and social challenges as confirmed by a number of expert studies. Despite past success, the financial and economic crisis of the last five years has led several European economies and the EU itself to one of their most difficult moments in the post-World War II period – not only in the case of internal issues, but in the case of international relations too. The EU is going through one of the most difficult periods since its establishment and management, with multiple challenges facing the EU, countries and regions policy-makers, especially in the link with economic crisis. Recent years have seen a myriad of economic and social difficulties, i.e. stagnating economic growth, rising unemployment leading to social tensions, continuing financial troubles and sovereign debt crises in several European countries, exacerbated by the fact that the future outlook remains uncertain.

The EU is a heterogeneous unit with significant disparities between its Member States and mainly among their regions in many areas of the modern economy. The support of cohesion and balanced regional development together with increasing level of EU national and regional competitiveness belong to the temporary EU's key development objectives. The process of European integration is thus guided by striving for two different objectives: to foster economic competitiveness and to reduce national/regional differences. Nowadays enlarged EU present area with unbalanced territorial allocation of economic activities resulting in different living standard, what has a negative effect on balanced development across the whole EU, level of economic, social and territorial disparities and on the endowment for EU competitiveness (Staničková, 2014, 2015). Close affinity with spatial planning policy and developmental spatial perspective in the EU has the EU Cohesion Policy that is mostly known as discrete policy with a set of specific instruments or Funds purposing to reduce disparities (Bachtler, Mendez and Wislade, 2013). Cohesion Policy has an important role in enhancing of regional competitiveness and prosperity. From the long-term perspectives, regional competitiveness requires paying attention not only to economic but also to social and environmental factors, in recent years especially to territorial characteristics of areas – cohesion and competitiveness are thus partly complementary EU goals (Molle, 2007). In the EU, emerging and re-emerging differentiating dimensions are combined; these dimensions are associated with the EU enlargement on the one hand and with the recent crisis impact of the other hand. This leads not only to transformation of economic stratification of society, but also to uneven manifestations and impacts of economic activities in European area. As a result of spatially selective effects of economic processes is then the newly forming spatial differentiation of the EU, which should be solved and minimize by the financing activities from the European Structural and Investments Funds (ESIF) through implementation of projects based on joint project management rules and procedures. Context above just confirms common need for discipline which is project management in EU surroundings, as stated Melecký (2016).

## **2. International Project Management**

Project management (PM) has been developed over the years, and nowadays PM is identified as the primary success factor for wide range of activities and economic entities. The global need for project management opens up a variety of research, grant and academic opportunities. Graduates with PM degrees or skills enter a job market that has already identified candidates with their skill-set as its number one hiring priority. This has led to an inexorable shift away from traditional management models toward a new paradigm of project management. It has also resulted in a dramatic increase in the need for skilled project managers.

Project management is planning, organization, monitoring and control of all aspects of project, with motivation of all included to achieve project goals on safe manner, within agreed schedule, budget and performance criteria. It can be seen from the definition of project management, that it is focused on project performance, regarding short-term dimensions of project success – adherence to criteria of time, cost and quality. The “iron triangle” model itself was the very first model of project management success, which has later proven to be only a part of overall project success. From this point of view, it is clear to see how it is possible to have a successful project with unsuccessful project management, and vice versa. Namely, project can be successful despite unsuccessful project management because it has achieved higher and long-term goals. In the moment when management of project stops, short-term orientation can be unsuccessful, but long-term outcome can be successful, because wider set of goals are satisfied, instead of narrow subset which project management consists of.

Besides the “iron triangle”, and taking into account considerations of project management success, it is possible to find many different approaches. Project manager is not responsible only for time, cost and quality management, but also integration, scope, human resource, communication, risk and procurement management, so he or she is the most responsible person for project success. With this in mind, it is surely possible to broaden “iron triangle” model on models that anticipate management of stakeholders’ satisfaction, benefits to organization that owns the project and long-term impacts on project environment.

How to measure if project management is successful? Project management success can be evaluated through already mentioned criteria of time, cost, quality, scope, resource and activity, but also through models of measuring success like Project Management Performance Assessment (PMPA) (Bryde, 2003) or maturity models of management within organization like Project Excellence Model (Westerveld, 2003). It is hard to answer the question of project management success evaluation precisely, because project management creates both tangible and intangible benefits. As stated earlier, it may be possible for a right project to succeed without successful project management, but successful project management can boost up its success. There is a significant positive relationship between project management practices and project success. Project management success is one of the elements of project success, because the latter is hardly achievable without it, as stated Radujkovića and Sjekavicab (2017).

Project management success is extremely interesting topic from scientific, as well as practical point of view. Namely, different models of project management success emerged through history, indicating the level of thoughts considering management of project successful, also with respect to project complexity. Understanding complexity is of significance importance for project managers because of the differences associated with decision making and goal attainment that appear to be related to complex projects. As projects have become more and more complex there has been an increasing concern about the concept of project complexity as it influences upon the project management process. The importance of complexity to the project management process is widely acknowledged for several reasons. Complexity affects the modelling, evaluation, and control of projects and the objectives of time, cost, quality and safety. Complexity can also affect the selection of an appropriate project organization form and the project management arrangement including the expertise and experience requirements of project managers. The importance of complexity to the project management process is widely acknowledged for several reasons: (i) it helps determine planning, coordination and control requirements; (ii) it hinders the clear identification of goals and objectives of major projects; (iii) it can affect the selection of an appropriate project organization form and experience requirements of management personnel; (iv) it can be used as a criteria in the selection of a suitable project management arrangement; (v) it can affect different project outcomes (time, cost, quality, safety, etc.), as mentioned San Cristóbal (2017).

Over the last decade, interest in project management has grown considerably (Söderlund, 2011). Indeed, by some accounts, 24% of the world GDP (\$19 trillion) is spent through projects every year (World Bank, 2015) and nearly 16 million new project management jobs are expected to be created globally by 2020 (PMI, 2013). Yet, while project management experiences a boom, gloom and doom performance often plague projects (Morris, 2013; Shenhar and Dvir, 2007). Not only do practitioners realize that projects are “cool” yet complex to manage (Grabher, 2002) but they often discover that the “iron law” has struck again, and, thus, that projects are often over budget, over time, over and over again (Flyvbjerg, 2014) or worse, that projects fail to deliver on their immediate objectives or their strategic goals (Matta and Ashkenas, 2003; Shenhar and Dvir, 2007).

Over the past years, various standards have emerged and have helped to increase the degree of professionalism of PM. Professional associations the world over are introducing ever more PM standards and certification processes. The well-known institution related to PM are Project Management Institute (PMI) and International Project Management Association (IPMA) which create own project standards. The large majority of providers and programmes in North America seem to focus on the Project Management Body of Knowledge (PMBOK) Guide (PMI, 2017) based transfer of ‘know what’ and ‘know how’ aimed at improving the problem-solving skills of junior level project management professionals. IPMA that represents members of various national organizations primarily in Europe, Asia, and Africa ‘has developed its own standards and certification programme which is comprised of a central framework and quality assurance process plus national programmes developed by association members’ (IPMA, 2006). Yet the trend towards professionalism and the focus on standardization come into question as the behavioural and personal competencies of project managers outside of PM standards appear to be more relevant for their workplace performance than the tools and techniques emphasized in the standards. Furthermore, failures to plan accurately and control within “acceptable” limits are commonplace and projects fail at an astonishing rate in spite of the increasing interest in PM and PM implementation over the last decades (Flyvbjerg, Bruzelius and Rothengatter, 2003). At the same time, the role of complexity, chaos, and uncertainty play within development projects and project environments is gaining recognition in both research and practice.

Projects which transcend national and cultural borders, as well as time zones are routine in the global marketplace – they are synergistic and facilitate the development of new markets. The heightened complexity of these projects places high demands on the “soft” and “hard” skills needed for the project steering process. Complications and misunderstandings often arise, not because of different languages being used, but because of cultural differences. These can include differing connotations within the language, culturally based differences of behaviour, different expectations of leadership behaviour, and of personal proximity and boundaries in the work atmosphere, differing ways of dealing with time, or the extent to which information is explicitly or implicitly transmitted.

In addition, the geographical distance places certain demands on the virtual communication structures of the project teams. The entire project team, but especially the project management faces the challenge of effective process management of the communication process, and content management of content and tasks. How are common visions and objectives defined? Which modes of communication are appropriate? How can new virtual team-members be integrated and trust developed? Competent international project management deals with these issues proactively, utilizing the knowledge of intercultural work procedures and project steering skills. What are the issues? Cultural differences may cause complications and misunderstandings which are magnified by the virtual situation.

International projects involve immense capital investment. The expense factor makes it even more important to bring these projects to a successful conclusion. Carefully planned competency development and project monitoring will minimize wasted energy caused by avoidable obstacles and the efforts to achieve the project goal will be enhanced by increased consistency, motivation, self-assurance, and adherence to deadlines. Taken together, these advantages guarantee project success!

### 3. Project and Grant Management Applied in the EU

The EU Member States are founded on the principles of solidarity, democracy, respect for human rights, fundamental freedoms and the rule of law. Among these fundamental freedoms is also the right of citizens to participate actively in society, what is a significant component of the EU and as such constitute an increasingly important channel for EU investments. However, it can be extremely challenging for individuals, companies and also public sector which are trying to understand how investment decisions are made within EU institutions and how to successfully apply for EU funding realized in the frame of the EU Cohesion policy. The EU distributes its internal (and also external) funding in a number of ways: through individual projects and grant scheme, via a sector approach or by budget support to recipient governments. The project approach is particularly used to support initiatives outside the public sector, such as through subjects of civil society and the private sectors. Thus, it is essential for all entities to understand the concept of ‘the project’ and to have the capacity to design and implement projects, and especially to manage them strategically (Staničková, 2016).

Also the EU developed its own approach to PM and implemented projects supported from EU funds. The current programming period 2014–2020 holds lots of opportunities to fund innovative ideas and projects. The architecture of European funds and direct grants continues to offer a wide range of funding opportunities in the EU Member States. However, funding is often not used effectively or it may be denied due to poor planning. Although numerous programmes and initiatives have different features, the development and implementation of projects in practice follow common rules. But the initial question is what the definition of project is? There are a variety of definitions of what is a project, but useful starting point is the definition used in the EU. In 1992 the European Commission (EC) adopted project approach called Project Cycle Management (PCM) as the primary set of project design and management tools based on the Logical Framework Approach (LFA) for EU funded projects. PCM divides general project cycle to six basic design phases displayed in Figure 1. The first PCM manual has been produced in 1993 and subsequently has been updated. Based on the EU’s own PCM Guidelines (EC, 2004), project is defined as ‘series of activities aimed at bringing about clearly specified objectives within a defined time-period and with a defined budget. A project should also have clearly identified stakeholders, including the primary target group and the final beneficiaries; clearly defined coordination, management and financing arrangements; a monitoring and evaluation system to support performance management; and an appropriate level of financial and economic analysis indicating the project’s benefits will exceed its costs’.

**Figure 1: EU Project Cycle Management**

Source: Melecký, 2016

Project Cycle Management (PCM) is an approach that allows to manage many different projects and improve the quality of your projects over time. PCM uses the idea of a continuous learning cycle and incorporates logical framework analysis to guarantee that the beneficiaries are involved in the project's design. A core tool within Project Cycle Management is the Logical Framework Approach (LFA). Where LFA is all about getting the point of view of the stakeholders to define the project, PCM focuses more on the project manager. It is not surprising that this method became popular in large organisations and donor institutions. PCM is a good method of managing multiple projects at once, seeing to it that they comply with the overall strategy of the organisation and respond to the right procedures and rules. PCM also forces you to reflect on what you will do when things don't go as planned, and allows you to learn from these experiences. It acknowledges that the environment you work in is constantly evolving, which means that you must be flexible and capable to adapt (European Commission, 2018).

PCM is also an approach that favours standardised procedures and models, which lead to rigidity and to (huge) administrative overhead. PCM is a simple model that facilitates project management, but this very simplicity also pushes people to oversimplify complex development situations. As with LFA – which it incorporates – the rigid cause-and-effect logic forces people to leave out important parts. On the other hand, PCM has been used to manage enormous and complex programmes that combine actions in many countries and regions all over the world, over long periods of time. In these cases, the overall programme regroups specific actions and sub-actions in different places at different moments. To manage such complex programmes, you need a project management approach that goes further than that of a simple individual project, what is the case of the EU and supported projects from the EU funds.

The programming period 2014–2020 brings a number of challenges for the EU, namely fostering job-rich recovery from the economic crisis, but also addressing environmental challenges and climate change, tackling persistent educational gaps and fighting poverty and social exclusion. These challenges affect or threaten millions of our fellow European citizens and require the establishment of new instruments according to their aspirations. This is why the new framework strongly focuses on results. It includes new mechanisms, which should lay down the conditions for making a difference: a sound strategic approach through Partnership Agreements and programmes, thematic concentration, the performance framework, ex ante conditionality, a closer link to European economic governance, increased opportunities for the use of financial instruments, support to institutional capacity, minimum shares for European Social Fund contribution and a Youth Employment Initiative specifically set out to combat youth unemployment.

It has been long known that the most effective educational approach is one founded on a combination of school (academic) instruction and the application of academic concepts in actual practice. Courses of EU Project and Grant Management A and B support both sides of this equation, providing invaluable professional and academic support to students. Students' professional development begins with the receipt of the 6th edition of the PMBOK Guide, the global resource on PM used to shape both professional practice and educational curricula around the world in all phases of PCM. PMBOK Guide is globally accepted and it has 'become the de facto global standard for project management' (PMI, 2017).

Moreover, it's necessary to take into account the fact, that as organizations become increasingly complex, understanding complexity has become more and more important in organizational theory. The interrelationships between internal and external environments – from the culture and products through the competition and customers – force economic entities to make decisions based on multiple unknown variables.

## 4. Conclusion

Project management is inevitable in today's world – a place of continuous improvement through different types of various projects. Project management is not only necessity for that improvement but also one field that seeks for improvement itself, through influence on different PM success factors and also PM practices worldwide. The actual architecture for the EU funds and grants offers a wide range of funding opportunities. However, funding is often not used effectively or it may be denied due to poor planning and implementation. Although numerous programmes and initiatives show different features, the development and implementation of projects in practice follows common EU rules. The main aim of the paper is to present the project management learning approach which responds to EU programming period 2014–2020 and thus it helps the students and junior project managers acquire professional project management skills under EU rules. From the reviewed literature, it has been suggested that a properly designed project management curriculum is essential and will not only result in well-prepared future project managers but a competent workforce. These facts are important because of improvements in the Czech project management culture; the drawing of EU funds; the correctness of EU projects implementation and the compliance with EU requirements. The increasing unpredictability and complexity of unforeseen consequences of actions means that new methods of managing, planning and executing strategy are needed.

### **Abstract**

*Project management for its part, has grown from the narrow execution-oriented management of a single project where the focus is doing the project right, i.e., meeting time, cost, and quality, to a broader, more strategic, and complex management of projects where the focus is doing the right things, i.e., delivering benefits for stakeholders and end-users. Understanding complexity is of significance importance for project managers (in public in private sphere) due to the differences associated with decision-making and goal attainment that appear to be related to complex projects. As projects have become more and more complex, there has been an increasing concern about the concept of project complexity as it influences upon the project management process. The importance of complexity to the project management process is widely acknowledged for several reasons, and especially in the European Union sphere due to its heterogeneity – number of member states, number of policies and topics to be solved by projects. Interestingly, the project management field is more and more looking to address the EU big questions, but the question is if the EU apply, or is able to adapt the best-practice of international projects approach for managing its projects?*

**Keywords:** Complexity, EU, ESIF, LFA, PCM, PMBOK, PMI, Project Management

### **1. Introduction**

The European Union (EU) is founded on the principles of liberty, democracy, respect for human rights and fundamental freedoms, and the rule of law. Among these fundamental freedoms is the right of citizens to form associations that pursue a common purpose and which respect the above-mentioned principles. Citizens also have a right to participate actively in society, and to be involved in political parties and trade unions. Although the EU is one of the most developed parts of the world with high living standards, there exist significant and huge economic, social and territorial disparities having a negative impact on the balanced development across Member States and their regions, and thus weaken EU's performance in a global context. European integration process is guided by striving for two different objectives: to foster economic competitiveness and to reduce differences (Molle, 2007). The support of cohesion and balanced development together with increasing level of EU competitiveness thus belong to the temporary EU's key development objectives (Melecký, 2015). The face of the EU undoubtedly changed with the latest enlargements of 2004, 2007 and 2013. The accession of new members not only entails the integration of countries with generally lower Gross Domestic Product (GDP) and higher unemployment levels, but also causes an increase in the Union's diversity in terms of e.g. social structures, institutional profiles, urban-rural relationships and environmental challenges and other changes, threats and challenges

(Šotkovský, 2016). Embracing this diversity however implies a need to adapt analytical approaches to social, economic and environmental phenomena correspondingly and testify the level of converge trends between group of old members and new, resp. relatively new members (Dvoroková, 2016). In this field is thus important to evaluate efficiency and effectiveness of using financial sources in the EU Members States to identify utility of these sources for national and regional development (Halásková and Halásková, 2014). Nowadays, the EU is going through one of the most difficult periods since its establishment, with multiple challenges facing the region's policy-makers. Recent years have seen a myriad of economic and social difficulties, i.e. stagnating economic growth, rising unemployment leading to social tensions, continuing financial troubles and sovereign debt crises in several European countries, exacerbated by the fact that the future outlook remains uncertain. There is widespread agreement that the root causes of this prolonged crisis lie in the lack of competitiveness of many countries (WEF, 2017). Territorial potentials of European regions and their diversity are thus becoming increasingly important for the development of the European economy, especially now in times of globalisation processes in world economy.

Interest in Project Management (PM) is growing significantly. And it's not just in business. The global need for skilled PM is being raised by such organizations as the International Monetary Fund, the World Bank and the EU. Nowadays, PM has developed into many activities in order to plan, co-ordinate and control the complex and diverse activities of wide range of projects. What is the reason for so high level of popularity of project management within the EU and co-financed of development activities from the EU funds?

The current programming period 2014-2020 holds lots of opportunities to fund innovative ideas and projects. The architecture of the EU funds and direct grants continues to offer a wide range of funding opportunities in the EU Member States, and especially NUTS 2 regions, i.e. in this field, the EU main focus is in investing in regions through the reformed EU Cohesion Policy 2014-2020. The adoption of the Partnership Agreements and programmes of the European Structural and Investment Funds (ESIF) constitutes a major step forward in the Union's support to the strategy for smart, sustainable and inclusive growth under the Europe 2020 strategy. By making available more than EUR 450 billion, the new programmes will enable the EU Member States and NUTS 2 regions to fully exploit their potential to achieve this threefold objective, while ensuring sound contribution to the Fund-specific purposes of the ESIFs; in particular, the objectives of economic, social and territorial cohesion, sustainable development of rural and maritime areas and sustainable management of natural resources.

Territorial potentials of European regions and their diversity are thus becoming increasingly important for the development of the European economy, especially now in times of globalisation processes in world economy. The EU, its regions and larger territories are increasingly affected by developments at the global level. New emerging challenges impact on territorial development and require policy responses. Territorial disparities on the other hand challenge the economic, social and territorial cohesion within the EU (Poledníková, 2014). Contributions from cities, regions and larger territories are important for Europe's position in the world and thus for the achievement of the aims set out in European growth strategies aiming on competitiveness, i.e. the Lisbon strategy for period 2000-2010 and the Strategy Europe 2020 for period 2010-2020. These strategies were and still are aimed to make Europe the world's leading knowledge-economy, based on the principle of sustainable development. But actions are needed at all levels of government – European, national and regional/local levels – if these ambitions are to be realised (Staničková, 2016).

However, funding is often not used as effectively as possible or it may be denied due to lack of knowledge or poor planning. Although the numerous programmes and initiatives have different features, the development and implementation of projects in practice follow common rules. But what is a project? According to definition, the Project Management Institute (PMI) defines project as follows: "A temporary endeavour undertaken to create a unique product, service, or result" (PMI, 2013). International Project Management Association (IPMA), the other well-known institution in the field of PM, defines project in following way: "A project is a time and cost constrained operation to realize a set of defined deliverables (the scope to fulfil the project's objectives) up to quality standards and requirements" (IPMA, 2006). European Commission defines project as follows: "A project is a series of activities aimed at bringing about clearly specified objectives within a defined time-period and with a defined budget" (EC, 2004). All definitions of project share one common characteristic - the projection of ideas and activities into new endeavours. The purpose of PM is to foresee as many dangers and problems as possible; and to plan, organise and control activities according to project lifecycle so that the project is completed as successfully as possible in spite of all the risks.

To achieve this goal and success of the whole project, the essential condition must be fulfilled - professional, relevant and effective PM. Is this PM easy to achieve and what knowledge and experience must have a responsible person? What are the basic knowledge and skills in PM needed by today's graduates to enter today's workplace as project managers? It has been long argued by some professionals that management is best learnt "on the job". Others on the other hand would say that a certain amount of management could be usefully and beneficially given to people as part of a learning package. One of the main arguments for this meaning is that if inexperienced personnel are encouraged to "learn on the job" they will not only learn good practice but also develop bad practice without being aware of its deficiencies (Melecký, 2016).

## **2. Project Cycle Management**

Project Cycle Management (PCM) is an approach that allows you to manage many different projects and improve the quality of your projects over time. PCM uses the idea of a continuous learning cycle and incorporates logical framework analysis to guarantee that the beneficiaries are involved in the project's design. However, PCM's built-in flexibility is often threatened by the way its tools and models are used in a rigid way by donors and strong non-government organization (NGO) partners. PCM is an approach to manage multiple projects or programmes and to improve the quality of projects by learning from one project and applying the lessons in the following ones. The approach was introduced by the World Bank in the 1980, and spread throughout the development world in the 90s, when it was picked up by the European Commission. Following an evaluation on Aid Efficiency, the European Commission introduced PCM as its main approach to manage and evaluate development project proposals.

Since then, other donor agencies and NGOs picked it up, although not always voluntarily. The fact that donor agencies actively pushed PCM and models and tools related to PCM led to resistance and often gave this approach a bad rep. One of the main tools of PCM, apart from the overall cycle, is the logical framework. With its emphasis on participation from both partners and beneficiaries, PCM incorporated the Logical Framework Approach (LFA) and added two main elements (EC, 2004):

- the link between the long term policies or the strategic framework of the organisation and their execution in the form of projects (or programmes);
- learning from experiences: PCM puts a heavy emphasis on monitoring and evaluation. The main idea behind the cycle is that the quality of projects gradually improves as lessons are passed on from one project to the next. Also, within a single project there is flexibility and learning, as continuous monitoring allows the people who manage the project to adapt the activities and planning to the (changing) situation in the field. At least, that is the theory.

Another benefit of PCM, both from the management point of view and the quality improvement point of view, is that it presents a standardised approach with standardised tools. However, this is also the main reason why PCM meets with a lot of resistance. As a project management approach, PCM is mainly interesting for donor agencies and large NGOs. The problem is that these large organisations tend to force their partners to use the procedures and tools in a very rigid way. This goes up to the point that the emphasis shifts from flexibility in the field and learning between projects, towards respecting contracts, forms, procedures, administrative rules, budget restrictions, and so on. PCM is used to manage contracts, control projects and see to it that laws, regulations and budgetary restrictions are respected. Often, this leads to a situation where both beneficiaries and the NGO or NGOs that manage the projects are bound by hands and feet to the contract, the log frame, the budget and the planning. This is a far cry from the original notion of flexibility and learning.

A core tool within Project Cycle Management is the Logical Framework Approach. LFA supports the different stages of PCM and should provide an information base for completing the required PCM documents. When understood and intelligently applied, LFA is a very effective analytical and managerial tool. Where LFA is all about getting the point of view of the stakeholders to define the project, PCM focuses more on the project manager. It is not surprising that this method became popular in large organisations and donor institutions. PCM is a good method of managing multiple projects at once, seeing to it that they comply with the overall strategy of the organisation and respond to the right procedures and rules.

For smaller organisations with fewer projects, PCM may seem more of a burden than a benefit and not worth the overhead. However, PCM does show us that there is more to development than just doing activities with your beneficiaries. You do need an idea where you are going in the long run, and your projects should all originate from a common sense of direction. Otherwise you'll just end up with a whole bunch of different activities that are difficult to manage (and fund). There are plenty of organisations that ended up in that situation.

PCM also forces you to reflect on what you will do when things don't go as planned, and allows you to learn from these experiences. It acknowledges that the environment you work in is constantly evolving, which means that you must be flexible and capable to adapt.

Learning from your successes and failures is equally important. Just trying to do well is not good enough. Your beneficiaries have a right to get quality assistance and to get the best you can deliver. International development and the fight against poverty, disease, and inequality are complicated domains that need more than well-meant amateurism (although professionals can also learn from the enthusiasm and the good spirit of small volunteer actions).

The idea of the learning cycle in PCM is a solid one. It also teaches us to check what we do and react, in other words to be flexible in the execution of our projects. However, we all know that theory and practice are sometimes far apart. PCM is also an approach that favours standardised procedures and models, which lead to rigidity and to (huge) administrative overhead. PCM is a simple model that facilitates project management, but this very simplicity

also pushes people to oversimplify complex development situations. As with LFA – which it incorporates – the rigid cause-and-effect logic forces people to leave out important parts. Especially when combined with rules such as ‘a maximum of one specific objective / project purpose per project is allowed’.

On the other hand, PCM has been used to manage enormous and complex programmes that combine actions in many countries and regions all over the world, over long periods of time. In these cases, the overall programme regroups specific actions and sub-actions in different places at different moments. To manage such complex programmes, you need a project management approach that goes further than that of a simple individual project.

### 3. Project Management for the EU Funded Projects

In 1992 the European Commission adopted PCM as its primary set of project design and management tools (based on Logical Framework Approach), and a first PCM manual was produced in 1993. The manual was subsequently updated in 2001, shortly after the publication of the EC’s most recent Development Policy document (April 2000). A decision was made in early 2003 to update PCM manual again (now referred to as PCM ‘Guidelines’) as a result of:

- experience gained through implementing the ‘new’ development policy;
- issues raised by the ongoing international debate on aid effectiveness;
- feedback from participants attending PCM training.

PCM is a complex and creative process – as much art as science – involving the negotiation of decisions acceptable to key stakeholder groups. Teamwork, negotiation and communication skills are thus central to effective PCM, as is an appreciation of the political context within which decisions are being made. PCM provides an overall analytical and decision making framework, which must nevertheless be complemented by the application of other specific ‘technical’ and ‘process’ tools. Thus, the Guidelines should also be used in conjunction with other important European Commission reference documents relevant to specific sectors (e.g. Transport, health, education), to specific cross-cutting issues (e.g. good governance and human rights, gender, environment) and to specific assessment tools (e.g. Economic and Financial Analysis).

In the EU practice and project and grant management, what is the relationship between projects, programmes and policies? A well-formulated project should derive from an appropriate balance between the European Commission’s development policy priorities and the partner’s development priorities. Within the scope of these policy priorities, the executive arms of government or non-governmental agencies formulate the broad areas of work required to implement policy decisions. These broad areas of work are often called programmes, which, like projects, may vary significantly in scope and scale. The definition of what a programme is depends essentially on how the responsible authority, resp. authorities choose to define it.

Here is required to distinguish between project and programme cycle management. Project and programme cycle management guidance relates to the approaches governing the programming, design, implementation and evaluation of projects and programmes funded by EU external assistance. Project and programme cycle management guidance proceeds on the fundamental principles governing the cycle of operations characterized by a five stage cycle (European Commission, 2018):

- programming, where the priorities of EU assistance to a partner country, region or decentralized actors are defined;
- identification, where the options for an intervention are considered;
- formulation or design, where the action is developed in detail on the basis of which funding is approved;
- implementation, where actions are carried out and monitored;
- evaluation where the achievements are assessed in depth and lessons learned.

The cycle of operations for managing the European Commission's external assistance projects has five phases, as shown in Figure 1.

**Figure 1: The Cycle of Operations**

Source: European Commission, 2004, p. 16

This cycle highlights three main principles:

1. decision making criteria and procedures are defined at each phase (including key information requirements and quality assessment criteria);
2. the phases in the cycle are progressive – each phase should be completed for the next to be tackled with success;
3. new programming and project identification draws on the results of monitoring and evaluation as part of a structured process of feedback and institutional learning.

In practice, the duration and importance of each phase of the cycle will vary for different projects, depending on their scale and scope and on the specific operating modalities under which they are set up. For example, a large and complex engineering project may take many years to pass from the identification through to the implementation phase, whereas a project to provide emergency assistance in a post-conflict context may only take a few weeks or months to commence operations on the ground. Nevertheless, ensuring that adequate time and resources are committed to project identification and formulation is critical to supporting the design and effective implementation of relevant and feasible projects.

## 4. Conclusion

Practitioners maintain that Project Management can be learnt “on the job” after formal training has been completed. This debate has continued for many years but now the evidence of many new PM programmes in a variety of disciplined areas suggest that it is now accepted that PM is an acceptable and recognised academic study.

Project Cycle Management (PCM) is an approach that allows to manage many different projects and improve the quality of your projects over time. PCM uses the idea of a continuous learning cycle and incorporates logical framework analysis to guarantee that the beneficiaries are involved in the project's design. A core tool within Project Cycle Management is the Logical Framework Approach (LFA). Where LFA is all about getting the point of view of the stakeholders to define the project, PCM focuses more on the project manager. It is not surprising that this method became popular in large organisations and donor institutions. PCM is a good method of managing multiple projects at once, seeing to it that they comply with the overall strategy of the organisation and respond to the right procedures and rules. PCM also forces you to reflect on what you will do when things don't go as planned, and allows you to learn from these experiences. It acknowledges that the environment you work in is constantly evolving, which means that you must be flexible and capable to adapt.

PCM is also an approach that favours standardised procedures and models, which lead to rigidity and to (huge) administrative overhead. PCM is a simple model that facilitates project management, but this very simplicity also pushes people to oversimplify complex development situations. As with LFA – which it incorporates – the rigid cause-and-effect logic forces people to leave out important parts. On the other hand, PCM has been used to manage enormous and complex programmes that combine actions in many countries and regions all over the world, over long periods of time. In these cases, the overall programme regroups specific actions and sub-actions in different places at different moments. To manage such complex programmes, you need a project management approach that goes further than that of a simple individual project, what is the case of the EU and supported projects from the EU funds.

The EU programming period 2014-2020 holds lots of opportunities to fund innovative ideas and projects. The architecture of European Structural and Investment Funds (ESIF) and direct grants continues to offer a wide range of funding opportunities in the EU Member States. However, funding is often not used effectively or it may be denied due to poor planning. Although numerous programmes and initiatives have different features, the development and implementation of projects in practice follow common rules. For the EU funded projects, the European Commission requires the use of PCM. PCM is divided into different project phases from programming, through formulation to evaluation and auditing. As a project manager you have to be familiar with all different phases of PCM to successfully implement and manage and the EU funded project and to fulfil the requirements of the European Commission.

### **Abstract**

*The concept of circular economy is earning recognition in theoretical research. The closed-loop economy is the fundamental concept for zero waste society, elimination of wastage of resources and reuse of products. Circular economy sets the framework for reverse flows, the basis of reverse logistics. Reverse logistics is responsible for the flow of products, components and materials from where they were used back to where they were produced in order to recover some of their initial value or to find the most appropriate use for them. The European integration has stimulated the correct behaviour in the Member States influencing the circular processes. The purpose of this article is to evaluate the directions of changes in the level of the circular material use rate, which is the main measurement of the degree of secondary materials in the economy in relation to the overall material use, and to classify the EU members through comparative analysis methods using a set of variables describing the circular processes.*

**Keywords:** *circular economy, circular material use rate, European integration, European Union environmental regulations, reverse logistics, zero waste society*

**JEL Classification:** *C10, F61, F64, M21*

### **1. Introduction**

Growth in manufacturing increases the pollution of the environment. Major culprits here, apart from waste itself, are all kinds of air, water and soil pollutants. A polluted environment means worse quality of life, which is why state governments initiate activities towards the reduction of negative environmental impacts of the economy.

Pro-environmental activities are also realized within the European Union. Waste generated by the member countries is not just a major challenge. It opens possibilities for the alleviation of material or energy shortages. It can help diversify energy and material sources and increase the security of supply through the reduction of dependence on import (Tomić and Schneider, 2017). This will only be possible when used products are no longer treated as valueless waste but perceived as potential resources of valuable materials instead. Reuse of waste which is directed towards the reduction of the environmental impact of manufacturing and consumption is fundamental to circular economy. Hence reverse logistics has become a vital element of the European integration. Pro-environmental activities creating closed economic cycles can only yield effects when approached in a systemic way. That is why European legislation binds the Member States to develop the reintroduction of waste into the economic cycle. Hence the purpose of the article is to evaluate the change in the basic measure of circular economy called

the circular material use rate as well as categorize the UE Member States in terms of variables determining the effects of the circular economy in the years 2010, 2012, 2014.

## **2. Relationship Between Circular Economy and Reverse Logistics**

Waste is a natural consequence of manufacturing and consumption processes. But the volume of waste today is so big that finding new solutions to managing or even avoiding waste has become priority for many global economies, including the European Union. Current waste management practice focuses on supporting sustainable development mainly through the recovery of waste. It is based more on environmental and economic than on social and technical effects (Iacovidou et al, 2017). It is important to include environmental, social and governance practice in the decision making process of enterprises (Kadłubek, 2016; Nitkiewicz, 2013; Włodarczyk, 2016). That is why the reduction of the environmental impact of manufacturing and consumption should go beyond managing waste to increasing the social awareness of the possibility of waste recovery.

Research on closed cycle economy shows that to just supply the product to the customer is not enough anymore. It is equally crucial to determine the responsibility for the product when it is used. But recycling alone will not ensure a closed material flow in the economy (Haas et al, 2015). The disassembly and recovery of a product should be planned right at the drawing board (Burchart-Korol, 2016), and its environmental impact should be clear to consumers at every stage of a product's life. So reaching the desired rate of consumption can only be done through the way the products are made, supplied, regenerated and renewed (Hazen, Mollenkopf and Wang, 2017), which will contribute to the efficient management of both resources and waste.

Sustainable use of resources is the key element to resource sufficiency in Europe, and, accordingly, to the EU circular economy. In this context, material efficiency can be increased by legal and administrative regulations which ensure durability, functionality, recovery, reuse and recycling of products. Regulations of this kind should be priority, because they allow for the elimination, or at least minimization, of material loss and the reduction of generated waste (Tecchio et al, 2017). Circular economy is more than an option. It is fundamental to maintaining economic wealth and ecological sustainability (Jawahir and Bradley, 2016). And the body of the European Union undertakes a number of legal initiatives in this respect. Table 1 shows the basic EU legal acts for environmental protection which ensure the functioning of circular economy.

Source: (Hughes, 2017)

A closer look at the EU legislation for the introduction and functioning of circular economy is enough to understand that is it perceived as a part of green economy (D'Amato et al, 2017). So circular economy can be defined as “a regenerative system in which resource input and waste, emission, and energy leakage are minimised by slowing, closing, and narrowing material and energy loops. This can be achieved through long-lasting design, maintenance, repair, reuse, remanufacturing, refurbishing, and recycling” (Geissdoerfer et al, 2017).

One must keep in mind that today's economy is largely based on non-renewable resources. Through processing and reuse, circular economy can increase the accessibility of non-renewable resources such as metals (Smol, Kulczycka and Avdiushchenko, 2017). Thanks to this circular economy breaks the dependence of economic growth on limited resources (Raftowicz-Filipkiewicz, 2016). However, it should not only be discussed in the light of waste management improvement (Ghisellini, Cialani and Ulgiati, 2016). One of the premises of circular economy is the application of strategies which contribute to a more intelligent utilization of a product and aim at the implementation of intelligent manufacturing systems through (Kirchherr, Reike and Hekkert, 2017):

- a. Increasing the efficiency of energy consumption and production by reduced natural resources use.
- b. Increasing the intensity of product use (e. g. through sharing a product).
- c. Rejecting product's uselessness when it has lost its functions and not replacing it with a different one having the same functions.

It is believed that using circular economy helps extend the life of a product, which seems to be the most effective way to preserve resources (den Hollander, Bakker and Hultink, 2017).

It should not be forgotten, though, that circular economy has its negative aftermath as well. It contributes to economic growth which leads to the rebound effect which in turn results in reduced environmental benefits from circular economy (Zink and Geyer, 2017). Therefore, the management of a product's life cycle requires the synergy of activities in terms of collecting, recycling, reusing and recovering discarded products (Accorsi et al, 2015). The idea often mentioned in this context is the paradigm of circular economy which aims at the retention of high product added value for as long as possible and the reduction of production (Urbinati, Chiaroni and Chiesa, 2017). Accordingly, the systems of product value recovery should be subjected to comprehensive, systemic and coherent checks in terms of sustainable development (Millward-Hopkins et al, 2017).

Considering circular economy in the context of coherent processes of the recovery of value from waste and its reintroduction to the economic system points to a connection between circular economy and reverse logistics. Reverse logistics is perceived as one of the business processes in a sustainable supply chain (Feitó-Cespón et al, 2017). It encompasses a series of operations within a supply chain oriented at the development of returns of products, their processing and regeneration. In the literature, the notion of reverse logistics is most frequently used in the context of: sustainability, remanufacture, reuse, recycle, recover, redesign, reprocess, replace, resale, leftover, wholesale price, revenue sharing, cost sharing, risk sharing, rebate contract, quantity flexibility, quantity discount contract, buyback, return (Guo, 2017). As a matter of fact, the body of literature increasingly discusses closed-loop supply chain networks which are an integral part of processes realized in the traditional direction (forward) and reverse processes (Govindana, Fattahi and Keyvanshokoo, 2017). Only the consideration of closed economic cycles can lead to actual environmental effects ensuring a sustainable economic development.

Effectiveness of pro-ecological activities within reverse logistics, and thereby of circular economy, is only possible through the development of proper tools supporting decision making processes in this respect and through a clear and forward-looking approach in order to reach economic and ecological value from a returned product (Madaan and Wadhwa, 2007) and to reintroduce it on the market. The measure showing the use rate of secondary products on a given market is the circular material use rate. It can determine which economies are characterized by a high level of effects in terms of circular economy. The measure depends on the level of the implementation and realization of circular processes equated with the processes of reverse logistics such as: recycling, efficient use of resources, utilization of renewable energy sources, remanufacturing, refurbishment and re-use of products and components. Accordingly, the article examines the changes in the value of circular material use rate in the years 2010-2014, as well as the level of the realization of the processes of reverse logistics in individual EU countries. The assumption was that the analysis would look at all current members of the European Union, regardless of their accession date.

### **3. Changing Dynamics of Circular Material Use Rate**

Circular material use rate measures the level of circular (secondary) materials utilization in the total use of materials in economy. The more secondary materials replace raw materials the lower the extraction rate of resources. The measure helps monitor the level of natural resources protection. The analysis of the annual average tempo of change (Figure 1) and the one-base indicators of dynamics (with 2010 as the base) for the value of the material use rate in the years 2010-2014 yielded the following conclusions:

- a. In the years 2010-2014 most EU countries show an annual average increase in the value of circular material use, the biggest in Latvia and Croatia and the smallest in Hungary, the United Kingdom and France. Luxembourg, Greece and Finland recorded the biggest annual average drop in the circular material use rate.
- b. The annual average increase in the level of circular material use rate observed in some countries was caused mainly by an increase in the year 2014 compared to 2010. Only in Cyprus, Slovenia, Estonia, Portugal, the Netherlands and Hungary the steepest growth of circular material use rate compared to 2010 happened in either 2012 or 2013.

**Figure 1: Annual Average Rate of Change of Circular Material Use Rate in the Years 2010-2014**

Source: author’s calculations based on (Eurostat [online], 2018)

An analysis of the level of circular material use rate complements the dynamics analysis. Table 2 presents the indicator values in the years 2010-2014 in the countries of the European Union.

**Table 2: Circular Material Use Rate in the Member States of European Union [in %]**

Countries	Circular material use rate				
	2010	2011	2012	2013	2014
Netherlands	25	25.1	26.7	27.5	26.7
Italy	11.6	12.1	14.6	16.4	18.5
France	17.5	16.8	16.9	17.3	17.8
Belgium	10.8	12.3	16	16.5	16.9
United Kingdom	14.6	14	13.9	14.5	14.9
Poland	10.8	9.2	10.6	11.8	12.5
Luxembourg	24.1	20.7	17.4	15.5	11.3
Estonia	8.8	14.3	19.2	14.6	11
Germany	11	10.3	10.7	10.9	10.7
Malta	5.5	4.7	4	8.9	10.2
Denmark	8.7	7.5	7.2	8.5	9.8
Austria	5.9	6.1	6.7	7.8	8.6
Slovenia	5.9	7.6	9.4	9.2	8.4
Spain	10.4	9.8	9.8	8.9	7.7
Finland	13.5	14	15.3	10.1	7.3
Czech Republic	5.3	5.4	6.3	6.7	6.9
Sweden	7.4	7.8	8.4	7.5	6.7
Hungary	5.2	5.4	6.1	6.2	5.4
Slovakia	5.1	4.7	4.1	4.6	4.8
Croatia	1.6	2.4	3.6	3.7	4.6
Lithuania	3.9	3.6	3.8	3.2	3.8
Latvia	0.7	1.6	0.7	2.3	3.1
Cyprus	2	2.4	3.5	3.9	3.1
Bulgaria	2.1	1.8	1.8	2.5	2.7
Portugal	2.2	2	2.1	2.6	2.4
Ireland	1.7	1.9	1.8	1.6	1.9
Romania	2.4	2.2	2.2	2	1.7
Greece	2.7	2.2	1.9	1.9	1.4

Source: author's calculations based on (Eurostat [online], 2018)

The highest value of the circular material use rate is observed in the year 2014 in the Netherlands (26.7%), Italy (18.5%), France (17.8%) and Belgium (16.9%), whereas the lowest in Ireland (1.9%), Romania (1.7%) and Greece (1.4%). The countries with the highest values of the circular material use rate are characterized by both high (higher than the third quartile) and low (lower than the first quartile, the Netherlands, France) average annual growth. The countries which saw an average annual drop in the value of circular material use rate are characterized in the examined years by the lowest (Greece) or moderate (Finland and Luxembourg) value of the circular material use rate, and Luxembourg had one of the highest values of circular material use rate in the years 2010 and 2011.

#### 4. Classification of the EU Countries According to the Level of the Realization of Circular Economy Goals

The value of circular material use is influenced by the intensification of the implementation and realization of reverse logistics processes in individual EU countries. The necessity to implement pro-ecological activities within reverse logistics stems from the increased pro-ecological awareness of consumers. The research shows that the pro-ecological behaviour of consumers depends on many factors such as gender, age, profession, monthly household income (Jotanović, Ratković and Zakić, 2017). These variables are both demographic and socioeconomic in nature, and so their value is highly influenced by belonging to a given social group, including nations. For this reason it was checked if there exist major differences (or similarities) in the level of the realization of reverse logistics processes in the Member Countries. Also, a classification of the countries in terms of similarity in a given scope was carried out.

In order to classify the EU countries according to the level of the realization of circular economy goals, Ward method from the group of agglomeration combinatorial methods was used. 28 EU countries were analyzed, and the classification was made for the years 2010, 2012 and 2014 which was dictated by the accessibility of data. The set of variables consisted of: share of renewable energy in gross final energy consumption (in %), recycling rate of municipal waste (in %), recycling rate of packaging waste (in %), recycling rate of e-waste (in %), recycling of biowaste (in %), recovery rate of construction and demolition mineral waste (in %), domestic material consumption (in tonnes per capita), generation of waste excluding major mineral wastes per domestic material consumption (in %). The classification for the years 2010, 2012 and 2014 is presented in figure 2.

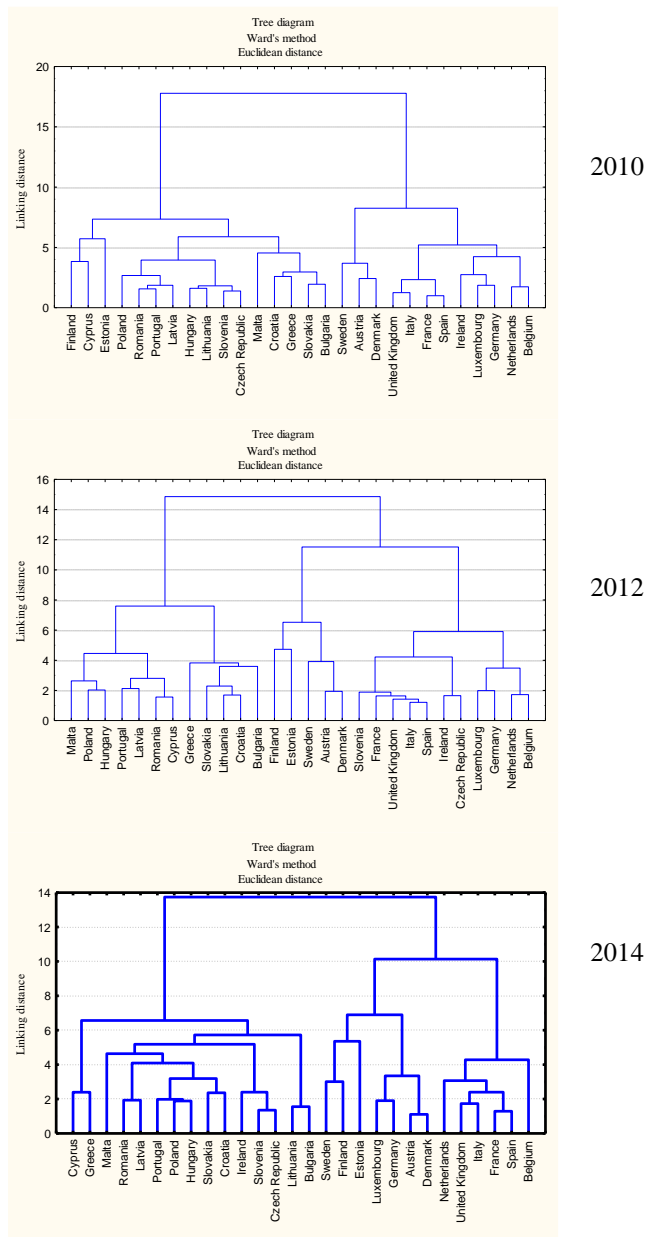

Assuming the binding distance 10, two groups of objects were obtained in the year 2010, and three in both 2012 and 2014. Group one is comprised mainly of countries which entered the European Union in the 2004-2013 period, the ones which accessed in the years 2012 and 2014 make group two, and the old members of the Union are found in group 3.

The classification indicates differences in the group membership and thereby similarities of the examined countries in the years 2010, 2012 and 2014. In 2010 two groups are distinguished: new and existing members of the European Union, yet among the countries which accessed the Union before 2004 Finland, Portugal and Greece showed greater similarity to the new members. In the years 2012 and 2014 the existing members of the Union made two separate groups, although Portugal and Greece and additionally Ireland in 2014 showed bigger similarity to the new members. Estonia was found in one group with the existing members in both years, while Slovenia and the Czech Republic in 2012. In the analyzed years the following countries were always in one group:

- Belgium, Netherlands,
- Poland, Cyprus, Romania, Portugal, Latvia, Hungary, Lithuania, Malta, Croatia, Greece, Slovakia, Bulgaria.

On the whole, though, the individual years of the examined period showed differences in the classification of the countries of the European Union in terms of the variables describing circular economy. This means we can speak of variability in the level of circular processes in the European Union. The variability is the result of significant differentiation in the level of: share of renewable energy in gross final energy consumption, recycling rate of municipal waste, recycling of biowaste, and generation of waste excluding major mineral wastes per domestic material consumption. Countries belonging to the same group showed a similar level of distinguished variables.

### 5. Conclusion

The article presents the analysis of the effects of activities aimed at the realization of circular economy in the countries of the European Union. Globalization of the economy increased the intensity of production and consumption processes, and accordingly, boosted the amount of generated waste. Striving for the reduction of negative effects of business and living has

become the basis for functioning of a society in the entire economy. The reduction of waste is possible through the reintroduction of materials into the economy which is the goal of circular economy and the reverse logistics processes realized within it. Coherent and collective policy in this respect leads to the achievement of environmental goals. Such policy is part of the EU legislation for environmental protection which is why the evaluation of effects of the activities towards circular economy seems well-founded.

The measure of circular economy is the circular material use rate. It turns out that the individual countries are characterized by different tendencies in terms of temporal change in the level of the circular material use rate value. In general, the biggest change is observed in the countries which showed some of the lowest values of the circular material use rate. Countries with significant ecological awareness show little change in the level of the circular use rate in the analyzed years.

On the basis of variables reflecting the effects of the implementation and functioning of circular economy and reverse logistics, the selected EU countries were compared and qualified. In order to do that a comparative analysis was used - especially classification methods. The analysis indicates variability in the intensification of activities within reverse logistics leading to the creation of closed material flows. It can be concluded, though, that the classification of the countries corresponds to the geopolitical arrangement into new and old members of the European Union.

But obviously, depending on the distance of the binding, it is possible to draw a more detailed differentiation of the EU countries in terms of the realization of circular processes. Nonetheless, the developed countries, where the level of ecological awareness is high, are the ones which support circular economy more. They have always shown a good level of secondary materials use, and continue to improve it.

### **Abstract**

*The subject of the paper is an analysis of post-crisis economic recovery in the European Union, which started much later than in the United States. A secular stagnation was a serious jeopardy for the European economy as a result of prolonged low investment propensity. However, after the second wave of recession, economic growth in the EU (from 2014) has been becoming more sustained. Nevertheless, the risk of secular stagnation persists because the investment rate still remains low. Analysis contains: basic theoretical assessment of the impact of investment on the economic growth and the statistical data cover two periods: 2009-2013 and 2014-2017. Presenting the results of GDP growth and its factors we use a demand and supply-side approach. Attention has been focused on investment and its barriers: macroeconomic, structural and resulting from a low quality of the business environment. The empirical analysis shows a large EU investment gap, deepened in the period 2009–2013 and the low rate of investment growth from 2014, when the EU economies entered the economic recovery.*

**Keywords:** determinants of investment, EU, investment gap, main barriers

**JEL Classification:** E22, E32, O11, O47

### **1. Introduction**

The recent financial and economic crisis 2008-2009, due to its course and consequences, is one of the greatest in the history of the market economy. Earlier deep recessions, which resulted in a permanent lack of sustainable economic growth ability in the long term, especially due to a low propensity to invest, were: the 1870s, the 1930s and the 1970s. The recent economic recession (2009) is most often compared to the recession of 1929-1933, mainly due to large declines in GDP, rising unemployment and lasting economic stagnation. That is why L. Summers at the IMF Research Conference on November 8, 2013, referring to the concept of A. Hansen's secular stagnation, presented the hypothesis of a new secular stagnation. It has attracted a lot of followers, particularly among American economists, who considered that the protracted weak economic situation in the European Union had the characteristics of secular stagnation. Such an evaluation of the economic situation in the European Union in 2009-2013 was confirmed by a decrease in the investment (-2.77% per year) and consumption rates (-0.01%) and, consequently, by a fall of GDP (-0.14%) (Table 1). At the same time, investment, consumption and GDP grew in the United States (except for 2008-2009) (AMECO [online], 2018).

The post-crisis recovery in the EU has continued since 2014. It should be stressed that the group of Central and Eastern European EU members, which are outside the euro area, have a

significant impact on the average (unweighted) growth rate in the EU. In 2016, GDP growth in the EU was 1.93%, while in seven CEE countries the growth rates were as follows: Hungary 2.21%, the Czech Republic 2.59%, Poland 2.86%, Croatia 2.98%, Slovakia 3.32%, Bulgaria 3.94% and Romania 4.59% (AMECO [online], 2018).

The question arises on the sources of a delayed yet stabilising economic recovery in the EU, which is crucial in the context of the threat of secular stagnation. According to a European Commission study, private consumption remains the main driver of post-crisis GDP growth in the EU. External demand and monetary policy also have an increasing impact (European Commission, 2018, p. 10-11). The investment rate is still low and labour productivity growth is lower than expected (European Commission, 2018, p. 1). Reforms in member states to create a more favourable business environment have a positive impact on growth in economic activity.

The aim of the paper is to analyze annual growth rates of investment, consumption, exports and GDP and to assess technological progress and structural changes measured by the growth of total factor productivity and labour productivity, as well as to identify factors influencing the level of investment. The analysis of the statistical data covers two periods: 2009-2013 and 2014-2017. Average annual growth rates of GDP, consumption, investment and net exports over the period 2009-2013 show the effects of the first and second wave of recession on the European Union as a whole, as well as on individual countries and the US due to a decrease in domestic and external demand. By contrast, the same macroeconomic indicators for 2014-2017 illustrate the growth of these three components of total demand and their impact on GDP growth in the EU, member states and the US. The same time periods were used in the assessment of the growth rate of supply-side of GDP growth factors. Considering the importance of investment in creating the foundations for sustainable economic growth and ensuring micro and macro-economic balance, the study included investment drivers and barriers. The theoretical works and empirical analyses of different authors as well as European Commission and European Central Bank were used to carry out the analysis and evaluations in the paper. Statistical data were obtained from the AMECO database and the Conference Board Total Economy Database.

## **2. The Role of Investment in Economic Growth - a Theoretical Framework**

A timeless contribution to the theory of economic development was made by A. Hansen, who presented an original interpretation of regressive processes in the US economy in the early 1930s, recognizing that recession and prolonged weak economic situation cannot be treated as a phase of the business cycle, but as an economic slowdown caused by low investment, slowdown of innovation and technological progress and sharp decline in the population growth rate. In formulating the hypothesis of secular stagnation, he stressed that it is a consequence of underinvestment in relation to higher savings (Taylor, 2013). A. Hansen specialized in both theoretical and empirical research on business cycles. According to his concept, sustained long-term GDP growth can only be achieved through investment leading to using new, more efficient technologies. Whereas, replacement investments, not supported by new technologies, were considered to be instruments of diminishing pro-growth impulses (Mucha-Leszko, 2016, p. 436-449). A. Hansen believed that recovery in the United States during 1934 -1937 was the result of an increase in consumer spending, such as household loans, help for veterans, wage increases and the introduction of a social security system, and that such measures could not ensure a sustained recovery. Moreover, technological progress stopped in the 1930s (Brown, 1989, p. 1-10).

Hansen's approach to the role of investment in economic development is shared by many other American economists. W. C. Peterson (1988, p. 198-199) focuses on the demand side of investment expenditure and its impact on the functioning of the economy, pointing out that: 1) investment expenditure has a strong impact on the total demand, 2) investment expenditure has a particular strategic impact on the economy, as purchases of capital goods contribute more to employment and income growth than purchases of consumer goods, 3) investment spending is more sensitive to changes in the economy than consumption expenditure, which is due to different assessments of growth prospects and investment effectiveness, as well as different investor risk propensity, 4) the main impact of investment expenditure on economic growth relies on the development of higher productive manufacturing capacity.

R. J. Barro (1990, p. 199-205) assesses the impact of investment on the economy from the perspective of their impact on cyclical development, economic growth and unemployment. The basis for conclusions and generalisations is the analysis of investment expenditures in 1925-1987 and the level of consumption and investment during the recessions in 1933-1982 in the United States. Studies show that investment expenditure was much more sensitive to economic downturns (and this also applied to replacement investments) than consumption expenditure. However, this general conclusion cannot be left without further comment. Consumption declines slightly during moderate recessions and falls significantly in periods of strong economic downturns. The level of consumption depends on the fall in income as a result of an increase in unemployment, social benefits and employers' wage policies. Consumers' behaviour may also change as a result of other factors that affect consumers' propensity to consume and their propensity to save. In the European Union, for example, during the 2001-2003 recession, consumer behaviour was against the principle of a decline in the propensity to save money in order to maintain consumption. On the contrary, the propensity to save increased as a result of states' pension and health care reforms. Reducing the scope of social security by states contributed to an increase in the propensity to accumulate individual savings (European Commission, 2004, p. 33).

The recent financial and economic crisis of 2008-2009, due to the extent, the scale of financial market destabilisation and the deep disturbance of economic equilibrium and prolonged economic stagnation, contributed to intensifying discussions and scientific research in order to solve economic problems and reduce the risk of repetition of similar processes destabilising national economies and international economic relations. The post-crisis economic situation is characterised by a persistent low propensity to invest, which, in particular as a major barrier to economic growth, is the subject of debates and initiatives supporting the development of investment in the European Union. The author of the hypothesis on the new secular stagnation L. Summers (2015) highlights many reasons for the persistence of private savings over private investment, which are not directly linked to the cyclical development of the market economy, but are a consequence of structural changes and to some extent of monetary policy. The most important causes of this problem are the following: 1) Asian countries' accumulation of high foreign currency reserves; 2) ageing of the population in rich countries and their lower propensity to consume and higher propensity to save due to increasing life expectancy; 3) lower natality, slower labour force growth and lower GDP growth; 4) lower employment growth - less need for job creation; 5) less necessity for investment as a result of e-business development - it does not require as much capital input, 6) low effectiveness of interest rate policy during deflation and low inflation, i. e. limited possibilities of achieving satisfactory economic growth and financial stability as a result of the use of traditional monetary policy instruments.

K. Pichelman (2015) argues that the hypothesis of a new secular stagnation was justified precisely by explaining the reasons for the fall in business and consumer spending at various interest rate levels. Investment demand can be reduced when labour resources and labour productivity decline. Increase in the income of the population may result in funds being transferred to the capital market. Low inflation does not cause an escape from money and rather slows down the growth of consumption and investment. If interest rates are higher than zero, then the savings that companies cannot invest are accumulated and risk aversion increases in a weak economic situation. Therefore, there is also no guarantee that, at zero interest rates, the investments will be high enough for the savings glut to be finished.

An increase in the propensity to invest may occur in a situation where investors will assess the economic prospects and opportunities as improving to achieve satisfactory profits. Investment decisions are also determined by the cost of capital, technological progress and state policy. The essence of the problem in today's economic situation lies in convincing private investors to treat real investment as more advantageous than investing capital in instruments of the financial market. The financialisation of the economy has caused the capital to be almost sucked in by the financial market, thus the real economy is deprived of capital and thus its development opportunities are limited (Mucha-Leszko, 2016, p. 438). However, the high propensity to invest is not a sufficient condition for sustained long-term economic growth, as can be seen in the case of Spain. The high investment rate, especially during the credit boom after the adoption of the euro (1999), led to overinvestment in the construction industry and a significant decline in investment during a longer than in other countries period of recession. The basis of sustained GDP growth is productive investment stimulated by scientific and technological progress. The result is development of new products and new types of services. They also provide opportunities to make better use of new technologies coming from abroad alongside capital in the form of foreign direct investment. According to Solow's theory of endogenous growth (1957), modern technology investment contributes to the total factor productivity (TFP) growth. The study on the contribution of indirect factors to real GDP growth based on TFP is widely used in analyses of labour productivity and sources of long-term economic growth. The TFP contains all factors that affect GDP but are not capital and labour input, and growth in total factor productivity is interpreted as a measure of technological progress and structural changes.

To conclude, in the assessment of the role of investment in the economy, the demand and supply side effects are analysed. In the first case, investment expenditures are a component of aggregate demand, while in the second case, investment expenditures are the basis for growth of production potential and creation of technological progress and innovation in the economy. The supply side of investment is crucial because it determines the conditions and opportunities for dynamic economic growth, structural changes and competitiveness.

In the next part of the paper we proceed to empirical analysis. We present the results of GDP growth and its factors in the EU countries in demand-side view for the years 2009-2013, which is the period covering two recessions and symptoms of a weak recovery, and for the years 2014-2017, in which the average annual economic growth rate of the European Union has come close to the level achieved by the United States at the same time. Then we present TFP and labour productivity ratios, which are the result of investment and structural changes. Attention has been focused on investment since they offer an opportunity to maintain a high rate of GDP growth in the long term and to reduce the EU's technological and economic gap towards the US, which increased particularly in 2009-2013.

### 3. GDP Growth and its Factors in 2009-2017: a Demand and Supply-Side Analysis

Table 1 contains figures illustrating average growth rates of GDP, consumption, investment and exports of goods and services for the 28 EU countries and the US (see also Figures 1 – 4).

**Table 1: Growth of GDP, Consumption, Investment and Exports of Goods and Services in 2009 – 2017 (Average Annual Growth Rate in %, in 2010 Constant Prices)**

Because of the large and diversified decreases in GDP between member states during the recession in 2009 and the protracted economic stagnation in most EU countries, in order to determine the effects of the crisis on the whole group and on individual countries, two periods have been identified: 2009-2013 (recessions and stagnation) and 2014-2017 (economic recovery in all EU-28 countries).

Average indicators for 2009-2013 show that GDP growth in the US was 1.05% (annual average) and in the EU there was a decline in GDP of -0.14%. Thus, the effects of the crisis in the European Union were much greater than in the United States. However, the situation in this field varied widely between member states. Exactly half of the countries (14) suffered a drop in GDP in the analysed period. In the other 14 countries, GDP growth also varied from 0.04% in Lithuania to 2.89% in Poland. Among the countries that achieved the highest GDP growth rate, apart from Poland, were Malta, Luxembourg, Slovakia, Sweden, Germany, Belgium and the United Kingdom (growth rates between 1.94% to 0.50%). In the group of countries that have suffered losses in GDP, the range of declines was from -0.11% in Denmark to -5.89% in Greece. The countries most affected by the crisis (apart from Greece) were Croatia, Slovenia, Spain, Cyprus, Portugal, Italy, Latvia, Finland and Hungary (from -2.52% to -0.76%). There were only four countries that achieved higher annual average GDP growth than the US in 2009-2013: Poland, Malta, Luxembourg and Slovakia. Unfortunately, countries with high GDP declines were a large group dominated by southern countries.

The figures show that the main contributor to the GDP decline was investment, which in the EU fell by -2.77% per year, and in the US investment was increasing, but only by 0.21%. GDP growth in the US was mainly maintained by consumption and exports. In the EU, even changes in consumption were on average slightly below zero. Whereas, exports have had a positive impact on economic growth in the EU. The decrease in investment in the member states was highly varied. Firstly, only a few countries recorded low annual average growth rates: Luxembourg 2.43%, Estonia 1.85%, Poland 0.64%, Malta 0.23% and Germany 0.11%. Secondly, the decrease was lower than the EU-28 average in ten countries: Austria, Sweden, the UK, Belgium, France, Slovakia, Lithuania, Denmark, Hungary and the Czech Republic (from -0.13% in Austria to -2.69% in the Czech Republic). Serious economic impacts were caused by a large drop in investment, which occurred in the following countries: Greece, Cyprus, Slovenia, Portugal, Romania, Spain, Bulgaria, Croatia and Italy (from -17.13% in Greece to -5.67% in Italy). Some of the countries with a deep fall in investment have not suffered any loss of GDP between 2009 and 2013 or the decline in GDP was modest because they achieved relatively high average annual growth of exports. These were: Bulgaria, Ireland and Romania. In addition, exports growth has maintained the economic growth in Lithuania, Estonia, Slovakia, Poland, Latvia and the Czech Republic. Consumption was an important demand driver in Luxembourg, Poland, Sweden, Malta, Belgium, Germany, France, and Austria.

The economic recovery in 2014-2017 reached an average annual GDP growth rate of 2.07% in the EU and 1.27% in the US. GDP growth occurred in all member states. The highest outputs measured by the average annual GDP growth rate were achieved by Ireland, Malta, Romania,

Luxembourg, the Czech Republic, Poland, Sweden, Hungary, Slovakia, Slovenia and Bulgaria (from 10.96% in Ireland to 3.19% in Bulgaria). The lowest output (GDP growth of 0.46%-1.49%) was in Greece, Italy, Finland, France, Belgium and Austria. It should be noted that the first three of these six countries suffered large GDP losses in 2009-2013 and continued to have a significantly lower economic output than the EU average. However, Spain has achieved an economic recovery thanks to relatively high growth in investment and exports. The structure of investments - an increase in expenditures on production equipment - is a symptom of positive changes in the Spanish economy. The improvement in investment also occurred in Cyprus and Portugal (European Commission, 2017, p. 10).

United States	0.25	-0.09	1.48	0.67

\*For EU-28: growth of labour productivity per person employed.

Source: authors' calculations based on (The Conference Board [online], 2018).

The statistical data shows that the countries most affected by the crisis are a varied group in terms of post-crisis economic recovery. Ireland, with impressive economic growth, investment and export performance, was also among these countries (Table 1). Moreover, Ireland achieved the highest growth rates of total factor productivity and labour productivity in the EU-15 (Table 2 and Figure 6). They are the result of high investment in intangible assets (such as intellectual property rights) and the activities of international corporations (European Commission, 2017, p. 10).

**Figure 5: Growth of Total Factor Productivity in the European Union and the United States in 2009 – 2016 (in %)**

**Figure 6: Growth of Total Factor Productivity in the European Union Countries in 2009-2013 and 2014- 2016 (Average Annual Growth Rate in %)**

Source: own elaboration based on (The Conference Board [online], 2018)

In regard to the thesis that growth of total factor productivity (TFP) and labour productivity are a prerequisite for long-term economic growth, in Table 2 we present the average annual TFP and labour productivity growth rates for 2009-2013 and 2014-2017 for the EU-28, member states and the US. TFP decreased by -0.79% in the EU-28 in 2009-2013 and by -0.33% in 2014-2016. In the US, there was a slight increase in the first period and in the second a minimal decrease in these indicators. More detailed data of TFP developments in 2009-2016 is presented in Figure 5. In the EU-28 there was a large fall in TFP in 2009 and a significant increase in 2010, followed by a fall of around -1% in 2012. After that, TFP

indicators improved and from 2014 they reached positive values and in the US they started to decrease. Before the crisis the TFP growth rate in the UE was periodically higher than in the US (Mucha-Leszko and Twarowska, 2016, p. 34). The EU-28 labour productivity growth rate was low in 2009-2013 (0.33%) and significantly higher during the economic recovery in 2014-2017 (0.94%) , while the US followed an opposite trend, with higher growth in the first period (1.48%) and a decline during 2014-2017 (0.67%). Total factor productivity and capital expenditures are the two main factors influencing the growth rate of labour productivity. The question therefore is why productivity has increased despite the fall in TFP. This concerns mainly the years of the crisis (2009-2013). In countries where investments were high, especially in housing before 2008, the recession resulted in the decline of the least efficient sectors and a decrease in employment, as well as an improvement in the capital-labour ratio. Both these factors have contributed to productivity growth. Spain was the best example of such processes (Mucha-Leszko, 2013, p. 107-120).

The indicators of TFP (Table 2) in the member states has been varied, but some patterns can be observed. In 2009-2013, the only countries where TFP increased were the five new member states (Poland, Latvia, Lithuania, Estonia and Slovakia) and Ireland. The deepest decreases in TFP rates occurred in Greece, Luxembourg, Croatia, Cyprus, Slovenia, the Czech Republic, Finland and Portugal. During the post-crisis economic recovery, TFP growth was observed in 22 of the EU countries, while in the remaining 6 countries TFP decreased, especially in Portugal, Finland and Belgium, but in France, Austria and Italy it was modest (Table 2). The highest TFP growth in the new EU-10 member states, with the exception of Cyprus and Croatia, is a peculiar feature underpinning long-term economic growth. In the group of highly developed EU-15 countries, good results in TFP growth in 2014-2017 were achieved by Luxembourg, Ireland, Sweden, Germany and the Netherlands, still growth rates were significantly lower than most of the new member states. It should be noted that investment, TFP and labour productivity growth are key prerequisites for closing the economic gap in the EU-12 countries. In the years preceding the crisis, the Baltic states (Lithuania, Latvia and Estonia), Romania and Bulgaria had the highest economic growth rates. This was mainly due to the inflow of foreign direct investment and access to low-interest loans. Foreign direct investment also contributed to growth of TFP, labour productivity and exports. In the second half of 2008, when the financial crisis began, CEE countries were in different phases of the business cycle. The degree of overheating before the crisis was decisive for the depth of the recession, and the Baltic states have suffered the greatest losses in GDP. Escalation of crisis phenomena increased the risk and led to withdrawal of foreign investors, which took place mainly in Estonia, Latvia, Lithuania and Romania (European Central Bank, 2010, p. 87-88).

As mentioned above, investment and TFP affect labour productivity, but its growth or decline is also influenced by other factors, including structural changes in economies. They caused both growth and decline in labour productivity, depending on which areas of the economy the most bankruptcies occurred and what impact they had on labour productivity. In countries where credit boom and excessive growth in the real estate market have occurred, the sudden fall in property prices led to the collapse of the housing sector and the production of construction materials (e. g. Spain), which are the lowest productivity sectors. This type of structural changes and loss of jobs by the lowest-skilled employees contributed to an increase in labour productivity and improved capital-labour relations. Construction, where half of the investments in overheating economies were concentrated, also had the greatest impact on the development of the Estonian, Latvian and Lithuanian economies (European Central Bank, 2010, p. 88-89). However, the consequences of the collapse of industrial enterprises in the GIPSIC countries (Greece, Ireland, Portugal, Spain, Italy and Cyprus) and France were different. The biggest decline in industrial production took place in Cyprus by 41%, Greece

by 31%, Spain by 30%, Italy by 23%, France by 16% and Portugal by 11%. In Ireland, industrial production fell only in 2009 and 2012 by around 10% and 5% and returned to pre-crisis level. For the other GIPSIC countries, this situation lasted until 2013 (Sinn, 2014, p. 110-111). The deindustrialisation of the economies reduced opportunities for a faster economic recovery, i.a. by deteriorating export potential and declining labour productivity or lowering its growth. In conclusion, it should be stressed that the new member states have shown greater capacity for post-crisis economic recovery than the southern EU-15 countries.

#### **4. Factors Influencing the Growth and Decline of Investment in the European Union Countries**

Investment is a result of decisions made by private entities and public authorities of countries. Private investment is essential for economic development. Investment may also increase as a result of foreign capital inflows and decrease when the capital is withdrawn. Investment decisions at company level depend on a number of factors, among which the most important are the following: the expected profit rate, the assessment of economic growth prospects and the risk propensity of potential investors. However, we should not overlook factors which are analysed in the second stage of the decision-making process by future investors, i. e. the cost of capital and the general conditions for investment on the domestic market or in other European Union countries. These factors may create a favourable climate for investment or discourage potential investors from undertaking projects stimulating their business activity. These include business environment, access to the production factors, labour and product market flexibility and structural changes in the economy. Improvement of the business environment is still in the spotlight of economic entities and member state authorities. It involves: improvement of law and the public administration system, law enforcement, creation of transparent tax system rules and ensuring stability of principles in business and investment activity.

The decreasing share of industry in the economies of highly developed countries was a specific structural factor influencing the decline in investment since the 1990s, and especially in the 21st century. The economies were dominated by services. However, the reallocation of investment to the service sector is not large enough to be seen as a significant factor of the decline in the EU investment rate. Nevertheless, in some member states, services are more important and the reallocation of investment to this sector has a greater impact on reducing investment in industry (e. g. Belgium, France and Finland) (European Commission, 2017, p. 7-12). Assessing the impact of the reallocation of investments on lowering the investment rate in the EU economies, it is important to take into account the credit boom between 2000 and 2007 that occurred in some EU member states (e. g. Spain and Baltic countries). It caused excessive growth of investment in housing construction. Structural and cyclical factors influenced the level of investment contributing to both their growth and decline. The analysis shows that the latest financial and economic crisis had the greatest impact on the decline in investment in the EU (Table 1). An analysis carried out by the European Commission showed that investment in the EU in 2014 in all selected sectors of the economy was lower than in 2007, except for Industry and Information and Communication. In construction, finance, real estate services and the Public administration, it was even below the 1995 values (European Commission, 2017, p. 8).

There is a lot of economic literature in which authors undertake theoretical and empirical analyses and assessments of various factors influence on the development of investment. The subject of these analyses are usually macroeconomic, microeconomic and structural factors, including the level of regulation of product and labour markets and economic sectors. The

business environment, especially in the EU, is also a very popular research area. Among macroeconomic factors, the following are considered to play a key role in driving investment: expected profit and economic prospects as well as the cost of capital. However, for small and medium-sized enterprises (SMEs), the conditions for raising capital needed to finance investments are very important (European Commission, 2017, p. 15; Banerjee et al., 2015, p. 67-82).

The level of product market regulation and its impact on investment has attracted the interest of economists since the liberalisation of economies in the 1980s and introduction of the Single European Market (including liberalisation of the public service market). A. Alesina, S. Ardagna, G. Nicoletti and F. Schiantarelli (2005, 791-825) analysed: entry barriers, public ownership, market share of the dominant players and price controls in services market in 21 OECD countries from 1975 to 1998. The results of the empirical analysis confirmed that market liberalisation leads to greater investment in the long-run. B. Egert's (2017) research confirmed the conclusions of analysis carried out by Alesina et al. in 2005 on the relationship between product market regulations and investment. B. Egert studied 32 OECD countries, showing that more stringent product and labour market regulations contribute to reducing investment.

Since the mid-1990s, employment policy and the flexibility of labour markets and their multidimensional effects on economies have still remained important research issues. Researches focused mainly on the effects of employment restrictions (employment protection legislation - EPL) associated with labour productivity. Furthermore, S. Laporsek and I. Stubelj (2012, p. 138-152) examined the relationship between EPL regulations and profits in 18 European countries in 1998 - 2008 using regression analysis. The result of the analysis shows that strict EPL has a negative impact on profit and authors suggest deepening the study in order to gain more knowledge about the relationship between employment protection and possible causality with profits, indicating interactions between profits and investments.

The impact of the labour markets on the economic performance from institutional approach, especially on total factor productivity is assessed by P. Čekmeová (2016, p. 116 – 123). The results of her empirical analysis suggest a significantly negative effect of trade unions, unemployment benefits and minimum wages on the growth rate of total factor productivity in 1995-2013. On the contrary, employment protection legislation indicates a significant positive impact.

Continuing the analysis of relations between employment protection and companies' and countries' economic outputs, it is worth noting the work of F. Cingano et al. (2010, p. 117-163), in which authors analysed the joint effect of EPL on investment, capital-labour substitution, labour productivity and jobs reallocation between countries. The results were as follows: EPL reduces all of them in high reallocation sectors relative to low reallocation sectors. An average effect of EPL on capital per worker was around -12%, investment per worker - 6,8% and labour productivity - 8,6%.

Finally, this leads us to the question: Which factors have the greatest influence on persistent low investment in the EU countries? The European Commission (2017) and the European Central Bank (2016) surveys show that these are mainly: cost of capital, corporate debt and non-performing loans, weak demand, uncertainty of expected profits and structural factors such as high regulation in product and labour markets. Member states still vary significantly in terms of the quality of business regulations and public administration, which also has an impact on investment.

## 5. Conclusion

According to the theoretical part of the analysis, we find a convincing argument in literature that investment is a prerequisite for economic growth in the medium and long term. The empirical analysis of economic growth in the European Union after crisis 2008-2009 shows a large EU investment gap, which deepened in the years 2009 - 2013 and a low rate of investment growth, when domestic economies, with a significant delay compared to the US, entered the economic recovery stage (from 2014).

At the current stage of the business cycle in the EU, the most important objective is to remove barriers hindering investment growth. In particular, these barriers are macroeconomic, structural and resulting from a low quality of the business environment. The following factors have the greatest impact on the low propensity of economic entities to invest: 1) pessimistic assessments of future profits and uncertainty concerning economic prospects, 2) increase in capital costs and more difficult access to credit, 3) companies' debt and non-performing loans, 4) highly regulated product and labour markets and sectoral entry barriers, 5) too low quality of business environment, 6) delays in implementing structural reforms. The risk of secular stagnation continues to exist because the investment rate still remains low.

### **Abstract**

*The article analyzes the current shortcomings and possibilities of developing a European governance mechanism. The European Union based on the Treaty of Lisbon needs to undergo a thorough revision to become more resilient in the difficult tests that it has to undergo. In the current decade, a period of extraordinary uncertainty has begun, which in its consequences may lead to the strengthening of secessionist tendencies in Europe, including the possible disintegration of the European Union. All proposed institutional reform represent a significant shift in the functioning of the European Union from the legislation enshrined in the Lisbon Treaty. Individual proposals reinforce the transnational character of the European Union and, at the same time, lead to changes in the interinstitutional arrangement. The current situation requires not only the reflection of the current developments of the part of the Union institutions but, in particular, the identification of the starting points and solutions by the Member States themselves.*

**Keywords:** *decision making, disintegration, European Union, governance mechanism, institutional reform*

**JEL Classification:** *E61, F02, F15*

### **1. Introduction**

The European Union (EU) is undergoing the most important transition since the beginning of the integration process. The Member States during this long period began to differ in many aspects more and more. Several factors of various nature and provenance have converged to challenge the goals, structures and equilibria of integration, thus requiring political and institutional responses from the Union. In many countries, public frustration, in particular where they cannot meet the challenges of globalization, is manifested.

The Member States currently are diverse especially in terms of economic wealth. The recent crisis has contributed to exacerbate the EU's longstanding democratic deficit. The EU institutions are seen as outright hostile and in the hands of unaccountable technocrats and EU officials – if not the big member countries. This type of diversity often leads to disagreements between net contributors to, and recipients from the EU budget. The EU leaders also disagreed on the relative priority that should be given to different policy areas.

As Kubicek (2017) says the EU's ability to resolve controversy was also tested by the enlargements that influenced the EU's capacity to act. The new members differ markedly from the old in terms of their recent historical experience and levels of economic development. The Member States also differ from one another in styles of national regulation. The way in which decisions has been taken is also the subject of controversy. The decision-making process has been often criticized for being undemocratic. Instead of bringing the Member States together

on European values and promoting the idea of European belonging, many apply eurosceptic populism and worrisome revival of nationalist sentiments in several Member States.

Internal problems are compounded by a number of external challenges (Russian annexation of Crimea, war in Syria, illegal immigration and refugee management in many member countries, political instability in almost the entire eastern and southern Mediterranean region, but also in many ways the unpredictability of the US administration policy). The Member States have a different opinion on some of these external issues, leading to fragmentation of the EU. As Fojtíková (2016) says, the separatist tendencies in the European Union can have a negative impact on the EU's external relations, for example at the EU's talks with China and other partners on a comprehensive investment agreements.

These are just some of the most visible problems currently facing the European Union. This social and political disintegration requires a discursive as well as institutional response from European leaders.

## **2. Intergovernmental Versus Supranational Mechanisms in the Area of Governance – Institutional Changes**

The European Union has a complex governing structures but it is not the government of individual states. Its structures blend together elements of intergovernmentalism, in which states are represented and their interests are given primary consideration, and supranationalism, which empowers EU structures and citizens directly, bypassing national governments. Many of acrimonious debates within the EU revolve around the question of whether its supranational or intergovernmental elements should guide policy (Kubicek, 2017).

It could be said that all political systems contain tensions between principles and practices, between the ideals and the realities of governance. This is true even in the case of the European Union. The result is that the more members there are in the Union, the more difficult it becomes to reach consensus on various topics, and the less likely it is that all would advance at the same pace in various fields. Many politicians believe that the path of this situation becomes the concept of a multi-speed or other concept of differently structured European integration. The current stagnation or crisis of the European integration process is a threat to Europe's future, because the acquis achieved could be gradually dismantled. It is a widely spread view (Vai, L. and Tortola, P., D., 2017) that the crisis has strengthened intergovernmentalism in the EU at the expense of supranational aspects. As examples, European Fiscal Compact (the *Treaty on Stability, Coordination and Governance in the Economic and Monetary Union* is the intergovernmental treaty introduced as a new stricter version of the Stability and Growth Pact, signed on 2 March 2012 by all Member States of the European Union), and the European Stability Mechanism (an intergovernmental organization established on 27 September 2012 and located in Luxembourg City, which operates under public international law for all Euroarea Member States having ratified a special intergovernmental treaty) can be used. New intergovernmentalism (Schmidt, 2017) is taking place in areas in which the European Union has recently acquired more powers compared to the past. Bickerton et al. (2015) call it as an integration paradox.

Alongside the establishment or reinforcement of intergovernmental mechanisms in the area of macroeconomic governance, recently we have witnessed an equally important strengthening of supranational institutions especially of the European Commission and the European Parliament:

- This was reflected in the selection of the candidate for the post of President of the European Commission. This process, referred to as the concept of top candidates (also called *Spitzenkandidaten* from German language) nominated by European political parties based on the outcome of the European Parliament elections, first applied in 2014. The result is a marked politicization of the work of the European Commission. This has reduced the role of the European Council in favor of the European Parliament. The European Commission thus loses its impartiality in guarding the Treaties and in seeking compromises between Member States. The strategic direction of the EU is thus transferred to the European Commission instead of staying on the shoulders of the European Council, representing national governments. The European Council has to stay the quintessential intergovernmental body also for future. This has affected the institutional balance that has existed until then. The permanent anchoring of this concept, which has not been formalized in the Treaties, is undesirable for a number of Member States (especially for smaller countries with shorter memberships in the EU such as the Czech Republic). These issues were discussed at the Round Table of the Czech National Convention on the EU on 16 February 2018, with the participation of government representatives, Parliament deputies, interest groups and unions as well as the academic sphere.
- Another outstanding issue is the number of seats in the European Parliament following the departure of the United Kingdom from the European Union in 2019. No permanent mechanism has been put in place to allocate mandates to individual Member States. The number of seats allocated to each country has been set ad hoc before all European Parliament elections. Part of the Member States promotes to make at least part of the loose UK mandate to create supranational candidates compiled by individual political parties at European level. However, these parties have not yet been sufficiently established and understandable for voters.
- The current debate on reforming the institutional set-up of the European Union also contains a number of other ideas. These include consideration of the merger of the positions of the President of the European Council and the European Commission President, as well as pressure to rationalize the functioning of the European institutions. The merging of the functions of the Presidents of the two mutually balancing institutions is a step towards centralization of the decision-making process and towards the weakening of the role of the European Council representing national interests. This proposal does not take into account the functional diversity and autonomous role of both institutions in the decision-making process, which is clearly enshrined in primary EU law.
- Similarly, the institutional balance is also undermined by another proposal to establish the post of European Economy and Finance Minister. It would actually merge two separate positions: the Vice-President of the European Commission and the President of the Eurogroup.
- Among the proposals that have been repeatedly debated with a view to streamlining the functioning and internal organization of the European Commission are the possibility of reducing the number of European Commissioners. The proposed reduction in the number of members of the European Commission could give rise to disputes over the form of the rotation principle on the basis of which Member States could nominate their representative.

- Also, the proposal for the creation of the European Monetary Fund, as a successor to the European stabilization mechanism (ESM), may be faced with the need to change primary legislation. The European Stability Mechanism is an intergovernmental organization located in Luxembourg, which operates under public international law for all eurozone Member States having ratified a special ESM intergovernmental treaty (established on 27 September 2012 as a permanent firewall for the euroarea, to safeguard and provide instant access to financial assistance programmes for Member States of the euroarea in financial difficulty).

Any proposed institutional change would, in view of its nature, trigger the need to revise the basic legal framework, such as the Treaty on European Union. These changes were legitimized by the need to subject them to national ratification processes.

### **3. Decision-Making Procedures - Extension of Qualified Majority Voting in the EU Council**

Among all the EU institutions, the Council of the EU is the most authoritative, as it is the institution that is most empowered to decide what the EU should and should not do. But the EU Council is not a single body. Rather it is more like collection of specialist sub committees, whose composition changes depending upon the issue at hand. In other words, the EU Council is not a single council but it is a series of issue-specific councils, and it meets in ten different forms about ninety times a year (Kubicek, 2017).

The EU Council takes decisions on proposed legislation. In the early period of European integration decisions had to be unanimous which could cripple the decision-making capacity of the EU. Therefore the European Union adopted a qualified-majority voting (QMV). Since March 2017 QMV has the form of double majority – 55 % of the states representing 65 % of the EU citizens. One could argue that use of QMV facilitates decision-making especially in the enlarged European Union. Nonetheless, there are still some areas that require unanimity. These issues are considered more sensitive to concerns about sovereignty, and thus by requiring unanimity, each Member State retains a veto over EU policy. This voting system used by the EU Council combines inter-governmentalism with supranationalism.

As with much in the EU, the push has been, over time, toward more supranationalism that would take away the power of any individual member state. For instance by a weakening of decision-making processes by more frequent use of the bridging clause - the so-called passerelle clause. Activating a passerelle clause still depends on a decision being adopted unanimously by the EU Council or by the European Council. Thus, in every case, all European Union countries must be in agreement before such a clause may be activated.

The existence of this institute (in which the legislative procedure used for a certain policy area can be changed without formally amending the treaties) is justified in primary law and is one of the options to allow for a more flexible decision-making process. Unlike formal treaty revision their use does not require national ratification. Passerelle clauses allow derogation from the legislative procedures initially provided for by the treaties. Specifically, and under certain conditions, they make it possible:

- to switch from the special legislative procedure to the ordinary legislative procedure in order to adopt an act in a given policy area;
- to switch from voting in the EU Council by unanimity to qualified majority voting in a given policy area.

Proposals for more frequent use of this clause, in addition to exceptional ad hoc situations, can bring a number of negative risks and weaken its influence in taking key decisions at the EU Council level. Also in this way, the fragile balance between the various EU institutions could be disrupted.

Tomášek (2018) who published the expert opinion for the Round Table of the Czech National Convention on February 16<sup>th</sup>, 2018 believes that support for the proposed extension of qualified majority voting in other areas of the internal market or foreign, security and defence policy must be very prudent. In the area of the internal market, this is true in most cases. It is expected that the proposal will be extended to qualified majority voting in the areas of the energy mix, some parts of social policy (such as the protection of workers upon termination of the contract, the collective protection of the interests of workers and employers, or the conditions for the employment of legal immigrants from third countries) and taxation.

Bartovic (who is the director of the Institute for European Policy Europeum in Prague) and Kasáková (2018) sees considerable risk especially from the possible harmonization of direct taxes, which could jeopardize the competitiveness of the Czech economy. Greater ambiguity also exists in the area of foreign policy and security. This is a sensitive area where the European Union creates a common position only where there is a consensus among all Member States. The Council may already vote by qualified majority on certain partial questions and there is de facto a right of veto in each of the Member States of the Union in accordance with Article 31 (2) of the EU Treaty.

Negative historical experience is related to the introduction of qualified majority voting on asylum and migration. The Czech Republic together with Hungary and Poland consequently faces the European Commission's action before the EU Court. In addition, the transition from unanimity to qualified majority voting in the Czech Republic and other countries is subject to the approval of the two chambers of the national parliament, which, to a certain extent, legitimizes this process but also makes it considerably more difficult.

#### **4. Conclusion**

All the institutional changes discussed represent a significant shift in the functioning of the European Union from the legislation enshrined in the Lisbon Treaty. Individual proposals reinforce the transnational character of the European Union and, at the same time, lead to changes in the interinstitutional arrangement, which should, however, guarantee a balance between EU institutions in the future. The debate on the appropriate setting of the institutional framework for the functioning of the European Union is crucial for the further direction of European integration and its perception by citizens of the Member States.

To make the European Union governance really workable the institutional decision making rules also require revision. The European Union needs greater legitimacy. This means also better procedural quality by being more open and accountable. Therefore is necessary to stop the centralization of the decision-making process and the weakening of the European Council role representing national interests. Together with Majone (1996) we can argue that the European Union should remain a technocratic, regulatory state that should focus on adopting policies to foster more effective and efficient international cooperation.

It also needs more extensive citizen participation and representation. Greater decentralisation of policy-making could help ensure greater direct involvement of citizens. This more direct citizen access is necessary through better opening to public interest groups via pluralist

processes. Also national parliaments would need to be better integrated into the policy-making process. The EU governance can become more effective and legitimate by bringing the people into governance processes as at the Union level as at the national level. The European Union will thus have a greater chance of solving the current crisis-related problems that have led citizens to move away from traditional parties in favor of populist movements.

Another debate on the appropriate setting of the institutional framework for the functioning of the European Union is crucial for further direction European integration and its perception by the EU citizens.

### **Abstract**

*Granting Market Economy Status for China will surely pose significant impact on China's prestige and trade with the EU. Such decision, however, must be made based on discussion, among other, on broad aspect of China's issues on trade practices such as state interference in the market, corporate governance, equal treatment of companies and banking sector. Whereas aspects of these issues are quite broad, in this paper we focus mainly on state interference in the market by presenting an empirical evidence based on Kornai's theory of soft budget constraint. The aim of this paper is to show an evidence of soft taxation and soft credit practices present in Chinese economy by using various mathematical and statistical methods as well as methods to verify accuracy of our hypotheses and applied techniques.*

**Keywords:** *China, European Union, market economy status, soft budget constraint, state interference*

**JEL Classification:** *F13, F38, G30*

### **1. Introduction**

Granting China's Market Economy Status (MES) will undoubtedly have huge impact on EU-China trade as well as World-China trade. As part of its integration into the global economy, China became a member of the World Trade Organization (WTO) on 11 December 2001. Certain provisions of China's WTO Accession Protocol which deal with the issue of dumping, had expired on 11 December 2016. Under the EU legislation, dumping occurs when a company exports its products to the EU at a price lower than the "normal value" (domestic prices of the product or the cost of production) in its own domestic market. Yet the simple expiration of this condition does not mean that WTO member countries must grant China Market Economy Status if they have not already done so. In this paper we focus on two empirical evidences of China's government interference to the market as an argument that China yet still employ some practices that must be undone on its path towards MES – soft taxation and soft credit as were defined in Kornai's theory of soft budget constraint.

### **2. EU-China Relations and the Impact of Granting MES**

In recent years, EU-China relations have achieved a high degree of institutionalization. However, the EU's commercial and political interests are different from Chinese. In terms of trade and commerce the major interest of the EU is to press China to fulfill the WTO obligations, and protect its trade and investment in China. The EU would like to deal with trade deficit, export restrictions on raw materials, exchange rates, market access, intellectual

property rights, service, investment, subsidies, government procurement, norms and standards. In regards the political dimension, there are also some very sensitive issues regarding democracy, human rights, the rule of law, Taiwan, the arms embargo, non-proliferation, disarmament, and the International Criminal Court. The EU also links trade with political matters of human rights and democracy (Cihelková, Nguyen, Woźniaková and Straková, 2017). All of these issues do not belong to China's priorities; China approaches them with limits and with different emphasis. In particular, China deal with EU's anti-dumping measures, anti-subsidy, safeguards, technical barrier to trade and other restrictions. Especially China aims to obtain the EU Market Economy Status and elimination of the arms embargo (Cihelková and Nguyen, 2016).

Since joining World Trade Organization in 2001, China benefited significantly from Trade agreements negotiated with WTO members and also contributed to a bigger openness of the Chinese economy (Fojtíková, 2016). Moreover, WTO accession helped China to move towards liberalization in many aspects (Fojtíková, 2012). Nevertheless, its accession agreement contained certain measures that China has to follow in a process of liberalization of its economy. WTO members that refuse to grant China Market Economy Status were allowed to choose the methodology for calculating the reference price used in anti-dumping cases. Dumping occurs when a company exports a product at a lower price than its normal value, i.e. the price used "in the normal course of trade, for a like product destined to be consumed in the exporting country" (WTO, 1994). Article 15 (a) (ii) of China's WTO Accession Protocol gave WTO members this possibility. It stipulates that "The importing WTO Member may use a methodology that is not based on a strict comparison with domestic prices or costs in China if the producers under investigation cannot clearly show that market economy conditions prevail in the industry producing the like product with regard to manufacture, production and sale of that product."

Nonetheless, the expiration of the article in 11 December 2016 did not resulted in instant granting of China's MES, if WTO members have not already done so. These countries that are reluctant to grant MES must review and propose new anti-dumping measures. In the case of the EU, according to European Commission statistics and Eurostat in 2016, China is EU's biggest trading partner, in term of import from China, with a volume of 344,8 billion dollars which represent for 20.14% share (EC, Nov 2017) (Figure 1), increase from roughly 10% of total 15 years ago (PNB PARIBAS, Jan 2017). Moreover, according to European Parliament report analysis China is one of the primary targets of EU's anti-dumping measures. Chinese exports to the EU were the target of 119 investigations and 85 measures between 1995 and 2014 (EP, Nov 2015).

As a consequence, the impact of granting MES would surely have significant impact on China-EU trade; as such existing ones would no longer be applicable on current terms. Nevertheless, the EU is willing to grant China's MES, if its further reform meets five criteria defined by the European Commission for a country to obtain Market Economy Status (EC, Nov 2002) (EP, Nov 2015). It is about: (1) A low degree of government influence in the allocation of resources and in decisions of enterprises, whether directly or indirectly (e.g. public bodies), for example through the use of state-fixed prices, or discrimination in the tax, trade or currency regimes. (2) An absence of distortion in the operation of the privatised economy. (3) The effective implementation of company law with adequate corporate governance rules. (4) Effective legal framework for the conduct of business and proper functioning of a free-market economy (including intellectual property rights, bankruptcy laws, etc.). (5) The existence of a genuine financial sector which operates independently from the state and which in law and practice is subject to sufficient guarantee provisions and adequate supervision.

**Figure 1: EU Imports from China**

Source: Eurostat (2017)

In this paper we, address China's practices does not meet (1) and (5) criteria in term of soft taxes and soft credit by applying Kornai's theory of soft budget constraint.

### 3. Soft Budget Constraint

Theoretically speaking, soft budget constraint is a form of state intervention into microeconomics. The concept of a soft budget constraint was formulated by Janos Kornai during the period of Hungarian market socialism, when it was common for the state to financially save the state owned enterprises (SOEs) from financial difficulties, regardless of whether the difficulties were due to their own fault or external factors. Of course, saving the failing SOEs is just the first reason. The second is to support the growth of SOEs, whose growth would be slow, if they relied only on own resources and profits. The opposite of the soft budget constraint, as defined by Kornai (1979, 1980), is hard budget constraint, which is a common market environment where budget constraints are set for the whole economy uniformly, and individual firms have no access to state benefits.

Furthermore, soft budget constraints may occur in several forms. First, soft subsidies provided by national or local governments. The subsidy is soft, if it is tradable, it is subject to bargaining, lobbying, etc. The subsidy is adjusted to exceed past, current or future costs. Second form is soft taxation. The soft definition in this case does not apply to the rate of taxation. Even with a low tax rate, the tax system can be hard if the tax rates are set uniformly, long-fixed and strictly levied. On the other hand, taxation is soft, even with a high tax rate, if the rules are negotiable, subject to political pressure. In other words, tax rates are not uniform, but are almost tailored to the financial situation of different sectors or regions, or to different forms of ownership. Compliance with tax obligations is not strict; there are leaks, ad hoc exceptions,

delays, etc. The third is a soft loan or a soft credit. Again, the softness does not refer to the interest rate. The credit system can be difficult even at a low interest rate (assuming that the credit market creates a low interest rate) if strictly enforcing the credit conditions that apply to all equally. The lender borrows money that awaits discipline in debt service and not to help ill-managed companies that will not be able to repay their debt. The implementation of the credit agreement stay unchanged; severe sanctions in the event of insolvency, including forced administration, bankruptcy, forced merger, sale or other similar legal remedies. On the other hand, the credit system can be soft even with high interest rates when the credit agreement is not fulfilled, unreliable debt service is tolerated and postponing repayment schedule is tolerated. The soft loan is used to help firms with big and chronic financial difficulties, without real hope of repaying the debt. Fourth is soft administrative prices. This can be applied if the price is not fixed by the seller and the buyer under the contract but by some bureaucratic institution. The administrative cost is difficult if it limits expenditure and automatically does not change the cost. The administrative price is soft if it is set according to the allowed “extra cost” principle, which automatically adjusts costs by cost (Kornai, 1979, 1980).

#### 4. Data

Most of the data will be retrieved from China’s statistical yearbook published by the National Bureau of Statistics of China, which includes statistics for “industrial enterprises above a certain size”. The data come from 2006 to 2015. We consider 2006 to be the beginning of the shaping of current reforms that are still ongoing and impact today, namely Property Law of the People’s Republic of China in 2007 and the beginning of a new phenomenon at the beginning of 2008, “The state advances, the private sector retreat” (国进民退). The data includes statistics for companies of a certain size, namely those enterprises whose income from the principal business is over 5 million yuan. These aggregated data are collected “mainly on the basis of relevant data in the annual reports on industrial statistics”. This data is a source of recent researches from recognized economists, including Lardy (2014).

For the purpose of research, we use data aggregated for 38 industries in the Chinese economy, which include more than 350,000 enterprises. Our research will mainly be based on industry-specific data (figures are quoted in integers and sums are aggregated at 100 million yuan): the total number of enterprises and the number of loss-making enterprises to identify developments in the sector; the amount paid on interest, total liabilities, short-term liabilities and long-term liabilities to calculate the interest rate; income from the principal business and taxes paid to determine the tax burden. These data will be examined and compared mainly among the three main ownership structures: First, state-owned and state-controlled enterprises. Secondly, privately owned enterprises are enterprises with Chinese privately owned capital. Thirdly, foreign-owned enterprises, including all foreign capital companies including Hong Kong, Makao, and Taiwan.

For the purpose of completeness and accuracy of data usage from the National Bureau of Statistics of China, we shall provide the definitions according to which the Bureau classifies the collected data (National Bureau of Statistics of China):

1. First, state-owned enterprises refers to industrial enterprises where the means of production or income are owned by the state. Joint state-private industries and private industries, which existed before 1957, have been transformed into state industries. Statistics on these enterprises has been included in the state-owned industries since 1957 when separation of data was no longer necessary.

2. Second, collective-owned enterprises refers to industrial enterprises where the means of production are owned collectively, including urban and rural enterprises invested by collectives and some enterprises which were formerly owned privately but have been registered in industrial and commercial administration agency as collective units through raising fund from the public.
3. Third, share-holding corporations refer to economic units registered in accordance with the regulation of the People's Republic of China on the Management of Registration of Corporate enterprises, with total registered capitals divided into equal shares and raised through issuing stocks. Each investor bears limited liability to the corporation depending on the holding of shares, and the corporation bears liability to its debt to the maximum of its total assets.
4. Fourth, enterprises with funds from Hong Kong, Macao and Taiwan refers to all industrial enterprises registered as the joint-venture, cooperative, sole (exclusive) investment industrial enterprises and limited liability corporations with funds from Hong Kong, Macao and Taiwan.
5. Fifth, foreign funded enterprises refers to all industrial enterprises registered as the joint-venture, cooperative, sole (exclusive) investment industrial enterprises and limited liability corporations with foreign funds.

## 5. Methods of Analysis

For a purpose of analysis we will employ following formulas to verify soft budget constrain, where will compare differences between SOEs and privately owned enterprises (POEs).

In the case of soft taxes, we will use the tax contribution formula, which is used by the National Bureau of Statistics of China for the contribution of enterprises. The formula is as follows:

$$\text{aggregate tax contribution} = \frac{\text{aggregate tax paid}}{\text{aggregate assets}} \times 100\%, \quad (1)$$

where aggregate taxes paid represent the aggregate of taxes paid across the industry, and aggregate assets represent the sum of all assets in the sector. Both variables are expressed in absolute values (in our case at 100 million yuan). The result is in percent. As we can see, the formula we have defined, takes into account aggregate assets rather than aggregate profits. Due to research by various authors such as Lardy (2014) who noted that Chinese SOEs are sluggish and inefficient giants, looking at their profits would not have to provide an objective view of the tax burden on SOEs. At the same time, Lardy (2014) in his research shows that the average margins in the state and non-state sectors are almost the same, i.e. 5.8 percent for the state and 5.6 percent for the non-state enterprises. In addition, the profit margins of the two types of firms are virtually indistinguishable in the past few years (ibid). Assuming the same margin, the formula we have set for the rate of tax contribution would be a better indicator.

In term of soft credit, we will be analyzing aggregate interest rate in following formula:

$$\text{aggregate interest rate} = \frac{\text{aggregate interest paid}}{\text{aggregate long-term liabilities}} \times 100\%, \quad (2)$$

where long-term liabilities are liabilities under which market interest rates would be payable by businesses and relate to the total debt due within one or more years, including long-term loans, payables, long-term liabilities. Both variables are expressed in absolute values (in our case at 100 million yuan). The result will be in percentage. To verify our choice of methodology we will also examine relationship between our results and People's Bank of China (Central bank) by regression and correlation analysis.

Correlation is the degree of dependence between two or more variables. Variables must at least be measured on an interval scale, but there are other types of correlation coefficients that work with other types of data. The correlation coefficient can range from  $-1$  to  $+1$ . The  $-1$  value represents the highest negative and  $+1$  the highest positive correlation. Value  $0$  denotes no correlation. In our work, we will most benefit from a linear correlation called Pearson's  $r$  that is used if the variables are measured at least on the interval scale. The correlation coefficient does not depend on the scale at which the variables were measured. We can manually correlate height with weight, expressed either in centimeters and kilograms, or in inches and pounds. Formula for correlation coefficient:

$$r = \frac{\sum XY - n\bar{X}\bar{Y}}{\sqrt{\sum X^2 - n\bar{X}^2} \sqrt{\sum Y^2 - n\bar{Y}^2}} \quad (3)$$

The correlation coefficient  $r$  may have a value between  $-1$  and  $1$ , where  $r$  is close to  $1$  will be a direct dependence, otherwise if  $r$  approaches  $-1$  it will be an indirect dependence. To interpret the  $r$  coefficient we will consider  $r < 0.3$  for low dependence;  $0.3 \leq r < 0.5$  for moderate dependence;  $0.5 \leq r < 0.7$  after significant dependence;  $0.7 \leq r < 0.9$  for high dependence;  $r \geq 0.9$  for very high dependence.

## 6. Empirical Evidence

In this section we will analyze applied quantitative methods based on data from the National Bureau of Statistics of China.

As we can see in Figure 2, the highest interest is paid by privately owned businesses. On the contrary, the lowest interest rates are paid by SOEs and the rate for foreign companies is positioned between the former two.

For a purpose of comparison, we have also highlighted the interest rate indicated by the central bank, which represents the basic interest in the market economy from which the other interest rates of the financial institutions are derived. Since the central bank's interest rate is basic rate set for the entire economy, it is placed at the lowest in the chart, below the aggregate interest rate of the SOEs, which confirms that our calculations are correct. Of course, the graphical analysis of the chart itself cannot give us a complete picture of how the state administers in the case of interest rate restrictions. Therefore, if we look at the data in more detail, we see in Table 1 that the interest rate for SOEs is on average 9%, with private companies paying almost double, 17.81%, on the other hand foreign companies pay an average of 13.76%, which is approximately one and a half times that of SOEs.

We now need to verify the accuracy of our results. Using the correlation method, we compare the central bank's interest with the interest we have calculated. Based on our calculations (Table 1), we can see that the strongest relationship is between the interest rate for privately-owned corporations, which is 0.81, which is a very strong dependence, which could be assumed, since interest for private enterprises is determined by the market, and which rise from the rate of interest set by the central bank. On the contrary, in the case of SOEs, the correlation is 0.02, which means very low dependence between interest for SOEs and interest rate determined by the central bank. The reason is a strong negotiating position resulting from the nature of SOEs. As far as foreign-owned enterprises are concerned, the correlation is 0.46, which is a slight correlation, which corresponds to our assumption, as foreign capital enterprises are not only dependent on national funding but can also obtain cheaper loans from abroad.

**Figure 2: Aggregate Interest Rate by Ownership 2006–2015 (%)**

Source: Author's calculations

The analysis of interest rates in the Chinese industry, described above, and the subsequent verification of the results, confirms us that the methodology we have chosen is correct and therefore, according to our theoretical knowledge, we can safely assume that there is a soft budget constraint in the Chinese system – soft credit.

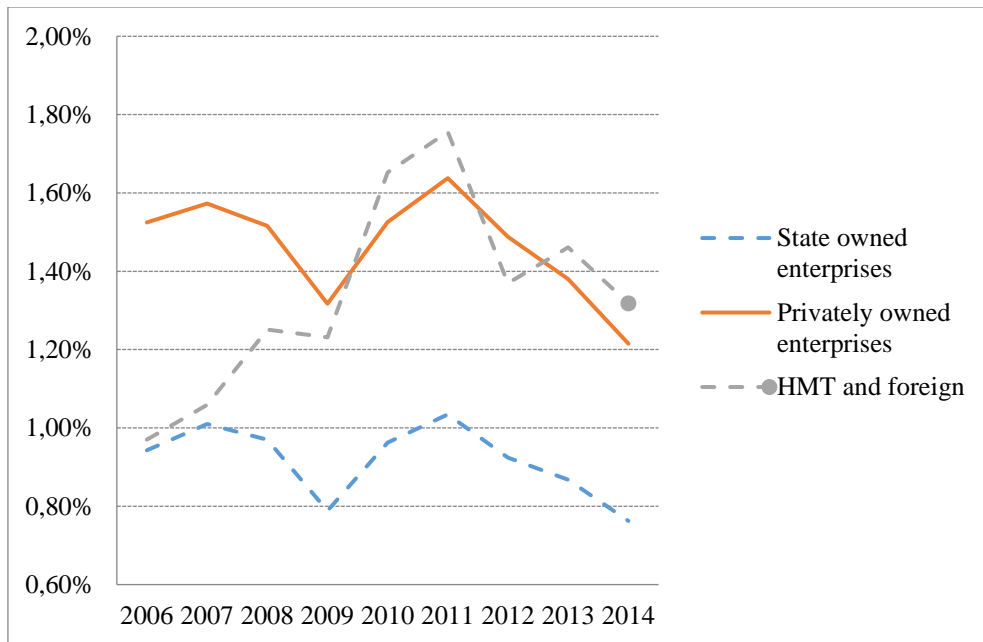

**Table 11: Aggregate Interest Rate According to Type of Ownership (%)**

Aggregate interest rate	2006	2007	2008	2009	2010	2011	2012
State owned enterprises	8.68	9.14	9.61	7.12	6.27	8.87	10.29
Privately owned enterprises	18.84	22.26	19.79	15.95	16.57	18.93	19.32
Hong Kong, Macao, Taiwan and foreign	13.22	14.23	14.69	11.73	11.79	15.69	16.32
People's Bank of China	6.12	7.47	5.31	5.31	5.81	6.56	6.00
Aggregate interest rate	2013	2014	2015	Average	Correlation	Difference	
State owned enterprises	10.01	10.65	9.36	9.00	0.02248	1.00	
Privately owned enterprises	17.22	15.37	13.85	17.81	0.8112	1.98	
Hong Kong, Macao, Taiwan and foreign	14.40	13.22	12.32	13.76	0.46281	1.53	
People's Bank of China	6.00	5.60	4.35	5.85	1	.	

Source: Author's calculations

As far as tax contribution is concerned, we can again see (Figure 3) tax contribution of POEs as twice as higher than tax contribution of SOEs. In a case of Hong Kong, Macao, Taiwan (HMT) and foreign funded enterprises, the tax contribution of such enterprises had increased since 2008. This as a consequent of new tax regime for foreign invested enterprises under which the newly enterprise income tax rate is 25% since 1 January 2008 (Bakker and Kloosterhof, 2010).

**Figure 3: Tax Contribution by Ownership**

Source: Author’s calculations

As we can see in Table 2, in term of aggregate tax contribution, privately owned businesses contribute 1.6 times more than SOEs to the state budget, and foreign firms contribute 1.5 times more than SOEs on average. We can say that, even in the case of tax burdens, SOEs have contribute significantly less amount of taxes than other market players. Therefore, we claim that there is a soft tax constraint in the Chinese system.

According to various researchers, such as Gregory and Stuart (2014) SOEs enjoy privileges, such as preferred access to bank credit at below market rates and favorable tax. Moreover, non-performing loans and political lending practices for SOEs prevail even nowadays (ibid). Naughton and Tsai (2015) speak of strong affinities between SOEs and state-run banks. According to Lardy (2014) and Gregory and Stuart (2014) private sector has only limited access to bank credit if they get any. Under such circumstances, after comparison and verifying with other researchers’ findings we state that our results are correct.

**Table 2: Aggregate tax Contribution (%)**

<b>Tax contribution</b>	<b>2006</b>	<b>2007</b>	<b>2008</b>	<b>2009</b>	<b>2010</b>	<b>2011</b>	<b>2012</b>
<b>State owned enterprises</b>	0.94	1.01	0.97	0.79	0.96	1.03	0.92
<b>Privately owned enterprises</b>	1.52	1.57	1.52	1.32	1.53	1.64	1.49
<b>Hong Kong, Macao, Taiwan and foreign</b>	0.97	1.06	1.25	1.23	1.65	1.76	1.37
<b>Aggregate interest rate</b>	<b>2013</b>	<b>2014</b>	<b>Average</b>		<b>Difference</b>		
<b>State owned enterprises</b>	0.87	0.76	0.92		1.00		
<b>Privately owned enterprises</b>	1.38	1.22	1.46		1.59		
<b>Hong Kong, Macao, Taiwan and foreign</b>	1.46	1.32	1.34		1.46		

Source: Author's calculations

## 7. Conclusion

In this work, we have analyzed through our analytical and statistical methods our theoretical assumptions that the Chinese government uses its influence and intervenes in the market, depending on Kornai's theory of soft budget constraints. Based on a comparison of empirical data on interest payments between SOEs, privately-owned enterprises and foreign companies, we found that SOEs have considerably lower interest rates on their long-term liabilities than privately owned businesses and foreign companies. We have repeated the same attempt in case of tax burden and the result has come out similar, so SOEs have a significantly lower tax burden than other market players. Therefore, we have proven that soft tax and soft credit practices are widespread across Chinese industry which means that the first and the fifth EC's criteria are not met. Therefore, China still has a lot of work to reform its economy in order to meet criteria to be granted with MES. For now, if based solely on our empirical evidences, the EU should reject China's MES.

# The Polish Healthcare System Towards the European Union Challenges

**Sylwia Nieszporska**

Czestochowa University of Technology  
Faculty of Management, Department of Econometrics and Statistics  
ul. Armii Krajowej 36 b, Częstochowa, 42-200  
Poland  
e-mail: sylvniesz@poczta.onet.pl

## **Abstract**

*The European Union policy on the functioning of health systems in the Member States clearly emphasise the importance of social cohesion and social justice as well as sustainable development in these countries. One of symptoms of that policy was the adoption of Directive 2011/24 / EU of the European Parliament and of the Council of 9 March 2011 on the application of patients' rights in the cross-border healthcare. In accordance with assumptions, from that time the Polish market of health services has been opened to patients from other EU countries, and this change has given Polish patients the chance to receive treatment outside of the country. The proposed study is an attempt to answer following questions: how has the Polish health care market changed since then, to what extent has it satisfied the health needs of citizens of the Union and how does it care about its position in rankings of European health systems. In order to answer such questions, the author refers to the analysis of basic statistical data about the Polish health system, and cites the results of the Euro Health Consumer Index report. In particular, changes in access to health services and dynamics of index changes have been tracked since 2013.*

**Keywords:** health care system, EU Directive, Euro Health Consumer Index

**JEL Classification:** I11, I140, I18

## **1. Introduction**

One of the fundamental objectives of the European Union is to reduce economic and social disparities in Europe, both in relation to all EU countries, as well as for individual regions of these countries. Whereas sustainable and uniform economic development of these areas for many years was monitored and assisted by, among others, one of the most important elements of economic development which is health. The European Union treats the functioning of health systems as one of the elements of competitiveness of Member States, but at the same time support measures to reduce possible inequalities occurring in this area, which has not had inconsiderable resources from the structural funds and the investment allocated to interventions in the field of health (Laskowska, 2017). In addition to financial resources, the realization of its objectives, the Union supports the relevant legislation, and among the many acts found a Directive of the European Parliament and of the Council 2011/24 / EU of 9 March 2011 on the application of patients' rights in cross-border healthcare. This directive has the support not only access to medical services for EU citizens moving between countries of the Community, but above all to ensure equal, non-discriminatory access to safe, high quality cross-border healthcare services.

The directive seems to play an important role considering the aging process of societies in Western and Eastern Europe (Simpach, Pechrowa, 2016). It can help European citizens in getting easier access to health service. It is also important because of the increasing rate of immigration in Europe in the past few years (Nenicka, 2016), and free movement of workers within the Union (Remsova, 2016).

## 2. Directive and the Polish Health Market

Under the assumptions of the directive, Polish patients from 15 November 2014 have the opportunity to choose a medical facility (public or private) in any country of the Union, which will realize the need for such care, which could be met in the framework of services covered by Poland guaranteed in the provision of health care ([http://www.nfzszczecin.pl/nguqv\\_dyrektywa\\_transgraniczna.htm](http://www.nfzszczecin.pl/nguqv_dyrektywa_transgraniczna.htm)). The Directive does not cover services such as compulsory vaccinations, long-term care, allocation and access to organs intended for transplantation.

For the Polish patient, the directive does not however mean the possibility of using medical services in any EU country without any restrictions of a formal nature. He or she must first obtain a promise from the public payer (NHF), the purse to finance private service in the chosen EU country, and only at the very end, claim for reimbursement of costs incurred in the NFZ pool.

The National Health Fund prepared in their budget for the years 2014 - 2016 more than one billion zlotys for cross-border healthcare, but according to the report of the Supreme Chamber of Control of November 15, 2014. February 10, 2017 it received 17 090 requests for reimbursement for treatment abroad the total amount of 54.7 million zł. Requests concerned mainly the implementation of services for the treatment of cataract (approx. 91% of all applications) and joint diseases, such as hip and knee (Respecting patients' rights in cross-border healthcare, information on the results of the audit, the Supreme Chamber of Control, 2017) joint replacement.

The law governing cross-border medical services gave foreigners the possibility of using Polish medical facilities and implementation of their health care needs. Foreigners, according to this may consider the use of the services of Polish institutions. Although the Polish patient could have some concerns with interest to the Polish health service by citizens of the Union (due at least to the increased likelihood of lengthening queues for specialists), the Polish Ministry of Health provides that: *Paying to adopt a patient from abroad in the context of cross-border healthcare by Polish provider having a contract with the NFZ is possible if it does not impede access to health care services to patients Polish* ([www.mz.gov.pl](http://www.mz.gov.pl) January 2018). Concerns of patients also decreased in statistical data, according to which in 2014 only 5% (per annum) of all patients, were patients from abroad (Member state Data on cross-border healthcare Following Directive, 2015). The vast majority of entities having medicinal benefits granted to foreigners in the context of cross-border directive, did so in accordance with the price lists of paid benefits, but half of them admitted that the prices contained therein were higher than those used in the settlements with the NFZ. According to the European Commission, in 2015 the Polish healthcare system then settled costs in the home country, foreigners made only 3331 claims for reimbursement of benefits. Most foreign patients treated in Poland in 2015 came from Slovakia (1567), Denmark (1007) and the UK (432) (Member state Data on cross-border healthcare Following Directive, 2015).

### 3. The Reaction of the Polish Healthcare System to EU Rules

In Poland, the planning of the health policy of the country is conducted by a number of government entities and the local governments, but the most important duties in this regard rests with the government (including the Ministry of Health). The mission of the Ministry is to *present a coherent, concerted and adequately justified Polish position in the area of health in all international forums* (www.mz.gov.pl 04.05.2016).

For the purposes of compliance with EU policy, it is assumed that the national strategic framework for policy in this area includes *a set of complementary documents defining the strategic direction and priorities for the provision of health care and public health (...) including the scope, timing, specific and comprehensive targets and instruments for monitoring and evaluation, to assess the progress in the implementation* (The national strategic framework. Policy Paper for the protection of health for the period 2014-2020, 2015).

The Polish health system, despite the very lofty goals and objectives, suffers from many problems of a legal, structural, but above all organizational one (Nieszporska, 2017). Among other things, because of this new ministers and thus, new parties having a significant impact on the creation of the health policy of the country today. They put emphasis on innovation, computerization, efficiency, dialogue and diminish bureaucracy of health (Janczewska-Radwan and evaluate BCC resort and present recommendations, 2018). All of these priorities for the sector are related to, but inseparable from improving the system in the context of the health needs of society, with better access to services, providing services of the highest professional level, efficient service for patients, or in establishing proper relationships between the patient and medical staff involved in the implementation of their health needs (Bielecki, Nieszporska, 2017).

**Figure 1: Availability of Treatment for Cataract in the Years 2013-2016 in the National Health Fund Controlled Branches (as of October 31)**

Source: Respecting patients' rights in cross-border healthcare, information on the results of the audit, the Supreme Chamber of Control, LOP.430.001.2017 Reg. 45/2017 / P / 16/084 / LOP, Branch in Opole, p.14.

As the relevant reports show, since the implementation of the cross-border directive, access to health services, which Polish patients applied for outside of Poland, that is cataract removal and arthroplasty, has not improved. The waiting time for these procedures still remains extremely long in Poland (Figure 1, Figure 2), and the cross border movement of patients has not affected its change (Respecting patients' rights in cross-border healthcare, information on the results of the audit, the Supreme Chamber of Control, 2017).

**Figure 2: Availability Hip Replacement in the 2013-2016 National Health Fund in Controlled Branches (as of October 31)**

Source: Respecting patients' rights in cross-border healthcare, information on the results of the audit, the Supreme Chamber of Control, LOP.430.001.2017 Reg. 45/2017 / P / 16/084 / LOP, Branch in Opole, p.14.

As mentioned earlier, the budget of the National Health Fund, and therefore the main source of funding for medical services in Poland, due to the implementation of the Directive for cross-border has neither been significantly undermined because of numerous trips by Polish patients abroad for medical purposes, nor significantly and additionally increased by the influence of fees for treatment brought by foreigners.

This situation leads to the conclusion that Polish health care system is not used effectively according to the EU regulations and the implementation of the cross-border directive. Indeed there has been an improvement to the availability of medical services in Poland, or to improve the financial sector, which in turn implies the need to look for reasons for this state of affairs.

#### 4. The Efficiency of the Polish Health System with Other European Countries

The cross-border directive in its premise was to help the Polish patients not only gain access to medical services; it also had to promote the opening of Polish medical facilities for patients from other EU countries. Thus could become a great tool for the promotion of Polish medical knowledge and experience of medical personnel, applied technologies and therapies. For three years of the directive that has not happened. Still Polish medical care is seen

through the prism of various rankings and European data sets, painstakingly experiencing not only the strengths of the sector, but especially emphasizing its weaknesses.

There are many indicators and reports about the efficiency of health systems. As a rule, due to the large variety of areas analyzed, they require the use of multiple methods of measuring indicators, analytical techniques, and various methods of data collection and processing.

Each of them, however, tends to (Lichiello, 2002):

1. determining and matching purposes to the system;
2. assess the feasibility of the system;
3. stakeholder communication system;
4. assign responsibility to individual professional groups;
5. improve the quality of services;
6. tracking progress;
7. provide information to stakeholders about the state of the system and the progress in achieving the objectives.

Generally speaking, these meters allow the measurement of the effectiveness of the strategy of health systems checked by practitioners and creators of public health in many countries, but also managers of both other public sector organizations and private.

One of the most interesting indicators for an assessment of the health sectors in different countries is the Euro Health Consumer Index (EHCI). Its weight and importance in the verification of the state of health systems in different countries related to the fact of their evaluation of the patient's perspective. It seems that in today's realities of the role of the patient around which health systems are created, and so the patient wears off, and the weight of analysis and critical reflection on the state system is flipped on the economic dimension. Therefore, look at the eyes of the patient's system and just an opinion from the perspective of today has extraordinary significance, because it restores faith in the primary role in the functioning of the individual systems.

*EHCI* allows you to monitor the state of health systems in different countries. Its origins date back to 2004 and the publication of the report of the Swedish Health Consumer Index, in which the comparison of 21 countries using 12 indicators and focusing on creating health policy in different countries, the choices made by beneficiaries, level of service and access to information. Over the years, measures have changed and as in the beginning they focused on the most basic measures, such as infant mortality, survival in cancer, the treatment of stroke and heart disease, in subsequent years have been enriched with data on access to information, quality of service, mobility benefits, funding in the framework of cross-border directive, e-health (Björnberg, 2017). In principle, all included in the *EHCI* measures are summarized in the latest report of 6 groups:

1. patients' rights and information (12 indicators)
2. accessibility (waiting times for treatment) (6 indicators)
3. outcomes (9 indicators)
4. Range and reach of services provided (7 indicators)
5. prevention (7 indicators)
6. pharmaceuticals (7 indicators).

The 48 indicators are connected in one synthetic Euro Consumer Health Index, which value belongs to the range [0.1000]; the highest value is the best estimate of the health system of the country.

In 2016, the Polish health care system received an index of 564 and was in 31<sup>st</sup> place (35 countries analyzed). Although since 2014 the value of this index increased steadily (Figure 3), the Polish position has improved only slightly in 2016 compared to the previous year (in 2015 occupied 34<sup>th</sup> place), but placing our country at the end of the line.

For the patient outside of Poland, such information is certainly not an encouraging incentive to come to our country and submit to the treatment of Polish specialists. The latest report points to the failure of the Polish system of health especially in the following fields:

- patients' access to information;
- the possibility of registration and use of IT technology in dealing with the service provider;
- access to specialists and the use of medical technology in the treatment process;
- informal fees paid to doctors.

The report's authors also point out that: It is well known from management practice, that if top management starts focussing on things other than producing the best products or services, the quality of products/services declines (Björnberg, 2017), which clearly indicates the need for decentralization of the entire health system.

## 5. Conclusion

One of the objectives for the implementation of the directive was to promote cross-border cooperation on healthcare between Member States. Thus, the directive committed their countries to strengthen the relationship between providers and payers, which in turn would affect the more efficient functioning of health systems. Polish realities and the example of Polish medical facilities, as well as branches of the National Health Fund, according to the data submitted, did not react in any way to the opportunities in front of them with open EU legislation. So there was no system to relieve and reduce queues for Polish patients to specialists, nor recorded in recent years, excessive interest of foreigners Polish health service.

The treatment of foreigners in Poland could result in additional revenues to the funds of the NFZ, effective use of not fully utilised medical equipment, but above all popularization and

promotion of Polish hospitals in Europe. For this to happen, you need a number of actions from not only the Ministry of Health, but the individual health institutions. It is not only to improve the image of the Polish health system, but above all to make real changes to improve certain shortcomings of the Polish system, which to a large extent determines its position in the European market.

Moreover, the directive could be one of the reasons for Polish physicians and nurses, often very famous and respected in Europe, to work and earn fairly in Polish health institutions, not to look for better existence abroad. Unfortunately, the migration of Polish medical staff is still a vital problem, and Polish health institutions are still losing well educated workers and a chance to exist on the map of European providers of health services.

### **Abstract**

*Migration is a significant process through which the dynamics of population on the move substantially affect the long-term development of mankind. During the recent sixty years a host of citizens of the world have enjoyed improvements in the key indicators of development, such as the life expectancy and access to education and/or medical services, though, admittedly, this rule does not apply to all countries and all regions. Relying for her argument on historical facts complemented by current events, the author of the paper will present the chosen subject of migration as it relates to the European future and to the demographic patterns of migration. The article deals with the current wave of migration - it is about integration and people on the road. The arguments that the author puts forward rely, inter alia, on her personal experience gathered in a refugee camp a.k.a. the hotspot.*

**Keywords:** *demographic development, European future, migration*

**JEL Classification:** *F22, F69, O15*

### **1. Introduction**

Relying on her own practice and personal experience, the author builds her argument on historical facts and supports her reasoning by what has already been published in books written by sociologists and Arabists. The paper presents some selected results of research performed among African Muslims in Uganda and other subjects.

As experienced today, the migration from Near East to Europe seems to be logical. Half of the migrants do not leave for Europe but they move to richer Arabian countries in the Persian Gulf, Libya and Asia (Černý, 2016).

The Arab world is passing through development observed in Europe between the end of the 18th century and the beginning of the 20th century when Europe witnessed a population explosion followed by mass migration to other continents. At the early stage of such process the mortality figures typically go down while natality remains relatively high, at least for some time, and population grows. This is what is called the period of demographic transition. The concept of demographic transition may help us understand what happens in the Arab world - the explosively increasing number of people, particularly young people, brings in political instability. Inspired by the historical development in Europe, the model of demographic transition is instrumental in comprehending the causes of the instability. A publication by Černý, a sociologist, ascribes a greater importance in the process of destabilization to the growing population than to any religious discussions and speculations.

The Arab countries are obviously going through the same tempestuous changes as those triggered previously by population explosion in Europe. The number of inhabitants (especially the young ones) rises, and the fact translates itself into political instability. Černý believes that the Near East instability can be attributed rather to the growth of population than to the extensively discussed topic of political Islam. The young generation of the Arab countries has reached the phase known as the "political storming".

Having examined the historical record of the European continent, we can see that Europe tackled the population explosion and the destabilization it entailed by simply "packing the young people off" the continent. In this way (as sociologists and historians remind us) the "pressurized" space of Europe was in the 19th century gradually relieved by large-scale migration of Europeans, primarily to North America and later on to also Australia and New Zealand.

The demographic surge *per se* would not have to exacerbate the migration problem so much. The situation, however, is aggravated by the economic development lacking behind the population growth as regards first and foremost new job opportunities. Another stumbling block rests in the rigidity of political systems - the Near Eastern countries are increasingly unable to govern their own territories, as apparent, for instance, from the inability of centralized Arab states to keep in check the rising number of weapons distributed among their citizenry. In Egypt even the middle classes try to acquire weapons to protect their families (Černý, 2017). Though highly authoritarian and claiming exclusive control over using force, these countries cannot guarantee their citizens adequate level of safety, summarizes Černý. Moreover, they are incapable of routinely providing social services and other essentials, a fact making the life sort of difficult. In effect, despite their authoritarian nature, the countries protect neither individuals nor families (Černý, 2016).

Islam is a factor capable of cutting both ways. Western Europe, on the one hand, tends to accentuate the destabilizing potential of the religion, mentioning specifically the radical political Islam as manifested in the Islam state, the Al Qaeda organization and various terrorist groups present more or less in all Arab countries since the 1970s.

On the other hand, Islam may do the duty of a stabilizing element in social solidarity and justice. In the Near East region the Islamic society can play a prominent role in substituting for the collapsing and increasingly dysfunctional governments. Organizations associated with mosques and/or other places of worship take on charitable work, run hospitals, provide healthcare, distribute clothes, offer courses to adults, arrange special-interest groups for kids, organize leisure-time activities for teenagers, etc. Acting in the place of government, the Islamic movement and Islamic charity often deliver social care and undertake tasks already abandoned by the state, thus long-term contributing to the stability of the relevant regions. Both literature, professional articles (Crawley 2017, Bartram 2012) and the author's hands-on experience lead us to believe that in Islam the belief in God is immediately followed by the belief in family, namely a multigenerational family, wherein the generations mutually support and help each other. These supportive family ties are deeply embedded in religion and, in a way, their nature is a matter of culture. Close-knit families are stable families, and this fact is pivotal in stabilizing the entire region. Whenever a person or a nuclear family cannot rely on the state, they turn to their extended family or to the Islamic society.

## 2. Method

The paper presents a selection of results yielded by the author's own research and employed to provide arguments valid for the chosen subject.

The research applied the technique of in-person individually conducted semi-structured interviews (the face-to-face method) broken into partial research questions whose sequence led the respondents to think about their demands. The data thus obtained were analyzed and interpreted by the open-coding method.

To make the sample sufficiently heterogeneous, the participants were selected purposefully, the sole conditions being their Muslim faith and their long-term residency in a Muslim region. The effort resulted in fourteen interviews carried out between November 2017 and January 2018 in five Ugandan villages (district Ntungamo) with Muslim population. Each interview lasted 60 minutes on average.

To operationalize the research and to facilitate the analysis of collected data, the partial research questions had assigned to them the easily recognizable indicators or markers specified below (Disman, 2000).

### ***2.1 Partial Research Questions and Indicators***

Partial research question 1: Do you wish to move to Europe?

Indicators: distinctive features of environment; knowledgeability and skills of inhabitants; financial situation; job opportunities

Partial research question 2: What are your educational, healthcare and social care needs?

Indicators: quality elementary schools; availability of healthcare; maternity clinics and pregnancy assistance; leisure-time facilities for kids; care for the dying

When theoretically understood and properly conceptualized, the key terms allowed us to choose a sufficiently heterogeneous sample adequately representative of the entire spectrum. Before conducting the interviews, we sought to become thoroughly familiarized with the environment so that we could find our way in a surfeit of information, avoid preconceptions based on our previous experience of developmental aid and thus were able to interpret the respondents' replies undistorted by our professional expectations. The participants were told the purpose of the research beforehand.

## **3. Results**

Below you will find a partial summary capable of fully responding to the main research question and followed also by a space wherein the analyzed topic can be discussed.

The analysis was accompanied by direct quotations of participants' answers, but to keep the scope of this paper manageable, we have chosen not to include them.

Summary of Partial research question 1: Do you wish to move to Europe?

This information is absolutely essential to find out whether the participants plan to leave their country or not.

The participants do not wish to move to Europe or to any other foreign country. Despite having to cope with all sorts of adverse social occurrences, their families feel closely tied to the region and their internal solidarity allows them to live even in dire circumstances. The participants are well aware that the cost of the journey is beyond their means. Moreover, they appreciate their own educational insufficiency. In spite of their limited knowledge of geography, they perceive Europe as a country too remote to reach. They expect harmful consequences, primarily the disruption of the family, even if just a single member should leave to live outside

the family. This negative expectation is exacerbated by the fact that the leaving persons are typically males, husbands or elder sons, and the task of providing for the family thus passes onto females.

Our research and years of relevant practice in Africa show that another crucial issue (the same as encountered in the Near East) lies in the growth of younger generations wishing to graduate and get jobs. Scarcity of vacancies, however, may then allow the young people a scope for indulging in socially pathological behavior. In our practice we have witnessed an increased number of girls and young women involved in the sex business, petty theft, car holdup and criminal assaults against people (without killing anyone).

Summary of Partial research question 2: What are your educational, healthcare and social care needs?

Following from the first research question, the second one inquired into the specific requirements for education, healthcare and social care that were specified by persons living in the given region. The feedback thus obtained revealed also opportunities for implementing projects organized from abroad and/or for encouraging private donors who might consider funding centers for relevant activities. Acquiring this information was necessary for disclosing the needs that the locals may have. The research results thus unveiled gaps in the social and health sectors.

Asked to specify the target groups, the participants mentioned children, women and the dying. As regards education, the local teachers should be better educated or successful graduates of local universities should be recruited. Missing educators can be replaced by volunteers from Europe or other countries of the world. A greater number of properly trained midwives are needed. The results also indicate an increasing demand for palliative care and a total absence of palliative care provided in the field.

All the mosques that we visited during our research were very effective in offering public courses to children and adults (focused on using computers; making clothes; working with wood, etc.) as well as in organizing remedial and special-interest courses for small children. The needs identified by the participants as still unsatisfied were the same as those mentioned above - they can inspire new projects and be of interest for foreign sponsors, grant agencies and foreign embassies.

#### **4. Discussion**

The paper is a qualitative study aimed to treat the subject of Muslim community and their plans to move abroad. The methods chosen for the study were (1) qualitative research and (2) interview.

The research results can be of interest to non-profit organizations in Europe and other countries of the world; to sponsors, foreign investors, philanthropists and others. They could help to bring into existence the facilities still missing, whose absence might further deteriorate living conditions, and tell the potential supporters what needs to be built for the region's inhabitants. Even though the participants covered in our research do not consider leaving their region or home country, their worsening quality of life could force them to change their mind - that is why their well-being is a matter of consequence.

Speaking about the African state of Uganda and judging by our own practical experience from Malawi and Rwanda, also countries with numerous Muslim regions, our research leads us to believe that the local Muslims, though poor, do not want to leave their familiar environment

and would prefer to have their quality of life improved particularly by better healthcare, social care and new job opportunities for the young generation coming of age and wishing to begin a gainful occupation.

Concerning the Near Eastern regions, the situation is characteristic of lax security that the local government is capable of providing to the inhabitants. What is more, the circumstances are aggravated by the large arsenal of weapons possessed by citizens. In consequence, the government loses its exclusive control over using force and the regions grow lawless. In contrast to the Near East, the army and police of the above-mentioned African countries do a relatively good job protecting the local civil population, and the people are not prone to carry weapons. We have found that the Near East inhabitants are often better positioned to leave for Europe because their financial situation is not as stressful as that of the African Muslims.

Regarding the relevant sociological indicators, we have treated below also problems possibly entailed by the transfer to Europe:

On the one hand the Near East and African countries of our interest are typically abandoned by qualified workforce (brain drain) and the situation gradually develops into a shortage of labor. On the other hand migration has also positive consequences. The migrants remit back home billions of dollars and thus provide a sort of social support to their families. Author Ackers (2005) later author Bal, Willems (2014) have noted, our practical experience tells us that after some time the strong family ties lead to the rest of the family joining their relatives in Europe or any other country of the world. This frequently happens even if the newcomers have no jobs pre-negotiated. They simply rely on landing a job, but their chances of success (e.g. in Germany and despite developing digitization) are still slim even in services and blue-collar occupations (Nová, 2016). This process generates groups of unemployable people who were better off in their home countries receiving money sent by a single member of the family.

Our lessons learned in the Near East should serve as a blueprint for providing remote village regions of Africa with social, healthcare and educational services, and particularly with new job opportunities. The recent forty years have witnessed an exodus of village people to big cities. The exodus and the ensuing urbanization altered the character of society and resulted in political instability. A large number of people crowded within a limited living space are easily disgruntled. Sociologist Černý believes that such people are susceptible to ideology and readily involved in collective actions. Young migrants can also be greatly influenced by media and easy access to social networks where the life in Europe is depicted as the life in affluence. The Near East regions are densely populated with young persons, but they are very modern. By comparison, the Muslim regions in Africa are also densely populated with young persons, but they stick to the traditional culture.

Examining sociological indicators, we can see that the numbers of people moving out of the Near East tend to drop when the population explosion is substantially over. This situation has already been witnessed in some countries - for example Tunisia has undergone this process.

Another reason why people leave their home countries lies in their poor identification with the nation, the nation's representatives and its politics. The Near East states came into existence after the dissolution of the Ottoman Empire in the aftermath of WWI. Their borders were drawn up artificially, a fact to which the current instability can be partially attributed. Research performed by Černý (Černý 2016) suggests that about one third to one half of people living in Arab countries identify with their states. Approximately one third of them identifies with the entire Pan-Arabic space split into more than 20 states. The remainder identifies with the Pan-Islamic Ummah, i.e. with all Muslims. In other words, they perceive themselves primarily as Muslims. Besides, Muslims in regions identify themselves with their extended families. These

observations contrast with what can be seen in Europe. Europeans identify themselves first and foremost with their nation. That is why the decision of leaving the home country and moving with the whole family to a different environment is easier for the people from the Near East.

The opinion that the current migrants may fill in job vacancies and will thus be ultimately beneficial for the European economy contrasts with concerns expressed by the World Economic Forum (Fransen, Riuz, Vargas-Silva, 2017). Debating the subject of automatization in relation to the anticipated implementation of sophisticated technologies in Europe, the Forum developed these expectations: unemployment will grow even in developed European countries; the phenomenon will be strongest in Germany, where the number of vacancies will be reduced by automatization; therefore, the migrants can hardly be perceived as needed workforce. In addition, the Oxford analyses indicate that the situation is grave - too few job opportunities for too many job seekers. Germany, for instance, will face the consequences of automation already implemented within 5 years. Redundancy threatens especially the blue-collar positions occupied by migrants who can hardly be requalified to become IT specialists overnight. Taken into account must also be the language barrier; the level of education; and the work habits and competencies. Europe can learn a useful lesson from the situation in the United States: the influx of unskilled labor unable to speak English put USA at the cutting edge of automated industry. It resulted in the emergence of working poor; the distribution of food aid; and the rise in crime figures attributable to unemployment. Different forms of social exclusion can be encountered perhaps in all traditional societies and the same can be said of socially excluded individuals, groups and categories of people (Cummins, 2018). The socially excluded people are cut off institutions and services, social networks and educational opportunities. Counted among factors typical of social exclusion can thus be long-time unemployment, dependence on social benefits, living in spatially separated parts of communities (ghettos), low qualification, poor health, disintegration of families and the loss of self-esteem (Nová, 2016).

## **5. Conclusion**

Every year millions of people leave their homes. Proper investigating, mapping and understanding the problem of migration is a matter of consequence not only for the first transit countries but for all who are affected by the phenomenon. We should perceive each migrant as a human being with a story to tell. Before everything, he or she had to muster the courage to set out on the journey. Related to the population of Europe, the percentage of newcomers is too small to be dangerous. Should the risk be greater than negligible, their numbers would have to be higher and the process longer. Relying on what she experienced on the Balkan route of migration, the author believes that, even when making the decision, a good deal of the migrants do not expect a better life in Europe. Many are convinced that all they need to improve their life is greater security, better education, better healthcare and social care, and above all new job opportunities. With these facts of life available, a host of the people would not be led to consider leaving their homes. The future, however, has in store some environmental themes that will burden the Arab countries and the North of Africa in the years to come. Climate changes in the region and the exodus they could trigger will become, or have already become, a topic of political debate.

### **Abstract**

*Nowadays, entering foreign markets is an important aspect of running a business. On the one hand, it is an opportunity to gain a new resource for customers to increase sales and profits. On the other hand, it is a challenge for the entrepreneurs, and therefore, it is important that firms take into account development of strategies and management methods to enter foreign markets and operate there with success. Entering markets of countries belonging to the European Union can be regarded as a step towards the internationalization of business activity. The article raises issues related to the operation and functioning of the European Union markets in the context of internationalization and analyzes what types of markets are attractive targets of the surveyed companies, and what expectations for these markets have entrepreneurs from Silesian Voivodeship.*

**Keywords:** business management, EU markets, internationalization

**JEL Classification:** F10, F23, F61

### **1. Introduction**

Strategic management in enterprises, like and internationalization strategies are the foundation of the company's development and orientation to foreign markets. The strength of the state's market economy is reflected in the entrepreneurial potential because the activity of enterprises essentially affects the state of the state economy and realistically translates into its position on the international arena. The notion of an enterprise understood as a unit transforming three types of production factors into homogeneous and durable goods, which meet the consumer's needs, or as small, medium and large specialized institutions guiding production processes and havening the leading position in a modern economy (Samuelson, William, Nordhaus, 1995). In the era of economic globalization processes, it is all the more important to enable entrepreneurs to make the right political and administrative decisions to enter foreign markets, establish international cooperation and acquire skills to cope with difficult, sometimes emergency market situations and dynamically changing business conditions (Ślusarczyk, 2013). Programs, workshops, courses, support of agencies, foundations and other institutions of individual local and state authorities should be a permanent element of the process of stimulating entrepreneurship. State's support translates measurably into nationwide success - the income of the population increases, the supply of goods and services grows dynamically, which in turn brings the country's economic growth. Such opportunities for the development of business are to find in the EU market and, in the authors' opinion, the entrepreneurs in the majority are oriented towards the Single Market (aka the Internal Market) in their functioning. External conditions of entrepreneurial behaviors depend to a large extent on the state's priorities and economic goals, which can be exemplified by appropriate tax and credit policy,

banking and financial system, customs and social policy focused on the entrepreneurial climate. Thus, the EU common market with its policy of smooth flow of people, goods and services, lack of economic barriers and unified rules of doing business gives the whole variety of chances for companies to interact, cooperate and develop the business (Beck, 2012, Czegledy, 2012). Policy in connection with appropriate legislative solutions should be in line with the interest of entrepreneurs and thus, stimulate entrepreneurship and eliminate all barriers that can drastically limit it. It is all the more important because nowadays, the challenge for entrepreneurs is to operate in an international environment, which for many business entities will be an opportunity to gain new sales markets, new clients and making good business relationships. Such activity should regard the phenomena of internationalization, according to which degree one can divide the enterprises (Sutherland, Canwell, 2008, Barcik, 2016, Fránková, 2016). The original criterion was the division of enterprises into national and international, or domestic and foreign. However, the criterion has lost its relevance because today companies are most likely to become divided into national, international, multinational and global ones. The criterion of the division of enterprises due to their scope of activity according to the concept of R. W. Griffin is presented in Table 1.

**Table 1: The Criterion of The Division of Enterprises due to Their Scope of Activity**

TYPE OF COMPANY	SCOPE OF ACTIVITIES
<b>National Enterprise</b>	Resources purchased in the country are 100%.Sales of products and/or services in one country only.
<b>International Company</b>	The location of the company is mainly in one country, but resources and revenues in some specific part are obtained from other countries.
<b>Multinational enterprise</b>	Resources, raw materials, financial support are sourced from different sources in different countries. Production or sales have a worldwide reach.
<b>Global Enterprise</b>	It is a worldwide global company that does not demonstrate attachment to a particular country, a home nation.

Source: Own elaboration based on Griffin, R. W. (1996). *Podstawy zarządzania organizacjami*. Warszawa: PWN, p. 168.; Griffin, R.W. (2018). *Podstawy zarządzania organizacjami*. Warszawa: PWN, p. 153.

B. Stępień (2009), on the other hand, indicates several business classifications, including:

- commercial transactions: enterprises can split into importers and exporters,
- non-capital cooperation: enterprises, in this case, are divided into recipients and license donors, franchisers, turnkey contract partners, subcontracts members, consortia members, strategic allotment alliance partners, foreign project companies,
- capital investments: enterprises divide into financial alliances, joint ventures, brownfields investments and greenfield investments.

Cooperation with foreign partners based on strictly defined conditions is more permanent than in the case of the company's contacts with a foreign contractor as the part of export contracts. Such cooperation can be done mainly due to the long-term planned joint action, which is based not only on a specific agreement but, above all, on combining the capital employed in cooperation of enterprises (Sitek, 2000). Each field should be based on its tactics and

approaches to internationalization, despite the levels on which this concept can be considered, whether it is macroeconomic or microeconomic, one must take into account the fact that there is no single definition of internationalization, hence the need for a multi-aspect analysis of the phenomenon. In the management sciences, the most important issue in considering internationalization is the exact location and reflection its phenomenon in the context of the functioning of enterprises in international conditions, which are determined by certain factors (Daszkiewicz, Wach, 2012, Daszkiewicz, 2008, Mainela, Puhakka, Servais, 2014). One such factor is the fact that today functioning of enterprises on foreign markets is frequently caused by the lack of the possibility of selling products and services on the home market. A company that has the ability and desire to produce more, but the market does not allow redundancy of excess resources may be more likely to look for markets abroad. Since the European companies have access to the Single Market, such functioning in an international context is easier and brings more chances of improving the business position of the company on the market. Therefore, there exists a high probability that in case of Polish entities the choice between the EU market and other distant foreign markets will fall in favor. The access to common market allowed for the expansion of economic activity to neighboring markets and further in EU due to the disappearance of borders and customs, and the free transport of goods and services (Eidenmueller, Engert, Hornuf, 2010). The common EU market certainly offers many possibilities and, at the same time, is devoid of legal and economic constraints, which inhibit the development of companies from the micro and small enterprises sector. One can nowadays observe that modern enterprises prefer a dynamic and flexible business model, which results from the prevailing environmental conditions, and these are not only variable but also turbulent. They force the change of approach to managing the enterprise and the entire business model to a dynamic one that can keep up with the environment (Normann, 2001, Kamoun, 2008).

## **2. Problem Formulation and Methodology**

The article aims to analyze the business orientation of Polish companies. The authors accepted the hypothesis that Polish companies in their process of going beyond the Polish market is conditional on the environment and is focused on The European Single Market, rather than on markets other than EU countries. The results of the research and conclusions may be regarded as the indicator showing the level and range of internationalization of Polish companies in the Silesian Voivodeship, as well as, the basis for further studies. Due to the accepted hypothesis, the authors conducted the survey based on the questionnaire with the use of techniques CAWI and CATI. The study included 100 enterprises in the Silesian Voivodeship in 2016. Only companies strictly Polish, i.e., without foreign capital above 50%, were taken into consideration. The gathered information allowed for drawing conclusions which may be used in further studies as the basis for more advanced analysis.

## **3. The Results of the Study**

Data collection was based on the use of a quantitative method on a test sample (N = 100). The research sample included micro, small, medium and large enterprises, irrespective of the type of activity. The surveyed firms indicated the market they operate on and the results are presented in Figure 1.

**Figure 1: Types of Markets the Companies Operate on N=100**

Source: Own elaboration (2018)

The majority of surveyed firms operate only in Poland – 30% function in the domestic market, whereas, 16% and 17% of firms do not function outside the voivodeship, city or province. 37% is present outside Poland. Due to the purpose of the paper, the further discussion of the study results will refer to the 37% of companies which factually operate abroad. The exact number of them is 33 entities. The collected and grouped answers allowed for the identification in which region the surveyed companies operate mostly. The results are shown in Table 2.

**Table 2: World Regions in which the Companies Operate N=33**

Region	Total number of indications per country in particular regions of the world
<b>European Union</b>	81
<b>Europe (non-EU)</b>	13
<b>Asia</b>	13
<b>North America</b>	8
<b>Middle East</b>	6
<b>South America</b>	4
<b>Africa</b>	1
<b>Australia</b>	1

Source: Own elaboration (2018)

The vast majority of the surveyed companies in the Silesian Voivodeship operate in the EU market. Much less have chosen the non-EU countries and Asia to enter with the business. The minority is present in the markets of countries of the North America or the Middle East, and just a few in South America. Just one company has the business connections in Africa (the country was not specified) and in Australia (one entrepreneur indicated this country). The general results support the authors' hypothesis that mainly EU countries are in favor and the companies choose them for their business activity. To find out in which countries the surveyed companies operate, they were asked to indicate specifically all states the companies have chosen to enter. The gathered information is presented in Figure 2.

**Figure 2: Countries in which Operate the Surveyed Companies N=33**

Source: Own elaboration (2018)

According to the collected data, it clearly can be noticed that if it comes to the EU markets, the companies which chose foreign markets mainly function in Germany (16 entities indicated this market), Czech Republic and France (11 and eight respectively). Subsequently, the markets of Slovakia, Lithuania are preferred. It should be evidently underlined, that the companies in the survey indicated in general EU counties as their answers and thus, the precise indications are not possible. However, it still proves the fact that in general, the EU market dominates as the direction of development of the surveyed companies. In case of other distant markets, the companies do their business in USA, Russia, and Ukraine. Individual units function in South America, Asia or the Middle East. Having in mind the orientation towards EU countries and principally German, Czech and French markets, it is worth showing what types of businesses operate there. The results are shown in Table 3.

**Table 3: Business Types Operating in EU Markets (the Cross-Section of Countries)**  
N=33

<b>TYPE OF BUSINESS</b>	<b>EU MARKETS</b>	<b>TOTAL NUMBER OF COUNTRIES</b>
<b>Building &amp; construction</b>	Finland	1
<b>Trade</b>	France, Austria, Czech Republic, United Kingdom, Hungary, Slovakia, Germany, Belgium	9
<b>IT</b>	European countries, Italy, France, Germany, Austria	4 (specified) 1 (generally EU)
<b>DTP</b>	Czech Republic, France, Austria	3
<b>Industrial manufacturing</b>	Czech Republic, Estonia, Latvia, Austria, Netherlands, Germany, Lithuania, France, Slovakia, Denmark, Bulgaria, Sweden, Slovenia	13
<b>The food industry</b>	Slovakia, Hungary, Lithuania, Bulgaria, United Kingdom	5
<b>Transport</b>	Germany, Czech Republic, Slovakia, Austria, Slovenia, Netherlands	6
<b>Tourism</b>	Italy, Bulgaria, Spain	3

Source: Own elaboration (2018)

According to data in Table 3, the companies of industrial manufacturing operate in 13 EU countries. Trade companies function in 9 EU countries, in 6 of them there are transport companies and five countries became the target for the food industry. The companies which do the tourism services operate in 3 EU markets, and the same situation is in case of the DPT companies. The IT entities operate in 4 specified countries of the European Union and one indicated in general EU countries in its answer. Only one company from the building and construction sector operates abroad in Finland.

## 5. Conclusion

The general conclusion based on the survey results is that:

- the level of internationalization of the surveyed companies is low: 37% out of 100 surveyed entities operate in foreign markets, the rest 63% of firms function only in Poland, which means they have not yet entered foreign markets,
- despite the low level of internationalization of business among the surveyed companies, it does not exclude the fact they do not benefit from the contact with foreign markets, which one may recognize in the supplementary analysis,
- regarding internationalization of business, the surveyed companies prefer the EU markets,
- the most attractive EU countries to operate in, according to the preferences of the surveyed entities, are Germany, Czech Republic, and France,
- principally the USA is as the distant non-EU target of doing business.

The results of the conducted survey among companies in the Silesian Voivodeship should be treated as a preliminary to further research and analysis. The authors accentuate the conclusion that if Polish companies consider extending their activities to foreign markets, they are willing to choose European Union countries, which probably results from the fact that the common EU market offers some development opportunities without undesirable restrictions. The additional reasons could be the proximity of these markets, cultural similarity, comparable habits and style of doing business, which translates into more comfortable conditions for achieving the intended goals.

### **Abstract**

*The aim of this paper is to present the 16+1 platform of cooperation between China and the participating countries of Central and Eastern Europe. The rationale behind China's creation of the platform will be explored, and the substance and mechanism of cooperation will be described. The results of this cooperation for trade between China and its European partners will be highlighted. Drawbacks of the cooperation will also be discussed. The results up to now show that while the platform has great potential, especially in the area of infrastructure development, the actual results so far have not lived up to expectations, due to the differing ideas of China and its European partners. The paper is written from the point of view of the realist school of the academic discipline of international relations, which views states as unitary actors. Information was obtained mainly through internet portals of the relevant Chinese and CEE governmental institutions, NGOs and media, due to the currency of the topic.*

**Keywords:** 16+1 platform, Central and Eastern Europe, China

**JEL Classification:** F50, F53, F55

### **1. Introduction**

The aim of this paper is to present the 16+1 platform of cooperation between China and the participating countries of Central and Eastern Europe (CEE). After the problem formulation and methodology, the paper will shift to the most important aspect of cooperation between the 16 CEE countries (CEECs) and China, i.e. the role of the CEECs in China's Belt and Road Initiative (BRI). Focus will also be on the results of economic cooperation within the 16+1 platform, e.g. trade but especially as concerns Chinese investment in the region and its drawbacks. The paper will then deal with the hurdles of cooperation between the CEECs and China.

First of all, it is necessary to present an outline of the 16+1 platform. This platform consists of China on the one hand (the "plus one") and sixteen CEECs on the other. The CEECs involved comprise 11 EU member states (Bulgaria, Croatia, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovakia and Slovenia – all of them were among the so-called "new" members, i.e. those countries that joined the EU in and after 2004), as well as 5 non-EU countries of the Western Balkans (Albania, Bosnia and Herzegovina, Macedonia, Montenegro and Serbia). These five Balkan countries are all candidates for EU membership in various stages of progress. Every one of these CEECs shares a common historical heritage of being part of the Soviet bloc in the recent past.

The 16+1 platform is a very loose grouping of states without any formal institutions other than a secretariat. This sole permanent organ is located in Beijing, and it is part of China's Ministry

of Foreign Affairs. The basis for the establishment of the 16+1 forum was laid in 2011 in Budapest, Hungary, as part of an official visit by Wen Jiabao, China's prime minister at the time. The first official 16+1 summit of heads of government took place the following year in Warsaw, Poland. This set the trend for subsequent annual summits. The 2012 Warsaw summit established the Secretariat and a 10 billion USD Chinese credit facility for CEECs. Following Warsaw, annual summits were held in Bucharest in 2013, Belgrade in 2014, Suzhou in 2015, Riga in 2016 and, most recently, Budapest in November 2017.

The ostensible reason why China initiated this platform was that there is still a big difference in the economies of these "new" EU members (and the EU candidates) compared to the "old" members states that were not formerly part of the Socialist bloc. Therefore China needed a separate platform to deal with these countries and their specificities. There is a tradition in China, going back to the beginnings of the Cold War, to see Eastern and Western Europe as separate. Even in the 1990s, CEE was categorized by the Ministry of Foreign Affairs of the PRC as belonging to the post-Soviet Eurasian grouping of states rather than to Europe. This view has been adjusted somewhat after 2004, when eight CEECs (as well as Cyprus and Malta) joined the EU. The ministry re-categorized these countries under the Europe grouping of states, even though a perception of difference remained. CEE is seen as distinct not only from the point of view of the economy, but also by its dependence on great powers and factionalism, as seen by the formation of sub-regional groupings such as the Visegrád Four forum of states (Pleschová, 2015, p. 582). Another reason was to partially reorient focus from the "old" EU members after a slump in trade because of the post-2008 economic crisis, due to a decrease in imports by the Western EU members from China. In CEE, China hoped to replicate what it had achieved with the "old" EU in the preceding decade of the 2000s, when trade between the EU and China increased by over 400%. This rapid growth in trade led to the formation of the China-EU strategic partnership in 2003. The EU became China's largest trading partner the following year (Baláž, Szokeová, Zábojník, 2012, p. 135). Apart from the decline in trade growth, there was also a cooling of political relations between China and the "old" EU caused by economic and ideological rivalry (Pleschová, 2015, p. 582).

The CEECs have a lot to offer China. Their workforce is equally skilled to the workers of Western countries, with the advantage of being much cheaper in comparison (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 1). The economies of these countries are also quite open and export-oriented, because of their relatively small size and population. Their openness is also due to their EU membership or, for the candidate countries, their ongoing process of European integration. The "new" EU members in the 16+1 platform also bring an added bonus for China, in that the products of Chinese companies are more easily able to get access to the markets in the Western EU countries, which China is still eminently interested in (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 7). Another aspect of the CEECs developed below is their prime location on China's Belt and Road project.

## **2. Problem Formulation and Methodology**

The 16+1 platform of cooperation was greeted with enthusiasm by the participating CEECs. They expected a significant increase in investment from Chinese companies, especially greenfield investment with the goal of bringing job opportunities. Expectations were especially high concerning the development of transportation infrastructure within the BRI project. However, the reality has not lived up to the optimism. The reasons for this are many and need to be further investigated to ensure higher effectiveness of regional cooperation in the future. The amount of Chinese investment in the region has been lower than expected, with its distribution also being an issue. This is however partly due to the inability of CEECs to

cooperate in presenting large cross-border investment opportunities which the Chinese would prefer. Instead, there is a sense of rivalry among the CEECs for Chinese investment. It is also necessary to take into account the wary attitude of the EU and its Western member states to this platform. It is viewed by them as an attempt by China to divide and thus weaken the EU. There are also fears of China flaunting the EU's strict regulations on investment. China and its partner CEECs must therefore find an effective way to allay these concerns.

Information was obtained mainly through internet portals of scientific institutions, NGOs and media, mainly from CEE. The currency of the topic necessitates the reliance on internet sources. Research was conducted mainly by the method of study of scholarly sources. Among the methodology used were the content analysis of texts by various scholars on the topic and the synthesis of their findings into a coherent narrative. The paper is written from the viewpoint of the discipline of International Relations (specifically the neorealist school of IR), and therefore it uses the terminology of IR. In this vein, the states involved will be studied as unitary actors in keeping with the realist paradigm. This is relevant especially in the case of China, where the state has extensive control over the economy and influence over economic actors. Internal policy debates within these states will thus not be highlighted.

### **3. Problem Solution**

#### ***3.1 The 16+1 Cooperation as a Mechanism for the BRI***

One of the main reasons for the initiation of the 16+1 platform was to facilitate cooperation on projects that fall under China's Belt and Road Initiative (Sinopsis, 2017). The CEE region is has the perfect position of being a gateway to the countries of Western Europe, which represent the opposite terminus of the BRI. In this respect, CEE forms part of the bridge spanning both edges of the Eurasian continent. In this vein, the summits of the 16+1 nations have been used to push forward several projects in the sphere of transportation infrastructure.

The importance of CEE can be seen in the volume of train traffic, as well as the enthusiasm of CEECs to be part of the main rail routes from China to Western Europe. There were 1 881 cargo trains between China and Europe in 2016, with this number forecast to rise to 5 000 trains a year by 2020 (SME, 2017). Almost all of them come to their destinations in Europe via the northern route, from China through Kazakhstan, Russia, Belarus and Poland, and from there on to Germany and the rest of Western Europe (Štálmach-Kušnírová, 2016). But in recent years, a southern route is being developed, which would run from Piraeus in Greece through Belgrade and Budapest to Vienna. The principal part of this transportation corridor, the Belgrade-Budapest railroad, was agreed upon at the 16+1s summit in Bucharest in 2013, and confirmed one year later at the 16+1 summit in Belgrade. It has since become the flagship project of the 16+1 platform and of the BRI in CEE. The railway would link the Maritime Silk Road, which goes from China to Piraeus, with the overland railway from China to Europe, as the so-called China-Europe Land-Sea Express Line (Eszterhai, 2017).

In addition to both these routes, there is also a potential middle route through the Ukraine and Slovakia and on to Vienna, where it would connect to the southern route. As could be expected, Slovakia has an interest in developing this alternative route (Štálmach-Kušnírová, 2016). Slovakia's arguments for the development of this corridor are based on the utilization of the cargo transfer node from the Soviet-style broad gauge railway to the European gauge in Čierna nad Tisou in Eastern Slovakia. So far, this potential route is only at the level of a memorandum of intent, signed at the 16+1 summit in Riga in 2016 (Pravda, 2016). Among other suggested transportation projects or corridors are a connection between Bucharest and Vienna, or a

reconstruction of the Belgrade to Bar railway, which was also agreed upon at the Riga 2016 summit. There is also an idea to connect the corners of CEE in the so-called Adriatic-Baltic-Black Sea Seaport Cooperation, put forward in 2015 (Eszterhai, 2017).

### **3.2 Results of Economic Cooperation**

So far, the results of this cooperation in the area of trade and investment have been uneven. Between 2009 and 2014, trade with China increased by 86% for the 16 involved CEECs. Exports from CEE to China grew by 173%, compared to a 91% increase in exports to China from the EU as a whole (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 6). On the whole, however, trade between the EU and China suffered, with total trade declining by 5.3% from 2014 to 2015. Even so, the EU remained China's largest and most important trade partner, with their mutual trade worth 323.01 billion yuan (Ziyadin, Suiubayeva, Kabasheva, Moldazhanov, 2017, p. 38). Therefore, the China-CEE trade has had a more positive dynamic than China-EU trade, visible mainly in the more rapid growth of exports. This development was in the context of the aftermath of the global economic recession of 2008 and the following years. The slowdown in mutual trade with the EU, especially its wealthy Western member states, was one of the main reasons China chose to develop its trade relations with the 16 CEECs. But in spite of these figures, export from the involved CEECs is still less than the amount of Chinese exports to this region, which causes the CEE region to have a 34% trade deficit with China. And for China, CEE went from being 9% to 10% of its trade, which does not suggest a rise in importance of the CEE region for Chinese trade so far.

In the case of investment, in the same period, FDI from China to the CEECs increased from 400 million USD to 1.7 billion USD (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 6). There is a certain level of disappointment among the CEECs about Chinese investment, namely its volume, structure and destination. Regarding the volume, there was far less investment coming from China than the CEECs hoped for (Pleschová, 2015a). This can be explained by the mentioned lack of cooperation between the CEECs, as well as them not being able to offer the specific types of investment opportunities the Chinese wanted. This ties in to criticism about the structure of China's investment. The governments of the CEECs were hoping to get greenfield investments in locations where none were present previously. They expected Chinese companies to develop infrastructure and create jobs in their respective countries. But most Chinese investments in the CEE region were acquisitions, aiming to obtain technological know-how and gain a foothold in the European market. (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 8). This focus by China fits within their investment strategy in Europe in general. It is most visible in Chinese investment in the EU, where China aims to acquire know-how in high-tech sectors of industry. This leads to a risk that China would reverse-engineer the know-how and use their economic advantages to take over those markets where the EU has been dominant (Baláž, 2014, p. 20). A similar trend is evident in the CEECs, mostly the new EU member states. This has led to a sense of caution on the part of the CEECs towards deepening their economic cooperation with China.

Finally, the destination of Chinese investment also faces criticism. There is also a perception in the CEECs of favoritism by China towards certain partners, especially the larger CEECs (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 3). This is shown by the fact that in 2014, 95% of investment from China went to just six countries – Hungary, Poland, the Czech Republic, Slovakia, Romania and Bulgaria. Of these, Hungary is the leader in gaining Chinese investment (Drapáková, 2017). Furthermore, also in 2014, 80% of Chinese trade with CEE went to just five countries, namely the same ones enumerated above minus Bulgaria (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 6). But this trend may be changing as China is redirecting its

focus on the EU candidate countries of the Western Balkans for reasons discussed below. These countries are a good alternative destination for Chinese investment thanks to their lower manufacturing costs and location between the Mediterranean Sea and the EU. They are also hungry for investment, to lower their exceptionally high unemployment rates and brain drain, as well as their employment structure, which is relatively more concentrated in low-tech and low value added sectors. This makes them more amenable to China's conditions (Gabrielová, 2012, p. 72-73). The impact of this on their EU membership aspirations may however become an issue. Among these countries, Serbia is emerging as a new favorite destination of Chinese investment. This was already visible in the approval of the Belgrade-Budapest and Belgrade-Bar railways. But transportation corridors are not the only area of China's economic interest in the region. Among the largest investment projects of China in CEE was the acquisition of the Železara steel works in Smederevo, Serbia, by the Chinese steel manufacturing conglomerate HeSteel Group in April 2016. HeSteel Group has pledged to continue production in the steel mill and to contribute another 300 million USD worth of investment for its development. There are plans for a similar acquisition of the U.S. Steel Košice steelworks in Eastern Slovakia by HeSteel Group (Brocková, 2016 p. 64). These steps open questions about Chinese trade practices, such as protection of intellectual property, unfair dumping (especially prevalent in the steel sector), the presence of Chinese companies linked to the state in key strategic sectors of the economies of the CEECs, or the position of European steel producers which are direct rivals of Chinese producers. There are, however, expectations that China will move closer to the global mainstream at least in the area of investment practices. This is due to China's rising status as an exporter of FDI, meaning that it would want to ensure that investments from China are welcomed (Brocková, 2015, p. 62).

### ***3.3 Problems of the 16+1 Cooperation***

The 16+1 platform of cooperation still has plenty of hurdles to overcome before the high expectations of the CEECs of this platform are met. Though the platform was expected to promote cooperation among the CEECs, in practice it has rather led to competition between them for Chinese investment (Sinopsis, 2017). As such, the platform often resembles 16 bilateral platforms rather than one single multilateral grouping. Another issue is that even though China sees CEECs as having enough in common to merit creating this forum, their differences, especially in their degree of EU integration, makes adopting a common policy difficult. This is visible e.g. in the Chinese demands for state guarantees for their investment projects, which is another major hurdle to more cooperation and investment from China. But such guarantees are often beyond the possibilities of the CEECs, especially for those heavily hit by the post-2008 economic recession. These guarantees can also be contrary to EU regulations on investment aid (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 8). The result is that the more integrated the country is in the EU (i.e. whether the country is a EU candidate, a full EU member, or Eurozone member), the less interested it is in accepting China's terms. This means that the Western Balkan countries that are not yet members of the EU are less constrained by EU regulations. This might help explain China's growing interest in Serbia and the infrastructure projects in the Balkans (Pleschová, 2015a).

Furthermore, the perceived favoritism of China towards certain larger CEE economies in allocating investment is also seen as a source of disappointment by those CEECs that see themselves as having been left out of the main scope of China's interest. However, this "favoritism" can be seen as a mark of Chinese pragmatism, since larger economies usually are more interesting trading partners and investment destinations. In any case, this trend may change as China shifts its focus from the EU member states in the platform to the candidate states of the Western Balkans. The reason for this shift is the aforementioned stricter

investment regulation of the EU. In contrast, the Balkan states are more open to China's methods. The shift is in progress as can be seen in the importance attached to the projects of the Belgrade-Budapest and Belgrade-Bar railways. For example, Serbia had the largest number of agreements with China as of 2016 (CorD, 2016). In the same year, Serbia and China upgraded their relations to a comprehensive strategic partnership (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 12).

The CEECs, especially EU members, also need to take into account the position of the EU and its powerful "old" members. When the 16+1 platform launched, the EU responded towards the initiative with wariness. The main reason for the EU's concerns was a fear of China using a "divide and conquer" approach to Europe and the EU. According to this position, China is using the 16+1 platform as an attempt to drive a wedge between the old and new EU members to weaken the EU, especially as an economic rival to China, as well as to increase China's own influence within it (Grieger, 2016, p. 10). What is more, even though the CEECs were supportive of the 16+1 cooperation at first, they have also partially internalized these concerns. This added to the caution of the EU-member CEECs towards deeper cooperation as explained above (Stanzel, Kratz, Szczudlik, Pavličević, 2016, p. 2). Of course, China declares that cooperation within the 16+1 platform is complementary to cooperation with the EU, not contradictory (Grieger, 2016, p. 4). This is one of the advertised features of China-led cooperation. In fact, the 16+1 partners have agreed that cooperation has to be in line with EU laws and regulations (Eszterhai, 2017). Another reason for the cool reception of the 16+1 cooperation by the EU was a fear that China would gain undue influence in the strategic enterprises of the members (Szalai, 2017). One example was an attempt by a Chinese company to win the contract on expanding the Czech nuclear power plant in Dukovany without a tender (Sinopsis, 2017). However, these fears have largely been alleviated because of the slow progress in 16+1 cooperation so far.

#### 4. Conclusion

The 16+1 partnership between China and the CEECs still has many hurdles to overcome. One of the most important of these is a failure of the CEECs to cooperate among themselves in preparing and presenting multinational projects, which would be more interesting for Chinese investors. This preference for bilateral relations with China among the CEECs and their small enthusiasm for multilateral cooperation pose a significant challenge to the effectiveness of the 16+1 platform. The CEECs are also disappointed that the amount of Chinese investment did not attain the levels that they had anticipated. This disappointment extend to the structure of the investment that did pour into the region, which was oriented more toward acquisitions rather than toward greenfield projects as the CEECs would have preferred, which would have resulted in more robust job creation. This is explained by the investment following the priorities of the Chinese companies involved. These companies prefer the acquisition of new technologies and knowhow as well as gaining a foothold for themselves in the EU market. The destination of the investments is also controversial, with most of them going to just a few of the largest CEECs. One suggested method of remedying this is by focusing more on non-economic cooperation to balance out the lack of economic cooperation, at least until the later is more substantial.

The attitude of the EU, and its Western or "old" members, presents another source of problems for the 16+1 forum. From the beginnings of the 16+1 cooperation, the EU has been wary towards it. The EU would have preferred a common approach toward China that would take the interests of all members into account and would not split the EU into two groups. There was, and continues to be, a suspicion within the EU that China is pursuing a "divide and

conquer” strategy and trying to divide the old and new members, weakening the Union and enabling China to influence EU affairs from within through member state governments favorable to China. The EU is also nervous about Chinese demands that the CEECs give state guarantees for the investments made by Chinese companies. However, many of the CEE partners were simply unable to offer guarantees of this type, especially in the aftermath of the post-2008 economic crisis. Furthermore, these guarantees could potentially be against EU investment regulations. This was another reason why the EU was wary of the increasing influence of China and Chinese companies on the policies of the EU. China has attempted to mitigate these suspicions with claims that the projects within the scope of the 16+1 platform are based on the necessary EU regulations. China also affirms that 16+1 cooperation it is complementary to EU-China cooperation, not an alternative to it. It is suggested that China and its CEE partners should involve the EU more closely in the workings of the 16+1 platform. This would get help China to get its point across that the membership of the CEECs in the platform is also complementary to their membership in the EU. In the meantime, during the last few years the focus of Chinese infrastructure investment has turned to the Balkans, especially Serbia. This is visible in the development of the two main infrastructure projects of the BRI in the region, the Belgrade-Budapest railway and the Belgrade-Bar railway. It remains to be seen how the CEE region will be able to better benefit from the potential of cooperation with China, as well as whether China will succeed in addressing the weaknesses of cooperation with CEE.

## **Abstract**

*The European Space Agency (ESA) stimulates the development of the space industry in Europe. Small and medium-sized enterprises (SMEs), which have great potential for development and are the driving force of the European economy, play an increasingly important role in the industrial policy of the ESA. Participation in ESA programs has multidimensional impact on small and medium-sized European enterprises, in particular on increasing their innovation capacity. The aim of the study is to present the main assumptions of the ESA industrial policy towards SME, as well as the ways in which it affects the innovation capacity of SME, understood as the ability to reconfigure internal and external resources and competences of an enterprise in response to fast-paced changes in the environment.*

**Keywords:** European Space Agency, industrial policy, innovation capacity, small and medium sized enterprises (SMEs), space industry

**JEL Classification:** L20, L52, O22, O33

## **1. Introduction**

For over 20 years, the European Space Agency (ESA) has been carrying out its industrial policy for small and medium enterprises (SME) considered to be the most “dynamic, flexible, innovative, as well as highly specialised in technology” (Faix, 2011, p. 50). The purpose of this policy is to increase the SME’s participation in ESA space projects and programmes and to include them into the global value chain of the space industry, in particular through stimulating partnerships between space companies and SME sector entities. Moreover, the participation of SMEs in ESA space projects and programmes generates numerous collateral effects: technological, commercial, related to work organization and methodology, as well as human resources, which are of crucial importance for achieving the goals of the ESA industrial policy on a long-term basis.

Due to the economic and social changes in the international environment, the transformation of the space industry into the industry of the Space 4.0 era, as well as resulting necessity to search for new ways to increase international innovativeness and competitiveness of the European industry, a new approach to ESA industrial policy was proposed in 2016, directed to a greater extent at space projects and programmes with high application potential, taking into greater consideration the spin off technologies which may be applied in other branches of economic activity (especially earth-based applications), as well as stimulating technology transfer and the development of business culture. This approach has been reflected in promoting such initiatives as Industry Space Days, Innovation Triangle Initiative or Business Innovation Centre, which are initiatives bringing together a variety of entities – space

companies, entrepreneurs, space agencies, start-ups, scientific institutions or mutual funds for space industry construction.

The research is based on the assumption that in ESA space projects and programmes, the partners are the enterprises whose competitive advantage is based mainly on technological innovation. The purpose of their activity is to develop technological resources and gaining – and later retaining – technological leadership (Autio, 1997, p. 276). These enterprises play an important role in the economy, which is to catalyse the innovation processes in “innovation networks”, which also include the innovative ecosystem of space industry (Mazzucato and Robinson [online] 2017, p. 26). The ESA industrial policy for SME affects not only the development of resources and technological competences, but most importantly impacts the enhancement of the innovation capabilities of SME, which conditions the transformation of “resources” into a success in the shape of product implementation and retaining the position in the value chain of the space industry.

The purpose of the present research is to present the main assumptions of the ESA industrial policy towards SME, as well as the ways in which it affects the innovation capacity of SME, understood as the ability to reconfigure internal and external resources and competences of an enterprise in response to fast-paced changes in the environment.

Such formulated research project is reflected in the construction of the paper, consisting of three parts, introduction and conclusions. In the research, analysis and synthesis were used interchangeably, as the disadvantages of an exclusive choice of either were acknowledged. The analysis and synthesis were conducted based on official ESA documentation and professional literature on the subject. The character of the research is interdisciplinary and it complies with the global development trend of humanist and social sciences.

Due to the complexity of the subject matter, the present research cannot be considered free of any limitations. The research does not exhaust the complex issue of the ESA industrial policy and its impact. It concentrates in particular on the role and significance of SME in the Agency’s industrial policy, the causes and consequences of such an approach, as well as on the innovation capacity of SME in space industry and the ESA’s ability to influence the innovation capacity of SME. The research was concluded on 28<sup>th</sup> February 2018.

## **2. The ESA Industrial Policy**

The main objective of the Agency, as stated in the ESA convention of 1975, is to ensure and promote the co-operation between European countries as regards research and development of space technologies and their application in space, with the intention of using them for peaceful – scientific – purposes and to employ them in usable operational systems (ESA [online], 1975). Moreover, the Convention establishes that one of the four main objectives of the Agency is to develop and implement the industrial policy coherent with other ESA objectives and the industrial policies of the Member States (ESA [online], 1975). Article VII defines the main assumptions for developing and implementing said policy, founding it i.a. on the principle of cost-effectiveness, market approach, equitable participation of the Member States in ESA programmes proportionally to their financial input, granting preference to industry of all the Member States and free competitive bidding (ESA [online], 1975).

The principles of the ESA industrial policy are elaborated on in Annex V of the Convention, entitled “Industrial Policy”, which presents in particular the assumptions for the bidding system and contractual operations by the ESA, and the rule of geographical division. Both instruments have constitute the pillars of the ESA industrial policy up to the present day. Simultaneously, the Convention guarantees that any additional aims of the industrial policy

may be defined by the ESA Council at any given moment, through unanimous decision of all Member States.

This possibility was used in 1997, when due to the economic and social changes in the international environment, the necessity to increase international competitiveness of European industry and growing (since 1980s) interest in space industry in the EU, the ESA Council passed a resolution to establish the industrial policy (ESA [online], 1997). The resolution gave a new direction to the policy, and small and medium enterprises were granted a special place in the area of defining the technological plan and activity of the Agency.

In 1997, a two-year transitional period was started, with the aim of adjusting the rules of co-financing technological operations to the size of an enterprise and introducing numerous instruments for SME, e.g. expert support and access to ESA laboratories in order to increase the technological competences of SME (ESA [online], 1997). In 1999, by order of the ESA Council, the industrial policy for SME was permanently placed on the ESA agenda. In the same year, changes in the general ESA budget were accepted, introducing a category with the objective of financing the SME policy on a permanent basis (Benamar, 2015). In 2008, by order of the ESA Council and based on the resolution on the evolution of the Agency (ESA [online], 2008), the position of SME in the industrial policy was strengthened, and this group of enterprises was acknowledged as an integral element of the space system in Europe, however requiring a separate, specific instrumentarium. In 2016, the ESA Council accepted an amended policy for SME, based on following principles (Kaufmann [online], 2017):

- using the innovativeness and efficiency of SME for ESA programmes;
- strengthening and developing the industrial base of the Member States;
- supporting SME in challenges typical for this sector, such as i.a. sustainable development, rate of return, access to space infrastructure, data and information, etc.

The instruments available to SME were also provided with details in four categories: General Support Measures, Procurement Measures, Industrial Policy Measures and Financial Measures.

### **3. The Significance of Small and Medium Enterprises in the ESA Industrial Policy**

As mentioned above, the challenges related to innovativeness and competitiveness of industry in Europe, the necessity to search for and create new sources of economic growth and increasing the impact of the European industry on the shaping of global value chains causes the ESA to carry out an increasingly active industrial policy for SME. The factors indicated by M. Mazzucatto and D.K.R. Robinson, such as the necessity to increase the efficiency of space agencies around the world, understood as generating – due to their activity – new workplaces, creating new enterprises and stimulating the economic growth, are not without significance (Mazzucatto and Robinson [online], 2016, p. 6). Another challenge is to include new Member States into the Agency (e.g. the Czech Republic or Poland in 2012), which results in the necessity to include new partners, most importantly from the SME sector, into ESA space projects and programmes.

Directing the ESA industrial policy towards SME is also related to their unique character. SME constitute a particular group of subjects with high potential of development due to their number and the scale of their influence on the economy, i.a. through their ability to create new workplaces. In 2016, 99,8% of all enterprises in the non-financial sector in the EU consisted of SME, employing 67% of all employees and generating 57% of added value in the whole

EU economy (EC, 2017). They are mostly predetermined to the role of an economic development stimulator due to their specific qualities, including i.a. low level of bureaucratization, high tendency for risk-taking or quick reaction to changing conditions in the environment. Their flexibility and tendency to take risks enhance the innovation and commercialization processes within them, as well as condition their participation in risky, from the SME point of view, enterprises. SME are able to respond quickly to changing market conditions and thus can easily adapt to them. They can also carry out effective restructuring more flexibly (Dziwiński, 2016, p. 192).

The ESA has recognized SME as the most “dynamic, flexible, innovative and highly specialized technology-wise” (Faix, 2011, p. 50). Specific qualities of SME are also acknowledged in a report from Ernst & Young, which highlights the fact that they have “unique competences as regards niche production, greater flexibility, lower overall cost and the ability to learn and absorb new technologies” at their disposal (Ernst&Young [online], 2009, p. 1). It is therefore worth noting that the enterprises which participate in space industry in Europe base their competitive advantage mainly on technological innovations. In theory, the key role is assigned in particular to these enterprises’ ability to increase technological competences, which can enable them, if other conditions are fulfilled, sustainable or vicious growth (Lee, 2010, p. 279). The ESA industrial policy towards the SME sector is therefore directed at increasing their innovation capacity and generating the greatest possible number of spin off technologies, which can be applied in the process of producing numerous components and equipment for use in space, but also in earth-based applications, the implementation of which is less costly and time-consuming. Coad and Reid (Coad and Reid, 2012, p. 8) point out the important role of the industrial policy in stimulating diffusion of innovations, propagating technological competences and increasing the absorptive capacity, especially in enterprises of lower level of technological advancement.

The benefits from including SME into ESA space programmes and projects are mutual in character. ESA benefits from the existing technological competences of European SME (Faix, 2011, pp. 49–50) in order to efficiently fulfil its main objectives, i.e. strengthen the competitiveness of the entire European space industry. At the same time, due to the active participation of SME in space projects and strengthening their position in the international arena, the ESA can prove the effectiveness of the actions it undertakes.

#### **4. The Significance of the ESA Industrial Policy for the Innovative Capacity of SME in Space Industry**

Innovative capacity, in literature of the subject also known as capacity to innovate or, less frequently, as innovative potential (which contradicts the so called dynamic innovative capacity paradigm), stems from the theory of resources in an enterprise, which assumes that the competitive advantage is attained by enterprises as a result of using rare and unlimited resources: human, material and capital at their disposal (Wernerfelt, 1995), as well as “dynamic capacities” theory, which means the ability to reconfigure internal and external competences in response to fast-paced changes in their internal and external environment (Teece et al., 1997, p. 515). The resources possessed by an enterprise can be the source of its innovative development, and the success or lack thereof is directly dependent on the ability to utilize them (Teece et al., 1997, p. 515). Szeto (2000) defines innovative capacity as a constant process of improving the enterprise’s general capability to create innovations in order to develop new products to meet the market demand. This capability may be increased in an incremental or radical way due to the enterprise’s participation in operations which activate innovative resources and transform them into a particular knowledge base for the company in

an interactive environment. Caniels and Romijn (2003) point out that innovative capacity can be increased by an enterprise's participation in collaborative networks. Širec and Bradac point out that collaboration with numerous partners is key for the success of SME (Širec i Bradac, 2009, p. 63). Therefore, an important determinant for thus understood innovative capacity is the participation of an enterprise in a collaborative network (Groen, 2005).

Collaborative networks commence in the value chain of space industry. As indicated by Ben Letaifa et al. (Ben Letaifa et al., 2013, pp. 233–234), there is a strong differentiation of subjects in the SME in the global space industry, they are however connected due to focus and organisation of their activity around space programmes and projects (Ben Letaifa, 2013, p. 233). As a result, an enterprise acting as a subsystem integrator in one project can act as a subsupplier of products and services in another project, in this way creating a network of mutual connections and codependencies, as well as organisational structures, which can change in a flexible way and adjust to the needs of a particular project. The issue of networks of mutual codependencies and relations in space industry was elaborated on, among others, by M. Mazzucato and D.K.R. Robinson, who drew attention to its usefulness in the analysis of the “ecosystem perspective” (Mazzucato and Robinson [online], 2016, p. 26). Small and medium enterprises participate in the value chain of space industry mainly as subsuppliers of specialist elements, technologies and Tier IV services, characterized by the highest level of dispersion, the lowest entry barriers, as well as lowest added value (Comparini [online], 2009). Few SME, the most technologically advanced ones, are also engaged in Tier III operations. However, the scale of this occurrence is small, as SME – system integrators generate only 3% of annual turnover in space industry (Comparini [online], 2009). Very rarely do SME migrate between particular levels of value chains, due to a string of internal and external barriers (Antill et al., 2001, pp. 14–15; Faix, 2011, p. 49; Kaufmann [online], 2017). However, due to collaboration with large entities and the Agency itself, SME can build up their innovation capacity, and in particular develop it external dimension based on collaboration networks with the scientific sphere and market collaboration (Autio, 1997, p. 276).

The ways of influencing SME by participation in space projects and programmes can be also described as follows (Bach and Lambert, 1992):

- stimulating technological innovation, leading to a new generation of products and services entering the market and generating other effects in the area of innovation, such as spin off technologies transferred to other sectors of economy, including earth-based ones;
- enterprises stimulating growth in the sales of products and services, conditioned by opening of new markets and creating new business ties between subjects, including outside the ESA;
- stimulating innovation in the area of management processes and new methods of work and production, resulting from transferring, among others, high quality work standards established by the ESA;
- improving the qualifications and skills of the staff employed in ESA space projects and programmes, as well as building interdisciplinary teams of specialists, creating a particular critical mass of knowledge in the European space sector

The ESA industrial policy towards SME thus influences the development of resources and technological competences, but first and foremost it affects the increase in the innovation capacity of SME, which conditions the transformation of resources into innovations which meet the market demand.

## 5. Conclusion

The innovative capacity of SME constitutes one of the most important factors in the development of an enterprise (micro level), is significant to the development of the industry (mezo level) and, as a result, contributes to the economic development of the country and region (macro level). The development of SME innovative capacity is therefore one of the most important objectives of the ESA industrial policy. The ESA is meeting this objective through including an increasing number of innovative, technologically specialised SME into the value chain, thus creating a network of mutual connections and codependencies, building and innovative “ecosystem”, which benefits (should benefit) all the parties involved.

Faced with new challenges to the ESA industrial policy, resulting from internal factors such as admitting new Member States into the ESA, and external, such as i.a. the dynamic growth of the space industry in emerging economies such as China or India, or the necessity to withstand the competition with the USA, it is necessary to maximise the effects of SME’s participation in the value chain of the space industry in Europe.

Due to their collaboration with large entities and the ESA itself, SME can increase its innovative capacity, being subject to a number of effects in the area of innovation and technology, management processes and work organisation, as well as raising the competences of their personnel.

The question remains open whether the innovation capacity of an enterprise increased in this way is enough for the enterprise to build lasting competitive advantage based on technologies.

### **Abstract**

*European enterprises operate in a dynamic social-economic environment. The dynamics of the environment increase the need for changes in the internal environment of the organization. Organizational culture is a very important factor determining the functioning and development of the organization in a dynamic environment of European Union. This study presents theoretical-empirical considerations on the organizational culture of a small companies. Then, the aim of the paper is to present findings of theoretical and empirical studies carried out with the aim of identifying the specificity of the organisational culture of a small company in European regional socio-economic context. The methodology of theoretical and empirical research includes a literature study and statistical analysis. Quantitative research was carried out using the questionnaire method among selected companies in the Silesia Voivodeship (Poland).*

**Keywords:** *dynamic environment, European Union context, organisational culture, small company*

**JEL Classification:** *M10, M12, M14, M21, M50*

### **1. Introduction**

Modern organisations function in a very dynamic European Union context and increasingly unpredictable global environment. Business environment is characterised by such attributes as: complexity, stochasticity and changeability. Cooperation, openness, sharing, trust and interrelation are regarded as the characteristics of a management system in a modern enterprise (Tapscott and Williams, 2011, p. 32). Other characteristics include fast and flexible activity, need for an agile synchronisation of the external and internal environments, and development of an organisation's dynamic capabilities (Koźmiński, 2005, p. 136). The existence and development of organisations is in a sense shifted to the dimension of organisational behaviours which essentially involve the search for a compromise between balance and imbalance, and order vs. chaos. A precondition for an organisation's survival in the environment is its openness to changes (Jeżak, 2016, p.54). In this context, an organisation is heading in the direction of an open, dynamic and flexible system. The internal environment of an organisation, in terms of its primary values, processes and undertaken activities, is determined by organisational culture, which also supports the development of external

relations (Serafin, 2015, pp. 90-91). Organisational culture determines openness, dynamics and flexibility of the internal structures of an enterprise. The internal environment of an organisation, in turn, determines its ability to create, sustain and utilise external relations. By adopting such perspective, organisational culture can be regarded as a highly important identifier of an organisation, which determines its functioning and development in a dynamic environment.

The aim of the paper is to present findings of theoretical and empirical studies carried out with the aim of identifying the specificity of the organisational culture of a small company in European regional context. The research problem involves analysis of the characteristics of organisational culture which are significant in terms of the functioning and development of a small company. The aim of empirical studies has been to define features of organisational culture that determine survival of a small company in a dynamic environment. The adopted methodology of theoretical and empirical studies is based on literature study and statistical analysis.

## 2. Organisational Culture in the Environment of a Small Company

In studies of management, the subject of organisational culture is widely addressed in the context of undertaken literature and empirical studies. There is a widespread view that every human collective, and an organised one in particular, has a culture. Organisational culture identifies the essence of the activities undertaken by an enterprise. It sets the direction of such activities and gives a meaning to them, creating a kind of "collective consciousness", which is characteristic of any given organisation. In the area of business activity, organisational culture is a system of shared beliefs, values, standards or behaviours of the members of an organisation (Luce, 1984, pp. 40-43). Organisational culture combines the goals, values and beliefs of an individual (employee) and an enterprise. It is regarded as an important attribute of an organisation which impacts its competitive advantage (Barney, 1986, pp. 656-665).

**Figure 1: Architecture of the Model „McKinsey 7-S”**

Source: Tracey and Blood [online], (2012), p. 7.

One of better known and at the same time pioneer approaches in management studies which recognises the prime importance of organisational culture is the so-called "7-S framework" model (also known as "McKinsey 7-S"). This model was developed at the end of the 1970s and the beginning of the 1980s by the consulting company McKinsey (Tracey and Blood [online], 2012, pp. 6-13). The architecture of the model, apart from organisational culture, consists of "hard" elements, which primarily describe the organisational environment of an enterprise, and "soft" factors, which mostly refer to immaterial resources (figure 1).

In the "McKinsey 7-S" model, the central element is identified to be organisational culture, which is expressed in the form of shared values (Pothiyadath and Wesley [online], 2014, pp. 14-16). The other elements are divided into (Pothiyadath and Wesley [online], 2014, pp. 14-16):

1. "hard" elements: strategy (understood as the set of actions by which a company plans to achieve competitive advantage) and structure (which is interpreted as the formal assignment of organizational specializations and authority), and
2. "soft" elements: style (the tangible patterns of the priorities for the managers), skills (i.e. dominating attributes and capabilities in the organization), systems (the processes routine and sets of operations) and staff (people of organization).

Management studies increasingly stress the importance of intangible factors in the context of creation of competitive advantage and development of an organisation's dynamic capabilities. Intangible factors also contribute to value creation. A significant role is played here by human resource management, however in the environment of a small company the HR management is usually minimised (Dzieńdziora and Smolarek, 2016, pp. 183- 185).

Literature highlights a strong relationship between organisational structure and capability of using the potential of intangible assets of enterprises (De Long and Fahey, 2000, pp. 113–127). However, empirical studies on intangible factors (e.g. knowledge management) are conducted more often in large companies and international corporations than small businesses (Hutchinson and Quintas, 2008, pp. 131–154). Studies on Japanese small companies from the Kobe region found that employees' qualifications were the most important determinants of the companies' development (Wijewardena and Cooray, 1995, pp. 87-92), thus clearly confirming the importance of intangible factors. What's more, the character of leadership, which is very important in terms of the functioning of a small company, corresponds closely with organisational culture. Organisational culture is to a large extent shaped by organisation leaders, but its features, at the same time, shape the character of such leadership (Bass and Avolio, 1993, pp. 112–117).

Organisational culture is also interpreted in the cultural context of the country, also related to the diversity of the European Union in which a given organisation carries out its business activity. In this respect, some variation can be seen with respect to the characterisation of companies based on their division into large, medium-sized and small companies. Literature points out that organisational culture of a company is not a natural picture reflecting the cultural context of a given country (Gerhart, 2009, pp. 241-259). More and more often, organisational environment of medium-sized and large companies is so complex, varied and open that the organisational culture of these organisations is heterogeneous. It is stressed that medium-sized and large companies often function in a multi-cultural environment. However, the specificity of the functioning of small companies provokes reflection on the significance of the cultural context of a country. Undoubtedly, the organisational culture of small companies does not directly reflect the culture of a country. However, the impact of the cultural context on the characteristics of the organisational culture of a small company seems to be much bigger than in the case of medium-sized and large companies. Studies in the area of marketing activities lead to the conclusion that socio-cultural conditions are equally important as the macroeconomic environment for the functioning of small companies (Siu, Zhu and Kirby, 2003, pp. 25-39).

Studies of organisational culture of family-run businesses point out the co-existence of sub-cultures: family and non-family cultures, with variation in the areas of integration and formalisation (Sułkowski, 2013, p. 19.). A higher degree of integration and lower degree of formalisation describe the family sub-culture, whereas the non-family sub-culture is less

integrated and more formalised (Sułkowski, 2013, p. 19.). With the organisational environment of a small company viewed from this perspective, it becomes interesting to identify such features of organisational culture that will contribute to the strengthening of internal integration, thus making it possible to limit the formalisation of internal procedures. Organisational culture as a set of fundamental assumptions of an organisation provides a foundation for internal integration within the organisational boundaries of an enterprise, as well as for external integration in the space surrounding the internal environment of an organisation (Schein, 1982, p. 12). It seems that attempts to harmonise the internal organisational system facilitate the development of an organisation's identity. Fundamental assumptions define the specificity of a business, laying foundations for the development of an organisation's competencies. They may underlie the development of an enterprise in a dynamic environment, also in the European Union context. However, if the organisational system is too hermetic and closed, and the organisational culture is rigid and conservative, this may limit development capabilities. Often, formalisation is associated with safety of running a small company. Strictly defined procedures enable full control over undertaken initiatives. However, by adopting such a mechanism of operation, a company may not be able to keep pace with the dynamics of its environment, in which time, speed, and free and spontaneous behaviour more and more often count. Thus, it seems that with the dynamics and unpredictability of the environment, the internal architecture of an organisation and organisational culture should be able to evolve, making it possible to implement changes and, at the same time, shape the foundations for internal and external integration. An organisation faces up changes from its dynamic European and global environment, but, what's very important, it generates changes too. The prospect of creating development opportunities increasingly refers to the need to reconfigure the internal environment of an organisation (Pachura [online], 2017, p. 175). It is worth stressing that the level of an organisation's internal and external integration is identified in temporal and spatial terms. This level reflects the particular stage in which an organisation finds itself (in the context of growth, development, structure of resources, etc.) and its place in the business environment (as competitive position, link in the network, etc.).

### **3. Identification of Organisational Culture in the Light of Empirical Studies**

#### ***3.1 Methodology of Empirical Studies: Presentation of Adopted Research Assumptions***

Empirical studies were conducted as part of the implementation of the project: "Tendencies and challenges in strategic management of small and medium-sized enterprises in Silesian Voivodeship." Quantitative research was conducted using the method of a survey, with a survey questionnaire as the research tool. The survey was conducted from November to December 2016 on a group of small enterprises of Silesian Voivodeship (Poland). The full research sample comprised 309 respondents (table 1).

The aim of the research was to diagnose the organisational culture of small enterprises in European regional context. Empirical studies were focused on the characterisation of the organisational climate, which was regarded as manifestation of organisational culture. Based on subjective feelings of employees, an attempt was made to assess the atmosphere in a company, internal communication and selected factors conducive to an employee's identification with the organisation. The adopted context of the research constituted a basis for

seeking desirable features of organisational culture in terms of the development of a small company's ability to survive in a dynamic environment.

**Table 1: Characterisation of the Research Sample**

<b>full research sample = 309 (100%)</b>

<b>international</b>	5,5%

Source: Own study

The research question was formulated as follows: what are the effects of building organisational culture in small enterprises? With respect to that question, the following hypothesis was set up: the organisational culture of a small company determines its functioning and development in a dynamic environment.

### **3.2 Results of the Empirical Studies**

Identifying the significance of organisational culture, the respondents mainly indicated such features as: facilitation of the company's functioning on the market (90,0%) and possibility of development (71,5%), which directly confirm the adopted research assumption. In the context of indicating the effects of positive organisational culture, the survey identified, among other things: creation of external relations, dynamics and flexibility of a company's internal structure (figure 2).

According to the respondents, organisational culture has a moderate impact on their loyalty and commitment (3,60)<sup>9</sup>. This impact was rated slightly higher in the group of companies

<sup>9</sup> The research used a 5-point rating scale.

employing up to 9 employees (score of 3,9). The survey evaluated one of the forms of identification with the workplace, i.e. work uniform. Only 22,0% of the respondents indicated the habit of wearing a corporate uniform (it should be noted that this applied to companies with rather larger scale of operation).

**Figure 2: Effects of Building a Positive Organisational Culture in Small Companies**

Source: Own study

Positive atmosphere facilitates cooperation and joint implementation of the goals adopted by a company. The analysis of the data shows that the weighted arithmetic mean of work atmosphere was 3,9. With additional division of companies into those employing up to 9 people and those employing 10 to 49 people, atmosphere at work was rated higher in micro-companies (at 4,2).

Other elements subject to assessment included: motivation system, social activity, and the form and manner of conducting trainings. The average score for these elements oscillated between 3,20 and 3,40, which is a moderate score on a 5-point scale. Effective implementation of an organisation's goals requires appropriate motivation of employees. As the survey shows, almost half the employees of small companies (48,9%) notice the existence of a motivation system. Such a system was rated quite low by the respondents, with the score of 3,40. What's interesting, the motivation system at workplace was rated a little higher by employees in micro-companies - score of 3,70. The form and manner of conducting training were rated similarly (3,20). It can be noticed that the score was higher, at 3,50, in companies employing up to 9 people, whereas in the remaining companies - employing between 10 and 49 people - it was only 2,95. This is not a high score given the fact that by appropriately managing the development of employees an enterprise can achieve a long-term success.

A very important thing in every organisation is appropriate communication, which should not be limited to one-way communication of information. In building the climate of an organisation, it is also important to create possibilities for employees to share their remarks and ideas with superiors and co-workers. For that purpose, cyclical conferences and meetings between the management and employees are held. In the case of small companies, the conferences and meeting were organised in 47,2% of the research group, with the possibilities of communicating remarks, ideas and opinions during such meetings rated at 3,85 (where 5,00

is the highest score). What's interesting, the situation looks a little better in micro-companies, for which the weighted arithmetic mean was 4,0. However, the differences are small, and the higher score for smaller entities may result from the scale of the organisational environment (i.e. it is more possible for more direct relations to exist in small companies).

In the area of communication in the internal environment of an organisation, of importance are, among other things: the degree of consistency of the information that is communicated, the form and direction of the communication of information and the degree of formalisation. The data show that in small companies information is usually communicated indirectly (73,5%), mainly in the verbal form (confirmed by 71,5%). The written form of communication was indicated by only 15,2% of those surveyed (the remaining 13,3% indicated a mixed form). As far as the dominating direction of information flow is concerned, the top-down approach is much more dominant (79,3%). The opposite approach (bottom-down) was indicated by 20,7% of those surveyed. The overwhelming majority of respondents stress inconsistency in the information that is communicated (78,0% of respondents). This phenomenon is especially prominent in micro-companies, where as many as 90,5% of respondents indicated the inconsistent character of information.

### ***3.3 Conclusions from the Empirical Studies***

The studies show that organisational culture plays an important role in small companies in regional and European Union context. It determines the level of job satisfaction, effectiveness, dynamics and flexibility of a small company's internal structures. By supporting the development of external relations, organisational culture helps a small company to function in a dynamic and increasingly unpredictable environment.

Findings of the research show that over half of the small companies covered by the research identify problems in the area of knowledge creation and flow. They include limited possibilities of undertaking creative initiatives and a low level of the effectiveness of motivation systems. These issues are accompanied by a very insufficient degree of using available means of communication that enable information flow and creation of new knowledge.

In small companies, employees' initiatives that facilitate trust-building are especially visible. They include: communicating information about irregularities in the overall functioning of the company and performed processes, responsible behaviour of employees, mutual support, feeling responsibility for the organisation's success, etc. It seems that an important contributing factor is direct communication used in the environment of a small company. However, the dominant top-down approach to information flow and insufficient consistency of communicated information may constitute an obstacle in the process of building a trust-based organisational culture. Another concern is the opinion among employees of small companies about the atmosphere in the workplace, motivation system and possibilities of sharing one's remarks, ideas and opinions.

## **4. Conclusion**

Modern small enterprises operating in the context of the European Union and the global market conditions, in order to survive and achieve success in a dynamic and increasingly unpredictable environment, should be characterised by: innovativeness, creativity, flexibility and adaptability, among other things. The development of capabilities to take initiatives in the area of creation and implementation of innovations, to create and use the potential of creativity, to

reconfigure the internal structures so that they approach open systems, as well as adaptive capabilities is determined, among other things, by organisational culture. In this context, the evolution of organisational culture observed in economic practice seems very interesting. It is worth stressing that there is a recognised need to create knowledge-based culture. Knowledge-based organisational culture contributes to broadly understood innovativeness of organisations, increasing their competitiveness (Skibiński and Sipa, 2015).

Thus, it seems that creation of organisational culture based on such attributes as dynamics, flexibility, openness, trust and creativity is one of key areas of reconfiguration of the internal environment of a small company. The directions of potential reconfiguration include the need to create climate that facilitates changes and intensification of the processes of creation, flow and diffusion of knowledge and skills. A company can create climate, through e.g. a clear and legitimate strategy of its development, innovation-oriented character, human resource management system, system for supporting the flow of information, knowledge and skills, and an open, dynamic and flexible organisational environment.

It seems that the constantly growing role of intangible factors, including aspects of organizational culture, requires further research. At the same time, the directions for further studies require the adoption of interdisciplinary perspectives. The growing importance of international teams in organizations, migration and the specific management practices globalization result in the need to explore new research areas. An interesting fields of research can be also the analysis of relations between organizational culture and global cultural patterns. The growing role of virtualization also causes challenges for research into organizational cultures.

The theoretical and empirical discussion on organisational culture in European regional context as presented in the paper certainly does not exhaust the subject of reconfiguration of the internal organisational environment of a small company. It aims to identify the elements of organisational culture that are characteristic of a small company in the context of the need to develop the capabilities of survival and development in a dynamic European Union and global environment.

### **Abstract**

*The aim of the article is to present the results of research on the diversity of the European Union in terms of eco-innovation. Considering the significant impact of eco-innovation on the economic development and competitiveness of the economy, the European Commission has established the Eco-Innovation Observatory. Since 2010, it has been operating as part of the General Directorate for the Environment and publishes the index Eco-Innovation Scoreboard, which shows the eco-innovation of the EU Member States in relation to the EU average. Using classical and positional statistical measures, an analysis of the diversification of the eco-innovation level of the European Union Member States in 2010-2016 was carried out and the trends of changes in this differentiation were identified. In the further part of the article an attempt was made to analyze the distribution of the eco-innovation index. However, based on the results, it was impossible to determine a uniform distribution of variables for the studied period or to determine the concentration for the entire research period.*

## **1. Introduction**

### **1.1 Innovation**

Innovations play a significant role in economic growth, which was already noted by the classic of the theory of economic development, J. Schumpeter, who is also the creator of the theory of innovation. He believed that innovation is the basic factor of economic development and the driving force of the economy. The role of innovation over the years is constantly growing and is now more significant than traditional development factors such as land, capital or labour. Although innovations do not play a decisive role in the national and international economic policies, they are a very important element of the sustainable development strategy (Rennings, 2000).

Promoting innovation is a policy goal of the European Union, and the policy itself is aimed at supporting enterprises in implementing innovations and better achievement of social goals, such as economic growth, employment and sustainable development. The Innovation Union is one of the seven flagship initiatives of the Europe 2020 strategy. This strategy is to ensure sustainable economic growth and competitiveness of the economy on a global scale (Kordoš, 2014). Innovation policy is an expensive policy but - if it proves successful - it ensures competitiveness and high profits. On the other hand, introduction of innovations is connected with the risk of failure and high costs. Therefore, it is necessary that the state policy supports innovators.

## ***1.2 Eco-innovation***

In the face of increasing environmental threats and a growing emphasis on environmental protection, economic development based on innovation has taken on a new dimension. Innovations should therefore increasingly be ecological innovations, that is, innovations that serve to reduce the burden on the natural environment, which is associated with economic activity and human existence on earth. Ecological innovations are innovations that aim at reducing the environmental impact of business operations. These are new or significantly improved products, processes, organizational or marketing methods that bring greater benefits to the environment than alternative solutions, as well as, of course, they bring benefits to an enterprise implementing them (Rozkrut, 2014; Ziółkowski, 2008, Kemp, Pearson, 2008, Ottman, 2011). Eco-innovations are also a response to the requirements of the market environment because it is a combination of modern innovative solutions with a concern for the environment.

According to Rennings, eco-innovations are (Rennings, 2000: "all measures of relevant actors (firms, politicians, unions, associations, churches, private households) which:

1. develop new ideas, behavior, products and processes, apply or introduce them and
2. contribute to a reduction of environmental burdens or to ecologically specified sustainability targets."

Eco-innovations are becoming an integral part of modern developed economies. As Kobryń and Prystrom (Kobryń, Prystrom, 2017) write, innovations, especially eco-innovations, have a decisive impact on economic development. Moreover, the importance of eco-innovations is growing and is much bigger than ever before, not only because of the urgency and importance of environmental issues but also because of a political interest in sustainable technologies (Berkhout, 2011). Ecological innovations are also a typical element of the next industrial revolution that we are currently witnessing (Mele, Spena, 2015). Văduva F., Gherghina R., Duca I. showed in their research that the level of eco-innovation affects the level of GDP, although it occurs with a certain delay. This was confirmed by the econometric tools they used (Văduva, Gherghina, Duca, 2017).

Already for a few years, the European Union has been placing a great emphasis on the development of economic innovation in its policy, and for many years it has been setting environmental protection as the primary objective in all activities. It is obvious, then, that eco-innovation had to become an important element of its policy over time. And so eco-innovations have become crucial for both the ecological and industrial policy of the European Union. Nevertheless, as this is an area of the Member States' policies, the EU can only support these actions, it cannot however pursue policies in place of the Member States. Eco-innovations are a means to achieve sustainability of economic development and an instrument for implementing a sustainable development programme in enterprises. They also affect changes in technologies, organization and management towards a more friendly direction for the environment (Urbaniec, 2015; Kobryń, Prystrom, 2017).

## ***1.3 Eco-Innovation Scoreboard***

Since 2010 the General Directorate for the Environment has presented the index Eco-Innovation Scoreboard (Eco-IS) for all Member States. It shows how much the level of eco-innovation in the Member States differs from the EU average, indicating at the same time the strengths and weaknesses of each country. Calculating this index, it was assumed that the average level of Eco-IS is 100, i.e. a country with an average level of eco-innovation is a

country with an index of 100. The index close to the average was recorded in 2010 in Italy, Ireland and Spain, in 2011 – in France, in 2012 - in the United Kingdom, in 2013 – in Belgium, in 2014 – in Portugal, Italy and United Kingdom, in 2016 – in the Czech Republic, in 2016 – in the Czech Republic and France.

The index consists of 16 indicators divided into 5 groups showing various dimensions of eco-innovation (see Table 1). Thanks to this shape of the index, various aspects of eco-innovation can be presented. Eco-IS illustrates how the individual EU Member States are doing in various areas of eco-innovation compared to the EU average. The index is an important information for each country about an eco-innovation level (Kobryń, Prystrom, 2017). Eco-Innovation Index gives the opportunity to analyse the impact of the eco-innovation policy on the environment, as well as it gives an answer to the question when and whether a new or improved product or process limits a negative impact on the environment (Berkhout, 2011).

Eco-innovation inputs include investments that stimulate eco-innovation. This applies to both financial investments and investments in human resources. Eco-innovation activities show the activity of enterprises in the field of eco-innovation. Eco-innovation outputs give a picture of the results of eco-innovative activities regarding patents, scientific literature and mass media news. Resource efficiency outcomes refer to the achievements of eco-innovation aimed at saving resources such as materials, energy and water, and the volume of greenhouse gas emissions. Socio-economic outcomes inform to what extent the introduction of eco-innovations gives positive effects from the point of view of social (employment) and economic (turnover, exports) aspects.

**Figure 1: Eco-innovation Scoreboard 2016**

**Table 1: Indicators That Make up the Eco-Innovation Index**

<b>INDICATORS CONNECTED WITH ECO-INNOVATIONS</b>
<b>Eco-innovation inputs</b>
Government`s environmental and energy R&D appropriations and outlays (% of GDP)
Total R&D personnel and researchers (% of total employment)
Total value of green early stage investments (per capita)
<b>Eco-innovation activities</b>
Enterprises that introduced innovation with environmental benefits obtained within the enterprise (% of total firms)
Enterprises that introduced innovation with environmental benefits obtained by the end user(% of total firms)
ISO 14001 registered organisations (per mln population)
<b>Eco-innovation outputs</b>
Eco-innovation-related patents (per mln population)
Eco-innovation-related academic publications (per mln population)
Eco-innovation-related media coverage (per numbers of electronic media)
<b>INDICATORS CONNECTED WITH INTRODUCING ECO-INNOVATIONS</b>
<b>Resource efficiency outcomes</b>
Material productivity (GDP/Domestic Material Consumption)
Water productivity (GDP/Water Footprint)
Energy productivity (GDP/gross inland energy consumption)
GHG emissions intensity (CO <sub>2</sub> e/GDP)
<b>Socio-economic outcomes</b>
Exports of products from eco-industries (% of total exports)
Employment in eco-industries (% of total employment across all companies)
Turnover in eco-industries

## 2. Methodology

The level of eco-innovation in the EU Member States is characterized by a relatively large diversification (see Figure 1). Such a presentation, however, does not allow us to determine the degree of this differentiation or assess the tendencies of changes over the years. Therefore, statistical calculations have been carried out which allow us, to a certain extent, to answer the questions what is the diversification of the level of eco-innovation in the European Union Member States, and whether this diversification diminishes or increases.

The classic and positional statistical measures were used to present the degree of differentiation of the eco-innovation level. Classic measures are exact measures that do not ignore any of the studied objects, among them two measures were used in the analysis: average and standard deviation. Classic measures can create problems of interpretation when a value deviates significantly from the others. Therefore, classic measures have been supplemented with positional measures, to determine which we take into account not all but the selected values. The analysis was based on range and quadrant deviation (Pułaska-Turyna, 2011). In addition, the distribution of the indicator value was analysed using skewness and kurtosis indicators.

### 3. Problem Solution

The range from the sample is a measure showing the difference between the smallest and the highest value of the indicator being examined. The higher this indicator, the less evenly distributed the level of ecological innovations and the greater is the dispersion of the values of individual countries' indicators around the average level of eco-innovation. The smallest difference is noted certainly when the range is 0, which in practice does not occur. In the case of the European Union Member States, it can be concluded that the range is quite high as it is formed in most of the years of the analysed period at a level higher than the average, i.e. 100. The highest range was calculated for 2010 (156) and 2012 (150). In 2010-2014 there is no tendency to be noted, that is the difference between the most and the least eco-innovative country is growing year by year, the next year it is decreasing, and the following year it is growing again. The situation has changed since 2014 when the range between the most and the least eco-innovative country began to decrease from 139 to 99. It is difficult to say whether it will be a long-lasting tendency, but the next three years of reducing the range are a positive phenomenon. However, the range is still high as it is close to the average.

**Figure 2: Range, Quadrant Deviation and Median**

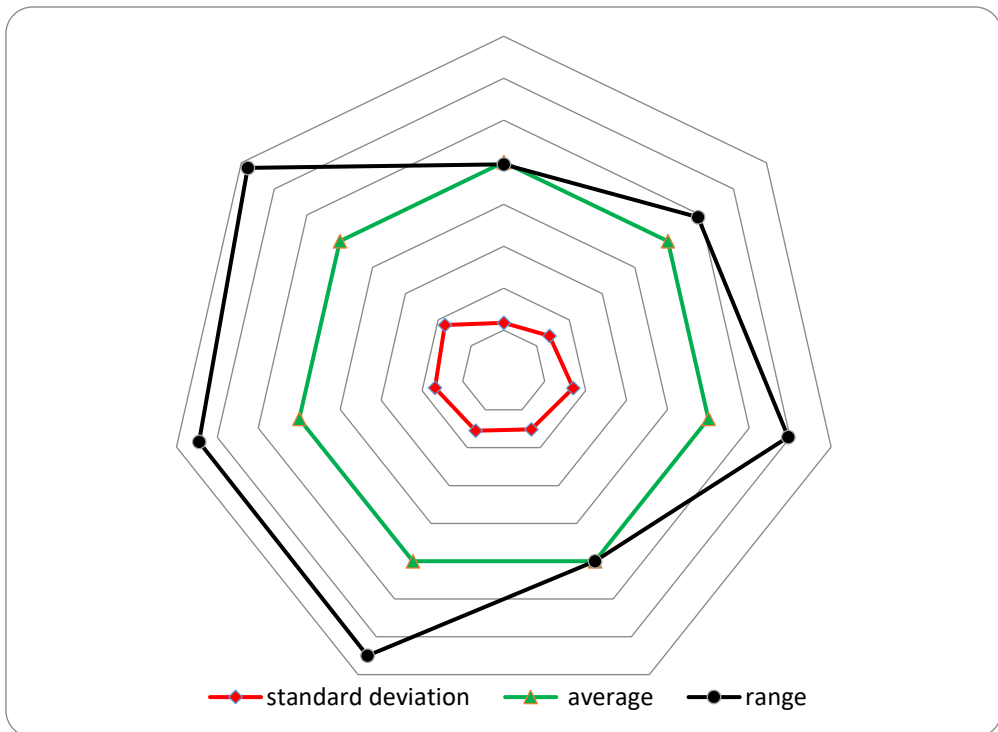

Source: own calculations based on data from European Commission (2017). Eco-innovation [online]. [cit.2018-01-22]. Available at: [https://ec.europa.eu/environment/ecoap/indicators/index\\_en](https://ec.europa.eu/environment/ecoap/indicators/index_en)

An indicator that can tell us a bit more is the quadrant deviation which is equal to half the interquartile range and measures the diversity of only a part of units after rejection of 25% of units with the smallest values and 25% of units with the highest values. Therefore, we receive information on the diversification of the level of eco-innovation, in 50% of the EU Member States at the level closest to the median. It is obvious that the level of diversification of these countries is smaller than all EU Member States. In this case, the decline in the diversification has been observed already since 2013. It is worth noting that in 2016 the diversification among these 50% of the countries is already very small.

Another indicator showing the diversification of the eco-innovation level of the EU Member States is the standard deviation which shows the deviation of the indicator from the average. In the analysed period, the indicator was differentiated at a moderate level and is at a level from 36 (in 2010) to 23.5 (in 2016). Although the highest value is in the initial period, and the lowest value - in the last year, it is difficult to observe any tendencies of a decline in diversification. In 2010-2014, the standard deviation decreased or grew year by year. However, since 2014 it has started to drop significantly. Whether this tendency shall continue - the question remains open. An indicator closely related to the standard deviation is the coefficient of variation. It indicates the diversification of the countries studied in terms of the level of eco-innovation and shows the typical percentage deviation from the average value, i.e. 100. Analysing the level of this indicator, it can be concluded that the variation of the eco-innovation level in the analysed period decreased from a large diversification (above 40%) to medium diversification (25%). In this case, the tendency is confirmed, which on the basis of other indicators can be seen only since 2014, i.e. the diminishing diversification of the level of ecological innovation.

**Figure 3: Standard Deviation, Average and Range**

Source: own calculations based on data from European Commission (2017). Eco-innovation [online]. [cit.2018-01-22]. Available at: [https://ec.europa.eu/environment/eoap/indicators/index\\_en](https://ec.europa.eu/environment/eoap/indicators/index_en)

The analyses conducted so far have allowed us to state the existence of at least an average differentiation in the level of eco-innovation in the EU Member States and the decrease in the level of this differentiation since at least 2014. Further analysis will allow us to answer the

question of how the distribution of the indicator value is shaped. For this purpose, we will use skewness and kurtosis indicators.

The skewness indicator allows us to determine whether the distribution is normal or asymmetrical (left- or right-sided). The left-sided asymmetry means that most numbers are less than the average, while the right-sided asymmetry means that more numbers are larger than the average. On the basis of the calculated indicator, however, it is difficult to determine any tendencies. The indicator is from 1.17 (2014), which shows a very strong right-sided asymmetry, through the indicator close to 0, which shows a very weak right-sided asymmetry, to negative indicators (-0.61 in 2012 and -0.48 in 2011), which reveals a moderate left-sided asymmetry. We do not see any tendencies, either, as we note large changes in the indicator in various directions from year to year. One can only pay attention to an interesting fact that the indicator is the same in the first and last year of the analysis.

The kurtosis indicator shows the concentration of the distribution, i.e. the density of the results around the average value. It answers the question whether the distribution is normal, which means that most values are close to the average. As in the case of the skewness indicator, no tendency of the kurtosis indicator can be observed. In 2010, 2015 and 2016, the indicator is close to 0, so we can say that in these years the distribution of the eco-innovation indicator in the EU Member States was a normal distribution. In 2012 and 2014, the indicator reached a fairly high positive value, which means that the level of eco-innovation focused around the EU average, and countries with extreme values of the indicators are very few.

A statistical analysis does not allow us to characterize the distribution of the eco-innovation index for the EU Member States. One can only say how this indicator was in the particular analysed years.

**Table 2: Skewness and Kurtosis**

	2010	2011	2012	2013	2014	2015	2016
<b>Skewness</b>	0.17	-0.48	-0.61	0.27	1.18	0.49	0.17
<b>Kurtosis</b>	-0.06	0.36	1.21	-1.09	1.44	-0.05	0.09

#### 4. Conclusion

Eco-innovation is a requirement of modern times. Non-innovative economies that do not care about the environment in which they operate and from which they draw the resources necessary for existence have no chance for development, let alone for competing with other economies. In its strategy, the European Union wants to strive to create a competitive and innovative economy, not forgetting about the care for the natural environment. Sustainable development and eco-innovation are the answer to these expectations.

The Member States of the European Union to a varying extent meet the requirements of eco-innovation, which largely depends on the level of their economic development and the development needs of their economies. Therefore, as shown in the analysis, there is at least the average variation in the level of eco-innovation in the European Union. However, as also countries with low ecological innovativeness put an increasingly more emphasis on the need to care for the environment, they also try to introduce the economy onto the path of sustainable

development. Therefore, it seems that the tendency, observed for 3 years, to decrease the diversification of the eco-innovation level is likely to last longer.

### **Abstract**

*Countries of the European Union are responsible for their systems of education and vocational training. These systems can fulfill its role only if they provide positive outcomes. National programmes, action plans and strategic frameworks for European cooperation in education and training are important in solving social, economic, demographic, environmental and technical challenges that European inhabitants face and will be facing in the forthcoming years. Firstly, the paper is pointing out the place of education as such in the value-creating chains that are built up by educational institutions. Secondly, paper pins down regional differences in education. These differences hinder balanced regional development and economic growth. The goal of the paper is an analysis of main problems and disparities, differences in the scope of International Standard Classification of Education – level 5 and 6 (tertiary education), using a method called open method of coordination. The comparison is done between Slovak Republic and EU countries.*

**Keywords:** *education, European integration, region, value chains*

**JEL Classification:** *A11, H52, I25, O30, R10*

### **1. Introduction**

According to Chakraborty (2012) and Krishnankutty (2012), the education is one of the most effective tools for lowering the unemployment, social and economic inequalities. It can be effective in increasing the competitiveness of the global economy. Providing the access to quality education for everybody is important and fundamental for economic growth and the development of particular countries (Čekneová, 2016).

National education policy of every European country is confronted by global demands of European education area. Education is becoming a variable which has to face a lot of factors in time and space (rapid development of information technology and its unpredictable growth, changing demographic indicators, changes in conceptions of education systems together with their conceptions of key competencies etc.). (Bobáková, Chylková, 2014; Jakubiec, 2016).

The countries can reach more massive growth if the development of skills is followed by joining global value chains. On behalf of the profit from global value chains, countries have

to fund the education and professional development. Last but not least, they have to improve the use of their skills, coordinate policy in the field of skills more – from the policy of education and migration policy to legal regulations for the protection of employability – and to adjust these policies with industrial and commercial policy (OECD [online], 2017).

The goal of this article is to express and reason the meaning of education and professional development in the value-creating chain of education institutions and present a current state of regional differences in education that prevent a balanced regional development and economic growth. The analysis of the number of expenses for tertiary education, science and research in Slovakia compared to the selected EU countries – Denmark and Finland and their impact on the amount of GDP through which we can measure the efficiency of economics is the parallel goal of this article.

We have chosen Scandinavian countries, such as Denmark and Finland because they belong to the countries with the highest living standards and the fastest economic growth. The amount of GDP in Denmark and Finland always fluctuated above 130 billion €, during our observation period of 2000 – 2013, while the values in Slovakia did not reach even 75 billion € (OECD [online], 2013).

The most important and highly competitive sector in Denmark and Finland is the sector of services. The service sector consists of the industries such as a wholesale and a retail, transportation and warehousing, education, health service, housing and catering, etc. (Ministerstvo zahraničných vecí SR [online], 2015). The high level of education and well-working education system is characteristic for them. Both countries belong to the most successful countries in the education industry. The reason for their success is possibly the fact that Scandinavian countries, among all OECD countries, fund their tertiary education as per one student the most. For instance, annual fees per one student in Finland present 16.714 € compared to the OECD average of 13.528 € (OECD [online], 2013).

The population of Slovakia, Denmark and Finland is approximately the same. Denmark and Finland have just been a proper choice for the purpose of further analyses in terms of the above-mentioned facts.

## 2. Problem Specification and Methodology

The creation of human capital is closely related to the term of education. Funding a human capital presents also the funding of education and various forms of practical training (offered mainly to particular companies) with the aim to improve the workforce skills, knowledge and experience. Both individuals and economy can benefit from these funds in the form of higher salaries and productivity respectively (Josan, 2002).

This statement in theory of human capital is confirmed even by Němec and Kotinková (2003), who claims that education provides knowledge and wisdom to people, who can become more productive for particular organizations, countries, regions and the whole society. The report of Annaby, Hanvey, and Lan (2009) says that funding the education and human capital are the key factors of a long-term growth of particular countries.

Theodore Schultz (1961), Gary Becker - Nigel Tomes (1994) and Jacob Mincer (1958) are one of the most significant economists, who have contributed to solving of the problem. Their analysis were formed into the integrated concept entitled “the theory of human capital”.

Analyzing tertiary education, we focused on the international standard classification of education (ISCED) consisting of ISCED 5-8 levels. We retrieved the necessary data from

Eurostat database from the period of 2000 – 2016. There has not been more updated data on Eurostat at the time of submitting the paper for publication. We processed the acquired data into graphs and tables through MS Excel functions. Visualization of data and performed calculations enabled an easier interpretation and comparison of particular results. Various mathematical and statistical methods were used to achieve the set goal.

The whole set of fundamental conceptional materials related to the development of human resources, ILO References on the development of human resources: education, professional development, and long-life learning no. 195 from 2004, Draft for ILO References on the transition from informal economy to formal economy, a Global program of employability accepted by the Board of ILO Directors in March 2003 was the source of our analysis. The European report “Mind the Gap” was fruitful for this paper because it researches the position of particular regions of EU based on different indicators: 10 regions located on the top positions and 10 regions located on the lowest positions (Ballas, 2012).

### 3. Evaluation and Analysis of the Research Results

In this part of our article, we focused on the analysis of investments in the tertiary education, science and research in Slovakia compared to the average EU-28 and selected countries of Denmark and Finland.

**Table 1: Expenditure on Tertiary Education**

Year	Expenditure on Tertiary Education as % of GDP			
	Average EU-28	Slovakia	Denmark	Finland
2000	1.18	0.80	2.70	2.00
2001	1.19	0.82	2.71	2.00
2002	1.20	0.87	2.70	2.02
2003	1.17	0.85	2.50	2.06
2004	1.16	0.98	2.51	2.07
2005	1.19	0.81	2.38	2.00
2006	1.19	0.90	2.26	1.96
2007	1.18	0.79	2.28	1.85
2008	1.22	0.78	2.17	1.89
2009	1.32	0.81	2.42	2.16
2010	1.32	0.83	2.41	2.18
2011	1.34	0.95	2.43	2.17
2012	1.34	0.93	2.25	2.11
2013	1.33	0.92	2.37	2.11

Source: Own collaboration based on the data of Eurostat, Total public expenditure on education as % of GDP, at tertiary level of education

As we can see in Table 1, Slovakia compared to Denmark and Finland has the lowest expenditure on tertiary education compared to its GDP. The average of EU-28 during the observed period of time has always been fluctuating over the limit of 1.16% of GDP, while the values in Slovakia did not reach even the limit of 1% of GDP. This result only confirms the fact that Slovak higher education is deeply undersized, even though the expenditure on tertiary education has been rising according to the Ministry of Education of the Slovak Republic during the observed period of time (Ministerstvo školstva, vedy, výskumu a športu SR [online], 2013).

There was a change in 2005 when the elections were held in Slovakia. That was a year of pre-election permanent political tension between particular political parties and groups. The result of the recession of governmental expenditures on tertiary education can be assigned to these events. Another event related to this year is the end of the transformation of study programs, based on European credit system (ECTS). The whole process of these changes could influence the transparency of financing in some way, the program changes could easily cause underfunding. The more significant decrease was noticed even in the period of 2007 – 2008, what was the period of great financial and economic crisis. This influenced all the spheres of economy, the education as well. In spite of this, since 2009, the expenditures on tertiary education has recorded the growing tendency. Such a result can be satisfying, because based on the report of the Ministry of Education, Science, Research and Sport of the Slovak Republic entitled “*The report on the state of the education system in Slovakia for the purpose of the public discussion*” from 2013, the Slovak Republic belongs among the EU countries funding the education the least compared to GDP (Ministerstvo školstva, vedy, výskumu a športu SR [online], 2013).

Scandinavian countries, such as Denmark and Finland, compared to Slovakia, belong to the countries with the best results during our observation period (2000-2013) regarding the funding of their education system. They belong to the countries with the highest expenditure on tertiary education compared to the GDP. The amount of expenditure on tertiary education in these countries was highly above the average of EU-28 countries, it exceeded the limit of 2 % of GDP almost every year. Only the period between 2006 and 2008 was an exception when the amount of expenditure on tertiary education in Finland was below the limit of 2%. The reason for such a result can be a financial and economic crisis and a decrease of GDP in Finland in 2008. In spite of this, the value is still high above the average of EU-28.

As for newer data: by the time of submitting of the paper OECD (2018) published the following data of expenditures on tertiary education: EU average was 1.14% of GDP, Slovakia – 0.86% of GDP, Denmark – 1.61% of GDP, Finland – 1.72% of GDP. These data are rather unfavorable compared to previous years.

### ***3.1. Analysis of Expenditure on Science and Research***

In addition to education universities that are providing tertiary education are involved in the science and research. Not only one complements the other moreover science and research, if successful may improve funding of education. This, partly, demonstrates the value-creating chain and dependency of the two industries.

The European Union pays a great attention to research, development, and innovation. It is believed that through the innovation it is possible to achieve mutual cohesion of European countries and regions as innovations are able to launch development and growth in any type of region using its inner potential (Melecký, Staničková, 2014). In the present globalized world, where all goods are easily accessible, knowledge is considered to be the most strategic good, the main source of competitive advantage for firms and the driver of the economic development of regions. Therefore the support for research, development, and innovation seems to be the best way to achieve cohesion of European countries and gradual European integration (Fránková, 2016).

We compare the amount of expenditure on science and research in comparison to the GDP in the observed countries, as per the Figure 1. The aim is to present the significant differences between Slovakia, Denmark and Finland.

Based on the analysis, we conclude that Scandinavian countries fund their science and research the most among of all EU countries. The expenditures of Denmark on science and research in the observed period was ranging from 2.2-3 % of GDP. Finland succeeded even better result, as their expenditures on science and research exceeded the limit of 3 % of GDP during the whole observed period of time. They reached the highest level in 2009 – it was 3.8 %. In spite of the fact, there was a slight decrease in the following years, Finland belongs to the countries with the highest expenditures in this field.

**Figure 1: Expenditures in Sciences and Research as % of GDP**

Source: Own collaboration based on the data from Eurostat, Total R&D expenditure by sectors of performance as % of GDP; All sectors

The situation in Slovakia is as follows: in spite of the slight increase of expenditures on science and research in recent years, their level is very low compared to Denmark and Finland. The expenditures of Slovakia did not exceed even 1 % of GDP. According to the Eurostat data, other countries funding their science and research in less than 1 % of GDP are mainly Eastern EU countries – Romania, Bulgaria, Poland and Greece.

#### 4. Conclusion

The essential pillar for economic growth can be a high-quality education, well-organized education system, as well as the system effectiveness of science, research, development, and innovations. However, the results of the analysis presented the fact that there are certain negatives regarding the number of expenditures on tertiary education, as well as science and research in Slovakia compared to the selected countries of Denmark and Finland and the average of EU-28.

It is likely sure some changes need to be done to improve the present situation in Slovakia. The possible solution can be:

- Efficient use of European structural funds that can help eliminate regional differences in the field of education, science, and research and to mitigate their negative impact. The successful tool to improve the situation can be the Operational Program Human resources and the Operational Program the Research and Innovations for the program time period 2014-2020.

- Strengthening the integration and intergovernmental cooperation between particular EU-28 member countries. Mentioned cooperation can be realized through the so-called open method of coordination (OMC) which could be applied only at its beginning in the field of employment and economic policy. However, later on, it expanded into other fields, such as the observed fields of education, science, and research and, last but not least, human capital (Radaelli, 2016). Through OMC we can strive for the solution of the unemployment problem that is being a huge problem regarding the creation of human capital.
- Intergovernmental cooperation between particular EU-28 member countries. The possibility of solving the problem offers even the analysis and searching for the reasons of successfulness of other countries, such as Denmark and Finland and following their model.

However, the unanswered question is whether the tools used in countries, such as Denmark and Finland, would work efficiently in Slovakia? It is important to consider that between particular EU-28 countries, there is a significant heterogeneity working the same way even for the education system. Education systems in particular EU member countries are different and work according to various rules. Therefore, the solution of individual problems in the field of education cannot be generalized, but they should be implied according to the conditions and the needs of particular countries.

### **Abstract**

*Multicultural education of students has become an important tool of acquiring knowledge, experience and skills in intercultural communication. With the progressive integration process in Europe and the globalization trends in the world economy, there is an increasingly busy and intensive contact between the inhabitants of countries with different cultural and historical backgrounds, history and present in the European and world economic and social world. Europe as a continent has a multicultural character with a high degree of cultural diversification. This is mainly due to the free movement of people, work mobility, study and educational stays, but also due to illegal mobility. Encountering different cultures, citizens are taught to respect and tolerate each other, exchange visions, experience and mutual enrichment. The above-mentioned aspects are the most important topics of the ERASMUS. It is open to all states of the European Union and their students, teachers and university researchers. The paper analyses the extent to which different states use the programme.*

**Keywords:** ERASMUS European programme, intercultural communication, multicultural education

**JEL Classification:** F68, F530, Y10

### **1. Introduction**

Respect for cultural diversity and tolerance are considered to be the guarantor of international security and cooperation among European nations. Global cultural diversity and intercultural dialogue have become major challenges for a global order based on peace, mutual understanding and respect for shared values, such as human rights protection and promotion of linguistic diversity (Krzyzanowski and Wodak, 2011; Levi-Strauss, 1999). Language diversity is one of the most characteristic features of the European Union, affecting not only the social, cultural and professional life of its citizens but also the economic and political activities of their member states (Vogiatzis, 2016; Bobáková, Chylková, 2014; Skokan, 2012).

Respect for linguistic, religious and cultural diversity is enshrined in Article 22 of the European Charter of Fundamental Rights adopted in 2000 (c 364/1, 2000). Multilingualism is very important for the functioning of the European Union and its importance is underlined by the independent function of the Commissioner for Multilingualism. In its Communication "The New Framework Strategy for Multilingualism in 2005", the European Commission underlines the need for the linguistic competence of European citizens and reports on the benefits of multilingualism for intercultural dialogue. Among the important measures of this strategy, it underlines support for the teaching and learning of foreign languages through cooperation

programs on education, training, youth, citizenship and culture (COM 596, 2005). The European Union has so far submitted a number of variable programs (COM 242, 2007) for students from secondary, tertiary and higher education institutions and programs intended for further vocational and tertiary education. Such major programs include Youth in Action, Culture, Europe for Citizens. Furthermore, the Lifelong Learning Program, which successfully followed Socrates, Leonardo da Vinci and others.

The most visible tool of the European Union's education and training policy in the current programming period 2014-2020 is the Erasmus + program. This program integrates the previous Lifelong Learning Program, Youth in Action, or Tempus (European Commission [online], 2014a, 2014b). Erasmus + is divided into key events (KA 1-3). KA 1 Educational mobility of individuals where activities such as Erasmus or Leonardo were included. KA 2 includes Cooperation on Innovation and the Exchange of Best Practices. KA 3 Support for Education Policy Reforms includes the activities of the former Youth in Action Program (The House of Foreign Cooperation, 2017). The objective of the Erasmus + program is to contribute to the achievement of the Europe 2020 objectives. Above all, these are the basic objectives of growth, employment, social equality and inclusion, as well as the EU Strategic Framework for Education and Training the preparation of ET 2020 (European Commission [online], 2017).

Specific actions related to language education, especially the improvement of language teaching and learning and to improve the EU promotion of linguistic diversity and multicultural awareness (Erasmus + Manual, 2016). According to Jirásková (2006), multiculturalism reflects the ideal of respecting the differences and differences of individuals and entire cultures and their mutual tolerance. Šimková and Zajíc (2010) understand multiculturalism as a state where people living in different cultural circles live together. And they can freely express this cultural difference.

Kořátková (2014) defines the differences between multi-culture and intercultural. Multicultural coexistence is one where minorities try to preserve their cultural features but respect differences, while intercultural coexistence is such if minorities adapt to the majority society, and cultural norms of both societies are slowly becoming intertwined. Multicultural resources help to spread the idea. Multicultural education and intercultural education are the most frequently used. Multicultural education refers to language education of children and youth, but also the entire society.

## **2. Problem Formulation and Methodology**

The aim of the paper is to present the Erasmus + program, its individual support. The willingness of young European generations, students and academics, especially those neighboring the Czech Republic, travels to another country within the European Union. A partial goal is to compare major universities and colleges and find out how this program is being used, what is the mobility of university students in the Czech Republic. Another goal was to find out whether young university educated people are ready to migrate for work within the framework of European Mobility.

Qualitative research includes analysis of secondary data, such as annual reports of the European Commission's long-term intentions of the European Commission, or from data provided by the House of international cooperation. All these institutions have annual reports and detailed statistics on the exits and mobility of students or academics.

In the analysis we used data on the number of students and employees at individual academic levels. The most relevant use of the secondary data analysis is shown in the analysis of

Erasmus+ 2016 Budget and Commitment, sector Education and Training, part Higher Education. These statistics represent a basic source of information for analysis in the present paper. For the sake of clarity, only Visegrad Four states were used.

### 3. Problem Solution

Erasmus is the world’s most successful student mobility programme. Since it began in 1987-99, the Erasmus programme has provided over three million European students with the opportunity to go abroad and study at a higher education institution or train in a company.

**Figure 1: Higher Education – EU Commitments**

Source: EU Open Data Portal [online], 2016, 2017

Fig. 1 illustrates the amount of financial resources earmarked by the European Union for the field of student and academic mobility for higher education (Sectoral Education and Training, part Higher Education). As can be seen in the picture, the amount of funds raised for the challenge in 2016 by almost 10 million Euros.

**Figure 2: Higher Education Projects, 2015**

Source: EU Open Data Portal [online], 2017

Fig. 2 gives a closer look at the situation between the V4 countries. Most of the projects have been submitted by Poland and are keeping up with the trend as in previous years. A total of 262 projects were submitted in 2015, with 258 supported. The success rate is 98%. The Czech Republic had 68 projects with 99% success rate, Hungary had 48 projects with 98% success rate and Slovakia 35 projects with a success rate of 100%.

**Figure 3: Higher Education Student and Staff Mobility**

Source: EU Open Data Portal [online], 2016, 2017

Staff mobility for teaching has become a very popular action since its introduction in 1997. With the creation of the Lifelong Learning Programme in 2007, staff mobility was extended to include staff training as well as the possibility for higher education institutions to invite staff from companies to come and teach at their institutions.

Figure 3 shows the number of submitted and supported projects for all countries under ERASMUS in the part for universities in 2014-2016. As can be seen, the number of projects submitted has a growing tendency over the period under review. The success rate is around 70%.

**Figure 4: Higher Education Mobility Within Programme Countries – Staff, 2015**

Source: EU Open Data Portal [online], 2017

Figure 4 shows the numbers of people who spent abroad on staff mobility. Poland sent the most staff abroad from all countries, not only V4. In 2015 it was 7 981. Of the Czech Republic, there were 2 760 academics from Hungary 1928 and Slovakia 1 590. For each country surveyed is the top receiving country different. Czech academics spent time on teaching assignments or training most in Slovakia during the reference year (18.73%), Poland (11.27%) and Spain (8.7%). For Hungarians was the top receiving country Romania (22.41%), Germany (9.54%) and Slovakia (7%) in 2015. Polish academics spent the most time in Spain (13.61%), for Slovakia (12.84%) and Italy (10.19%). For Slovakian academics were the most visited countries the Czech Republic (41.01%), Poland (17.48%) and Hungary (5.22%). Teachers taught the most in English, with the exception of the Czech Republic and Slovak, where they could teach in their mother tongues due to linguistic similarity.

#### 4. Conclusion

It is increasingly difficult for European countries to find the rules of conflict-free coexistence between European and non-European cultures, ethnicity and religion, and thus to cope with the multicultural environment. The aim of the EU is therefore not to eradicate these cultural differences but to promote, preserve and honor them. It is this diversity and intercultural dialogue that have become a major challenge in a global organization that is based on mutual respect for shared values and the promotion of linguistic diversity. These are the main features of the new Erasmus + Education Program. Erasmus + is the European Union's education program valid for the seven-year period 2014-2020 with a budget of € 14.7 billion. Its foundations are based on thirty years of experience in the existence of European educational programs. The Erasmus program provides students with internships abroad, while supporting individuals from the university environment and companies interested in lecturing at universities abroad. Over the past 25 years, student mobility has employs more than 2.7 million students.

The main objective of this program is to reduce unemployment, especially among young people, thus contributing to 75% of employment in the 20-65 age group. However, it is true that mobility has a positive effect on individuals and their application to the labor market. Students who have a foreign experience have more than 70% better skills for applying on the labor market than students than this experience. This is what the EU wants to achieve by investing in developing career counseling and consulting services, promoting job opportunities, foreign internships, learning and entrepreneurship. The aim of the new program is to enable at least 20% of university graduates and 6% of people aged 18-34 to complete a basic training course abroad. Another objective is to support adult education. This, however, appears to be a different target for EU countries. In some countries, this is an increase of 1.4% for other countries by 31.6% compared to the original state.

The benefit of this program is indisputable. Foreign mobility is important for personal development and reinforces human capabilities and employment. People acquire new knowledge, new competencies. Mobility, among other things, removes barriers between people and groups and creates a sense of European citizenship. Those who graduate from mobility are more open to new challenges and changes, more tolerant and more interested in European integration. Mobility promotes multicultural society and encourages them to study the foreign languages that are so necessary for the good functioning of the single market. Equally important is mobility for researchers, allowing for the unique transfer of information and experience, improves the potential for innovation to ensure pan-European competitiveness.

## **Abstract**

*The aim of the paper is to analyze the evolution of the EU standardization policy (EU STP) and the potential impact of economic globalization trend on EU STP. Inter-relations between standardization, international (regional) economic integration and economic globalization are complex; at present, potential changes are expected, however, not yet sufficiently crystalized to be correctly identified. The analysis of specific features of the EU STP depends on a correct evaluation of the current globalization trends. Our analysis is based on a hypothesis that in the long run, international standards development will be going on more slowly (due to the partial de-globalization), and the EU STP will have to be partially modified.*

**Keywords:** EU standardization policy, globalization, standardization

**JEL Classification:** F02, F69, 039

## **1. Introduction**

The paper deals with the evolution of the EU standardization policy (EU STP) and the potential impact of economic globalization development trend on EU STP. Inter-relations between standardization, international (regional) economic integration and economic globalization are complex; at present, potential changes are expected, however, not yet sufficiently crystalized to be correctly identified. The analysis of specific features of the EU STP depends on a correct evaluation of the current globalization trends.

The primary objective of our research was the potential modification of the EU standardization policy under the influence of the changing trend of internationalization and globalization. The paper was designed as a research and argumentative study based on an analysis of academic literature and available EU documents. These documents partially reflect discussions, contradictions, barriers and limits to further international co-operation. Our analysis is based on a hypothesis that in the long run, international standards development will be going on more slowly (due to the partial de-globalization), and the EU STP will have to be partially modified.

### **1.1 Survey of Literature**

The survey of literature on standardization has to begin with information on the history of standardization described in a paper of A. Russell (2017). As for standards definition, only the selected sources from numerous sources are to be recommended (for example, The Cambridge Dictionary. Standardization, 2017). As for types of standards, it is important to distinguish technical standards from organizational standards (Analytic Quality Glossary, 2017), and service industry standards (ISO Strategy for services. Case Study. May 2016, p. 2), which

include services for financial markets' infrastructure - for example: accounting standards (IAS, 2017), reporting standards (IFRS, 2017) etc. An ISO- definition of services high-lights the relation of servicing industries to financial markets infrastructures (ISO/IEC Guide 76:2008, Development of service standards.), i.e. it explains the interconnectedness of both categories. A new list of international standard-setters has been recently published by FSB (FSB. Standard - Setting Bodies in the Compendium. FSB 2017.) For unknown reasons, International organization for standardization (ISO. org., 2017), was not included into the list of 14 leading international standard-setter. A comprehensive list of ISO-standards was published in 2015 (International Classification for Standards, 2015). Older classification standards are available in the following sources: the complete standards classification by Baynard (1982), Bonino & Spring (1991), Cargill (1990), Coles (1949, pp. 115–117), David (1995a, pp. 211–217), and Le Lourd (1992, p.14), and a classification by de Vries H.J. (1999). Mutual relations between globalization and standardization were analyzed by Purcell, Donald, Kushnier, Gary (2016). The relation between standardization and globalization is very close: to be able to enter the international and more and more market, export product have to be standardized; standardization is an important factor supporting globalization. Globalization, in turn, is an important driving-force of standardization. The cited authors defined impact of standardization on the policy of standardization as well: the relationship between globalization and standardization is, or should be, a critical area of understanding for policy makers all over the world. A paper written by Pavlat (2014) proposed standardization to be included into financial markets infrastructures in a broader sense, i. e. as one of the necessary conditions for financial markets functioning. Barriers to the process of standardization and standard-setting (characterized as “pitfalls” were analyzed by Pavlat (2016).

## **2. Problem Formulation and Methodology**

The aim of the paper is to analyze the expected modifications of the EU STP after 2020.

The methods of description and classification are used to present the characteristic features of the EU STP since 2012 (which is a benchmark for a new actual shape of the EU STP.) Comparative analysis is applied to identify both the influence of the elements of transition from industry 3.0 to 4.0 models and a possible impact of the changing trend of globalization on the character of EU regional economic integration. This expectation is based on the assumption of mutual interactions of globalization, integration and STP. A hypothesis of a slower speed of EU integration was set up based on the actual discussions about different possible globalization trends.

## **3. Findings**

In the first part of Findings, selected relevant literature about standardization is commented. Than two research hypotheses are presented based on a model of relations between EU standardization policy, economic globalization and international economic integration.

### **3.1 First Part**

The 1<sup>st</sup> part of Findings is based on selected literature. In spite of the fact that discussion on the concepts of globalization, internationalization, regional integration and standardization has been going on for decades, no common consent still exists (except for general definitions). For illustration of controversies two examples from academic literature were selected: 1. the paper written by Scharpf (1994) reflecting the endless discussion on the final shape of “United Europe”; 2. the paper reflecting the ideas of marketing experts on the brand marketing strategy significance for globalization (Douglas, Wind, 1987). Academic characteristics of

globalization were gradually changing; they were frequently modified. However, as for international economic integration (regional integration), the theoretic foundations of this important process elaborated by Balassa (1961) in the sixties, are still accepted by many authors. What has substantially changed in the research of all above mentioned categories is the attempt to elaborate a multi-dimensional approach which gives a possibility to find a deeper insight of different aspects of globalization. Another new feature of research consists of different attempts to apply an inter-disciplinary research.

Before two research working hypothesis will be set up, let us briefly characterize important relations between the EU Standardization Policy, Economic Globalization and International Economic Integration (although relations were not – per se - the object of author's paper).

Generally speaking, the standardization policy can be characterized as a part of economic policy by means of which a state regulation of technical, economic, financial and other types of standards is implemented. To be binding for entrepreneurial subjects, a standardization policy must be incarnated in a legal form. Therefore, the EU Standardization Policy could be characterized as a set of legal regulations regulating the standard-setting processes, their implementation and other related activities.

Economic globalization can be understood as a process of growing mutual relations between economic subject localized in different states which is manifested through a world-wide growth of international trade, international financial markets and international mobility of labor.

International economic integration (on a macroeconomic level) is often characterized as a process of economic interpenetration between national economies of different states which is supposed to stimulate creation of bigger economic entities – integration communities such as Common Markets etc.

In general, economic globalization as a dynamic process stimulates creation of bigger economic entities (on the level of big world-wide firms and on the level of a group of states as well), i.e. is a process leading to creation of the future world economy.

The EU Standardization Policy based on EU standards' regulation aims at a growth of EU economic coherence, and – if correct – stimulates the world-wide economic globalization.

This model of relations between the above three components is feasible in the upward phase of economic cycle; in the downward phase of the cycle, these relations most probably are not fully workable. A different model should be elaborated based on experience of the last world crisis attempts to apply an inter-disciplinary research.

In this paper, the following two simplified general hypotheses – as a basic approach to analysis – are applied: 1. Standardization (ST) is one of necessary conditions for international economic (regional) integration (and for economic globalization (GL) as well; 2. The GL has a feed-back impact on the international economic (regional) integration (its existing form of EU included), *ergo* GL has an impact on EU STP as well. In this paper, the *economic dimension* of internationalization and GL are referred to.

### 3.2. The Second Part

In this part the main steps of the EU Standardization Policy development based on official documents are presented. The selected important institutions involved in the world-wide standardization process are enumerated and characterized.

The 2nd part of findings presenting results of own analysis is based mainly on selected EU documents related to EU STP. Since the beginning of the 2nd decade of our century, the EU STP has been gradually formed and upgraded. This process can be characterized by the following steps (marked by main EU documents): 1. Single Market Strategy (Single Market Strategy, 2012); 2. The Regulation (EU) No 1025/2012 adopted in October 2012 aiming to improve the procedure involved in setting European standards to make it faster and more inclusive (The Regulation (EU) No 1025/2012); 3. Joint Initiative on Standardization (2016) is a vision for a single and efficient standardization policy (Joint Initiative on Standardization, 2016); 4. The Annual Union Work Program for European standardization identifying strategic priorities for European Standardization for the upcoming year. "The program lays down the Commission's intentions to use standardization in support of new or existing legislation and policies". (The Annual Union Work Program for European standardization for 2018; 2017); 5. Notification (EC. Europa (2012). Notification System\_[online].). These documents are relatively independent; however, they are interconnected and as such they represent a whole.

In principle, the EU ESP evolution was based on "Europe 2020 Strategy for smart, sustainable and inclusive growth" (EC Europe, 2020) and its support.

The issue of the Single Market Strategy (2012) was preceded by other EC documents which proposed a series of measures to strengthen the system of standard-setting (*inter alia* drafting European standards with help of other organizations, recognizing the importance of the Global Information and Communication Technology Standards, increasing the number of standards for services). Positives and Negatives of the Digital Single Markets and their implications were analyzed by Kolár-Melková (2016). The reasons of possible Brexit from EU and are analyzed in an analytical paper written by Meluš, (2016).

There are a great number of different institutions, organizations and stakeholders involved in European standardization: 1. ESOs – CEN (European Committee for Standardization), CENELEC (European Committee for Electrotechnical Standardization, and ETSI (European Telecommunications Standards Institute). (EC. Europa (2017). Key Players in European Standardization.); 2. National Standardization Bodies (NSBs); 3. small and medium-sized enterprises' (SMEs); 4. small and medium-sized enterprises' (SMEs); the comprehensive information on European Standardization was published in a Vademecum on European standardization .( EC Europe [online], 2018).

## 4. Discussion

Relations between the world-wide standardization development and the EU STP are highlighted. Criticism about the EU based on divergence of national interests is briefly analyzed.

### 4.1. Basics of EU STP and Analysis of its Modifications

Document „Europe 2020“ set out a vision of Europe's social market economy for the 21st century based on the priority of a smart, sustainable and inclusive growth and set out targets to be achieved by 2020. Seen by optics of 2017, many approaches were gradually modified. The most important corrections are related with ICT and the transition from Industry 3.0 to Industry 4.0 (I-SCOOP [online], 2017. Industry 4.0: the fourth industrial revolution (4IR) –

guide to Industry 4.0), and with the need to research social impact of the world standardization on the EU STP. These changes were partially reflected in the Single Market Strategy as well. However, seen by 2017 optics, it is still dubious which one of the three scenarios for 2020, i.e. sustainable recovery, sluggish recovery or a “lost decade” scenario will prevail.

#### ***4.2 Uncertainties About the Transition from Industry 3.0 to Industry 4.0***

As for ICT agendas, including the Internet, wireless networks, cell phones, and other communication mediums, it is worthwhile to remind many questions connected with the criticized “lagging of Europe” on this field, and the leading role of USA and China. At the same time, there are uncertainties about the on-going transition from Industry 3.0 to 4.0; comparisons based on historical analogies are evidently oversimplified. There are more reasons in favor of this view: (a) the national economy before 3.0 was more primitive; the actual state of Industry 3.0 in developed countries is incomparably more complex; (b) completely different character and dynamics of economic development; (c) different character of economic growth. (d) As for the actual state of the Industry 4.0, there is a lack of reliable facts; there are plenty of guesses based on different premises from which different hypotheses are derived. Many different Industry 4.0 concepts were elaborated by many authors. (e) The actual role of the modern state and its economic policy differs from new its role in the past. There is a justified tendency, to understand this process in a broader sense (Valenčík, R., 2018), and to apply multi-dimensional and interdisciplinary approaches. According to new approaches, the 4.0 Industry consists of much more elements than it was earlier defined (Civín, L., 2017).

#### ***4.3 Criticism of EU STP by ESOS***

In spite of the fact that the Regulation on EU STP (2012) was supported by ESOS (a mandatory energy assessment scheme for organizations in the UK that meet the qualification criteria) and its 38 member organizations, the inefficiency of this regulation was criticized shortly after its issuance: „ECOS regrets that the system does not currently guarantee such effective participation of societal stakeholders, neither at European nor national level”

ECOS advocates for a truly inclusive and transparent standards’ setting process which delivers standards reflecting societal and environmental interests most appropriately.” (ECOS [online], 2017. Standardization and Policy). But more than that: there were complaints that the EU Commission is attempting to abuse its STP to promote a supreme EU concept (United Europe against the “Europe of nations”). The question of different interests of the UK and EU was recently analyzed by Ševčíková (2016).

#### ***4.4 The World-wide STP of the ISO***

The leading role of the world-wide standardization organization - the ISO (ISO.org, 2017) - is undisputable. On the contrary, up-to-now the role of the EU STP was only regional and this situation probably cannot be changed; the EU STP is rather non-transparent and bureaucratic; therefore it is unattractive for its potential followers in the world.

#### ***4.5 EU STP Design***

The basics of the EU STP design are sound and reasonable. However, the “lost decade” syndrome which seems to be a prevailing expectation and feeling of many subjects, together with the growing opposition against the European Union future shape defined as a “super-state” is one of the barriers to a successful EC STP in the decade after 2020. In my opinion,

the EU future depends on absorption of the general globalization impact on one side, and the acceptance of the Europe of Nations on the other side.

## 5. Conclusion

Over the last 4 decades, a valuable theoretical knowledge was accumulated through academic research on the field of ST. However, the practical use of the majority of this knowledge is limited by political factors, as the fight about the final EU shape has not been decided. The litigation between the supra- and national- federalist concepts still continues. The economic growth in the upward phase of cycle seems to stimulate the first concept, the downward phase the second one. According to the facts presented in this paper, more facts support the “lost decade” paradigm, and the general GL trend of de-globalization is expected to win in the near future. If this is true, then a modification of EU STP will be necessary: a less tight regulation without rigidity and more flexibility, more space for competition and a more free play of market forces, more space for national STP needs. This expectation seems to be blocked by the present attempts of the unelected EC to continue its inefficient EU STP conserving the “lagging of Europe”. (Digital Europe. (2017, p. 8). Unfortunately, a more clear vision of a world-wide STP is still missing.

## **Disparities in Development Based on Taxonomic Research: a Case of Poland in the European Union**

**Iwona Pawlas**

University of Economics in Katowice

Faculty of Economics, Department of International Economic Relations

1 Maja 50, Katowice, 40-287

Poland

e-mail: iwona.pawlas@ue.katowice.pl

### **Abstract**

*Poland joined the European Union as a considerably poor economy characterized by relatively low socioeconomic development. Participation in the processes of regional economic integration and being a net beneficiary of the EU budget created a huge stimulus for acceleration of development of the Polish economy. The paper focuses on identification and assessment of disparities in socioeconomic development among European Union Member States. An attempt has been made in the paper to study and evaluate socioeconomic development of Poland's economy against the background of other European Union Member countries. Selected methods of multivariate comparative analysis, i.e. Z. Hellwig's taxonomic measure of development and standard deviation method of linearly ordered objects' grouping, were used. Research was conducted for the years 2004 and 2016.*

**Keywords:** *European Union, Poland, socioeconomic development, taxonomic research*

**JEL Classification:** *O11, C38, F63.*

### **1. Introduction**

Regional economic integration is considered to be one of the most characteristic processes for the world economy in the last decade of the 20<sup>th</sup> century and the beginning of the 21<sup>st</sup> century (Bjorvatn, 2004). The European Union is viewed as one of the most complex integration blocks (Pawlas, 2015). The last three enlargements of the EU, namely the ones that occurred in 2004 (Poland, seven other Central and East European countries, as well as Malta and Cyprus joined the EU), 2007 (Bulgaria and Romania became EU Member States) and 2013 (Croatia joined the EU as its 28<sup>th</sup> Member State), considerably changed the socioeconomic picture of the EU (Barcz, Wyrozumska and Górka, 2017). What's more, the 2008+ global financial crisis and later economic instability in the world economy created additional challenges for the EU and its Member States (Pawlas, 2018; Horúcková and Lebieczik, 2014). Regionally balanced economic development was stressed in the Rome Treaty already (Beck, 2012; Poledníková, 2014), its importance was further strengthened in Single European Act (Borowiec, 2011) and it still remains one of crucial macroeconomic objectives of the EU (Grosse (ed.), 2017). Economic development includes three areas that go beyond increase in income per capita, namely: development of the economic system of the country (economic development is facilitated by structural changes, including urbanisation, increase in the size of companies, relative decline in the importance of agricultural sector, rising significance of processing industry and service sector, geographical expansion of markets, increased diversity of produced and internationally traded products), distribution of benefits resulting from economic growth, which helps reduce poverty, as well as sustainable development (i.e. development that allows to meet the needs of current generations at a level that does not limit

the possibility to meet the needs of future generations) (Reinert and Rajan, 2009). Europe 2020 Strategy has resulted in the focus on three priorities: Smart growth, Sustainable growth and Inclusive growth (Pawlas, 2016). Poland joined the EU in 2004 as a poor economy characterized by a relatively low level of socioeconomic development. Participation in the processes of regional economic integration and being a net beneficiary of the EU budget created a huge stimulus for acceleration of development of the Polish economy (Belka, 2013). Therefore, it seems of vital importance to undertake research focusing on identification and assessment of disparities in socioeconomic development among European Union Member States. The paper aims to present the results of research, study and analysis regarding the evaluation of socioeconomic development of Poland's economy against the background of other European Union Member countries. Because of the complexity of the category of socioeconomic development, it was necessary to take into consideration a set of variables, not just one or two of them; therefore, the selected methods of multivariate comparative analysis were applied (Pawlas, 2014). Conducting the research for both 2004 and 2016 made it possible to determine changes that occurred after the 2004 enlargement of the EU. The scope of the undertaken and carried out research with the application of the two selected methods of taxonomic analysis in terms of the combination of 28 EU economies, 16 variables and the period from 2004 up to 2016 is new.

## 2. Problem Formulation and Methodology

The main problem of this article is the exploration, evaluation and diagnosis of disparities in development among European Union Member States. The economies of 28 EU Member States were studied in regard to their socioeconomic development in order to determine the relative position of Poland in the EU. Research was conducted for the years 2004 and 2016.

The research included the following tasks: A - Selecting the set of diagnostic variables, B - Exploring and diagnosing the situation in the analysed subjects i.e. EU Member States in selected aspects of socioeconomic development in order to make a hierarchy of the analysed in regard to synthetic measure of socioeconomic development, C – Grouping the analysed subjects – EU Member States – in four clusters according to the level of socioeconomic development.

The research tools used in the article included literature studies, descriptive analysis and multivariate comparative analysis, and in particular Z. Hellwig's taxonomic measure of development as well as standard deviations' method. Statistical material provided by EUROSTAT (Eurostat, 2018) and Central Statistical Office (Central Statistical Office, 2006; Central Statistical Office, 2007; Central Statistical Office, 2017a; Central Statistical Office, 2017b), Poland was used for the analysis.

Multidimensional methods of comparative analysis seem to be quite useful here due to the fact that as many as 28 economies are subject to comparisons and in addition to that one has to apply a great number of variables, indices. The research was based on Z. Hellwig's taxonomic measure of development (Malina, Zeliaś, 1996; Nowak, 1990; Pluta, 1986; Zeliaś 2004). The research included the following operations:

- a) Determining the set of diagnostic variables:  $\{x_1, x_2, \dots, x_m\}$ ;
- b) Determining the character of each of the variables (stimulus, de-stimulus);
- c) Standardizing the  $j$  variable in  $i$  unit:

$$z_j = \frac{x_{ij} - \bar{x}_j}{S_{x_j}} \quad (1)$$

where:

$x_{ij}$  - empirical value of  $j$  variable in  $i$  unit,

$\bar{x}_j$  - arithmetic mean of  $x_j$  diagnostic variable,

$S_{x_j}$  - standard deviation in  $x_j$  diagnostic variable distribution,

d) Constructing development model - a model unit, where values of diagnostic variables are determined according to the rule:

$$z_{0j} = \max_i (z_{ij}) \quad (2)$$

for stimulus, or

$$z_{0j} = \min_i (z_{ij}) \quad (3)$$

for de-stimulus;

e) Using Euclid's measure to calculate the distance of  $i$ -unit from the development model:

$$d_{oi} = \sqrt{\sum_{j=1}^m (z_{ij} - z_{0j})^2} \quad (4)$$

f) Calculating taxonomic measure of development (TMD) according to the formula:

$$\text{TMD}_{i=1} = 1 - \frac{d_{oi}}{d_o} \quad (5)$$

where:

$$d_o = \bar{d}_o + 2S_0 \quad (6)$$

$$\bar{d}_o = \frac{1}{n} \sum_{i=1}^n d_{oi} \quad (7)$$

$$S_0 = \sqrt{\frac{1}{n} \sum_{i=1}^n (d_{oi} - \bar{d}_o)^2} \quad (8)$$

g) Arranging the analysed subjects in order according to the level of development expressed by taxonomic measure of development (TMD).

The implementation of Z. Hellwig's taxonomic measure of development is widely used in comparative research. It made it possible to make a hierarchy of the analysed EU economies: from the most developed one to the least developed one.

Moreover, the application of cluster analysis for the research resulted in grouping of the analysed subjects – EU Member States – in four clusters according to the level of socioeconomic development in 2004 and 2016. A selected method of grouping of linearly ordered objects, namely the method of standard deviations was used for this purpose. EU Member States were divided into four groups, according to the following rules (Pawlas, 2017):

$$G_1 : s_i < \bar{s} - S(s), \quad (9)$$

$$G_2 : \bar{s} > s_i \geq s_i - S(s), \quad (10)$$

$$G_3 : \bar{s} + S(s) > s_i \geq \bar{s}, \quad (11)$$

$$G_4 : s_i \geq \bar{s} + S(s), \quad (12)$$

where:  $\bar{s}$  - arithmetic mean of synthetic variable (in this study: arithmetic mean of TMD), while  $S(s)$  - standard deviation of synthetic variable (in this study: standard deviation of TMD),  $s_i$  - value of the synthetic variable of the object  $i$  (in this study: TMD value in  $i$  economy).

The socioeconomic development of EU countries was analysed taking into consideration the following 16 variables:  $x_1$  – GDP dynamics (previous year=100);  $x_2$  – GDP per capita (PPP – purchasing parity power);  $x_3$  – inflation rate (%);  $x_4$  – activity rate (%);  $x_5$  – unemployment rate (%);  $x_6$  – public finance sector deficit/surplus (% GDP);  $x_7$  – general government gross debt (% GDP);  $x_8$  – exports per capita;  $x_9$  – employment in agriculture (% of total employment);  $x_{10}$  – share of service sector in GDP creation (%);  $x_{11}$  – natural growth (%);  $x_{12}$  – gross expenditure on research and development (R&D) (% GDP);  $x_{13}$  – mobile phone subscribers (per 1000 population);  $x_{14}$  – Internet users (per 1000 population);  $x_{15}$  – infant mortality rate (per 1000 born);  $x_{16}$  – population with tertiary education (% of population aged 30-34 years).

As mentioned before, for the needs of the research, the variables had to be divided into stimuli and de-stimuli. Most of the variables were treated as stimuli. The set of de-stimuli included: inflation rate, unemployment rate, general government gross debt, employment in agriculture as well as infant mortality rate.

It is necessary to stress, that because of the complexity of a category of socioeconomic development (Eberhardt and Presbitero, 2015; Faria, Montesinos-Yufa, Morales and Navarro, 2016; Zeira and Zoabi, 2015) a set of variables (not just one variable) ought to be used for analysis and surveys. The number of variables, however, depends on the scope of research. Sometimes lack of statistical data results in reducing the initial set of variables. One can also talk of a sort of freedom of selection of variables by researchers (Bařa, 2016; Pawlas, 2014). The set of diagnostic variables used for the analysis of disparities in socioeconomic development of EU countries described crucial areas of socioeconomic life of the analysed subjects. The variables were chosen on the basis of both theoretical background and literature review in consideration if similar empirical studies. An attempt was made to take into consideration the following elements/areas: demographic potential (natural growth, infant mortality rate), labour market (activity rate, unemployment rate), economic development (GDP per capita, GDP dynamics, employment in agriculture, share of service sector in GDP creation, inflation rate, exports per capita), situation of public finance sector (public finance sector deficit/surplus as % GDP and general government gross debt as % GDP), education and R&D activity (population with tertiary education, gross expenditure on research and development as % GDP) and Information and Communication Technologies sector development (mobile phone subscribers per 1000 population and Internet users per 1000 population). The usage of six more variables were considered on the initial stage of research, namely: railway lines per 100 km<sup>2</sup>, hard surface public roads per 100 km<sup>2</sup>, water supply network in km per 100 km<sup>2</sup>, sewage network in km per km<sup>2</sup>, population per bed in general hospitals, number of medicine doctors per 1000 population. Unfortunately, it was impossible to collect complete statistical data for all analysed EU Member States, that's why they were not used in the research. The diagnostic variables presented the economies of studied subjects (EU countries) fully and synthetically.

### 3. Problem Solution

Tables 1 and 2 present the achieved results of multidimensional comparative analysis conducted with the implementation of Z. Hellwig's method of taxonomic measure of development for the years 2004 and 2016 respectively.

The undertaken multidimensional comparative analysis showed that both in 2004 and in 2016 Luxembourg held the top position in the EU in terms of socioeconomic development expressed by synthetic measure of TMD. In 2004 five other EU economies were characterized by a comparatively high level of TMD, namely: Denmark, Netherlands, Ireland, Sweden and

Finland. Poland was positioned very low: it took the 26<sup>th</sup> position (Romania was the only EU27 economy placed below Poland). In 2016, the top five EU economies in regard to synthetic measure of development (TMD) included: Luxembourg, Netherland, Sweden, Denmark and Ireland. Poland was classified as the 18<sup>th</sup> economy out of 28 studied countries: 10 EU economies were classified lower than Poland. The following EU economies were characterized by a lower level of synthetic measure of socioeconomic development TMD: Slovakia, Latvia, Hungary, Spain, Portugal, Italy, Croatia, Bulgaria, Greece and Romania.

**Table 1: Ranking of 27 EU Economies According to Synthetic Measure of Development (TMD) in 2004**

Position	Economy	TMD	Position	Economy	TMD
1	Luxembourg	0.538	15	Cyprus	0.279
2	Denmark	0.459	16	Lithuania	0.250
3	Netherlands	0.451	17	Czech Republic	0.238
4	Ireland	0.450	18	Portugal	0.219
5	Sweden	0.450	19	Latvia	0.210
6	Finland	0.422	20	Italy	0.199
7	United Kingdom	0.403	21	Hungary	0.164
8	Belgium	0.379	22	Malta	0.163
9	Austria	0.351	23	Slovakia	0.160
10	France	0.333	24	Greece	0.157
11	Estonia	0.314	25	Bulgaria	0.133
12	Spain	0.306	26	<b>Poland</b>	<b>0.096</b>
13	Germany	0.306	27	Romania	0.001
14	Slovenia	0.297			

Source: Author's calculations based on statistical data from (Central Statistical Office, 2006; Central Statistical Office, 2007; Eurostat, 2018; PRO INNO EUROPE, 2007)

In 2004 Luxembourg's leading position resulted from a number of factors: Luxembourg was the number one EU economy in terms of GDP per capita, exports per capita and share of service sector in GDP creation, what's more Luxembourg was the EU economy with the second lowest general government gross debt in relation to GDP and employment in agriculture. In 2016 Luxembourg's top position resulted from the following factors: Luxembourg was the leading in EU economy in regard to GDP per capita, public finance sector surplus in relation to GDP, share of service sector in GDP creation, Internet users per 1000 population and employment in agriculture, moreover Luxembourg took the second highest position in terms of population with tertiary education as % of population aged 30-34 years and additionally Luxembourg was characterized by the second lowest level of general government gross debt in relation to GDP.

Poland's extremely low (26<sup>th</sup>) position in 2004 resulted (among others) from the following factors: the lowest activity rate, the highest unemployment rate as well as the second highest share of employment in agriculture and the second lowest number of mobile phone subscribers per 1000 population of all studied 27 economies. In 2016 the position of Poland was much higher. The improvement of Poland's position among 28 EU Member States in terms of synthetic measure of socioeconomic development in 2016 resulted from: a much lower unemployment rate, much higher intensity of mobile telecommunication subscription, as well as a relatively good situation in Poland in regard to GDP dynamics and the share of population with tertiary education in population aged 30-34 years.

Additionally, standard deviations' method of linearly ordered subjects' classification was applied in order to group EU economies into clusters (according to the level of their socioeconomic development). As a result, EU economies were grouped into four clusters, where cluster G4 included EU economies with the highest TMD (TMD of those countries amounted to at least arithmetic mean of TMD plus standard deviation of TMD), while cluster G1 included EU economies with the lowest TMD (for those countries TMD was lower than arithmetic mean of TMD minus standard deviation of TMD). The results of analysis with the application of standard deviations' method of classification of linearly ordered subjects for the years 2004 and 2016 are presented in tables 3 and 4.

In 2004 there were six economies in cluster G4, namely: Luxembourg, Denmark, the Netherlands, Ireland, Sweden and Finland. Cluster G3 embraced seven EU economies, in that: Belgium, Austria, France, the United Kingdom, Estonia, Spain and Germany. Cluster G2 consisted of ten EU economies: Cyprus, Lithuania, Czech Republic, Portugal, Latvia, Italy, Hungary, Malta, Slovakia and Greece. Cluster G1 was formed by three economies with the lowest level of synthetic measure of socioeconomic development TMD, namely: Bulgaria, Poland and Romania.

Source: Author's calculations

In 2016 cluster G4 was formed by four EU economies, namely: Luxembourg, the Netherlands, Sweden and Denmark. This time Ireland and Finland were elements of cluster G3 together with Austria, Germany, Estonia, United Kingdom, Cyprus, Slovenia, the Czech Republic, Belgium and Malta. Cluster G2 was formed by nine EU economies, namely: France, Poland, Slovakia, Latvia, Hungary, Spain, Portugal and Italy. A four-element cluster G1 was built by: Croatia, Bulgaria, Romania and Greece.

#### 4. Conclusion

Both the theory and practice suggest that regional economic integration processes create favourable conditions for socioeconomic development. The process of Poland's economy opening began in 1989. In the beginning of the 1990s Poland focused on association with the European Communities and in 1994 it officially applied for the European Union membership. The accession process was really long and complicated; it brought full access to the structures of the European Union in May 2004. Nine other economies joined the EU together with Poland. Bulgaria and Romania were granted EU membership in 2007. In mid 2013 Croatia joined the EU as the 28<sup>th</sup> Member State. The last three enlargements of the EU resulted in significant broadening of disparities in socioeconomic development within the European Union on the level of both national economies and regions. The main objective of the research was to study the disparities in development among the EU economies in order to determine the position of Poland in the EU in regard to socioeconomic development. Having in mind the assumption resulting from literature studies according to which socioeconomic development

is a broad, multidimensional category, a set of sixteen variables was used for the comparative analysis and the selected methods of multivariate analysis were adopted in research. The undertaken and carried out research let me prove hypothesis concerning internal diversity of the European Union in terms of economic development. Some changes were observed in the analysed period of time i.e. from 2004 to 2016. The application of Z. Hellwig's taxonomic measure of development made it possible to hierarchize EU economies according to socioeconomic development, while the standard deviation method of linearly ordered objects' grouping made it possible to group the analysed economies in four clusters. Conducting the research for the years 2004 and 2016 let me conclude that huge relative changes in levels of socioeconomic development of the economies of EU Member States occurred during the analysed period. Moreover, the research let me prove hypothesis according to which Poland considerably improved its relative position against the background of other EU economies and reduced the distance for the EU Member States characterized by the highest level of socioeconomic development: in 2004 only Romania was classified below Poland, while in 2016 Poland was classified as the 18<sup>th</sup> EU economy (it outpaced not only six new EU Member States, i.e. Slovakia, Latvia, Hungary, Bulgaria, Romania and Croatia, but also for old EU economies, i.e. Greece, Portugal, Spain and Italy). In 2004 Poland constituted cluster G1, which included also Bulgaria and Romania, i.e. the least developed economies, while in 2016 it was an element of cluster G2. It seems that the observed, considerable increase in level of socioeconomic development of Poland was partly caused by the use of structural funds and Cohesion Fund, while the relative decrease in socioeconomic development of South European EU Member States and some new EU Member States was the outcome of financial and economic crisis 2008+.

### **Abstract**

*European Union, its cohesion and competitiveness need new impulses which will encourages SMEs cooperation throw all EU. SMEs performance is very important for European economy, unfortunately SME are limited by financial capital and there is lack of solutions for closer cooperation between SMEs in all EU. It can be changed by advanced method of controlling as a management tool implemented in information systems, especially ERP systems. This advanced controlling systems supported by high performance IT systems are looking for gaps, stimulate creating solutions and allow usage all of capital types with higher efficiency. These advanced controlling systems should create new process system, more effective supply chains, new dimension of marketing and much more. Other great advantage is creating of management and communication systems which will allow connectivity across national border throw all Europe Union and which will stimulate economic cohesion and competitiveness of European SMEs and stimulate growth of strong and united European Union.*

**Keywords:** *controlling, management, ERP, Europe Union, SMEs*

**JEL Classification:** *M10, M15, L11, L15*

### **1. Introduction**

This review article analyses and synthesizes present position of European SMEs (Small and Medium Enterprises) in global view of European Union and its possible developing in near future. The basic research of the issue is based on the findings and outputs of project 7427/2017/4 entitled Specifics of Family Business under the auspices University of Finance and Administration, Prague. European SMEs are basic forces of European Union (EU) economy. SMEs and their development are therefore crucial to increasing the competitiveness of the European Union and their mutual cooperation within the single market then leads to the cohesion of the European Union. These goals and their achieving are in consequences with Strategy Europe 2020.

Motivation for basic research was understanding of SME and Family Business limitation for effective cross boarding cooperation and decreasing of cost inside companies. During basic case studies research, it was found that an effective tool for suppressing the effects of these limiting factors could be the implementation of an enterprise management system based on the principles of controlling and modern information systems.

These advanced managerial systems based on controlling are supporting increasing of efficiency, initiate effective supply chains, cutting cost – especially operational costs, support innovations leading to digitized interconnection and cooperation between individual SMEs and more others. The crucial questions of present will be also effective usage of human capital

and its development. Controlling system implemented to information system will support human resources capital and will open also cross boarder usage of these resources.

The European single market or the internal market or the common market within the European Union is an area without the internal borders of the Member States in which the free movement of goods, persons, services and capital is in force and which is defined by the Maastricht Treaty. The common European market is relatively homogeneous environment, but the benefits of this situation are more used by conglomerates than by SME. However, taking advantage of the controlling-based management system supported by the computational capacity of the current IT systems, the constraints for SMEs are shrinking and offer more efficient use of the potential of SMEs as one of the main strengths of the European economy, because cost of implementation and operating cost of these systems. European Commission and its “Strategy Europe 2020” is supporting development SMEs. It is necessary step for enhancing competitiveness and cohesion of European Union.

### ***1.1 SMEs are Basic Force of European Competitiveness and Cohesion***

European competitiveness and cohesion is important and actual topic. European supporting of Cohesion Policy Cohesion Policy has a strong impact at many areas. It is supporting European solidarity, creating jobs, support enterprises, research activities and others. Cohesion Policy is the EU’s main investment policy. It targets all regions and cities in the European Union in order to support job creation, business competitiveness, economic growth, sustainable development, and improve citizens’ quality of life. (European Commission [online], 2014) Cohesion Policy has 11 thematic objectives supporting growth for the period 2014-2020. Objective no. 3. is Enhancing the competitiveness of SMEs.

Present business environment in European Union and globally has been changed and becoming changes are still faster. SMEs in Europe Union have to adapt to this hyper-competitive environment. Market, business environment and entrepreneurship as such are now changing faster and less predictably due to a number of factors (globalisation, digitalisation, changes in shopping and communication habits of customers etc.). Achieving permanent success in this complex and dynamic environment has become very difficult, especially for small and medium-sized enterprises. (Petrů, N., & Havlíček, K., 2017)

SME business is sensitive to external influences and is very important part of EU economy. For its future development is necessary create condition for its supporting, include looking for performance management tools as an ERP system. Small and medium-sized enterprises face a number of problems which are difficult to overcome due to the nature of these enterprises which are very sensitive to changes in the business environment. (Piotr, D., 2016)

European SMEs are basic forces and create the backbone of the EU economy. SME are one of most important groups of employers and innovators in EU. SMEs employed 93 million people, accounting for 67 % of total employment in the EU-28 non-financial business sector and generating 57 % of value added in the EU-28 non-financial business sector. Almost all (93 %) of the SMEs were micro SMEs employing less than 10 persons. (European Commission [online], 2017).

Well-functioning economy is one of the basic preconditions for the cohesion and competitiveness of the European Union. Research on geographical proximity for SME exporting has not focused on the inter-regional liability of foreignness between the European Union (EU) and its motivations, while it has been shown that SME internationalization performance is affected by geographical scope. (D’Angelo et al., 2013; Rugman, 2003).

Furthermore, we cannot omit the special SME subgroup. They are family-owned SME businesses that are characterized by family ties with high resistance to negative influences of various character. They are an important subgroup of SMEs. European Union offered support to SMEs through Community programmes like the Multiannual Programme for Enterprise and Entrepreneurship and the Competitiveness and Innovation Framework Programme, combined with additional sources. Structural funds are used in promoting entrepreneurship and skills and improving SMEs growth potential. (Borbás, L. [online], 2015)

The aim of the article is to focus on the key factors that will enable the development of SMEs and the development of their mutual cooperation. Despite the important role played by services SMEs in national economies, their participation in international trade is perceived to be marginal and lags considerably behind the trade performance of their counterparts in manufacturing. (Lejárraga, I., & Oberhofer, H., 2015)

One of the major challenges for SMEs in the near future will be the transition to industry 4.0 and its connection with the necessary implementation of advanced information systems based on the principles of modern controlling. These new methods of controlling will improve of previously separated management disciplines and concentrate them in a single information system based on controlling. Firms look to adopt technological innovations in hopes of realizing a variety of positive outcomes, such as to increase productivity and attain higher service levels without expending more resources. (Pralhad, C.K. and Mashelkar, R.A., 2010)

Still faster growing and more important markets are e-commerce channels. It is very important part of European economy. SME and their full engagement and use of the potential is crucial to their future. Implementation and usage of e-business as way of interconnection between business partners through modern information and communication technology (ICT) is on path of growth. Their effects in use are actual topic of many scientific and pragmatic research projects. Challenges of e-business development, growth and future implementation in companies across the world are in focus of strategies in many countries and political and economic associations. (Pihir, I., 2013)

Controlling as a management tool offers many opportunities how support SME and their activities throw national borders. Its successfully implementation and developing in connection with Enterprises Resources Planning systems (ERP) will offer and in order to properly understand the nature of controlling, it is necessary to understand the link between strategic planning, operational planning, evaluation and risk management. Management activities depend on determination of the strategy (in the form of a strategic plan), followed by operational plans (marketing, sales, financial, human resources, innovation, etc.). (Havlíček, K., & Schlossberger, O. [online], 2013)

Therefore, the limited theories explaining information technology (IT) governance in large organizations cannot be linearly extrapolated to SMEs, since we are dealing with a completely different economic, cultural and managerial environment. (Devos, J., Hendrik, V. L., & Deschoolmeester, D., 2012) The main limitation of developing and implementing ERP controlling system are human factor, nature changes refusing statement and necessary capital resources. At present, however, the development of technologies and user interfaces is at advanced position. New technologies are user friendly and their more frequent usage makes their implementation for SMEs affordable. These ERP systems with the implemented controlling system are becoming to a significant competitive advantage.

SMEs are generally low-tech firms, but cutting-edge firms in biotechnology and in the computer, sector are often small or medium enterprises. SMEs produce 13 to 14 times more patents per employee than large patenting firms. (Bharati, P., & Chaudhury, A. [online], 2009)

It is obviously, that SME are main force in innovation process and their supporting will support strength of the competitiveness and cohesion of the European Union.

## 2. Problem Formulations and Methodology

Customized controlling implementations into advanced information systems, its operating in SME business management and measuring enterprise performance, is the task where is necessary check more criteria than financial statements, economic indicators or some levels of profit indicator.

There are main factors which are influencing implementation process and its performance:

- a) Basic analysis of strategy, process, enterprise need and selection of ERP or other information system.
- b) Implementation controlling management system and its customization for enterprise need.
- c) Sensitive managing of enterprises human resources and implementation process from new system from phase alignment throw synchronization phase to convergence phase.

Based on these basic points is necessary compare the enterprise economic data or other performance indicators with sociologic research inside company with general question. How the enterprises controlling ERP (Enterprise Resources Planning) system is used and assimilated by human capital?

It is very important, because this factor is influencing final results and we have to know reasons of success or fails in consequences at every implementation case. Other important data source is research inside companies before or without implementation ERP systems. Reached data will serve for comparison with data of enterprise which are using controlling ERP system.

In case of proofing influence to this managing controlling ERP system we will recognise increasing of enterprise activities and reaching better economic indicators as a causality of controlling ERP systems. Based on reached data define possible contribution to the competitiveness of the European Union and supporting of its cohesion.

### 2.1 Research Model

Research model was composed from 2 basic parts.

Part no. 1- define SME company under 50 million € turnover and under 250 employees, set up research survey focused on tasks of controlling and validate it. General tasks were to be focused at information systems, human capital and its assimilation process level.

After research data receiving the model proceed measure of economic indicators and their evaluation. Primary group of the surveyed companies were selected on the basis of business activities with emphasis at crossing the national borders of the Member States of the European Union.

Part no. 2 – recognise SME activities and its performance in comparing of usage or implementation ERP controlling systems as a management tool. Those companies were investigated in several consecutive periods and were evaluated again. For evaluating was used financial analysis of ROA (return of assets).

$$ROA = \frac{\text{Net Income}}{\text{Average Total Assets}} \quad (1)$$

Where:

Net income is a company's total earnings (or profit).

Average total assets are defined as the average amount of assets recorded on a company's balance sheet at the end of the current year and preceding year.

### 2.1.1 Model Calibration

This research is in progress and follows the research project of the vitality of family business and at present it is basic research. Selected enterprises are examined in the Administrative Register of Businesses (ARES) and then placed on the list in Microsoft Excel for their analysis. The total number of subjects advanced research is 44 (December 18. 2017). The purpose of this basic research is to calibrate the model for research on the significance and implementation information systems based on controlling and its impact on the future performance of the enterprise.

### 2.2 Data Analysis

Enterprises which were joined to research started first phase with fulfilling data to e-survey. First analysis was oriented if enterprise meets basic research requirements for this research if SME is doing business cross boarding in EU. If enterprise passed the basic analysis, then a closer internal personnel research was carried out, focusing on business management, process efficiency and its performance. This research process is comparing data from empirical analysis following periods from 2015 to 2017.

**Table 1: Development of IS Implementation in SME**

enterprise and its level of IS	2015		2016		2017	
	comp. no.	in %	comp. no.	in %	comp. no.	in %
without information system	8	24.20%	6	18.20%	3	9.10%
basic information system	12	36.40%	14	42.40%	18	54.50%
basic information system based on controlling	8	24.20%	12	36.40%	12	36.40%
advanced information system based on controlling	3	9.10%	5	15.20%	11	33.30%
not identified or lack of information	2	6.10%	0	0.00%	0	0.00%
<b>in total</b>	<b>33</b>		<b>37</b>		<b>44</b>	

Source: authors

### 3. Problem Solution

This basic research shows, that solution looking process and topic problematic is complicated and it is necessary to define main research areas to get relevant results.

### 3.1 Degree of Maturity of Controlling Processes

Based on reached data was researched maturity of controlling processes or others management tools in companies. There were recognised many different principles from very simple systems based on paper reporting and calculator to advanced and largely automated information systems - usually ERP. The majority common factor that influenced the maturity of management processes and deployment of the information system was the attitude of the owners or top management at this issue. Enterprises with higher maturity IS (information system) and controlling were managed and developed with an emphasis on implementing new technologies and finding solutions that will reduce operating costs and which will support effective communication in company.

**Table 2: Managers and Owners Attitude to IS Controlling System**

attitude to IS controlling system	2015		2016		2017	
	comp. no.	in %	comp. no.	in %	comp. no.	in %
no need for information systems	13	39.4 %	9	27.3 %	3	9.1 %
yes, it is usefully, but not necessary	12	36.4 %	9	27.3 %	4	12.1 %
we need it, but we do not have plan for implementation	4	12.1 %	13	39.4 %	18	54.6 %
yes, we started with implementation IS	3	9.1 %	4	12.1 %	11	33.3 %
yes, we use IS and we are working on its development	1	3.0 %	2	6.1 %	8	24.3 %
<b>in total</b>	<b>33</b>		<b>37</b>		<b>44</b>	

Source: authors

Another important factor that significantly affected the level of implementation of the IS based on controlling was the size of the business and its performance. Smaller businesses (turnover under 5 million € or less than 50 employees) were mostly oriented on operatives and were behind the implementation tasks.

### 3.2 Information Systems

The information system (IS) and its choice is a key issue for the enterprise. About 26% of total enterprises during this research (2016-2017) has decided about changing their information system, because their previous system had basic limitations, which did not support necessary enterprise needs for its development and growth. There are two main ways, how to choose information system. First is premanufactured system called also as a box solution, which is relative cheap but its usage opportunities are limited, or choose systems based on advanced database systems which should be customized up to enterprise requests. At second case the enterprise will have "unlimited" opportunities for functionality and customization, but purchase, implementation and its operation are orders of magnitude higher. At this moment the enterprise has to decide which one solution is optimal. Usually, the enterprise use "box ERP solution" and after some period this ERP system is replaced by so customized solution.

### **3.3 Human Resources and Technology**

The crucial task for successful implementation of information system based on controlling is acceptance process by enterprise human resources. Based on research survey (2015-2017) 91.6 % of all respondents understood that a properly set information system can have a positive impact on performance of the company and its future development. But only 26.4 % of respondents would appreciate if these technologies were installed at their working position.

People and their acceptance of technology is crucial question for successive information system implementation and its operating and future development. During this basic research had 4 enterprises serious problems with own business operation and be seriously damaged, because they underestimate work with human resources regarding the implementation of new information technologies and business management system based on controlling.

### **3.4 Enterprise Performance Analysis**

Return of assets (ROA) ratio, often called the return on total assets, is a profitability ratio that measures the net income produced by total assets during a period by comparing net income to the average total assets. It is significant ratio for enterprise management system performance. ROA indicates that the performance of researched enterprises which used ERP controlling system was on average 0.32% higher after the ERP implementation than before implementation process.

Other very interesting research area was employees' fluctuation. About the fluctuation question is not significant result yet. This research suggests, that in consequences of information systems are connected human resources structural changes. It is significant that companies need flexible employees. If employee will accept this challenge, then support from the company will across current shortcomings and from the other hand is still difficult find work for inflexible employees. These two main streams are against each other and making conclusions at this point would be premature. It is important to notice, that these results are only the conclusions of basic research. It is necessary continue with this research on a larger research sample of companies for a longer period to get to significant results.

### **3.5 Main Barriers for Implementation**

Based on research (surveys and personnel interviews) these basic barriers to successful implementation have been identified as:

- a) Lack of financial resources for purchasing and customization of ERP based on controlling.
- b) Deeper managerial degree of awareness of the needs for implementation.
- c) Human resources degree and skills level throw all company structures include top management and owners and their necessary support of implementation process.

In managerial overview the biggest task is change meaning of decision making responsible people which are perceive of the controlling-based information system implementation as an operational task. This task is important and for its successful implementation is necessary start thinking about business strategy and strategic investment more than about operational goal.

### **3.6 Opportunities for Future Development**

Based on research there were recognised areas which are being to open new opportunity which should be important for future SMEs and their developing and competitiveness. For the European Union, this development could boost its global competitiveness and its cohesion.

- a) Increasing efficiency based on quality management, cutting operational cost, higher capital usage with bigger efficiency. In consequences of this research was discovered that all researched enterprises will recognise their cross-border cooperation as an increasing.
- b) Creating of new communication standards which allow automated inter-company cooperation within the territory of the European Union. This new communication standards will support shorter supply chains, higher efficiency for manufacturing, inventory planning, and goods or services customization.
- c) Usage of these ERP controlling system will create enterprise management tool, which should create environment for continual improving of any process and all company.
- d) These ERP controlling systems will offer many opportunities how to use it. For example, these systems should be used as a toll which is supporting hand overring process in family business, it should be the main management base for creating franchisee business, it should serve like main base for implementation industry 4.0 and others.

## **4. Conclusion**

Innovations are the main forces which push the boundaries of the known and are the driving force of the SMEs business, which is backbone of Europe Union economy. Supporting and developing SMEs operation, their development and cooperation is one of main task for European economy. Process of implementation information systems based on controlling should be one of ways how to effective support SME and boost their cross-boarding cooperation in Europe Union. At present there are not serious limitations for implementation of this technology a management controlling system. The biggest challenge for supporting this solution is set up effective structures for accessibility information, to stimulate the education of future implementers and create or restart the financial resources and programs that will support this trend. Cohesion and competitiveness of the European Union is crucial task and if we will support idea of Europe Union, then we have ideal tool how to do it.

### **4.1 Future Research Debate**

Future research SME and its supporting is challenging task for any country and especially for cohesion and competitiveness of Europe Union. There are many tasks for research. The main areas we can recognise are effective communication inside and outside of SME, its accessibility to financial resources, its supporting of new technology and investment to education of new technological skilled generation. In the case of the European Union, a special attention was conferred to the following types of SME: SME from the rush and medium technical sectors that have affinities by the nature of their businesses deployed with Internet and the new evolutions of the market; the SME that exploit the opportunities offered by the electronic commerce, especially in the services sector - sometimes named cyber-firms; the SME integrated in the chains of added value of the big companies which are forced to innovate under the pressure of the main clients. (Oncioiu, I. [online], 2013) Most of the empirical research viewed the SME's involvement in international operations as an evolutionary and sequential process, based on the fundamental assumption that export activity develops from a

series of incremental decisions. (Stouraitis, V., Mior Harun, M. H., & Kyritsis, M. [online], 2017) Currently, in the SME sector (in accordance with the above-mentioned assumption of the authors) one can notice combining basic goals of operation with their pro-ecological activeness in support of natural environment, as well as local community. (Jedrzejczyk, W., & Kuceba, R. [online], 2015) Information and communication technologies (ICT) play an important role by contributing to rapid technological progress and productivity growth. The ICT sector represents 4.8% of the European economy. It generates 25% of total business expenditure in Research and Development (R&D), and investments in ICT account for 50% of all European productivity growth. (Folea, V. [online], 2015).

## The Future of European Education in Context of Socio-economic Trends

**Aleksandra Pleśniarska**

Cracow University of Economics  
Faculty of Economics and International Relations,  
Department of European Economic Integration  
Rakowicka Street 27, Cracow, 31-510  
Poland  
e-mail: [aleksandra.plesniarska@uek.krakow.pl](mailto:aleksandra.plesniarska@uek.krakow.pl)

### **Abstract**

*The economies of highly developed countries are based on the growing resources of a well-educated workforce with creative and innovative skills, which is a necessary condition for economic and social progress. It seems that knowledge is one of the most valuable resources that affects economic development. At the same time, the multidimensional character of socio-economic changes implies the need for constantly implementing new solutions that will be a real response to current challenges. Therefore, education should be at the centre of attention of EU member states' policies. The article presents the significance of education, especially higher education, in economic development based on the debate taking place in literature on the subject. The aim of the article is to attempt to identify the most important socio-economic trends that may shape the directions of education development, especially among EU member states. Based on theoretical findings, having examined the European Union's documents and the international reports, an attempt was made to identify the potential areas of challenges that European education might need to face in the near future.*

**Keywords:** *challenges for education, European education, higher education, socio-economic trends*

**JEL Classification:** *I20, I23, I25*

### **1. Introduction**

The European Union sets goals and frameworks for education policy, but each EU country is responsible for its own education and training system. The EU contributes to the development of quality education by encouraging cooperation between member states and, if necessary, by supporting and supplementing their action (TFEU, article 165). The EU action shall be, among others, aimed at: developing the European dimension in education, encouraging mobility of students and teachers, promoting cooperation between educational establishments, developing exchanges of information and experience on issues common to the education systems of the member states and encouraging the development of distance education (TFEU, article 165).

The EU's reflection paper on *harnessing globalisation* identifies education and skills as a priority for European cooperation (European Commission, 2017b). It seems that the development of higher education is of particular importance to education policy. The European Commission (EC) underlines that higher education plays a significant role, because demand for highly skilled people is increasing. Jobs are becoming more complex. People's capacities to be entrepreneurial, manage complex information or think creatively are a crucial element for economic development (European Commission, 2017a).

It seems that, if education is to fulfil its role in the economic growth of each country, educational progress should be oriented at adaptation to the socio-economic changes. Despite the fact that education is among supporting competences (TFEU, article 6), it seems that the member states face similar challenges in this field.

## **2. Problem Formulation and Methodology**

The main purpose of the article is to attempt to identify the challenges that European education, especially higher education, is facing. Why is education significant for economic growth? Which socio-economic changes (trends) can influence the future of education? What are the implications for higher education? This article endeavours to answer the above questions.

To accomplish the objectives of the article, the analysis is divided into three parts. At the beginning, an attempt was made to explain the role of education in the economic development. The next part describes selected socio-economic trends, which may shape education. In the last part, an attempt was made to identify the potential challenges that European higher education might need to face in the near future.

The research method here adopted involves a literature survey and its critical analysis, a study of treaty regulations and strategic European documents and the analysis of international reports.

## **3. Problem Solution**

It seems that the multidimensional character of socio-economic changes implies the need for constant development in education, especially higher education. Reflections on the above issue were presented in this section.

### ***3.1 The Role of Education in Socio-Economic Development***

The World Bank's report *The Changing Wealth of Nations 2018* attempts to estimate sources of global wealth in the context of three types of capital. According to this source, 9% of world wealth is attributable to natural capital, 27% produced capital, and the rest, 64% to human capital. In high-income OECD countries, human capital accounts for 70% of total wealth, produced capital for almost 28%, and natural capital for almost 3% in 2014. (Lange et.al., 2018). N. Bontis (2004) noticed that human capital is defined as the knowledge, education and competencies of individuals that enable them to perform their work and achieve their social goals. "The human capital of a nation begins with the intellectual wealth of its citizens" (Bontis, 2004, p. 20).

The economies of highly developed countries are based on the growing resources of a well-educated workforce with creative and innovative skills, which is a necessary condition for economic and social progress. Links between the level of economic development and investments in human capital run in two directions - human capital, as a factor of economic growth, it affects the pace of economic development, however the quality of educational infrastructure and investments in skills and knowledge are also directly proportional to the level of income (Skubiak, 2013, p.195-196).

Regarding literature review, the role of education in economic growth has often been emphasized. Studies of the following researchers should be mentioned: R. Barro (e.g. positive association between quantitative measures of schooling and economic growth), E. A. Hanushek and D. Kimko (analysis of the results in mathematics and science and their

correlation with indicators of economic growth), S. Teodorescu (the impact of formal education on the macroeconomic development in Romania and in other EU member states) or N. U. R. Khattak and J. Khan (study on the contribution of education on economic growth in Pakistan) (Teodorescu, 2017).

F. Margan (2012) noted that "investing in education, particularly in secondary and lifelong learning" is among the Golden Rules of Competitiveness by Garelli. The significance of education, especially higher education, is demonstrated by the fact that some indicators, corresponding to this area, are taken into account in the measurement of competitiveness and innovations of national economies. For example, indicators such as total public expenditure on education or achievements in higher education are available in the methodology used by the IMD World Competitiveness Centre (IMD, 2018) indicators, which are harnessed in *Higher education and training* pillar, which is one of elements of the *Global Competitiveness Index*, prepared by World Economic Forum (Schwab 2017), or indicators such as new doctorate graduates, population aged 25-34 with tertiary education, lifelong learning, which are used in *European Innovation Scoreboard* (Hollanders, 2017).

It is worth mentioning, that nowadays universities are becoming a place of creation of not only scientific and theoretical knowledge but useful knowledge as well (Pleśniarska, 2016). Higher education is significant for both economic and social progress and aligning skills with labour market needs is essential in this. However, the role of universities is much wider than patents generation, publications or education and training. Universities should be seen as creators and translators of innovations (Vidican, 2009). In an increasingly globalized and knowledge-based economy, the European Union is in need of a well-skilled workforce, which will be able to compete in terms of productivity, quality, and innovation. Taking into account the above considerations, it is worth attempting to identify the challenges that higher education is facing. It seems that the quality and development of this sector may have a significant impact on the development of national economies and the future welfare of European citizens.

### **3.2 A Discussion of Economic and Social Trends**

Contemporary times are characterized by the extraordinary dynamics of changes in the socio-economic area. Further considerations therefore focus on identifying selected areas and directions of changes in social, demographic, economic, technological and political aspects. It seems that those changes may affect the development of education, especially higher education.

In economic aspect the following tendencies can be observed:

- a) *New directions of development in economy and demand for new skills* – There are noticeable changes in the economic area, due to the development of new directions e.g. circular economy, digital economy, green economy and sustainable economy. The structure of economy is changing (mainly due to the growing importance of services). In that case, there is a growing demand for people with higher education, highly skilled, having digital skills. With reference to forecast, half of all jobs are projected to require high-level qualifications in Europe, up to 2025 (European Commission, 2017a).
- b) *Focus on innovations* – Innovations and knowledge resources have importance in building a competitive advantage in both the micro and macroeconomic dimensions (Pleśniarska, 2016). Nowadays, the importance of social innovations is also growing in the EU.
- c) *Globalisation* – Consequences of globalisation are observed in the increase of international trade and other markers of worldwide financial integration. For example, multinational companies (e.g. Starbucks, H&M) had a presence in only a few countries

in the 1990s. Nowadays, they have operated in multiple nations (in 2014 Starbucks - 66 countries, H&M - 55 countries). Inditex, has a presence in over 80 national markets worldwide. It is worth mentioning that world values for foreign direct investment increased by 170% between 1970 and 2013 (OECD, 2016b).

- d) *Urbanisation* – Currently, over 50% of the world's population lives in cities, up to 2050 it could be seven out of ten people. For example, over 90% of population lived in cities in Belgium, over 80% in Luxembourg, Netherlands, Denmark, Sweden and Finland in 2013. Moreover, metropolitan areas produce a disproportionately higher percentage of the country's GDP when compared to the percentage of the population living in metropolitan areas in most countries. For example, 80% of the national GDP growth was contributed by cities in Greece, over 70% in France and Hungary, over 60% in Estonia and Denmark between 2000 and 2010 (OECD, 2013).

In social and demographic aspects, the following tendencies can be observed:

- a) *Changing in global population* – With reference to forecast, 61% of the world's 8-billion population will be in Asia, while the EU-27 will be accounting for 5.5% in 2025. This may bring about a multipolar world (different political and economic powers) (European Commission, 2017b).
- b) *Migration* – Mobility seems certain to increase in the near future. According to the International Organisation for Migration (IOM) the number of international migrants worldwide reached 244 million in 2015 (in 2013 was 232 million). Germany became the second most popular destination for international migrants globally. The year 2015 saw the highest levels of forced displacement globally recorded since World War II. Almost 1 in 3 first-time asylum applicants in the EU were minors, a 9% increase compared to 2014 levels (IOM, 2018).
- c) *Society and lifestyle* – Changes in lifestyle are caused mainly by development of information society, knowledge society and changes in social relations (e.g. diversity of families - traditional vs. non-traditional families) and consequences of ageing society.

In technological aspect, the following tendencies can be observed:

- a) *Digital revolution* – In reference to the fifth wave of development, defined by J. Schumpeter, the Internet and new technologies have determined the changes in almost all areas of human life since the 1990s (Pleśniarska, 2016). It seems that the digital revolution is progressing so fast that fundamental changes are noticed during life of one generation. European Commission (2017b) suggests that digitalisation, robots, artificial intelligence, and 3D printing will revolutionise production, working, transport and consumption. A lot of all sectors will be changed in the near future, for example: transport (e.g. driverless and connected cars), energy (e.g. smart grids), agri-food (e.g. applications to reduce food waste), health care (e.g. online diagnosis) (European Commission, 2017b). Moreover, one in ten jobs across the OECD is at high risk of automation (OECD, 2016a).
- b) *The Internet* has become an integral part of people's lives, especially with the development of mobile handheld devices. For example, online shopping is very popular in the EU. In 2017 online purchases by internet users increased by 18 percentage points compared to 2007 (Eurostat, 2017).
- c) *Multi-tasking* – Technologies also shape individual behaviours and abilities. Generally, the average number of activities performed online at the same time (e.g. sending emails, checking social networks, reading) has increased. However, differences are noticeable between the EU, for example Polish Internet users perform on nearly five activities simultaneously, while Swedish or Finnish almost eight in 2013 (OECD, 2016b).
- d) *The impact of social networks* – For example, the number of Twitter accounts dramatically picked up. Only 4 international organisations and 5 world leaders had

Twitter accounts in 2007 while it was accordingly 89 international organisations and 660 world leaders in 2015. Facebook has recorded over 1 billion users in a single day (OECD, 2016b).

A political aspect is also worth mentioning. In the context of the European Union two points should be pointed out: multidimensional consequences resulting from Brexit and threats and opportunities associated with the future of European integration (relevance of the European project, multi-speed Europe, differences between member states etc.).

### ***3.3 Challenges for European Education***

The European Union is involved in the development of education in many ways, by setting development goals and their monitoring (e.g. Strategy Europe 2020, Education and Training 2020 strategy) or by supporting higher education through policy cooperation and funding programmes (e.g. a renewed EU agenda for higher education, Erasmus+, Horizon 2020). In 2017, the EC pointed out new direction to EU support for higher education and delimited four priorities for action: 1) tackling future skills mismatches and promoting excellence in skills development; 2) building inclusive and connected higher education systems; 3) ensuring higher education institutions contribute to innovation; 4) supporting effective and efficient higher education systems (European Commission, 2017a).

It is a well-known fact that some of the challenges that higher education is facing are related to the following areas: massive education, internationalization, quality of education, the structure of university financing (increasing the expenditure, engaging the private sector), and cooperation between science and business. However, with reference to the above mentioned tendencies (in economic, social, technological, political aspect) it is worth attempting to identify some challenges and implications for higher education (table 1).

**Table 1: Selected Challenges and Implications for European Education**

<b>Type of tendencies</b>	<b>Selected challenges and implications for higher education*</b>
<b>Economic</b>	<ul style="list-style-type: none"> <li>- the need to develop teaching specialist skills, which are necessary in the labour market,</li> <li>- the need to prepare students to work in multinational companies, develop intercultural business skills,</li> <li>- the need to teach people universal skills to understand and solve problems (teach how to learn, what is important in continuing lifelong learning in future),</li> <li>- the need to follow the newest directions in economy steadily and fast not only through preparing well-educated workforce but creating useful knowledge (also social innovations),</li> <li>- the need to foster creativity in science and teaching,</li> <li>- the need to plan university infrastructure around sustainability,</li> <li>- the need to ensure well-educated graduates, due to the higher productivity of cities.</li> </ul>
<b>Social and demographic</b>	<ul style="list-style-type: none"> <li>- the need to prepare for the inflow of students from various backgrounds (socio-economic classes or cultures),</li> <li>-the need to develop global competencies such as tolerance, understanding and acceptance of diverse cultural values, and also cooperation in a multinational classroom</li> <li>- reskilling aging workforce through lifelong learning,</li> <li>- the need to create more mobile and flexible education</li> </ul>
<b>Technological</b>	<ul style="list-style-type: none"> <li>- using new technologies to extend the reach and quality of education,</li> <li>- the need to monitor the quality of online educational materials,</li> <li>- the need for personalisation in education with the use of new devices and technology,</li> <li>- providing training on the use of big data,</li> <li>-the need to teach and develop digital literacy and multitasking necessary in the modern world,</li> <li>- the need to follow the digital revolution (especially in context of the development of new directions in teaching),</li> <li>- the need for teaching students how to evaluate the validity of online information,</li> <li>- the need to include the possibilities of social networks in learning system</li> </ul>
<b>Political</b>	<ul style="list-style-type: none"> <li>- the need to revise programmes (e.g. Erasmus+, Horizon 2020) due to the UK's status changing after Brexit,</li> <li>- losing the UK's higher education, which is one of the most important elements in European science and research development sector,</li> <li>- changing the EU's position in international university rankings after Brexit (nowadays, British universities rank leading position),</li> <li>- eliminating the differences between member states in the development and quality of higher education.</li> </ul>

\* Selected implications are based on OECD (2016b) report.

Source: Own elaboration

## 4. Conclusion

The role of education in the socio-economic development seems to be determined in the face of the increasing significance of human capital and the need for innovations. Education should then be first of all characterized by flexibility and constant readiness for implementing changes in many areas almost simultaneously. In addition, development of learning skills and universal skills, together with skills necessary on the labour market, should be a pivot of education.

Challenges and implications discussed in this paper, which higher education in EU member states might need to face in the future, are characterized by: multidimensional nature (they influence different areas of education and operation of universities), the necessity of opening for new stakeholders (multinational group of students, of varied ages, students with different experience), as well as becoming partially dependent on external incentives (e. g. technology development, new devices that can be used for example in education).

In the face of contemporary globalization processes and tendencies of global nature (such as migrations, demographic changes and digital revolution etc.) it could be doubted whether particular member states are ready for and capable of facing many challenges in education. In the light of the above, a decision to qualify education policy as supporting competences, might not be enough. On the other hand, a condition and a quality of education have a significant influence on generating economic growth of particular economies, which in a way constitutes their power, international significance and identity. In the future, education policy might therefore become one of the elements determining the shape of European integration.

## **Abstract**

*The promotion of employment is a central goal of the economic and social policy both of the European Union and also of its Member States. The relevant State aid rules therefore have to outweigh on the one hand the coherence between competition rules and on the other hand to secure measures for fighting unemployment. This paper discusses guidelines for implementation of art. 107-109 of the Treaty from the point of view of State aid for employment. This has to lead to verification of two research theses. According to the first thesis, the Central and Eastern Europe countries approved and granted State aid for employment by far smaller amounts than the EU-15 Member States. Whereas the second thesis highlights that the amount of State aid provided by EU Member States should be negatively correlated with the size of their general government sector debt. The analysis was based on a linear regression model. The response variable is the size of general government sector debt, while the explanatory variable is the expenditure on State aid for employment.*

**Keywords:** *competition policy, employment, European Union, general government sector debt, State aid*

## **1. Introduction**

Social and economic advancement is one of the main objectives of the internal market, and employment and training are seen as fundamental to attaining these aims. The first objective set out in Article 2 of the Treaty on European Union (TEU, OJ 2016 C 202/13) specifically states that it is an objective of the European Union "to promote economic and social progress and a high level of development". Consistent with this aim, the 2005 re-launch of the Lisbon Strategy marked "growth and jobs" as the cornerstone for the policy and reform and the method for stimulating greater economic development in the EU (Communication, 2005). The EU has also recognized the support of a high-employment economy as one of the priorities of the 'Europe 2020' Strategy and set the ambitious goal of reaching by 2020 a level of 75% of employment for people belonging to the age group of 20-64 years (European Commission, 2010a). As part of the flagship initiative "An agenda for new skills and employment" (European Commission, 2010b), the main priorities were identified to address this challenge; they included a better-functioning labour markets, a better qualified workforce that should be able to contribute to technological evolution and adapt to it through new work organization systems, better jobs and better working conditions, and more effective policies to stimulate job creation and demand for labour.

The purpose of this article is to analyze the conditions of admissibility of State aid for employment from the perspective of its impact on the *general government* sector debt of EU Member States. The analysis of State aid should lead to the verification of two research theses. According to the first thesis, the Central and Eastern Europe countries approved and granted State aid for employment by far smaller amounts than the EU-15 Member States. Whereas the second thesis highlights that the amount of State aid provided by EU Member States should be negatively correlated with the size of *general government* sector debt of these countries. The connection between State aid expenditures and public debt in economic literature was never confirmed. The article offers an analysis of connection between State aid expenditures for employment purposes and *general government* sector debt using a linear regression model.

### ***1.1 State Aid for Employment***

From the economic point of view relating to State interventionism it ought to be noted that State aid can be a justified action mainly because of the social prosperity if free competition market mechanism does not bring satisfactory results (Biondi, 2013; Crafts, 2017). In this case, a well-planned State intervention may improve the allocation of production factors, reduce the irregularity in the market functioning and enable the achievement of common interest (Ferčič and Samec, 2014; Stöllinger, R. and Holzner, 2017). The major criterion for providing State aid should be rationality, which is the highest determinant of the admissibility of using the aid measures (Maurici and Sargent, 2015; Bumane, 2017). It results from the fact that in a market economy the competition is essential for the proper functioning of the market and protecting the interests of its participants (Pisapia, 2015; Popović and Caka, 2017). State aid should not violate it unless its violation will be compensated by positive market phenomena that were caused by providing the aid. With the use of the aid instrument the State realizes the objectives that are considered a priority for socioeconomic development (Tunali and Fidrmuc, 2015).

Legal regulation of the issue of State aid is an element of protection of the mechanism of competition, which has been recognized in the Treaty on the Functioning of the European Union (TFEU, OJ 2016 C 202/47) as one of the basic tools for the realization of the tasks assigned in it. The general prohibition of providing State aid has been formulated in Article 107 par. 1 TFEU, whereas this provision does not specify the definition of State aid, but indicates the criteria taken into account when assessing the specific actual circumstances (Podsiadło, 2016). Many forms of State intervention to support employment will not constitute State aid, particularly where assistance is granted to individuals, rather than undertakings, or where support is provided through general measures. In some circumstances, however, the promotion of employment and the funding of training programmes may trigger State aid, for example where the State provides or supports training and employment for specific sectors or enterprises.

#### ***1.1.1 Legal Basis - Guidelines and Block Exemptions***

In 1995 the Commission published guidelines on aid to employment (Guidelines, 1995), which set out the Commission's policy in this area. A number of subsequent guidelines were issued by the Commission providing further inside into the policy behind its State aid decisions regarding employment (Botta, 2016). These included a notice on the monitoring of State aid and reduction of labour costs (Notice, 1997) and a second set of guidelines on employment aid (European Commission, 2000). In 2002, pursuant to the Enabling Regulation (Council of the European Union, 1998), the Commission adopted a block exemption for certain types of aid for employment (European Commission, 2002), in particular schemes to encourage the creation of employment in deprived areas of the EU, and schemes promoting the employment

of disabled or disadvantaged workers (Ferri, 2015). The block exemption replaced the Commission's guidelines on employment aid and allowed Member States to award certain types of employment aid without the need for approval or prior notification to the Commission (Hölscher, Nulsch and Stephan, 2017). A further exclusion of State aid for employment from the notification rules was included in the General Block Exemption Regulation (GBER) (European Commission, 2008). The GBER Regulation provides a framework that allows Member States to provide aid targeted at creating jobs, increasing competitiveness and improving the environment without having to contact the European Commission. The GBER Regulation allowed Member States to grant aid to facilitate workers with disabilities or disadvantaged workers for another reason to find employment on the open labour market without first having to report this aid to the Commission. These provisions set a block exemption for three types of employment aid, i.e. aid in the form of wage subsidies for the recruitment of employees, aid in the form of wage subsidies for the employment of disabled workers, and aid to compensate for additional costs related to employment of disabled workers. As from 1 July 2014, a new regulation came into force – with a perspective until the end of 2020 - it excluded certain horizontal aid categories from the notification procedure to the Commission (European Commission, 2014). The regulation underlined that supporting the recruitment and employment of disadvantaged and disabled workers are extremely important goals of the economic and social policy of the Union and its Member States (Nicolaidis and Schoenmaekers, 2015). Therefore, public authorities may take measures to encourage enterprises to increase the employment levels of these categories of workers, especially young people. Thus, three categories of employment aid introduced by the GBER regulation were maintained.

## 2. Problem Formulation and Methodology

State expenditure policy, which includes the policy of State aid to enterprises, can boost GDP growth and increase GDP *per capita* (which means the national economy is becoming more competitive) even if the State spends more money than it has accumulated in the budget. This portends the appearance of budget deficits, the accumulation of which in the coming years leads to the formation of *general government* sector debt. Deficits and the public debt that attends them are financed through domestic monetary savings or foreign ones. The State accomplishes this process by taking a loan in the form of debt securities, which are bought by banks, investment funds, insurance companies and the like - that is, institutions that accumulate the monetary savings of entities participating in the economy, mainly households. Fiscal policy therefore plays an important role in economic growth, especially when enterprises and commercial banks won't support real economic processes (investment processes) and economic growth: the refusal happens for various reasons, including an increased risk of capital loss is among them. The savings accumulated in commercial banks and other financial institutions are thus borrowed by the State, which creates the demand for consumer goods and investment goods, consequently stimulating the processes of economic growth.

The level of *general government* sector debt is useful information not only in studying the sustainability of public finance resulting from the weight of burdens with service costs in the short term. It also shows the implementation of the redistribution-intergenerational function: where the growing public debt in the current period may result in the instability of public finance for future generations. In the article as a test period the years 2000-2016 were adopted, i.e. the period of implementation of the two most important development strategies of the European Union - the Lisbon Strategy and the "Europe 2020" Strategy (taking the year 2016 as the closing period of observation was due to the available annual data on State aid, which is published by Eurostat). The thesis was accepted that the amount of State aid provided by

EU Member States should be negatively correlated with the size of *general government* sector debt of these countries. The response variable (dependent variable Y) is the size of *general government* sector debt, while the explanatory variable (independent variable X) is the expenditure on State aid for employment. The negative correlation of the size of *general government* sector debt with the amount of State aid for employment would mean that with the increase of such State aid there should be the decrease in the debt of the public finance sector of EU Member States providing such aid.

Statistical analysis will be carried out based on two source tables.

The first shows the calculations for the linear regression model concerning the slope parameter (directional factor  $\beta$ ). t Stat is a test of the occurrence of a linear relationship between expenditures on State aid for employment and the size of the *general government* sector debt. This statistical test makes it possible to verify the authenticity of the null hypothesis that the parameter of regression function I type  $\beta$  is equal to zero, and the alternative hypothesis that it is not equal to zero ( $H_0: \beta = 0; H_A: \beta \neq 0$ ). The acceptance of the null hypothesis that parameter  $\beta = 0$  would mean that the increase in the value of expenditure on State aid by €1 does not cause any changes in the size of the *general government* sector debt. This in turn means the lack of a relationship between expenditure on State aid and the size of the *general government* sector debt. In other words, the acceptance of the null hypothesis means the lack of the influence of the State aid for employment provided by the Member States of the European Union on the size of their *general government* sector debt. Given the perspective taken in this paper, it will be essential to reject the null hypothesis in favor of the alternative - that is, there is a significant statistical relationship between expenditure on State aid and the size of the *general government* sector debt. From the tables of critical values of t-Student it is seen that  $\pm t_{\frac{\alpha}{2}} = \pm 2.1315$  for  $\alpha = 0.05$  and  $n - 2 = 15$  degrees of freedom. The null hypothesis can be rejected in favour of the alternative hypothesis only when  $t_b < t_{\frac{\alpha}{2}}$  or  $t_b > t_{\frac{\alpha}{2}}$ , that is when  $-t_b < -2.1315$  or  $+t_b > +2.1315$ . The  $p$ -value is the probability of making a type I error. This would involve, based on the results of the test, the rejection of the hypothesis that the value of parameter  $\beta$  is zero, when in fact it is zero in the entire population. In other words, a type I error is a rejection of a real null hypothesis. The higher the value of the t-test means, the lower the probability of a type I error occurring. In general, it is assumed that if the  $p$ -value is less than 0.05, the null hypothesis can be rejected in favour of the alternative hypothesis, and thus it can be claimed that there is a statistically significant relationship between the expenditure of EU Member States on State aid for employment and the size of the *general government* sector debt of these countries.

The second table contains regression statistics, including the correlation coefficient, determination coefficient, standard error and the parameters of the F test - that is, the value of F-test and the probability of making a type I error, when it is verified that expenditure on State aid does not impact the size of the *general government* sector debt (the irrelevance of State aid expenditure in the regression model). Similar to the t-test described above, the F-test is used to test the significance of linear regression coefficient  $\beta$  evaluation. Statistic F with F-Snedecor distribution of  $k_1$  and  $k_2$  degrees of freedom is used to check this test. When rejecting the null hypothesis  $F > F_{\alpha}$  of no relation between expenditure on State aid and the size of the *general government* sector debt and accepting the alternative hypothesis of the existence of a statistically significant relationship between the variables. From the table of critical values of the F-Snedecor for  $k_1 = 1$  (1 independent variable) and  $k_2 = n - 2 = 15$  degrees of freedom and  $\alpha = 0.05$  we read  $F_{0,05} = 4.543$ . Thus, the alternative hypothesis can be adopted only when  $F > 4.543$ .

## 2.1 Model and Data

Member States granted aid earmarked for employment of about €43.7 billion in 2000-2016: EU-15 - €31.6 billion, EU-12 - only €12.1 billion (Eurostat, 2018). The largest amounts of employment aid have been granted by Denmark (€15.7 billion), Italy (€4.2 billion), France (€3.9 billion), Belgium (€1.7 billion) and United Kingdom (€1.4 billion). In the Central and Eastern Europe area the countries that provided the greatest employment aid are Poland, Hungary and Slovenia - respectively €8.9 billion, €2.1 billion and €0.7 billion.

Does State aid for employment provided by Member States to enterprises have an adverse effect on the condition of their public finance, leading to a decrease or increase in the size of the *general government* sector debt of these countries? Or does such aid not have any impact on the *general government* sector debt? Answers to these questions will be provided by the regression analysis.

### 2.1.1 Model Calibration

The most important statistical test in the simple regression analysis is a test of whether the regression coefficient equals zero. If it can be concluded that the directional coefficient of the real regression line in the population equals zero, it will mean that there is no linear relation between expenditure on state aid and the size of *general government* sector debt, or expenditure on State aid and the size of *general government* sector debt are not linearly dependent. Therefore, there should be a test to determine the occurrence of the linear relation between expenditure on State aid for employment in the Member States and the size of their *general government* sector debt. Table 1 shows the statistics on this test.

The calculations in table 1 indicate that 11 Member States have a linear relationship between expenditure on State aid for employment and the size of *general government* sector debt.

Only in the case of Austria, Germany and Ireland, the regression coefficient takes a negative value. Consequently, the increase in expenditure on State aid by €1 is accompanied by a decrease in *general government* sector debt by an average of (by country): €3979.33, €7742.69 and €2882.27. Margin of error is: €636.34, €2067.04 and €487.45. Bearing in mind, however, the confidence interval for the regression coefficient, it is nearly certain (95% probability) that an increase in State aid of €1 will cause general government sector debt to fall in the following countries: Austria from €2623.01 to €5335.65, Germany from €3336.90 to €12148.50 and Ireland from €1843.30 to €3921.24.

For Belgium, Estonia, Finland, Latvia, Lithuania, Malta, Poland and Slovenia the regression coefficients take positive values. This means that expenditures on employment aid have a positive impact on the state of public finance for these countries. An increase in expenditure on State aid by €1 is accompanied by an increase in the size of *general government* sector debt, by an average of, respectively, €799.42, €397.19, €1096.97, €3477.56, €821.45, €241.38, €190.86 and €214.26. Estimation errors are respectively €264.47, €166.19, €319.23, €1015.18, €58.04, €92.11, €35.19 and €37.60. Taking into account the confidence interval for the regression coefficient, it is a near certainty (95% probability) that an increase in expenditure for State aid of €1 million will raise *general government* sector debt by the value of the interval (€235.72; €1363.12) for Belgium, (€42.96; €751.42) for Estonia, (€416.54; €1777.39) for Finland, (€1313.76; €5641.36) for Latvia, (€697.74; €945.16) for Lithuania, (€45.06; €437.70) for Malta, (€115.85; €265.86) for Poland and (€134.12; €294.41) for Slovenia.

For these countries, the probability of making a type I error is very small, and does not exceed the accepted level of significance of 0.05. Such an error would be connected with the rejection

of a real null hypothesis concerning the lack of a correlation between the size of the State aid for employment and the size of *general government* sector debt.

**Table 1: State Aid for Employment and General Government Sector Debt – Analysis of Variance: the Line "Variable X"**

EU Member State	Regression coefficient $b$	Standard error $S_b$	$t$ Stat $tb$	$p$ -value	Lower 95%	Upper 95%

Source: The author's own calculations

Analysis of the value of the test F (greater than 4.543) and F significance (lower than 0.05) bears out the hypothesis. Table 2 lists the test F parameters and regression statistics for the relationship between the size of State aid and the size of *general government* sector debt in EU countries.

For both Austria and Ireland, there is a strong and negative correlation between employment aid granted to undertakings and the amount of the countries' *general government* sector debt: 0.850158 and 0.836528, respectively. These models have a good fit to the empirical data, as their coefficient of determination comes out to 0.722768 and 0.69978, also respectively. 72.28% and 69.98% of the variations in *general government* sector debt in these countries were attributed to variations in expenditures on State aid for employment, while the remaining 27.72% and 30.02% resulted from the impact of other factors.

**Table 2: State Aid for Employment and General Government Sector Debt - Regression Statistics and F-test**

Source: The author's own calculations

For Germany, the value of the correlation coefficient is 0.695204. This country exhibits a medium negative relationship occurring between the amount of State aid and the level of its *general government* sector debt. Moreover, the regression line cannot be satisfactorily adjusted to the empirical data. The determination coefficient for Germany is lower than 0.50.

Lithuania shows a very strong and positive correlation between State aid for employment and the size of *general government* sector debt. The correlation indicator is 0.964538. With Lithuania's determination coefficient at 0.930333, this model has a very good fit to the empirical data. 93.03% of the variations in the size of the government's *general government* sector debt were attributed to variations in expenditure on State aid, while the remaining 6.97% were the result of other factors (other non-aid variables, imprecise fit of a straight line to the empirical data). If the coefficient of determination takes values of less than 0.5, the regression explains only less than 50% of the variation in *general government* sector debt and predictions based on such a regression model may be unsuccessful because the model then explains very little. This means that predictions can be created based on the Lithuanian model, because the

regression model is characterised by a very good fit and is not burdened much by the estimation error, which provides grounds for precise forecasting.

At 0.813811 and 0.827065, respectively, Poland and Slovenia all show a strong positive correlation between the amount of State aid provided and the level of *general government* sector debt. However, the determination coefficients have a very low value - 0.662289 and 0.684036.

In the case of Belgium, Estonia, Finland, Latvia and Malta, the values of the correlation coefficient are included in the interval (0.525145; 0.663676). These countries demonstrated a weak and medium positive relationship between the amount of State aid they provided and *general government* sector debt. Moreover, the regression line cannot be adjusted to the empirical data to a satisfactory degree. The determination coefficients for these countries are: 0.37855, 0.275777, 0.440466, 0.438928 and 0.314064.

### 3. Discussion

From the point of view of the regression analysis carried out in the area of the condition of public finances, the case of Lithuania, Latvia and Estonia is very interesting. The Baltic countries since the accession in 2004 to the European Union were characterized by a high rate of economic growth. Until 2007, high GDP growth in nominal and real terms, an increase in the number of employed and employment rates, a decline in unemployment, stabilization of prices, increase in final demand and private and public consumption caused that the development process of the Baltic countries economies was called the "Baltic miracle", and the countries - "Baltic tigers". As a result of the global financial crisis, the intense economic development of the Baltic countries has been halted. The consequences of the slowdown and the recession were particularly felt on the labour market, which was confirmed by the increase in the unemployment rate. In the public finance sector, it was necessary to take consolidation measures to reduce the budget deficit and public debt. The consolidation structure in the Baltic countries was very similar, as more than two-thirds of the reduction in the budget deficit constituted cuts in expenditures, mainly current ones. Thus, increasing public aid expenditures must ultimately lead to an increase in public debt – as demonstrated by the regression analysis carried out. Cuts in expenses were of a different scale and depended on the extent to which the economy was affected by the crisis. The smallest were in the case of Estonia, whose recession did not prevent the euro adoption in 2011. In the case of Lithuania, it was necessary to undertake a more radical expenditure consolidation, which resulted from the existing legal regulations, according to which any change in the Lithuanian tax law should be announced at least six months before the introduction, which prevented quick implementation of changes in tax rates. Latvia had the most difficult economic and fiscal situation, which required the application of extremely radical adjustment measures and the acquisition of 7.5 billion euro of foreign aid from the International Monetary Fund, the World Bank and the Scandinavian countries.

### 4. Conclusion

In relation to the proposed research theses in the paper it also should be concluded that:

1. The first thesis, according to which the Central and Eastern Europe countries approved and granted State aid for employment by far smaller amounts than the EU-15 Member States, were positively verified.

2. The second thesis, according to which, both in relation to the European Union and its individual Member States, the amount of expenditure on State aid for employment is negatively correlated with the size of *general government* sector debt of these countries, should be rejected. It was incorrect to assume that this correlation occurs for all Member States, because of the amount spent on State aid for employment to undertakings are very different at the level of individual Member States. Different is also the proportion of aid actually granted in the aid approved by the European Commission.

Summing up the considerations on the impact of State aid for employment on the indebtedness of EU Member States, it is worth adding that certain categories of disadvantaged workers and workers with disabilities still experience particular difficulties in entering and remaining in the labour market. For this reason, public authorities may apply measures providing incentives to undertakings to increase the levels of employment of these categories of workers, in particular of young people. As employment costs form part of the normal operating costs of any undertaking aid for the employment of disadvantaged workers and of workers with disabilities should have a positive effect on employment levels of those categories of workers and should not merely enable undertakings to reduce costs which they would otherwise have to bear. Consequently, such aid should be exempted from the notification requirement when it is likely to assist those categories of workers in entering or re-entering and remaining in the job market.

### **Abstract**

*In 2016, the level of unemployment in the EU-28 reflected the end of the crisis with an 8.5%. However, despite the European economic recovery, quantified by the stabilized unemployment rate and a GDP growth, the European poverty rate did not stop increasing since 2007. Thus, European Governments face a new uncertain but dramatic social phenomenon enhanced by the so-called European “gig economy” characterized as a race to the bottom in wages and labour rights bringing the impoverishment of workers.*

*The symptoms of this European pandemic are numerous such as the youth unemployment ratio of 20.9% in 2016; the deterioration of the European welfare system; the constant decrease of permanent fixed contracts and the incessant growth of temporary or involuntary part-time contracts combined with the false self-employed have caused a huge tide of precarious.*

*In this paper, firstly we identify the drivers that explain the emergence of the precarious population in Europe but we also build a compartmental discrete model to explain the growth of the precariat in the coming years for the case of Spain.*

**Keywords:** European “gig economy”, European poverty rate, European precariat, forecast, model

**JEL Classification:** C30, C63, I32

### **1. Introduction**

Last economic crisis started in August 2007 in United States spread throughout the world producing the European governments were not capable to maintain the level and quality of employment combined with the state of citizenship well being.

For the particular case of Spain, the level of youth unemployment is extremely high, wages have dropped considerably, University degrees are not balanced with salaries, labour stability has almost disappeared, pensions lost purchasing power, the population ages, losing citizens in during the last two years. Young people can not become independent at a reasonable age, nor do they think about having children and forming a family, (Standing, 2012; 2014).

In addition to the domestic issues experienced by European countries, Governments have to deal with migrants and refugees, secessionist problems, and the real threat of initial job

destruction from the impending Internet of Things economy, robotization and digitalization that will initially destroy a significant number of jobs.

It seems that, the economic effects of the crisis along with the low-cost labour competition of Asian countries, will continue to deteriorate European economies, and Spanish in particular. Macroeconomic growth does not translate into a real improvement of the employees and underemployed, and much less of the unemployed who are heading towards a horizon of poverty without solution.

For the particular case of Spain, the last Spanish governments have not been able to adapt the prevailing capitalism to distribute the benefits derived from the macroeconomic improvement. As a result they were not capable to transfer the economic improvement to the citizens. Governments do not want to regulate the markets, or interfering in the firms' managerial accounting what would result into policies about how firms must manage their performance and how they should distribute their results. Indeed, firms are used to pay low-level wages, (Srnicek, 2007). This fact has a long-term lethal effect for the maintenance of pensions because low contributions make it difficult to pay the future pensions of future generations, (Nachtwey, 2017). In addition, the average expectancy age increases annually, and because of this the volume of pensions and the public healthcare expenditures does too while the retirement age has not been delayed yet or at least in the same proportion.

Given this situation, it is natural that new parties, sometimes populist and extremist, across Europe find an important niche of electoral support that can threaten European unity.

The reaction of the marginalized, which are very large sections of the population, unemployed, temporary and partial workers, pensioners with insufficient pensions, is leading to the birth of the so-called collaborative economy (Bostman and Rogers, 2011), sharing flats, cars and substituting the paradigm of ownership for sharing, (Rifkin, 2011; Goldthorpe, 2016). Prior to the last crisis, the so-called middle class, decreased in a large proportion.

In this context the precarious citizen is defined as the adult who does not have a quality of income to become independent, or if s/he does, with the ability to make plans in the medium term, with a satisfactory state of well-being, (Barbieri, 2009).

In this paper, we propose a dynamic mathematical model to show how the precarious population will continue growing in Europe in the coming years. The proposed model is built for the particular case of Spain but it is applicable to any European country when data is available. The approach used in this paper has been recently considered when dealing with other social problems (De la Poza and Jódar, 2016; De la Poza *et al.*, 2016; 2017). Thus our compartment model (De la Poza *et al.*, 2017) measures the amount of the Spanish population by their degree of risk to become precariat over time. The relevance of this study relies on reporting the problem to public authorities responsible for addressing policies to stop this trend (Benach, *et al.*, 2014). Otherwise, future European generations will face dramatically the consequences of this social problem.

## **2. Problem Formulation and Methodology**

Undoubtedly, it is interesting to quantify the magnitude of the problem, that is, the amount of precarious people. On one hand, it is not expected the population composed of precarious citizens supports the "establishment" system. In Spain, the establishment embraces two parties that since 1978 have alternately divided up the Spanish government, that is, the Spanish socialist party (PSOE), and the conservative or popular party (PP). It is expected that the new

emerging parties such as Ciudadans and Podemos capture a large proportion of the electoral register, which was voting the two major parties only a few years ago (Rivero *et al.*, 2017).

In this work we propose a dynamic discrete model by firstly identifying the compartments in which the Spanish population is split at the initial time of the study (December 2017); secondly the drivers that determine the transits between subpopulations are identified; thirdly the transits between subpopulations are drawn.

The main contribution of this study consists of proposing a theoretical model by identifying and discussing the compartments/subpopulations and drivers that will let us quantify the size of the precariat population with the available data. The period of study must be short (December 2017 to December 2020), otherwise the hypotheses are not reliable. This model has been built by the researchers and previous applications of these type of epidemiological models have been previously applied to social problems such as De la Poza *et al.*, 2016 and De la Poza *et al.*, 2017.

## 2.1 Model and Data

In this paper we provide a dynamic population model (Haddad *et al.*, 2002) to analyse the size of the alarming social problem of population who lives in precarious condition. In order to quantify the size of the precarious population the first step consist of defining the concept of precarious. For this purpose it is necessary to understand that the term precarious implies a status quo. Individuals do not choose to be precarious, but the combination of factors affecting their life results into their transit to higher or lower degrees of precariat.

In fact, the population over 18 years old of a country can be split into 6 categories or subpopulations. Thus, our model is a compartment one (Haddad *et al.*, 2002) classifies and quantifies the population of a given country from 18 years old by their degree of precarious standard of life risk and their changes over time. We agreed with Sulich (2016) about youth's and young people's unemployment is a multidimensional problem, related to education, labour market, and demographic changes such as migration. However, the precarious situation does not only strike youth but also the overall population.

The proposed model is dynamic, that means the individuals may transit among categories. The intercompartmental transits are due to several reasons: demographic, labour stress, emotional stress, social contagion, drugs and alcohol abuse, technology, (De la Poza *et al.*, 2017; 2016). For building the model, the country of Spain has been considered in order to determine the sources of information required. However, the study can be applied to any European country.

Thus, the 6 categories to classify the Spanish population according to their level of precariat are:

L (n)=L: leisure people. It represents the population over 18 years old that is idle (lives on income) or is retired with sufficient income in the nth semester after December 2017, which corresponds to the initial time,  $n = 0$ . This population is assumed to remain constant for the period of study (Spanish Statistics Institute, 2016).

PL (n): professional training students, also university students (Bachelor and Master students) who are older than 18 years old. This category includes those people who will embrace the job market after they graduate or they already are part-time workers (in Spain this proportion is 30% part-time workers, OECD, 2018).

E (n): entrepreneurs. It represents the population of authentic entrepreneurs, in front of the false self-employed, who, forced by the gig economy are forced to be self-employed, so that

the companies of the capitalist platform can avoid the payment of social expenses (Spanish Statistics Institute, 2016).

F (n): fixed employed people. This category represents employees with permanent contracts, which include civil servants, public employees and employees of large corporations belonging to different sectors of activity such as banks, successful retail chains and commercial brands (Spanish Statistics Institute, 2016).

P (n): precarious people. It includes a large population of false self-employed workers, non-registered household workers, all types of temporary and part-time employees (excluding those who are students at the same time, 30%, OECD, 2018), pensioners with insufficient pensions and unemployed people.

The last category embraces the marginalized population, M (n), which includes marginalized sectors such as gypsies, refugees and undocumented immigrants, convicted prisoners (Spanish Statistics Institute, 2016).

Starting from an approximate initial population in December 2017, corresponding to  $n = 0$ , the initial population of each subcategory is calculated.

As it was said before, these populations may vary continuously (with the exception of the leisure category,  $L(n)=L$ , that is considered constant for the period of study), from semester  $n$  to semester  $n+1$ , and they do so by addressing several factors, which are enumerated as follows:

1. Demographic factor: population changes due to their entry or exit in the system. Thus, they entry in the system when they become 18 years old and they exit the system when they die. In addition, this factor considers the net migration balance resulting from subtracting those who immigrate to the country less those who emigrate (Spanish Statistics Institute, 2016).
2. Economic factor: the level of incomes received and the type of contract produces the transit of population between categories. This factor is measured in terms of the percentage of unemployment population (Spanish Statistics Institute, 2016).
3. Work Stress factor: it expresses the stress suffered by the labour conditions of workers who can be afraid of losing their jobs but they even can be victims of mobbing. This factor is quantified by the temporary contracts but also by the proportion of population suffering from mobbing (Spanish Statistics Institute, 2016).
4. Emotional stress factor: it is defined as the stress suffered by experiencing the loss of a close relative or a friend. This situation can derive into the transit of the person from one category to another (De la Poza *et al.*, 2016).
5. Alcohol and Drug Consumption factor: this factor collects the impact of alcohol and drug abuse of individuals, (De la Poza *et al.*, 2016).
6. Technology, motivated by robotization, digitalization and internet of things. The technology revolution is producing the massive replacement of works by robots.

Demographic data are obtained from the Spanish Institute of Statistics. The data of precarious pensioners and unemployment comes from the Spanish Office related to social issues but also from the Spanish Institute of Statistics. The other transit coefficients are built from different sources.

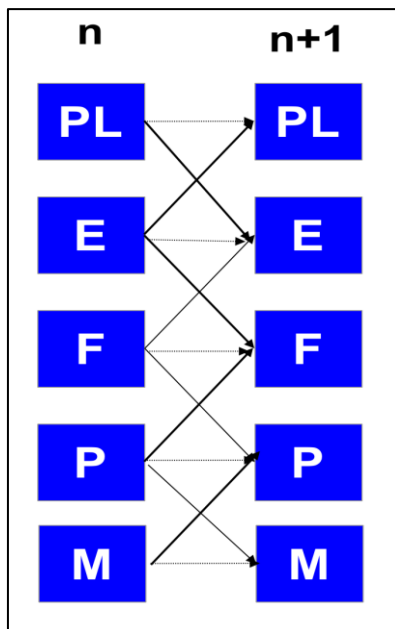

### 3. Problem Solution

The proposed model is a system of equations in difference that let us compute the value of each subpopulation at semester  $n$ . The variation of the size of each subpopulation by semester is explained by the shifts among subpopulations. These movements can be quantified according to the transit coefficient built.

It is important to remark that a transit coefficient measures the proportion (or probability) of transit from the origin compartment subpopulation to move to the destination compartment subpopulation. So transit coefficients take values within the interval  $(0, 1)$ . The construction and estimation of transit coefficients is based on the hypotheses made mainly and according to information provided by Spanish Statistics Institute, (2016).

Considering the variation of these subpopulations, block diagram is presented

**Figure 1: Block Diagram,  $n$  Denotes Semester.**

The general expression of the model is:

$$PL(n+1)-L(n) = -\alpha_i(n) \cdot PL(n) + \beta_{ii}(n) \cdot E(n) + b_1$$

$$E(n+1)-E(n) = -\alpha_i(n) \cdot E(n) - \beta_{ri}(n) \cdot E(n) + \beta_{ii}(n) \cdot F(n) + \alpha_i(n) \cdot PL(n) + b_2$$

$$F(n+1)-F(n) = -\alpha_i(n) \cdot F(n) + \alpha_i(n) \cdot E(n) - \beta_{ri}(n) \cdot F(n) + \beta_{ii}(n) \cdot P(n) + b_3$$

$$P(n+1)-P(n) = -\alpha_i(n) \cdot P(n) + \alpha_i(n) \cdot F(n) - \beta_{ri}(n) \cdot P(n) + \beta_{ii}(n) \cdot M(n) + b_4$$

$$M(n+1)-M(n) = -\alpha_i(n) \cdot M(n) + \alpha_i(n) \cdot P(n) - \beta_{ri}(n) \cdot M(n) + b_4$$

The coefficients  $\alpha_i(n)$  and  $\beta_{ri}$  express and quantify the transits among subpopulations PL, E, F, P and M.

In addition, the model relies on the one semi-annual jump principle, which assumes individuals transit at the most from one category to another during one semester period. Also, the transits can split into two types:  $\alpha_i(n)$  and  $\beta_{ri}$ ;  $\alpha_i(n)$  implies a jump to a higher risk category while  $\beta_{ri}$  means a jump to a lower risk category.

#### 4. Conclusion

The paper proposes a model that identifies and classifies the overall population of a country according to the level of risk of individuals to become precariat. The model is dynamic, that explains the subpopulations change over time. For this reason, the transits coefficients must be built based on hypotheses and data. The study identifies the drivers that determine the transit between subpopulations. One of the model's potential utilities is to diagnose the magnitude of this social problem. In addition, the model can be applied to any European country, when data is available.

Further result will let us quantify the initial subpopulations and the transit coefficients to measure the changes among subpopulations following the thinking of Michael Faraday: what is not measured is not controlled and cannot be improved (Fischhoff and Kadvaný 2011).

Finally, the results obtained by the application of the model can be useful as an input for public authorities to pay attention to this social problem and policies might be addressed on the relevant issues for guaranteeing citizens well being.

### **Abstract**

*In modern conditions the international integration processes act as pledge of the states' sustainable development, activization of investment cooperation, implementation of joint perspective projects. The emergence of new international economic integration organizations predetermines the need to rethink the patterns of development models of international economic integration processes, especially in the context of their impact on the economies of the participating countries. Economic studies show that the EAEU integration has exerted a beneficial effect on mutual trade. It encouraged the foreign investments and facilitated the development of particular industries. The aim of the paper is to evaluate of the potential and opportunities to boost an economic growth in the EAEU Member States. The authors created approach to study of international economic integration influence on development of EAEU members. Further collaboration of the Member States will create the opportunities for industry development, improvements in infrastructure, transportation, and logistics in frame of the Union. It also will facilitate the cooperation ties and, finally, raise the living standards.*

**Keywords:** *international economic integration, economic potential, economic growth, Eurasian Economic Union (EAEU), international economic integration influence*

**JEL Classification:** *C18, F02, F15, F36, F63*

### **1. Introduction**

Regional economic cooperation allows using wide range of integration tools to stimulate states' economic, social and technological development. The Eurasian Economic Union of the Republic of Armenia, the Republic of Belarus, the Republic of Kazakhstan, the Kyrgyz Republic, and the Russian Federation can be an example of such interaction.

Today regional integration in Eurasia has reached qualitatively new level. The Eurasian Economic Union is established on the basis of the Treaty on the Eurasian Economic Union dated May 29, 2014. The EAEU currently operates as an international organisation of regional economic integration and has the international legal personality (Pridachuk, Tolstel, 2016).

The Treaty on the EAEU identified the following key development goals: to create proper conditions for sustainable economic development of the EAEU Member States in order to

improve the living standards of their population, to seek the creation of a single market for goods, services, capital and labour force within the Union as well as to ensure comprehensive modernisation, cooperation and competitiveness of national economies within the global economy.

In order to achieve these goals an internal market of the Member States within the Union was created and agreed (coordinated) policies in key sectors of the economy are implemented.

Thus, the integration capacity of the Union in conjunction with the existing national sustainable development measures objectively contributes to the SDGs achievement by the Member States.

In particular, cooperation of the Member States in the regulation of labour migration within the Union contributes to a more efficient distribution of labour force, unemployment reduction as well as establishment of decent working conditions for citizens. Integration liberalisation of markets for goods, services and capital stimulates business development and increases public access to a wide range of services, including financial, thus contributing to the healthy competition.

At the same time, the existing differences in the levels of economic, scientific, technological and institutional development, as well as the degree of influence of internal and external challenges on the national economy, determine the specifics of the basic development measures implemented by each Member State.

The aim of the paper is to evaluate of the potential and opportunities to boost an economic growth in the EAEU Member States.

## ***1.1 Overview of the Economic Development' Dynamics and Present Status of the EAEU Members' Competitiveness***

### *1.1.1 The Eurasian Economic Union: Realities of the Member States Economies' development*

An analysis of the economic development of the Member States shows that when responding to the social and economic challenge by common areas of economic development and structural reforms in the period 2010-2015, were the maintenance of macroeconomic stability and the increased competitiveness of national economies. At the same time, the possibilities for transforming the existing structures of the Member States economies were limited, including due to turbulence in the world economy.

Over the past years, the most dynamic growth among the EAEU countries was in the economies of Armenia, Kazakhstan and Kyrgyzstan. The data of the economy through the implementation of stabilizing economic policies and less influence of unfavourable external conditions overcame the difficulties of 2014-2016 more confidently about Belarus and Russia. Compared with the world GDP, between two episodes of decline in economic activity (from 2009 to 2016), only two economies of the EAEU have exceeded the average world GDP growth rates: Kazakhstan and Kyrgyzstan. The low level of Armenia's GDP was due to a deeper economic decline in 2009 compared to the rest of the EAEU states. At the same time, there is a gap in the growth rates of the economies of Russia, Belarus and the world average growth rates. The weakest growth among the EAEU countries is demonstrated by the economy of Russia due to a double shock, the adaptation to which continues from 2014 (the sanction regime of the economy and the double drop in world oil prices).

Taking into account global economic changes, the first results of the EAEU functioning are very tangible: a good institutional shell has been created, the main barriers to the movement of production factors have been eliminated, and single markets have been formed. As a result, the tendency of convergence and improvement of individual indicators of social and economic development was manifested.

The correctness of the chosen integration direction proves the growth for 2010-2015 of the GDP of the EAEU at purchasing power parity (PPP) by 23.4% to 4247.6 billion US dollars, which is 22659 US dollars per capita (Table 1).

**Table 1: Gross Domestic Product per Capita by PPP (US dollars)**

	2005	2010	2015	2017
<b>Armenia</b>	4716	6376	8419	9006
<b>Belarus</b>	8639	16929	18223	18349
<b>Kazakhstan</b>	14259	19690	24727	25942
<b>Kyrgyzstan</b>	2110	2734	4350	3670
<b>Russia</b>	11822	20498	23703	27466
<b>EAEU</b>	11508	19443	22659	26256

Source: IMF (2017)

The tendency of economic development level' equalization among the Member States of the EAEU was observed: the gap in the GDP per capita by PPP among the EAEU Member States: decreased from 7.67 times in 2010 up to 7.56 times in 2015, and in GDP per capita - from 11.6 in 2010 to 9.1 in 2015.

An essential change in the foreign trade of the Member States in 2010-2015 is not to change the dynamics, but to improve its structure. In the structure of foreign trade, the share of services increased (from 11% in 2010 to 13.95% in 2015, in imports from 22.4% in 2010 to 29.15% in 2015). The outpacing rates of growth demonstrated final consumer goods in comparison with intermediate goods, which indicate an increase in the level of processing of the export products of the EAEU and the improvement of the exports structure from the EAEU. The share of hydrocarbon raw materials in the structure of exports declined from 54.3% in 2010 to 47.9% in 2015, and as a result, non-oil and gas exports by the end of 2015 accounted for more than half of the total export of EAEU Member States' goods.

Also positive results of the foreign trade development of the EAEU Member States are confirmed by the improvement of their positions in the Index of the countries' involvement in the international trade of the IEF. Mutual foreign direct investment following the results of 2014 showed growth and a fairly even distribution (the share of the Russian Federation decreased, and the shares of the Republic of Belarus and the Republic of Kazakhstan grew) (Table 2).

Regarding the response to the social and economic challenge, it should be noted that the potential of the EAEU is still not being implemented sufficiently. As a consequence, the expectations of business and citizens from the fact of the establishment of the EAEU, related to its role in modernizing the economies and improving the quality of citizens, remain unrealized.

### 1.1.2 The Global Competitiveness Index and Assessing Progress Toward the EAEU' Sustainable Growth

The Global Competitiveness Index has been used as an important tool by policymakers of many countries over the years. Since its first publication in 2005, the Global Competitiveness Index (GCI) has been used by the World Economic Forum to assess the level of productivity of an economy, which determines its long-term growth potential.

**Table 2: Direct and Mutual Investments to the EAEU Member States (During the Reporting Period)**

	2010	2014	2015
Direct investments to the EAEU Member States, million US dollars, including:	<b>52984</b>	<b>31870</b>	<b>15902</b>
Mutual investments to the EAEU Member States, million US dollars, including into:	<b>858</b>	<b>1818</b>	<b>2106</b>
<b>Armenia</b>	5	109	130
<b>Belarus</b>	934	617	736
<b>Kazakhstan</b>	-225	485	214
<b>Kyrgyzstan</b>	76	148	513
<b>Russia</b>	68	460	513
Share of mutual direct investments in the total direct investment of the EAEU, percent	1.6	5.7	13.2
<b>Armenia</b>	0.9	26.8	73.1
<b>Belarus</b>	67.0	33.1	44.5
<b>Kazakhstan</b>	-3.0	6.7	3.3
<b>Kyrgyzstan</b>	17.4	42.6	44.9
<b>Russia</b>	0.2	2.1	7.9

Source: Eurasian Economic Commission (2017)

This open-endedness is captured within the GCI by including a weighted average of many different components, each measuring a different aspect of competitiveness. The components are grouped into 12 pillars of competitiveness: Institutions; Infrastructure; Macroeconomic environment; Health and Primary education; Higher education and Training; Goods market efficiency; Labour market efficiency; Financial market development; Technological readiness; Market size, both domestic and international; Business sophistication; Innovation (World Economic Forum (2016)).

**Figure 1: The Global Competitiveness Index: the EAEU Countries' Review (Period 2007-2016)**

Source: own elaboration on the basis of the Competitiveness Dataset (2016)

Figure 1 shows changes in the positions of The GCI ranking. According to the Index, the EAEU countries' competitiveness increased very little compared to the preceding year. At the time of writing, the Russian economy continues to face many deeply rooted challenges that will have to be addressed for the country to strengthen its competitiveness. It is reflected not only on the Russian economy, but also on the EAEU economies, instantly depriving them long-term growth potential (Tolstel, Pridachuk, 2016).

## **2. Methodological Approach to Assessing the Dynamics of Economic Activity in the EAEU Member States and its Short-Term Prospects**

The EAEU Member States passed the phase of economic activity recovery. It is expected that its positive dynamics will continue in the short term, as evidenced by the concurrent and outrunning indicators calculated by the Department of Macroeconomic Policy of the Eurasian Economic Commission. The growth of the level of economic activity is expected in the economies of Armenia, Belarus and Kyrgyzstan. At the same time, the growth rates in Belarus are approaching the growth rates of the fast growing economies of the Union, among which Armenia occupies a leading position. In Kazakhstan and Russia, economic activity will be at a level close to the current values (Eurasian Economic Commission, 2017).

### **2.1 Model and Data**

The Consolidated Convergent Indicator (CCI) and the Consolidated Lead Indicator (CLI) are calculated by the Department of Macroeconomic Policy of the Eurasian Economic Commission for Armenia, Belarus, Kazakhstan (jointly with the Institute for Economic Research under the Ministry of National Economy of the Republic of Kazakhstan), Kyrgyzstan and Russia in accordance with the methodological approaches developed based on the recommendations of the OECD.

Both indicators (CCI and CLI) are measured in percentage points. As a conditional level, a value of 100 percentage points was adopted, corresponding to the average value of each indicator for the entire observation period (since January 2000). Calculation of indicators is carried out monthly. In addition, the accuracy of the indicators is periodically checked, and if necessary, the indicators are adjusted, on the basis of which the indicators are calculated (calibration is performed).

CCI characterizes the current dynamics of economic activity and is built on the basis of indicators published on a monthly basis and characterizing the development of economic activities that have the most significant impact on economic development. Economic activity is defined as medium-term GDP fluctuations that are not seasonal, around a long-term trend. Given the latest calibration for countries for which there is no monthly GDP data, they are:

Armenia: the volume of industrial production, the retail turnover, the volume of paid services provided to the population, the volume of investment in fixed assets, the volume of agricultural production;

Kazakhstan: the volume of industrial production, the retail turnover, the volume of construction, the output of agricultural products;

Russia: the volume of industrial production, the retail turnover, the volume of investment in fixed assets.

Data on GDP were used as CCI for Belarus and Kyrgyzstan due to the availability of their publications on a monthly basis.

CLI characterizes short-term prospects for the dynamics of economic activity (an average of 2-3 months) and allows to making a conclusion about the expected growth (positive or negative) of economic activity or about the absence of changes. The conclusion is made on the basis of the change in the value of the CLI in recent months: the repetition of the sign "+" or "-" for three consecutive months or alternating the corresponding sign with "0" for 5 months shows the presence of a trend. In other cases, the situation is interpreted as the absence of a trend of changes in economic activity. CLI is calculated on the basis of a leading indicators set, which are periodically (usually 2 times a year, but if necessary quarterly) selected according to the procedure fixed in the methodological approaches.

Table 3 shows the dynamics of economic activity in the EAEU Member States and its short-term prospects.

**Table 3: The Dynamics of Economic Activity in the EAEU Member States and its Short-Term Prospects**

EAEU Member States	GDP growth	CCI	CLI			Expected Trend until February 2018
	January – November 2017 (approximation)	November 2017	November 2017	change in the last 6 months	change in the last 3 months	
Armenia	+6.1	100.7	100.3	+0.4	+0.3	Economic Activity Increase
Belarus	+2.2	101.0	100.8	+0.8	+0.5	Economic Activity Increase
Kazakhstan	+3.9	98.8	100.3	-0.1	+0.1	Economic Activity Stabilization
Kyrgyzstan	+4.0	99.8	101.5	+1.3	+0.5	Economic Activity Increase
Russia	+1.4	100.0	100.4	+0.1	+0.1	Economic Activity Stabilization

Source: Eurasian Economic Commission (2017)

## 2.2 Factors of Risks

The risks of the Member States economic growth are due to external and internal factors. At the same time, after a decline in world oil prices and their stabilization within the conditional corridor (40-60 US dollars per barrel), the risk of a new sharp decline in oil prices below 40 US dollars per barrel is unlikely. The budgets of the Member States for the medium term were adopted on the basis of the minimum level of oil prices. At the same time, the expected tightening of monetary policies of the FED and the ECB can significantly affect the state of the external balances of the EAEU states in view of the possible outflow of capital.

Internal risks of the sustainable development of Member States are associated with low consumer and investment activity and the prevalence of unfavourable expectations about their future dynamics (Klenow, Rodriguez, 1996). The worsening of the external economic situation in recent years, the decline in living standards, the active measures of economic policy, in terms of limited growth in budget expenditures, and the persistence of high interest rates, have led to a deterioration in the expectations of economic agents. Decrease in households' demand in a number of the EAEU countries is caused by a decrease in real incomes of the population,

a decrease in investments in fixed assets - unfavourable expectations of economic agents (Gertler, 1988). Taking into account the planned measures to consolidate the budgetary policy in all the countries of the EAEU, the support of domestic demand from the budget funds will decrease, which creates high risks of maintaining weak domestic demand.

Maintaining relatively high interest rates by central (national) banks of the EAEU states in order to reduce both inflation levels and preserve the attractiveness of assets in national currencies (overcoming high dollarization) contain the risks of limiting GDP growth, and in case of premature policy mitigation they will contribute to outflows of capital from the EAEU countries (Rajan, Zingales, 1998).

### **3. Problem Solution**

The potential of economic integration between the Member States is determined by the following factors.

Firstly, the potential growth of mutual trade will be ensured by gradual elimination of non-tariff barriers, exemptions.

Secondly, the development of manufacturing variety, new value added chains, as well as infrastructural, industrial, innovative, and other integration projects will promote an export growth and import substitution from the third countries.

Thirdly, the integration will lead to the “economies of scale” effect (Ross, 1998).

Fourthly, integration will attract extra foreign direct investments (FDI) both mutual and from the third countries. Profitability of the FDI will be achieved mostly due to the large single market and the Member States’ competitive advantages.

Finally, the realization of integration potential will facilitate the multiplication effects in the certain sectors of economy such as transport, electric power, financial markets, but also in the sectors of economy, which benefit from the size of the market. Moreover, additional impulse for growth of new spheres will be based on intensification of mutual cooperation instead of competition on the common markets (Beck, Levine and Loayza, 2000).

The extra growth of the EAEU GDP as a result of integration measures is estimated near 2.9% by 2030 or 211.4 billion US dollars in current prices. Member States’ results of integration depend on the scale of economies: for the Republic of Belarus it will be the most significant +13.1% of GDP, for the Republic of Kazakhstan +10.4% of GDP, and for the Russian Federation +1.4% of GDP.

### **4. Conclusion**

As shown by the analysis of the impact of different economic integration levels within the Eurasian Economic Union on the socio-economic development of the participating countries, the potential for enhancing the economic effect of integration remains significant. It will increase due to the growth of mutual trade - its share remains significantly lower than in the EU and other regional associations, and through deepening integration, with the creation of the EAEU will cover not only market of goods but also the services market, labour and capital, which requires an appropriate institutional support (Pollack, 2001).

The expansion of the economic space greatly increases the potential of existing opportunities, which dramatically enhances the effect of the mentioned factors, differentiating and increasing their variability, this is especially important under the conditions of global instability. Further

collaboration of the Member States will create the opportunities for industry development, improvements in infrastructure, transportation, and logistics in frame of the Union. It also will facilitate the cooperation ties and, finally, raise the living standards.

## **Abstract**

*As an alternative to the Eurozone research, the purpose of the paper is to present the criteria of the classical optimal monetary areas theory as met by the Eastern Caribbean Currency Union, and to present the most important benefits and potential losses resulting from monetary integration in the above-mentioned region. An attempt was also made to answer the research question regarding the description of factors determining successful monetary integration under the ECCU. The success of the Union proves that having met the criteria of the classical theory is not always the main factor determining the success of monetary integration. Certain criteria met by the ECCU countries, together with their common history, geographical proximity and similar economies are sufficient to create an optimal monetary area, understood as an area in which the introduction of common currency brings more gains than losses.*

**Keywords:** *currency union, Eastern Caribbean Currency Union, monetary integration, optimal monetary area, optimal monetary areas theory*

**JEL Classification:** *F33, F36, F45*

## **1. Introduction**

There is no doubt that monetary integration constitutes a remedy to the problems related to the risk of fluctuations in foreign exchange rates, of crises and currency wars, as well as other dangers resulting from the imperfections of the contemporary international monetary system. However, as a result a country is deprived of its own monetary policy – an important instrument in its economic policy, especially when it comes to mitigating or preventing negative economic shocks. This is why candidates for, but also members of the currency union should monitor the economic criteria in the form of adaptation mechanisms, efficiently absorbing negative economic shocks or lowering the risk of such a shock occurring in the first place. They can also survey the economic costs and benefits of their participation in the union (Gyoerk, 2017, pp. 893–921).

In general, the literature on the subject identifies three approaches to the theory of the optimum currency area: exogenous, endogenous, and an analysis of costs and benefits of participating in a currency union (Krasiuk, 2013, p. 126). The criteria levelling the negative effects of monetary integration have been specified in the classical theory of optimum currency area, which supposes that mitigating the effects of negative asymmetric shocks occurring between countries will be happening spontaneously, provided that they are equipped with suitable adaptation mechanisms (i.e. specific conditions necessary to avoid or absorb such a shock are

met). According to the second approach, countries in a currency union do not have to form an *ex ante* optimum currency area, due to the fact that, as a result of increased economic co-operation, their economies will become similar and business cycles will converge. However, the analysis of costs and benefits concentrates at establishing which outcomes of the integration will prevail after joining the currency union (Kraciuk, 2013, p. 127).

The purpose of the present study is to define the criteria of the classical theory of optimum currency areas met by the East Caribbean Currency Union, as well as to present the most important benefits and losses resulting from monetary integration in the region. The particular Union was chosen deliberately, due to its distant geographical location and low levels of popularity in Europe while providing good material for analysis to study the processes of monetary integration. At the same time, it should be noted that the ECCU is rarely studied. Recently research on the ECCU has been conducted by: S. Braithwaite (Braithwaite, 2017), A.H. Hallett and S.E.H. Jensen (Hallett and Jensen, 2016) and A. Mounsey and D.T. Polius (Mounsey and Polius, 2015).

The non-reactive research method – analysis alongside descriptive synthesis – and comparative method were applied in the research process. They were based on the professional literature on the subject, as well as reports and statistics by international institutions, and aimed at answering the research question regarding the description of factors determining successful monetary integration in the region. A conceptual apparatus typical for research in economy and international finances was applied. The paper constitutes a study of selected problems and does not aspire to exhaust the extensive range of problems within the subject. The research was completed on 20<sup>th</sup> February 2018.

## **2. The Nature of an Optimum Currency Area in Theoretical Deliberations**

The deliberations on the subject of the process of monetary integration started in the 1960s. In 1961, R.A. Mundell introduced the notion of optimum currency area. He states that the condition which needs to be met in order to single out a group of countries constituting an OCA is the high mobility of production factors, particularly the workforce, which supports the process of introducing the common currency through minimising the asymmetrical shocks such as unemployment and inflation. According to him, an OCA is characterised by two basic features – high internal mobility of the workforce and capital, combined with low external mobility, which is a necessary criterion, but which applied in isolation is insufficient to determine an OCA. Such an area is supposed to be using one common currency, while the exchange rate between the area in question and other regions should be floating (Mundell, 1961, pp. 657–665).

The lack of a complete solution as regards the requirements for distinguishing an optimum currency area presented by R.A. Mundell left an open door for other theoreticians, one of whom was R.I. Kinnon. He replaced the mobility criterion with an open economy criterion, i.e. low or non-existent trade barriers between the countries undergoing integration (Lachowicz, 2008, p. 10). As maintained by R.I. Kinnon, the mechanism of fixed exchange rate is more favourable to small and open economies which have strong trade connections, due to which they can ensure stable prices and limit the costs related to exchange. On the other hand, big and (as a result) relatively closed off countries, should apply floating exchange rates (McKinnon, 1963, pp. 717–725). P.B. Kenen, in his turn, regarded structural differentiation of national economies as a significant condition to distinguish such an area. He thought that if one sector of an economy was to be affected by a crisis, a speculative attack or demand shock, the other ones will be able to shoulder the burden of stabilising the economy and, to a greater or lesser extent, compensate for the resulting losses (Kenen, 1969, pp. 41–60). According to

him, big economies, which at the same time are usually more diversified, ought to have a fixed exchange rate. However, J.C. Ingram noticed that in financially integrated countries free movement of capital can be utilised as an adaptation mechanism to restore balance (Urban and Baranowski, 2003, p. 56). The capital then follows the variable interest rates, which results in more effective use of resources (Ingram, 1969, pp. 95–100). Then in turn G. von Haberler and M.J. Fleming proposed convergent inflation rates as the criterion for establishing an OCA, pointing out that it is a significant, but not the only premise for currency integration. The inflation rate which remains at a similar level in the countries of a currency union helps to maintain stable prices internally and to keep the balance of payments, as well as level the conflicts related to the manner in which monetary policy is being conducted (Fleming, 1971, pp. 467–488). D.A. Snider was the first to clearly indicate that to achieve an OCA not only monetary, but also fiscal integration is necessary. He claimed that only single, centralised tax authority guarantees stabilisation of prices, employment and balance of trade without the necessity to resort to limiting the movement of capital (Snider, 1967, pp. 13–17). As stated by O. Issing, currency integration is one of the outcomes of economic integration, and together they lead to political integration (Issing, 2001). He did not account for an opposite interaction, i.e. economic integration resultant from precedent currency integration.

The change in perspective in looking at the process of currency integration was proposed by I. Frankel and A. Rose, who claimed that it is not necessary for countries accessing the union to meet the criteria of the classical theory *ex ante*, as it is possible to achieve that *ex post* as well (the endogenic approach to the OCA theory). Owing to the adoption of common currency, trade and mobility of production factors between the countries of the union increase, resulting in approximation of the business cycles and opening of the economies of the countries in question (Urban and Baranowski, 2003, p. 58). Due to initiated integration processes, countries are able to absorb possible negative asymmetric shocks more effectively.

Due to the fact that countries did not meet most of the criteria indicated in the classical theory of optimum currency areas, and monetary integration bears numerous consequences for participating countries, both positive and negative, economic and non-economic, a new approach emerged in the 1970s as regards research on optimum currency area, based upon the analysis of costs and benefits of currency integration (Ładyka, 2001, p. 173). The new approach was proposed by H.G. Grubel, who defined OCA as an area in which the common currency facilitates the growth of the wealth of the citizens of participating countries. In order to confirm if an area belongs to an OCA one needs to analyse if the benefits of monetary integration outweigh the losses, while monetary integration is not necessarily connected to economic integration (Grubel, 1970, pp. 318–324). This is an innovative approach, as the previous deliberations were focused on the angle of minimising the costs related to asymmetric shocks and did not sufficiently take potential benefits of monetary integration into consideration (Zawiślińska, 2008, pp. 55–58). P. Krugman contributed to this approach as well. According to him, the benefits of monetary integration must balance the negative occurrences related to the impossibility to use the instruments of monetary policy to intervene in case of differences in pricing and remunerations between the countries of a union (Krugmann, 2013, pp. 439–440). Referring to H.G. Grubel's concept, G.E. Wood concluded that the key criterion while deciding on currency integration ought to be the prevalence of benefits over costs (Wood, 1973, pp. 1–23). Among the former he listed greater self-sufficiency of the economy of the currency area, a possibility to diminish and merge their foreign exchange reserves needed to operate foreign trade, simultaneously rendering the entire area less vulnerable to speculative attacks from the outside. However, W.M. Corden named the stability of prices and trade flows and limiting the speculative movement of capital as the

advantages of integration. The main cost which he pointed out is the departure from internal stability (Corden, 1972, pp. 1–41). Research on the costs and benefits of currency integration has also been conducted by, among others, R. Heller (Heller, 1972, pp. 1–41) and Y. Ishiyama (Ishiyama, 1975, p. 344–383).

Defining and analyzing the costs and benefits of currency integration is not a difficult task. It is, however, problematic to present them in a tangible form which allows for them to be compared. Moreover, certain effects of currency integration can only be observed after the process of integration is complete, which hinders *ex ante* assessment. Therefore, the analysis of costs and benefits requires high cognitive skills, knowledge of the economic environment, thorough empirical research and objectivity not to make overly optimistic or pessimistic assumptions.

### 3. East Caribbean Currency Union Versus Classical Theory of OCA

The establishment of the East Caribbean Currency Union (ECCU) in 1983 was a logical consequence of hundreds of years of monetary, as well as economic and political, integration in the region (Rouse, 1992, p. 63). The East Caribbean dollar (XCD) is a direct successor to the common currency which was the British West India dollar, and the Organisation of East Caribbean States, including ECCU, which is part of it, is to an extent the heir to the West Indies Federation, which in 1958 united the Caribbean islands in their common quest for independence and which was theoretically supposed to unite them into a single country. At present, ECCU consists of 8 members, including 6 independent countries and 2 dependent territories. These are: Antigua and Barbuda, Dominica, Grenada, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, and Anguilla and Montserrat, which constitute overseas territories of Great Britain. In 2016, ECCU was populated by almost 643 thousand people, comparable to the number of inhabitants in European Montenegro. The collective area of all the member countries and territories is 3006 km<sup>2</sup>, a little less than Northern Cyprus. In 2016, the GDP of the Union was 16 959.19 mn XCD, i.e. 6 281.18 mn USD (ECCB [online], 2018), which is approximately the same as the GDP of Kosovo. The ECCU economies are very open, in some cases the sum of import and export exceeds 100% GDP (World Bank [online], 2017). A significant element of these countries and territories' GDP are tourist and financial services. The small size and economic potential of the member countries and territories allows for posing a thesis that none of them independently constitute an optimum currency area (Zawiślińska, 2008, pp. 208–209). Maintaining separate monetary units would be unjustified from the economic, but also political standpoint, as all the ECCU members are closely related in historical and political terms and have a long history of maintaining a common currency – the main legal tender in 19th c. Caribbean was the Spanish dollar (a global currency, used in numerous places around the world at the time). The first attempt to introduce the pound sterling as the official currency in the British colonies was made as early as 1825 (Woodcock, 2009, pp. 104–105). A thesis can also be posed that when ECCU was being established, little attention was paid to the OCA theory, which was only emerging at the time (Zawiślińska, 2008, p. 209). Below, an attempt was made at analysing the present extent to which the OCA criteria are met by ECCU, in order to evaluate the process of currency integration in the region.

According to the classical theory by R.A. Mundell, the basic criterion to determine if a particular area constitutes an OCA is the internal mobility of the workforce (Mundell, 1961, pp. 657–665). The East Caribbean Currency Union does presently fulfil this condition, due to the membership of all the countries and territories using the East Caribbean dollar in the OECS,

which guarantees a free flow of workers between the member states, on a similar basis as in the European Union. However, the fixed exchange rate of XCD to USD (1 USD = 2.7 XCD) stands in contrast to R.A. Mundell's theory, as he believed that floating exchange rates should be applied to currencies from outside the currency union (Mundell, 1961, pp. 657–665).

According to R.I. McKinnon's theory, the common currency is most advantageous for small and open economies (McKinnon, 1963, pp. 717–725), which the East Caribbean islands undoubtedly are. The fixed exchange rate of the East Caribbean dollar to the American dollar is in agreement with R.I. McKinnon's postulates, according to whom such a solution allows for achieving greater stability and increases the trustworthiness of the currency, which is overall extremely important for the currency's meaning in world economy.

The East Caribbean Currency Union is not, however, an OCA in P.B. Kenen's understanding, whose basic OCA criterion is a diversified structure of production and export, which is supposed to guarantee greater stability and decreased vulnerability to shocks (Kenen, 1969, pp. 41–60). The economies of the ECCU members are similar, as all of them rely on tourism and agricultural crops exports, especially citrus fruit and bananas, as well as financial services, due to which the structure of the economy of the Union cannot be described as diversified.

Furthermore, ECCU does not meet other criteria of the classical OCA theory listed by the theoreticians, for instance the fiscal integration criterion (D.A. Snider), financial market integration (J.C. Ingram), although actions are currently being taken in order to deepen this aspect of integration, e.g. by the Eastern Caribbean Central Bank, or the convergent inflation rates (G. Von Haberler and M.J. Fleming). The case of the ECCU contradicts the theory by O. Issing as well, according to which currency integration is supposed to result from economic integration (Issing, 2001), as the currency union in the region was formed before the economic union and aimed at, among others, facilitating other aspects of integration, including the political and economic ones. The agreement on currency union was therefore achieved mainly due to common history and very similar, i.e. small and open, economies, as well as due to the willingness to tighten the economic and political co-operation between them.

#### **4. The Benefits and Costs for the Members of the East Caribbean Currency Union**

The assessment of the functioning of the East Caribbean Currency Union is not an easy undertaking, as the member countries and territories have, *de facto*, never had separate currencies, due to which there is no data which could illustrate the functioning of an alternative monetary system in the region, before currency integration took place. One can however compare and contrast the processes observed in the ECCU against the currency integration theory or against observations of the functioning of other monetary unions, especially the eurozone.

Following the formation of ECCU, i.e. mid-1980s, significant improvement of the economic situation was noted, expressing itself through the growing GDP, on average 2 pp per annum (Zawiślińska, 2008, p. 216). In the 1990s, the ECCU countries reached the price stability. As an example, in 1995 the CPI index amounted to 3.5%, and four years later only 2.3%. In the 21<sup>st</sup> century, inflation has hardly ever exceeded 3–4%, except 2008, when it was higher in the entire Union (ECCB [online], 2016). One can therefore conclude that without a stable common currency, bound by a fixed exchange rate to a much stronger American dollar, such economic and price stability in the region would have been impossible to achieve.

The economies of the ECCU members are classified as open – as mentioned before, in some cases the sum of export and import exceeds 100% of the GDP (World Bank [online], 2017). In this situation, having a currency bound to the American dollar by a fixed exchange rate is undoubtedly favourable, as it guarantees a greater stability of prices and increased trust of foreign partners. The same is true for foreign investments. A stable currency ensures the safety of investors. In this context, the relation to the American dollar is more significant than the currency union itself, as the ECCU countries are trade partners to each other only to a very small extent. Nevertheless, any trade exchange, as well as mutual investments, are easier within ECCU and their costs are lower (Zawiślińska, 2008, pp. 211–212).

An indubitable advantage of the membership in the Union for the East Caribbean countries and territories is the access to the financial aid from the Eastern Caribbean Central Bank and other institutions in case of financial difficulties resulting from unpredictable causes. This is particularly important in the context of natural disasters, which are relatively common in the region. The hurricanes which regularly ravage the islands hinder the economic growth and make the aid indispensable when it comes to alleviating the losses.

The ECCU economies are largely dependent on the development of tourism. In this context, the fixed exchange rate of the currency to the American dollar is not the only helpful factor, giving the tourists the security of stable prices and in the periods of its weakening, draws in travellers from Europe and Canada (Zawiślińska, 2008, p. 220). The common currency in the countries and territories facilitates moving around the region and gives tourists an opportunity to lower the costs of travel. In 2015, a new record of the number of visitors in ECCU was beaten, as for the first time in history their number exceeded 4 mn (ECCB [online], 2016b). Part of this record can surely be attributed to the Eastern Caribbean dollar.

A significant advantage of the existence of the Eastern Caribbean Currency Union is its influence on other signs of integration in the region. Its establishment was an important impulse to further deepening of the economic and political integration, both within the ECCU and the OECS. At present, the countries and territories in the Union are deeply integrated as regards i.a. the judiciary, education, healthcare and security (OECS [online], 2017). Free movement of people and capital, which is one of the greatest achievements of the OECS, would have certainly been more difficult to achieve without prior currency integration.

On the other hand, the critics of the idea of common currency frequently argue the loss of an important national symbol – the currency. It is difficult to assume that the currency of any of the ECCU countries could be internationally recognisable worldwide, and as none of the countries in question has ever had its own, separate legal tender, the loss of a national symbol is not applicable in this case. It is possible that separate currencies would be more unstable and have a weaker international position than the Eastern Caribbean dollar. Potential disadvantages of the currency union often include the loss of income from seignorage, however in the case of countries and territories of such a small economic potential as that of the ECCU countries, it can be assumed that the income in question would be very slight. The currency union countries certainly do not enjoy independence in the area of monetary policy, which may result in a disturbance of internal equilibrium (Zawiślińska, 2008, p. 77). However, in the case of ECCU, all member states have similar economies and often face identical or similar problems, which is why one can assume that in most cases, their monetary policies would be similar nonetheless.

Fixing the exchange rate to the American dollar, which as shown above is frequently favourable to the ECCU members, may also become a disadvantage. A high exchange rate of the USD to other currencies makes the ECCU countries and territories less competitive to

tourists from outside the USA, who constitute a large share of the visitors. It also causes the goods exported from the Union to be more expensive to importers.

## 5. Conclusion

One can argue that currency integration of the East Caribbean can be counted as successful, despite the fact that the ECCU countries do not meet some of the criteria of the classical OCA theory. The success of the Union proves that those criteria are not always the most important factor determining the success of currency integration, although it is certainly difficult to assess how the ECCU countries and territories would function if they used separate legal tenders. It is enough to say, then, that certain criteria met by the ECCU countries, together with common history, geographical proximity and similar economies are enough to create an OCA, understood as an area where the introduction of common currency brings more benefits than losses.

The common currency constitutes an incentive and facilitates mutual investments and trade, which is significant taking into account the geographical isolation of the ECCU islands. Maintaining separate legal tenders would be economically or politically unjustified, due to the very small size of their economies. Such currencies would be deprived of importance in global markets and would hinder trade relations, as well as tourist and financial services.

Apart from the financial crisis of 2008 and, in particular countries, the aftermath of natural disasters, the ECCU economies exhibit relative stability and growth tendencies from the time of the ECCU's very establishment, which – taking into account the frequency of natural disasters, which mainly affect agriculture and tourism, which constitute the main source of income on the islands – should be considered a success. It can also be assumed that it is, among others, an outcome of currency integration, as well as fixing the exchange rate of the Eastern Caribbean dollar to the American dollar, which ensures greater stability of the countries and, in effect, draws in investors and tourists. The political situation in the region, i.e. the absence of conflicts between the Eastern Caribbean countries and territories, can also be ascribed to their participation in the currency union.

Deepening integration within the ECCU is to be expected in the future, however the accession of new members to the currency union is unlikely. From the geographical point of view, the most logical candidates would be Martinique and Guadelupe, located between the island which use the Eastern Caribbean dollar. They do, however, belong to France, and as a result to the eurozone, which renders their ECCU membership impossible for the time being.

### **Abstract**

*The main advantage of the indirect support for research and development is that this type of support is not selective and each company that meets the legal requirements can use it for financing of its research and innovation activities. Thus, this support is more compatible with economic competition. It also represents one of the means to reach the Europe 2020 target in the field of research and development and most of the EU countries use it. This paper deals with indirect support for R&D that is used for promotion of innovation activities in the Czech Republic and the Netherlands. The aims of the article are to compare indirect R&D support in both countries, to provide new empirical evidence on using this type of support, and to find some inspiration for the Czech Republic from the Dutch example. It has been observed that this instrument is used in different ways in both analysed countries. The Netherlands has more experience with tax incentives and the impact of the support is regularly evaluated.*

**Keywords:** Czech Republic, European research policy, indirect R&D support, Netherlands, tax incentives

**JEL Classification:** H25, O38, R12

### **1. Introduction**

Innovations are generally perceived as a decisive factor for competitiveness of enterprises and for socio-economic development of regions and countries. They represent a way to achieve economic growth, productivity increase, new jobs and wealth creation. Research and development (R&D) is one of the most important sources for innovations, particularly the radical ones, because it brings new knowledge that are vital for revolutionary innovations with high value added (Žitek, 2014; Halásková et al., 2016). The importance of innovations for economic and social development was also confirmed by the Europe 2020 Strategy (European Commission, 2010) and an increase in expenditures on R&D is the main way to improve the innovation performance and competitiveness of the European economies. The EU2020 target is to invest 3% of GDP in research and development in 2020 and member states determine their own targets. The most innovative countries invest more than 3 per cent of GDP in R&D now and a significant part of it is financed by enterprises. The role of public support is to boost private expenditures on R&D and the countries that are the innovation leaders put a strong emphasis on innovation and research policy (Gál, 2014; Mynarzová and Štverková, 2015).

In the scientific literature, public interventions are justified by the neoclassical argument about market failures (Arrow, 1962) and the institutionalist argument about systemic failures (Woolthuis et al., 2005). The market failures and imperfections discourage companies from

investing in R&D (Bronzini and Piselli, 2016). Results of R&D have a character of a public good, because knowledge is regarded as non-rival and non-excludable goods (Arrow, 1962). New knowledge cannot be fully appropriated and due to knowledge spillovers (Fischer et al., 2009) the firm's rivals may be able to free-ride on its investment (Aerts and Schmidt, 2008). It decreases private rate of returns of R&D for the company that invested in R&D. On the other hand, creation and diffusion of new knowledge is vital for the development of society. The decrease in private investment means that the level of R&D expenditures is below the socially desirable optimum (Brown et al., 2017). The systemic failures are discussed in the concept of innovation systems and they are comprised of infrastructural, institutional, interaction and capabilities failures (Woolthuis et al., 2005).

Research projects in businesses can be supported in a direct or an indirect way. The direct way is usually based on providing subsidies to companies in tenders. The less frequent way is providing favourable bank loans or guarantees. The indirect support for R&D usually lies in some type of tax incentive (see table 1). This paper deals with the indirect support of R&D in the Czech Republic and the Netherlands. The Dutch Promotion of Research and Development Act (WBSO) was introduced in 1994, with the aim to stimulate research and development growth. The argument behind WBSO was the classical market-failure discussion, as well as the concern about the high labour costs in the Netherlands that had a negative impact on the business environment (Verhoeven et al., 2012 in CPB et al., 2014a). In the Czech Republic, indirect support of R&D has been provided since 2005 in the form of expenses as deductible items from the tax base of income tax.

The aims of this article are to compare indirect R&D support in both countries, to provide new empirical evidence on using this type of support, and to find some inspiration for the Czech Republic from the Dutch example. Empirical data for our research come from European Commission, OECD, Eurostat and Czech and Dutch administrative resources. The comparison of both countries is carried out with respect to the setting of the tax incentive system, extent of use of the indirect support by enterprises, and the evaluation of public intervention impacts.

## **2. Tax Incentives for Research and Development**

The indirect support for R&D has some advantages as well as disadvantages in comparison with the direct support. Czarnitzki et al. (2011) recommended providing the indirect support rather than the direct type. They pointed out the government failure that is usually connected with direct support. In the case of indirect support, this risk is minimized. They also stressed that indirect support is considered to be a neutral form of encouragement to R&D as all companies, irrespective of the industry, size and innovation activity, can claim it. Tax incentives are market-based and thus they are considered more neutral than direct support. On the other hand, it means that the government cannot influence the structure of research and choice of R&D projects (Elschner et al., 2011). We think that this is true only to some extent. Some countries have more favourable conditions for specific groups of enterprises, e.g. for small and medium-sized enterprises, or specific industries, e.g. energy (see CPB et al., 2014b; OECD, 2018). Some authors argue that private companies use indirect support to implement projects with high private returns inducing investments with a short-term horizon that would have been implemented in any case, i.e., without public aid (Crespi et al., 2016).

Berube and Mohnen (2009) argued that companies should combine both types of support. They found out that companies using both instruments introduce more new products than their counterparts that only receive the indirect support. Busom et al. (2014) connected the type of public support with the character of companies. They stated that direct and indirect funding are not perfect substitutes with respect to their ability to reach firms facing barriers associated

to market failures. Subsidies may be better suited than tax reliefs to encourage companies to start doing R&D, which is valid especially for young knowledge-based companies. Brown et al. (2017) tested the relation between indirect support and the character of industry. They argue that private R&D investment is below the socially optimal level, particularly in high-tech industries, and that the indirect support is more effective in promoting low-tech R&D, but it is not sufficient for promoting high-tech R&D. Figure 1 shows a proportion between indirect and direct support for R&D. The higher share of indirect support can be observed in the Netherlands. The Czech Republic can be found on the opposite side of the ranking.

**Table 1: Typology of R&D Tax Incentives in EU Countries**

Tax credit	Tax allowance	Payroll withholding tax	Social security contribution	Accelerated depreciation of R&D capital
Austria (AT), Belgium (BE), Denmark (DK), France (FR), Hungary (HU), Ireland (IR), Italy (IT), Portugal (PT), Spain (ES), United Kingdom (UK)	Austria (AT), Belgium (BE), Czech Republic (CZ), Greece (EL), Hungary (HU), Latvia (LV), Lithuania (LT), Poland (PL), Romania (RO), Slovakia (SK), Slovenia (SI), United Kingdom (UK)	Belgium (BE), Netherlands (NL), Spain (ES)	France (FR), Hungary (HU), Netherlands (NL), Sweden (SE)	Belgium (BE), Denmark (DK), France (FR), Lithuania (LT), Poland (PL), Romania (RO), Spain (ES), United Kingdom (UK)

Source: authors' own processing based on OECD (2017a)

Experts at the European Commission state that 26 EU countries use some type of R&D tax incentive (CPB et al., 2014b), whereas OECD (2017b) quote only 22 countries. The difference is caused by the fact that the EC also analyses states that use tax incentives for acquisition of intellectual property rights. In our paper, we only deal with tax incentives for research activities. Table 1 provides an overview of various types of R&D tax incentives that are applied in EU countries. The most frequent forms of incentives are tax credits and tax allowances.

### 3. Indirect Support for R&D in the Czech Republic and the Netherlands

As shown in Figure 1, the Netherlands belongs to European leaders in providing indirect public support for R&D activities. This country is also well-known for its high patent activity and quite high expenditures on R&D, although some EU countries such as Sweden, Finland and

Austria invest more. Table 2 compares expenditures on R&D in both analysed countries. It can be surprising that the Czech Republic set out a higher EU2020 target for itself than the Netherlands.

**Table 2: Expenditures on Research and Development**

	GERD (share in GDP, %)			BERD (share in GERD, %)		BERD (share in GDP, %)		BERD (PPS per inhabitant)	
	2010	2015	EU2020 target	2009	2015	2010	2015	2010	2015
<b>CZ</b>	1.34	1.93	2.7	39.8	34.5	0.77	1.05	163	267
<b>NL</b>	1.72	2.00	2.5	45.1	48.6	0.83	1.12	282	420

Source: authors' own processing and calculation based on Eurostat (2017)

In the Czech Republic, enterprises can deduct the expenditures on R&D from the tax base and in reality, these expenses are deducted twice (KDP, 2017). They are first deducted within the tax base calculation and for the second time they are deducted from the calculated tax base. Tax rate for corporate income tax is 19%; therefore, the taxpayer can save up to 19% of the R&D costs. If the tax base does not cover all expenses, they can be deducted within the three following years (so called carry forward). Companies have to elaborate their research project in a written form and submit it together with their tax return to the Tax Office. Enterprises can ask the relevant Tax Office in advance for a binding assessment whether the project expenses are really tax deductible. The research project has to identify some element of novelty and to resolve some technology uncertainty. The second condition for using this type of support is that the same research project cannot be subsidized by any type of direct public aid. The innovative company has to decide whether it prefers a direct or an indirect form of support.

Since 1994, the Dutch government has offered the opportunity for companies that perform R&D-activities to decrease their R&D costs through the fiscal scheme 'Wet Bevordering Speur- en Ontwikkelingswerk' (WBSO). This scheme is implemented by the Netherlands Enterprise Agency (CPB et al., 2014b). The WBSO scheme is designed for Dutch companies as well as self-employed entrepreneurs. Companies performing R&D activities may benefit from a 32% tax credit (40% for start-ups) of the first €350,000 in R&D wage costs and other expenses and investments, and 16% for those costs and investments exceeding €350,000. Self-employed persons are entitled to a fixed tax deduction of €12,522 (and additional €6,264 for start-up self-employed persons). The R&D project has to meet the following conditions before the company can apply for the tax incentive: the proposed R&D activities take place in their own company, the technological development is new to the organisation, the development is accompanied by technical problems, the R&D work has yet to take place (companies have to submit a WBSO application in advance) (RVO, 2017b). Firms are automatically guided through the process of application by the Agency, which administers the scheme. Application is carried online and the decision is made within three months. (CPB et al., 2014b)

Comparing both systems we can find several differences (details in table 3). The Czech Republic uses tax incentives in the form of extra-deductions from the taxable base that exceed the really invested expenditures. This way can be called a reduction of taxable base. Dutch companies use a special form of tax incentive, which lies in reduction of costs for personnel. It means that companies are able to either employ more researchers or to compete successfully for researchers by offering higher net salaries. (Elschner et al., 2011) Furthermore, special incentives are provided to self-employed persons. The differences can also be found in the type of deductible expenses (table 4) and they are related to contracted research and long-term assets (expenses for acquisition vs. depreciation).

**Table 3: Comparison of R&D Tax Incentive Schemes**

	Czech Republic	Netherlands
Type of scheme	R&D tax allowance	Payroll withholding tax credit for R&D wages / social security contribution
Deducted from	Taxable income	R&D wage cost and non-R&D wage related costs and expenses attributable to R&D
Vol-based rate	100%	32% for eligible R&D costs up to EUR 350 thous., 16% above EUR 350 thous.
Incremental rate	10%	-
Ceiling on amounts that can be claimed	no	yes
Carry forward	3 years	-
Deductible R&D expenses	wages and salaries, R&D services (contracted research), consumables, depreciation	wages and salaries, consumables, M&E (acquisition of plant, machinery or equipment for R&D ), land and buildings (acquisition)

Source: OECD (2017a)

Tables 5 and 6 show the extent to which the indirect support is used by enterprises. However, it is quite difficult to find some statistical data that would be mutually comparable. In this respect, the Czech Republic publishes more data than the Netherlands. When looking at number of companies (table 5), we can state that R&D tax incentives are more popular in the Netherlands. The increase in their number between 2007 and 2015 is higher in the Czech Republic, but this can be explained by the Czech shorter history.

**Table 5: Number of Companies Using R&D Tax Incentives**

	2007	2008	2009	2010	2011	2012	2013	2014	2015	Increase
<b>Number of companies</b>										
<b>CZ</b>	574	598	634	716	859	1021	1120	1264	1306	228%
<b>NL</b>	13 000	13 450	16 620	19 450	20 530	22 220	22 640	22 970	22 980	177%
<b>Number of companies per million inhabitants</b>										
<b>CZ</b>	56	58	61	68	82	97	107	120	124	-
<b>NL</b>	795	820	1 008	1 173	1 233	1 328	1 349	1 365	1 360	-

Source: authors' own calculation based on CSO (2017), Eurostat (2017) and RVO (2017a)

Table 6 shows the amount of expenses and the amount of indirect support. When we calculate the volume of tax incentives in USD purchasing power standard (PPS) per inhabitant, we can observe that the support in the Netherlands is about 4 times higher than in the Czech Republic.

**Table 6: Indirect Government Support Through R&D Tax Incentives in 2015**

	Deductible expenses (mil. EUR)	Deductible expenses (EUR per inhabitant)	Volume of R&D tax incentives (mil. USD PPS)	Volume of R&D tax incentives (USD PPS per inhabitant)	Tax incentives (as a % of GDP)
<b>CZ</b>	492	47	198	19	0.06
<b>NL</b>	3,870	229	1,265	75	0.15

Source: authors' own processing and calculation based on CSO (2017), Eurostat (2017), OECD (2017b) and RVO (2017a)

For the sake of completeness, we would like to emphasize that the impact of the Dutch tax incentives is regularly evaluated by the government, which is not carried out in the Czech Republic. We can also find several research studies that deal with the Dutch system. The official WBSO evaluations were carried out in 2002, 2007, and 2012. In general, these evaluations found out large and significant benefits of the WBSO, indicating that one euro

spent as foregone tax revenue results in around one euro of additional R&D (CPB et al., 2014). The WBSO has also been proven to be effective in creating absorptive capacity and additional R&D expenditures, especially among SMEs (Brouwer et al., 2002; Poot et al., 2003). The study by Cornet and Vroomen (2005) outlined that the WBSO provides large positive benefits for start-ups. Lokshin and Mohnen (2007) concluded their research by outlining that the program of R&D incentives in the Netherlands has been effective in reducing the user cost of R&D and therefore has been successful in stimulating firm R&D capital formation. In terms of the effect on R&D wages, Lokshin and Mohnen (2008) found out that elasticity between the effective rate of the Dutch payroll tax withholding R&D tax credit and average R&D wage is 0.2 in the long run. Lokshin and Mohnen (2012) defined that, on average, ten percent decrease in the user-cost of R&D capital induced by the tax credit leads to four percent more R&D capital in the short run and six percent more in the long run.

#### 4. Conclusion

The Dutch system of indirect R&D support has much longer history than the Czech system. Whereas it has been running since 1994, the Czech system has been provided since 2005. Both systems differ in their basic elements, because the Czech system has a form of reduction of the taxable base while the Dutch system focuses on the reduction of the costs for personnel. The Dutch tax incentives are also available for self-employed persons that carry out R&D activities. It is the same for the Czech Republic, however, in this case the self-employed persons do not use that opportunity very often. There is also a practice by the Dutch system of targeting young start-ups by offering them a preferential rate, which could be inspiring for the Czech Republic.

In the Netherlands, it is very usual and customary to use indirect tax support in contrast to the direct support. This is mostly because of the historical development of the support system, the cultural differences, the mentality of entrepreneurs and the character of the business environment. The Czech Republic lags behind the Netherlands in this case. This is partly influenced by the fact that the Czech Republic is eligible for higher support from the Structural Funds through the Operational Program Enterprise and Innovation (2007–2013) and the Operational Program Enterprise and Innovation for Competitiveness (2014–2020).

The statistical data concerning the indirect support are well managed and regularly published by the Czech Statistical Office. The Dutch system does not have the same qualities in these terms and Statistics Netherlands does not publish relevant data regularly. On the other hand, the official evaluation of the scheme is missing in the Czech Republic. The Czech Republic can learn from the Dutch experience of evaluation practices that reinforces better policy making and policy effectiveness.

The WBSO system is governed by Netherlands Enterprise Agency that aims to help the entrepreneurs with administration and guides them through the process with available consultations. In the Czech Republic, the assessment of the application is in the competence of the Tax Office and the application is submitted together with the tax return. Hence, Czech entrepreneurs see the rules for the tax reduction unclear, fear sanctions, and therefore are less willing to use the support. These good Dutch administrative practices can be adopted in the Czech Republic by offering guidance through the process and by making the system more transparent to give businesses greater legal certainty.

e-mail: riedelr@wp.pl

### **Abstract :**

*The objective of the paper is to highlight the correlations between the evolving system of differentiation in Europe and the monetary union as the core of the European Union. So far the monetary integration has been one of the most important elements of the “Europe of different speeds”. In the up-coming future it is expected that the fiscal federalism will further evolve and it is going to have serious political externalities and spill-overs. Consequently this paper will focus on the sources, determinants, mechanisms and anticipated outcomes of the multi-speed Europe of tomorrow. The anticipated scenarios span from the prospects of building some (quasi)federal structures, through various concepts of differentiated integration, up to the visions of disintegration. The author stands behind the argument that the most likely outcome of the current crisis and the future evolutionary trajectory of the European Union will lead towards a system of differentiated integration in which there will be place for deeper (federal-type) integration of some member states, disintegration for some others and in-between solutions for the rest.*

**Keywords:** *differentiated integration, disintegration, Europe, fiscal federalism, monetary union*

**JEL Classification:** *E00, E06, F00, F34, F45*

### **1. Introduction**

The existing literature on differentiation and the monetary integration in Europe focuses predominantly on the descriptive models of various forms of differentiated integration in relation to the level and scope of the monetary policy (and related policies) coordination. The concepts used, similarly to the standard ones exploited in the differentiated integration literature, range from the *Europe a la Carte* metaphor, through Europe of different speeds, concentric circles, differentiated geometries, up to the diversified hemispheres of integration (Andersen, Sitter 2006). More and more analysts, experts and academics claim that the observed increase in differentiation came to the limits in which it carries the potential for disintegration. Exemptions from the Eurozone and Schengen area have already been quite prominent examples of differentiation. But undermining one of the four freedoms (free movement of people), which was the case in the (in)famous Brexit referendum, attacks one of the fundamentals and questions the very idea of the European integration project. Openly opposing the very core of the Single Market turns the direction of the integration trajectory. The economic theories of international integration inform us that it is not only the free movement of products and services which constitutes a common market. But for its creation and functioning, it is conditional to liberalize also the free movement the factors of production: the capital and the labor. This is why the four freedoms were treated so far as the inseparable

four elements of one concept. The group of countries that decided to integrate further even widened the circles of integration, expanding the system of differentiation.

Both in academic deliberations and in the real life politics, the differentiated integration concepts offered, so far, a way out from the dichotomous thinking between full membership and full non-membership. Moreover, nowadays they are treated much more as a solution than a problem. Differentiated integration in Europe has reached the very top of the agenda both in the scientific (Duttle 2016) and in the public discourses (Bernstein 2016). Even though it has been present in the European integration project for decades (Deutsch 1957, Dahredorf 1973), never before has it gained so much attention due to its saliency and dynamism (Fossum 2015). The so called Brexit (Hodgson 2016) and the shift in French (Emmanuel Macron) and German (Angela Merkel) attitudes towards the differentiation (namely open permissive, accepting and even welcoming) changed the “ever closer Union” paradigm substantially. Britain’s going out of the EU will widen the circles of integration, at the same time the Franco-German engine is determined to deepen integration, and the two dynamics will most probably result in the new system of differentiation, unknown so far in history of the European integration project. The new evolving situation requires intense scientific investigation that will enhance our knowledge about its determinants and dynamics.

This paper aims at highlighting the correlations between the evolving system of differentiation in Europe and the monetary union as the core of the European Union. So far the monetary integration has been one of the most important elements of the “Europe of different speeds”. In the up-coming future it is expected that the fiscal federalism will further evolve and it is going to have serious political externalities and spill-overs. Consequently this paper focuses on the sources, determinants, mechanisms and anticipated outcomes of the multi-speed Europe of tomorrow. The anticipated scenarios span from the prospects of building some (quasi)federal structures, through various concepts of differentiated integration, up to the visions of disintegration. The author stands behind the argument that the most likely outcome of the current crisis and the future evolutionary trajectory of the European Union will lead towards a system of differentiated integration in which there will be place for deeper (federal-type) integration of some member states, disintegration for some others and in-between solutions for the rest - including the members and non-members of the European Union.

## **2. Problem Formulation and Methodology**

Based on the analysis of the existing literature about the differentiated integration, this contribution sees the 2008+ economic crisis in Europe as a structural problem for the EU. Following the logic of the integration evolution from one crisis to another one, it is possible to interpret the economic crisis and its consequences as an opportunity for EU’s reforms. Its reformist impulse may enhance the European integration in two various possible ways. First, it may help to reform the EU into a more differentiated system which will allow accommodate countries willing to integrate at various speeds and extends. Secondly, once “getting rid” of the major trouble-maker and marauder, that is the United Kingdom (after the Brexit process is concluded with UK leaving the EU structures) as a country opposing the further integration, the EU may accelerate towards the “ever closer union”.

Differentiated integration as a scholarly concept is a relatively new phenomenon in the European studies, or wider: international relations, legal studies, political science or economy (Andersen, Sitter 2006, Mohler, Seitz 2012). It grew together with the real life increase in differentiation (opt-outs, exemptions, enhanced cooperation, constructive abstention, special clauses, additional protocols, etc.). In the last two decades, differentiation has been a dominant feature of European integration (Boerzel 2005). It is argued that approximately half of the EU

policies are implemented in different ways (Lord, Leruth 2015). Undoubtedly studying differentiated integration contributes to the better and more refined theoretical and empirical understanding of the European integration process as such (Genschel, Jachtenfuchs 2014). Differentiated integration can be best understood as the institutional response to the increasing heterogeneity of the member states preferences and capacities resulting both from the widening and the deepening of the EU (Leuffen *at al* 2013, Schimmelfennig 2014).

The political idea of differentiated integration can be tracked back to the famous Tindemans report (1975), whereas as a legal concept it appeared in the Single European Act (1986). The academic debates on the topic find their roots in Dahrendorf's formulation of *Europe a la carte* (1970s.). Already by the 1980s. scholars have identified several variations of differentiated integration and the scientific discourse has exploded ever since. From that moment on many various conceptualisations can be traced in the literature, including flexible integration, multi-speed Europe, Europe as an empire, Europe of variable geometries, concentric circles, hemispheres, etc. (Jensen, Slapin 2012, De Neve 2007, Zielonka 2007, Koelliker 2001). Yet differentiated integration is understudied in comparison with the huge literature on integration as a whole. The reason for it may be it has been limited by an assumption that differentiated integration would erode over time (Lord, Leruth 2015). That member states (and their neighborhood) would converge over time, the same variously applied policies would find their cohesive end. This assumption was however challenged by the crisis (Lemke 2014). The new one suggests that we are heading towards some more diversified forms of integration. It is John Eric Fossum who claims that the EU of tomorrow may combine all three of the following: accelerated integration for some, outright disintegration for others and greater differentiation for the rest (Fossum 2015). The idea that differentiated integration amounts to little more than a process of convergence on similar outcomes at different speeds, seems increasingly questionable. Instead we observe a growing consensus among the observers and analysts that differentiated integration is a permanent organizational principle of the EU. The need to manage divisions or disagreements will no simply go away (Lord, Leruth 2015).

There is many ways of analyzing this multifaceted phenomenon, from the analysis of the primary and secondary law (Szwarc 2005, Zhelyankova 2014), through multilateral negotiations (Winzen, Schimmelfennig 2015), up to the party politics (Leruth 2015) in the domestic contexts. It can be studied as a phenomenon, concept, process or as a system (Dyson, Sepos 2010). The complexity and plurality of approaches is justified by the very nature of differentiated integration. This chapter offers a scholastic approach which tries to integrate the national level, which appeared to be decisive in the British case, together with the sub-national level and supra-national level of analysis.

The Central and Eastern European perspective on the Eurozone is a complex and intriguing one (Riedel 2017). On one side the majority of countries of the 2004, 2007 and 2013 enlargements belong to the Euroclub. On the other side still, the largest economies of the region, that is Poland, Hungary and the Czech Republic (as counted by the population, territory or the GDP) stubbornly stay outside of it, without much prospect for joining in the foreseeable future. Both insiders and outsiders grew comparatively fast, both groups had similar experience with the economic crisis. The citizens do not see much difference if they are better off inside or outside of the Eurozone. Nevertheless, several eastern-European countries already peg their currency to the euro or to a currency basket that includes the euro (among those that did not adopt Euro in the past) (Brown, Stix, 2014). One cannot forget that the monetary union in Europe is a hybrid between a fixed exchange rate system and a unitary state. Consequently no theoretical model can capture its characteristics, neither the closed-economy macro models nor classical international macro models (Muenchau 2013, 535).

For the Central and Eastern European new EU member states, the so far comfortable situation of voluntary and non-consequential opt-in or opt-out type of participation in the European monetary union is coming to an end. In the foreseeable future, the evolving system will require critical decision about participating in the core of the union or remaining at the peripheries. Whereas the two situations will differ much from today's ones as well as they will constitute just scope conditions of the whole spectrum in-between. The fiscal union of the most integrated countries will create externalities with far-going consequences. The integration of financial systems, banking union, stronger fiscal and economic union will spill over into the reform of the institutional system of the EU. Such a shift in integration priorities would hit predominantly the countries focused on the cohesion policy and its redistributive outcomes.

### **3. Problem Solution**

The future scenarios for the evolution of the monetary regime in Europe span from the quasi-federal solutions, up to soft modes of coordination. The most ambitious plans foresee the development of the solidarity mechanisms allowing the redistribution of fiscal capacities in the scale of the continent, or at least the Eurozone. Such fiscal federalism would not only stronger unite the core states and their economies creating a community of fate, but it would also create some externalities for the non-members. The outer core or peripheries would suffer further marginalisation as a consequence of institutionalisation the enhanced fiscal coordination. Separate groupings in the EU Parliament and Council as well as maybe also in the EU Commission, together with the separate Eurozone budget, mutualisation of debt and related fiscal solidarity would communitarize the core countries to a large extend and at the same time it would leave the remaining states outside of the mainstream of the European integration project. The scope and level of differentiation would increase tremendously, in an unprecedented scale.

The story of European integration can be told as a story of its deepening and widening – these two dynamics have found the mechanics of differentiation so far. Consequently the progress in integration meant the increase in differentiation over time (Schimmelfenning, Winzen 2014). However the most recent political and economic developments in the European Union and beyond clearly show that the differentiation gained its momentum and its dynamics has accelerated. This constitutes the extraordinary significance of the scientific problem to be solved. One of the most important characteristics of the contemporary European integration process requires further exploration in order to advance our understanding of its dynamics and determinants. It is fundamentally important from the point of view of the scholarly explanations as well as it is furthermore crucially salient from the practical point of view of the real-existing phenomena – shedding some light on the critical point in which the uniting Europe has found itself. The scholarly deliberations in this regard are vitally important for the real life politics at domestic and European level. The decision-makers (officials, politicians, public servants, etc.), opinion leaders (journalists, experts, activists, etc.) and many other social groups will benefit from the enhanced knowledge generated in this field.

One of the most important facts to be realised in the context of the anticipated enhanced differentiation in the sphere of the supranationalized monetary policy, is the imbalance between the Eurozone and the non-Eurozone countries. Especially after the United Kingdom's potential leaving the European Union, the biggest non-Eurozone economy of the EU would remain Poland. The cumulated GDP of the EU non-Eurozone members would constitute less than 10% of the total EU GDP. This figure shows that the EU equalizes the Eurozone and the non-Eurozone countries will suffer further and further peripherization in the process of time. New financial and institutional settings will disconnect them not only from the access to

substantial parts of the EU budgets but also from the key decision making bodies that would gravitate around the fiscal federalist solutions.

The above mentioned dynamics may easily become an engine for disintegration. Without access to EU financial resources and participation in the real decision making process, the membership may soon be evaluated as much less valuable for the peripheries. If confronted with the “take it or leave it” dilemma, many of the sceptics of the communitarized monetary integration, would likely opt for the EU-exit scenarios (Riedel 2016). From this point of view, in the long-time perspective the federalisation of monetary regimes (and related policies) may bring about the consolidation effect in the core of EU and, at the same time, some disintegration tendencies in the peripheries.

#### 4. Conclusion

The emerging system of differentiation is based on the relation of EU member states' economies towards the supranationalised monetary union. The last economic crisis revealed, in a sharp contrast, some deficiencies of the so-far solutions of the monetary integration. In line with the logic of integration “from one crisis to another” the EU developed some solutions (experimental fiscal federalism) improving the system in the most optimal, possible way. Far from perfect, as always in the EU context, but build on the compromise and the lowest common denominator, the Eurozone has learnt its lesson from the last economic crisis. The implemented solutions are far from being ideal and therefore the political agenda is filled with the further reform proposals enhancing the system into some (quasi) federal structure. The difficulties to reach an agreement among the twenty eight (and possibly twenty seven member states, in case of the Brexit process coming to conclusion) countries condemn the worked out solutions into the system of even more differentiated integration.

Differentiation in Europe has reached such a phase, scale and depth in which it is legitimate to agree to the argument that it is a systematic characteristic of the European integration project as seen in XXI century. Frank Schimmelfennig, Dirk Leuffen and Berthold Rittberger wrote even about the system of differentiated integration, in which differentiation is essential and enduring characteristic of the EU (Schimmelfennig, Leuffen, Rittberger 2015). Directly after the Brexit referendum, the initial six founding states (Germany, France, Italy, Belgium, Luxemburg and the Netherlands) met in Berlin in order to discuss the new circumstances generated by the Brexit earthquake as well as to identify the options ahead. Symptomatically, the rest of the EU was called to a meeting in Warsaw a day later for the same purpose. The new divisions in Europe became even more clear in the sharp picture after the British decided to leave. Brexit gave the differentiated integration new impetus and dynamics. The near future will reveal whether it was a turning point, reversing the trend towards disintegration.

Together with the economic crisis, the Brexit process constitutes one of the most important driving forces behind the enhancing differentiation. Once the new form of fiscal federalism is established and the solidarity transfers in place, the institutional system of the will need to be adjusted as well. It will be, most probably, a flexible system based on the principle of “Bund der Willigen” (the Coalition of the Willing), this is why the author calls the process of building the new system of differentiation, a *Helvetisation*. It will be a voluntary process, just like at the beginning of the Swiss Confederation, which will give a new beginning and dynamics for the new evolutionary path. The path that may end in a federalized structure.

### **Abstract**

*European integration is a multidimensional process, which can be seen both in economic and innovations aspects. The growth of importance of digitalization and smart cities development can be analysed as a factor of European integration. A significant number of smart cities, which may be connected in a network, is located in Western Europe. This article reflects on searching for European Integration conditions as was as for turning points in digitalization process. It is intended to draw attention to several issues related to European Integration, which are crucial from the vantage point of Europe's prospective development. Location of smart cities and their networks indicates on weak innovation capacity and development disparities in some member countries of European Union. Therefore, smart cities can be also an indicator of European integration process but their wider cooperation can create new solutions for developing regions of European Union.*

**Keywords:** European Integration, smart city, smart cities network

**JEL Classification:** G18, L86, O18, O19, N14

### **1. Introduction**

The contemporary growth of the economy is determined by a number of simultaneous processes such as: globalization, scientific and technical revolution connected with the expansion of internet technologies and telecommunication technologies, system transformation of post-socialist countries and their more or less successful attempts at European Integration. Progress is caused by many factors which have the ability and strength to influence the structure of the European Union. One of them is digitization in form of Industry 4.0, because is an element of economic growth and it can be seen as a part of European integration process. Moreover some digitization aspects create all necessary infrastructure for integration processes (Klímová and Žitek, 2012).

In this paper the digitization is analysed as a factor of European integration process based on term “smart city”, which in connection with European Union and its cities is important to discuss. The article reflects on searching for European Integration conditions as well as for turning points in digitalization process. It is intended to draw attention to several issues related to European Integration, which are crucial from the vantage point of Europe's prospective development. The formulated problem is based on characteristic of smart cities, which create network of well managed and developed cities located in Western Europe mainly in so-called “old European Union” countries, and indicate on weaker innovation capacity in some other regions of EU and significant development disparities.

## 2. The Definition of Smart City

The ongoing digitization is not only restricted to the classic factories and manufacturing economic sector. Indeed is the so called Industry 4.0 almost fully connected with this sector of the economy, but many parts of it are easy to find in other sectors of private and public life i.e. in cities. In case of privacy the influence of technical and digital improvements has the name of smart home. And in this specific case the digitization concentrated around few themes, like energy management (contains heating and cooling system management), but also communication between human and machine; machine in form of household facilities i.e. refrigerator, oven, TV. But in this particular paper the digitization on this private sphere would not be discussed. We decided to focus on the public sector and special on the Smart Cities and possibilities to create networks containing them.

Looking back in the past to the 20th century there can be defined two main reasons, which caused growth of greater cities and on the other site the marginalization of the rural spaces. These are the urbanisation and continuously higher importance of so called Information and Communication Technologies (ICT). Beside also other two evident factors were the economic acceleration and the technological innovations in the urban environment, that mainly speed up in 1980's and 1990's (Cocchia [online], 2014, p. 14).

One of the two terms, which are mainly in use to explain the continuously digital implementation in urban spaces are the Smart or Digital City. Other words, that embrace this same, but seldom to find are: intelligent city, ubiquitous city or sustainable city (Cocchia [online], 2014, p. 13). Between the scientists there is no one ultimate description of the term Smart City or Digital City. In following two tables each Smart City and Digital City definitions are presented, but all of them show a different approach to the topic of new-age city.

**Table 1: Extraction of Different Meaning of the Term Smart City**

Source	Definition
(Su, Li and Fu, 2011, p.1029)	“Smart City is the product of Digital City combined with the Internet of Things”
(Northstream [online], 2018, p. 4)	“A Smart City uses innovation and technology to contribute to sustainability, an efficient use of resources, and a higher quality of life for its citizens.”
(Hall, 2000, p. 635)	“A city that monitors and integrates conditions of all of its critical infrastructures, including roads, bridges, tunnels, rails, subways, airports, seaports, communications, water, power, even major buildings, can better optimize its resources, plan its preventive maintenance activities, and monitor security aspects while maximizing services to its citizens”

Source: listed in the left side of this table.

Taking into consideration definitions mentioned above it is possible to define smart city as a city, which is smart if investments in human and social capital and traditional (transport) and modern (ICT) communication infrastructure promote sustainable economic growth and a high quality of life, with a wise management of natural resources, through participatory governance. Then idea of smart city can be distinguished in to digital city which is more connected to new internet based technologies. The Digital City definition then is more focused on technical aspect of its maintenance. In Table 2 definitions of digital city presented and compared.

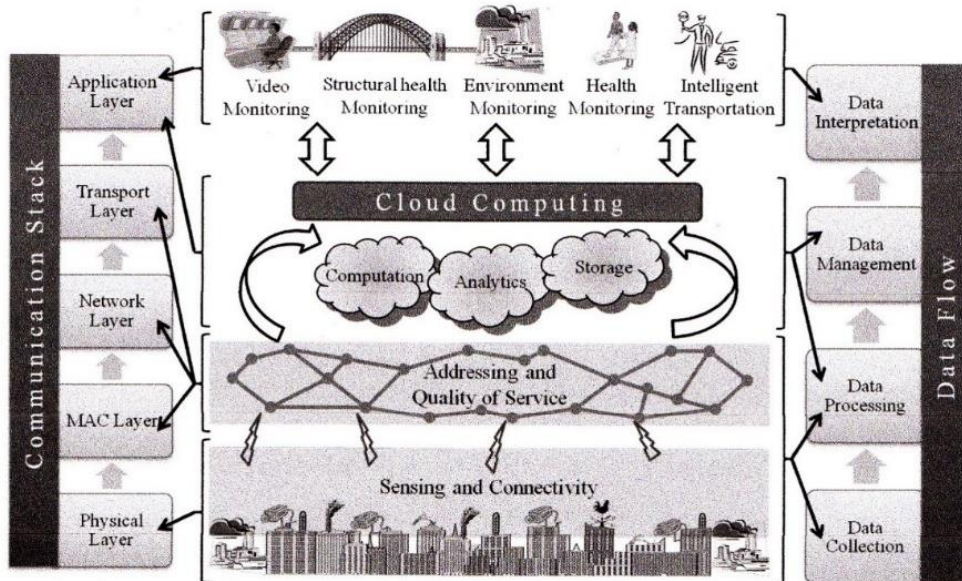

**Table 2: Extraction of Different Meaning of the Term Digital City**

Source	Definition
(Qi and Shaofu, 2001, p. 32)	“A digital city is substantively an open, complex and adaptive system based on computer network and urban information resources, which forms a virtual digital space for a city. It creates an information service marketplace and information resource deployment centre”
(Ishida and Hiramotsu, 2001, p. 106)	“The concept of Digital City is to build an arena in which people in regional communities can interact and share knowledge, experiences, and mutual interests. Digital City integrates urban information (both achievable and real time) and create public spaces in the Internet for people living/visiting the city”
(Komminos, 2008, p.120).	“Digital city denotes an area that combines broadband communication infrastructure with flexible, service-oriented computing systems. These new digital infrastructures seek to ensure better services for citizens, consumers and business in a specific area”

Source: listed in the left side of this table.

According to the concept of Smart City there can be defined three key determinants: technology, people and institutions (Taewoo and Pardo [online], 2011, p. 282). From the technological side it contains all elements of technological infrastructure needed to maintain a functioning of Smart City. On the other side at least it's important to strengthening human individuals in case of continuous learning (Kollár and Melková, 2014). Last crucial essential components of it are institutions i.e. in form of governance. Especially the governance is responsible for the engagement of its citizens and improvements on an institutional layer.

The overall concept of Smart City is not entirely new. But what is new, is the usage of so called ICT in term of implementation in city surround (Taewoo and Pardo [online], 2011, p. 283). The main purpose of it to integrate the important services ongoing in city infrastructure. The smartness of a Smart City is mainly grounded by usability of ICT and especially the recent emerging technology of Internet of Things (IoT). It's even more than that. In such an evolutionary environment exist a ubiquitous Internet network that not only receives the information from interconnected objects (on a hardware level). Such new-aged Internet also interact with the physical world through every kind of actuators and giving commands and controlling even providing information transfer services or analytics (Jiong et al. [online], 2013, p. 1). An example of working of IoT in a Smart City environment is presented in a Picture 1.

**Figure 1: Extraction of Different Meaning of the Term Smart City**

Source: Jiong et. al (2013, p. 3)

The continuous increase of population in cities conduct to a higher density in urban centres. Year 2008 was a very significant year in this case, in that more than 50% of a world's population (this meant to that time 3,3 billions of individuals) lived in urban places. The forecast till 2030 shows also this trend, where the total amount of people living in cities are going to be 5 billion (Taewoo and Pardo [online], 2011, p. 282). By 2050 this number will cross the line of 6 billion if individuals, which is equal to a 70% of the expected world's population, where the center of them lifes are going to be the big cities or the surrounding regions (Jiong et. al [online], 2013, p. 1). According to the definitions of Smart City it's possible to find even nowadays few examples of this type of cities, and there can be defined overall three main geographic spots of accumulation of so called Smart Cities which are:

- a) South East Asia (mainly China),
- b) North-Western and South-Western Europe,
- c) East and West of North America (USA and Canada).

Listed above regions have one characteristics in common all these spaces are to find at or near to coast-sides and lead to formulation of problem.

### 3. Problem Formulation

The main problem can be formulated based on characteristic of smart cities, which create network of well managed and developed cities located in Western Europe mainly in so-called "old European Union" countries, and indicate on weaker innovation capacity in some other regions of EU and significant development disparities. On the other hand, this dynamic economic growth leads to numerous hazards typical of economies that enter the path of fast development. Moreover, the European economy features innovation capacity that is weaker than that of the USA when measured by the traditional ratio of R&D to GNP expenditures, but is also characterized by the share of innovative high tech products in the EU exports and the

pace of expenditure growth (Sulikova et al., 2015). The innovation capacity of economies is the result of knowledge development which becomes the most important. This resource grows in the process of its being exploited in smart city concept. Moreover European countries are characterized by considerable differences in the development level. That may be a future European integration asset, if it is considered that less developed countries will manage to catch up in the field of development.

#### 4. Problem Solution

The concept of Smart City tries to solve problems, which came onto surface in the same time of rapid increase of population in big cities. That problems are for example deteriorating conditions in transportation and air. The highest goal is defined as a creation of better life for their citizens living in this environment. The vision of Smart City (Taewoo and Pardo [online], 2011, p. 283) are to gain improvements on such areas as: transportation, mobility, environment, energy consumption, safety and so on. The basic of effective realisation of Smart City is the digital hardware. From this site it's necessary to enrich every kind of facilities to find in a city, like: private households, schools, universities, airports, main stations, hospitals. These buildings have to be equipped with sensors, actuators, as embedded devices and mobile terminals. A fully digitalized Smart City contains of: sensors level, storage level, analytics including the right data interpretations (Jiong et. al [online], 2013, p. 2).

Since the European Integration process has diminished differences in economic, social and environmental standards, cities have converged in their basic conditions for competition, which is increasingly scaled down from the national level to the level of cities and regions (Giffinger and Haindlmaier, 2010, p.8). This trend enhances the importance of specific local six characteristics (Table 3).

**Table 2: List of Characteristics and Areas of Smart City Enhancing European Integration**

Areas	Characteristics
Competitiveness	Smart Economy, described by: innovative spirit, entrepreneurship, economic image and trademarks, productivity, flexibility of labour market, international embeddedness, ability to transform.
Social and human capital	Smart People, represented by: level of qualification, affinity to lifelong learning, social and ethnic plurality, flexibility, creativity, cosmopolitanism/open-mindedness, participation in public life.
Participation	Smart Governance: participation in decision-making, public and social services, transparent governance, political strategies & perspectives
Transport and ICT	Smart Mobility: local accessibility, (inter-)national accessibility, availability of ICT-infrastructure, sustainable, innovative and safe transport systems.
Natural resource	Smart Environment: lack of pollution of natural conditions, pollution, environmental protection, sustainable resource management.
Quality of life	Smart Living: cultural facilities, health conditions, individual safety, housing quality, education facilities, touristic, social cohesion

Source: (Giffinger and Haindlmaier, 2010, p.14-15)

There are different areas of city's life, in which a concept of Smart City gives promising improvements. The added-value is expected on a ground of: health, wellbeing mobility,

pollution or productivity. So from the health site many applications are according to noise limitations, air and water quality ensuring (Vlček, Čemerková and Wilczková, 2014). To the examples of the Smart City in terms of transportations, there are to define the mobility of pedestrians, cyclists, cars, freight vehicles or a smart public smart monitoring system, which helps easily to find empty spots in a neighbourhood without long searching process (Jiong et. al [online], 2013, p. 2). The same approach can be expected in case of energy management and the methods of resources savings (Klímová and Žitek, 2012).

## 5. Conclusion

Creation of Smart Cities in Western Europe leads to creation Europe of two speeds of development, and creates peripheries in European Union. When some part of EU become periphery then all Europe become it. To prevent such situation significant increase in research and development expenditures and directing them at the areas that have been discussed above, as well as a coherent European policy determining medium and long term goals in the field of innovation policies and science development. Necessary is also a “new opening” in the area of regional convergence, creation of economically strong economic regions, which may also contain border areas that have similar economic position, are culturally closely connected and boast development potential.

Growth of the economy and progress in European Consistent realization of the idea of society based on knowledge, achieved through support and spread of innovative technologies (ICT) and development of Smart or Digital Cities need balanced management to create also favourable conditions for social life and environmentally friendly technologies and their implementation. Growth of the economy and progress in European integration is based on innovations related to technical revolution and the smart cities development in area of the Industry 4.0 technology. Consistent realization of the idea of society based on knowledge, achieved through support and spread of innovative technologies (ICT) and development of Smart or Digital Cities need balanced management to create also favourable conditions for social life and environmentally friendly technologies and their implementation. Smart cities are based on the newest achievements, dedicated for the citizens’ prosperity and protection combined with the natural environment care. Quantitative analysis based on data related to smart cities development and their direct impact on the European integration should be examined in further researches.

### **Abstract**

*The development of eco-innovation is a necessary 'tool' to permanently reduce human pressure on the environment and efficient use of dwindling natural resources. Increasingly, however, literature emphasizes the role of eco-innovation as one of the basic factors of sustainable development. The article presents issues concerning eco-innovation, its later part analyses the capabilities and limitations of their introduction to the economy of selected European Union countries, including Poland. The aim of the study is to systematize the knowledge of environmental investment, and to indicate the possibility and necessity of their continuous development. The methodology used is based on an analysis of available literature and analysis of statistical data.*

**Keywords:** *eco-innovation, eco-innovation inputs and outputs, Eco-IS in EU countries*

**JEL Classification:** *F23, O39, Q52*

### **1. Introduction**

Socio-economic development has brought a number of indisputable opportunities but at the same time developed societies have never been struggling with challenges of so many kinds. Together with growing economies and societies, we have been witnessing the escalation of problems of demographic, societal (Szczygiel, Almeida, 2017) and ecological nature leading to works on economic growth, power generation and sustainability (Bento, Szczygiel and Moutinho 2017), and raising discussion on policies, methods and tools in practice. In view of increasing pollution and depletion of natural resources, environmental investments are now of interest to both researchers and decision-makers. However, some EU member states have different environmental competitive advantages and economical characteristics (Sulikova, Djukic, Gazda, Kulhanek, 2015). In all highly developed countries, it emphasizes that without the implementation of eco-innovation to the economy cannot be an effective solution to the growing environmental problems. The development of eco-innovation is a necessary 'tool' to permanently reduce human pressure on the environment and efficient use of dwindling natural resources. Already in the 90s of the twentieth century began research on eco-innovation. On their development, they influenced, among others, increase awareness of environmental threats, as well as seeking more sustainable model of economic development. The pioneers of this study were C. Fussler, P. James, R. Kemp and P. Pearson.

The concept of 'co-innovation' is relatively new. The prefix 'eco' comes from the word ecology, while by the 'innovation' we mean everything that is new. The aim of eco-innovation is the development of new products and processes that significantly reduce their negative impact on the environment. National as well as foreign literature on eco-innovation is quite poor. Increasingly, however, it emphasizes the role of eco-innovation as one of the basic factors of sustainable development. Thanks to them so-called 'clean technologies', and the economy becomes more 'organic'. The development of this kind of innovation is one of the elements of the OECD strategy which assumes encouraging companies limit their harmful effects on the environment and to finance research for this purpose.

The first part of the article presents issues concerning eco-innovation, its later part analyses the capabilities and limitations of their introduction to the economy of selected European Union countries, including Poland. It will contribute to science. The aim of the study is not only to systematize the knowledge of environmental investment, but above all an indication of the possibility and necessity of their continuous development in the European Union.

## **2. Methodology**

The methodology used is based on an analysis of available literature and analysis of statistical data. In statistical analysis, data for the years 2010-2016 have been used. The data have been acquired from official sources about EU countries. As a preliminary tool, the descriptive method is used. It consists of isolating and describing some definitions of eco-innovation. The following part of the study presents the measurement of eco-innovativeness in Poland and in European Union countries.

Measuring the level of innovation in a country is difficult, but examining the level of eco-innovation is even more difficult. This involves difficulties related to determining the scope of research, as well as the method of measuring the effects of introducing new environmental solutions. Attention should be drawn here to the Eco-Innovation Observatory, which is an EU initiative focused on the research of eco-innovations in the European Union. On the basis of the collected data, since 2011 it has been issuing a yearly ranking called the Eco - Innovation Scoreboard (Eco -IS) (Szpor, Śniegocki, 2012).

16 indicators divided into five groups are used to measure the levels of eco-innovation. Expenditures, or 'Eco-innovation inputs are the first one of the five areas in the Eco-Innovation Scoreboard. The index for this area is calculated based on three indicators: government investments in environmental and energy R&D, green early stage investments and total R&D personnel. Eco-innovation activities are number two; the index for this area is calculated based on three indicators: Implementation of innovation activities to reduce material inputs per unit of output in companies, implementation of innovation activities to reduce energy inputs per unit of output in companies and firms with environmental management (ISO 14001) systems.

Eco-innovation outputs are the next area in the Eco-Innovation Scoreboard. The index for this area is based on three indicators: eco-innovation related patents, academic publications related to eco-innovation and coverage of 'eco-innovation' in electronic media. For a detailed description of the indicators included in the Eco-Innovation Scoreboard and the calculation details. Resource efficiency outcomes are the next area in the Eco-Innovation Scoreboard. The index for this area is calculated based on four indicators: countries' productivities in material consumption, energy use and water use as well as countries' intensity of GHG emissions.

The index for socio-economic outcomes is calculated based on three indicators: Exports of products from eco-industries (% of total exports), employment in eco-industries (% of total workforce) and turnover in eco-industries' (<http://database.eco-innovation.eu/> access: 03,01,2016).

### **3. Result and Discussion**

Eco-innovation is a very important element of modern economies increasingly decisive for their competitiveness. Therefore, it is worth paying attention to what they are and what determines that innovation is ecological. The EU countries are characterized by a fairly large variation in the level of eco-innovation, and in most cases have a fairly stable position in this ranking. Poland ranks at one of the last places, which indicates a low level of eco-innovation compared to the EU average.

#### ***3.1 The Essence of Eco-innovation***

Eco-innovation, due to the greater complexity and different hierarchy of objectives is very different from innovation in general. In the literature there are many definitions of the term. This paper does not aim at deeper analysis of them all, but concentrates on the development of the major ones. The concept of innovation is steadily evolving, which is why it was assumed, that 'innovation is a new or a significantly improved product, process, goods or service introduced to the market or to a company. Innovation uses the results of technological developments, new combinations of existing technology or utilization of other knowledge desired by the company' (Wozniak et al., 2006).

According to the classical definition of eco-innovation, it is a new product that provides value for the customer and for business, while significantly reducing the negative impact on the environment (James, 2001). Innovations implemented by a business entity are defined as 'the implementation of a new or significantly improved product or process, a new organizational method or marketing, in practice, economic, workplace organization or external relations' (Oslo Manual, 2008). By eco-innovations, some authors understand 'all new forms of activities aimed at significant and demonstrable progress towards the goal of sustainable development, through reducing impacts on the environment or achieving a more efficient and responsible use of natural resources, including energy' (Prystrom, 2013). Eco-innovation is 'intentional conduct characterized by the establishment, comprising the stage of product design and integrated management during its lifecycle, which contributes to ecological modernization of the industrial age population by addressing the environmental problems in developing products and related processes. Eco-innovation leads to integrated solutions aimed at reducing energy and resource use, while improving product quality and services. Technological innovation is one way of eco-innovations' (Carley, Spapens, 2000). Moreover, ecological product innovation is an innovation that integrates ecological features of the product and technology lifecycle (from 'cradle to grave'), highlighting the same product against competitive products. Its goal is to realize the assumptions of 'environmental quality' (Chodyński, 2003).

The examples of definitions of eco-innovation presented above show that in practice it may take various forms. Despite the fact that the literature on this subject mentions three main groups of definitions; namely: environmental technologies, eco-effective innovations and system innovations, their common feature is that they all contribute to reducing environmental burdens by economic operators. As to the characteristics of these burdens, they vary quite significantly (Graczyk, Kazmierczak-Beer, 2011). Therefore, defining eco-innovation in a synthetic way it should be stated that eco-innovation is an innovation aimed at improving

relations between business and environment; and it can affect every environmental aspect of the business activity. On the level of strategic expectations of an enterprise, the activities related to the improvement of this relationship should primarily aim at such expansion of the system of eco-innovation within the economic entity, which will ensure that in the future it will be eco-efficient, by reducing the environmental (ecological) risk and bring benefits for the enterprise, as well as ensure its success (Graczyk, 2008). Eco-innovation is the innovation which seeks to reduce the burden on the environment and to achieve a specified performance environment. Eco-innovation is a policy of reducing pressure on the environment by using environmentally-friendly solutions. Eco-innovation solution is one which is innovative compared to solve the most modern (Jarża, 2013). Eco-innovation is most often understood as innovation (that is, changes in technology, organizational structure and management of the company which are designed to eliminate or at least reduce the negative impact of business on the environment (Witkowski, 2008).

In Poland, the concept of eco-innovations have been comprehensively for the first time defined only in 2009 by the Central Statistical Office as ‘innovation that benefits the environment, as a new or significantly improved product (product or service), process, marketing method or organization that bring environmental benefits compared with the alternatives’ (Activities, 2010). In contrast, at the European level to define this concept taken, among others The European Commission, the OECD and Eurostat. The European Commission defines eco-innovation as ‘a form of innovation aiming at significant and demonstrable progress towards achieving the objectives of sustainable development by reducing the impact on the environment or achieving a more efficient and responsible use of natural resources, including energy’ (Competitiveness, 2006). The Framework Programme for Competitiveness and Innovation eco-innovation defined as such innovations that reduce environmental impacts or have the purpose of making better use of environmental resources and thus serve sustainable development (Decyzja NR 1639/2006/WE Parlamentu Europejskiego i Rady z dnia 24 października 2006 r. ustanawiająca Program ramowy na rzecz konkurencyjności i innowacji (2007–2013), Dziennik Urzędowy Unii Europejskiej, L 310/15).

Given the above, it should be assumed that the primary objective of eco-innovation on the one hand, the environmental benefits and reduction of the negative impact of economic activities on the environment by reducing the energy intensity of consumption of natural resources or reduce emissions of harmful substances on the other (Ottoman et al., 2006). In the literature used a variety of divisions eco-innovation, including among other things for eco-innovation: product, process, organizational and marketing.

- Eco-Product, as a general category of innovation is the introduction of products or services, so that in a better way will be implemented environmental objectives. The main purpose of their introduction is to reduce the consumption of materials throughout the product life cycle (i.e. from its production process, right through to disposal at the end of life). This is made possible by the possibility of product repair, regeneration and use of materials that can be recycled.
- Eco-innovation process associated with improvement or introduction of new production technologies and new devices that serve to mitigate the negative impact on the environment, e.g. to reduce energy consumption through energy-efficient refrigerators.
- Eco-innovation are organizational changes in the company on the company's organization and management, designed for the purpose of increasing awareness and implementation of ecological sustainability, e.g. the implementation of an environmental management system ISO 14000.

- Eco-marketing concern at the introduction of new marketing methods drawing attention to changes in the product or packaging, distribution and promotion with particular emphasis on ecological principles, for example eco-label (Matejun, 2005).

### **3.2 Eco-Innovation Level of Poland against the European Union**

Analysing the state of the Polish economy, it is noted that its economy is largely dependent on other countries. Polish economy is based on coal and agriculture. Businesses are profitable thanks to low costs and low wages, not on the basis of implementing modern solutions. Poland has become an ideal expansion market for western companies, which dominate many industries. Therefore, it is important to move from labour-intensive industries to knowledge-intensive ones. Table 1 shows eco-innovative economies as ranked by the Eco-Innovation Scoreboard (Eco-IS), which measures the relative performance of eco-innovative EU countries to the EU average. Eco-gauge-IS is the basis for the division of European Union countries into three groups, i.e.:

1. eco-innovation leaders, where the value of the index is above 120 (Germany, Luxembourg, Finland, Denmark),
2. advocates of eco-innovation where the index value ranges from 81 to 119,
3. countries catching up on eco-innovation, with the index below 80 (Estonia, Poland, Cyprus, Romania, Malta, Hungary and Bulgaria) (Węgrzyn, 2013).

In 2010, the largest group was the group of countries catching up on eco-innovation (14 countries). In 2011 and 2012, the largest group consisted of supporters of eco-innovation (11 and 12 countries respectively), while in 2013 again the largest group were the countries catching up on eco-innovation (15 countries). In 2016, the largest group was the group advocates of eco-innovation (17 countries) - see table. 2. In that period Poland was classified as belonging to countries catching up on eco-innovation, and it held one of the lowest positions. In 2010 it held 4th place from the end, in 2011 - the last in 2012 and 2013 - the last-but-one. The last year was a little better, because Poland there is very little missing to be in the group of countries of advocates of eco-innovation. Eco-gauge-IS for Poland has significantly deteriorated in the year 2013 (it dropped by as much as 13 points), but the next years have brought about a significant improvement in the situation. Moreover, if compared to the six least innovative countries in Europe, measured by the level of eco-innovation Eco-IS Poland has shown increasing trend in the past four years. However, this does not change the opinion that Poland is one of the least eco-innovative countries in Europe. Also we need to emphasize that Polish economy is far behind the leaders of eco-innovation, as well as those catching up on eco-innovation. Such poor results stem from the weak position of the innovative trend in the country, as well as from small resources devoted to research and development activity. (Rutkowska-Podolowska, Pakulska, 2016).

**Table 1: Eco-Innovation Scoreboard (Eco-IS) 2010-2016**

Country	2010	2011	2012	2013	2014	2015	2016
UE	100	100	100	100	100	100	100

Source: own calculations based on Ranking Innovation Union Scoreboard 2014, [www.database.eco-innovation.eu](http://www.database.eco-innovation.eu) (access: 28.06.2017)

The Eco-Innovation Index shows how well individual Member States perform in different dimensions of eco-innovation compared to the EU average and presents their strengths and weaknesses. The Eco-IS and the Eco-Innovation Index aims to promote a holistic view on economic, environmental and social performance.

#### 4. Conclusion

Eco-innovation is the basis of the new model of development. Each EU country should promote and encourage the introduction of eco-innovative solutions by applying the relevant laws and regulations. Polish results in this area compared to other European Union countries present themselves very badly, because Poland is one of the least eco-innovative countries in Europe. In addition, Polish indicators are not improving but deteriorating. It is an asymmetric relation between public debt and economic growth in the EU countries. Some countries creates closed "circle" consist of Austria, Belgium, Finland. Netherlands, Italy, Spain, Denmark and Sweden (Sulikova, Djukic, Gazda, Kulhanek, 2015).

In the second part of the article we analysed in detail the various groups of indicators and their changes in the analysed period. The group of countries with the highest level of eco-innovation has been quite stable. These are countries with a high level of overall innovation. Hence, it can be assumed that in these countries there is a good system to support innovation, especially ecological. A higher changeability occurs among countries with very low eco-innovation levels. Moreover, the countries which leave the lowest positions on the list, move only a bit higher. These are countries with low overall innovation levels. Therefore it is recommended, in order to improve the situation in those countries, they should follow the leaders' example and apply similar systems to support eco-innovation.

Polish low eco-innovation level is due to an overall low level of innovation in the country and low expenditures on R & D. Low eco-innovation levels also may be linked to structural factors, such as cooperation between science and industry, absorbency of SMEs, or lack of financial incentives for the implementation of eco-innovation. Also, compared to other EU countries and especially the leaders of eco-innovation, Polish companies do not have sufficient capital necessary for the introduction of eco-innovation. This is all the more important as eco-innovations, like innovations in general, are characterized by high costs of implementation, and associated with high risk of failure.

### **Abstract**

*The aim of the article is to present green economy and green entrepreneurship. The green entrepreneurship is a necessary 'tool' to economy development. The article refers green entrepreneurship for the excluded and their influence to the economy of selected European Union countries, including Poland. The aim of the study is to systematize the knowledge of participation green jobs for green entrepreneurship for the excluded. The methodology used is based on an analysis of available domestic and foreign literature and analysis of statistical data. This article refers to the most accepted approaches towards greening economy, which is based on sustainable development concept. The article presents an analysis based on selected definition of green entrepreneurship of possible prevention unemployment in Poland and chosen EU countries (Ireland, Italy and Germany).*

**Keywords:** European integration, green economy, green entrepreneurship, green jobs

**JEL Classification:** F63, O44, Q56, Q57

## **1. Introduction**

Currently, the European Union's Energy and Climate Package obliges all member states to reduce greenhouse gas emissions, increase the share of energy from renewable sources, and increase energy efficiency. Therefore, green jobs are becoming a significant sector of the European economy, which will develop the most rapidly in the upcoming years (Rutkowska-Podołowska et. al., 2016). Green jobs and green entrepreneurship can be indicators of the new upcoming trend of green European integration which aim is to protect natural environment or reduce negative impact of human activity. However, some EU member states have different environmental competitive advantages and economical characteristics (Kasztelan, 2016; Sulikova et.al., 2015). Therefore, the creation of such jobs can be an important tool of the so-called social inclusion (Sulich, 2016) and be recognized as a European integration tool. Creating green jobs and transferring knowledge about green technologies is an opportunity for European Union to solve the problems of inequality and discrimination in the labour market and create a new speed of green, economic development

This article aim is to present most spectacular examples of the green entrepreneurship in chosen EU countries and point to the fact that this successful projects can inspire other member states to launch the own specific projects. The aim of the study is to systematize the knowledge of participation green jobs for green entrepreneurship for the excluded. First the idea of the

green entrepreneurship and green jobs are presented - as the problem formulation, then programmes in chosen countries were characterized - a solution for presented problem. This article assume that creation of green entrepreneurship network can be an attempt not only to protect natural environment but also enhance European integration in its social dimension.

## 2. The Essence of Green Entrepreneurship

In the literature there are many definitions of entrepreneurship, but there is no one unified and widely accepted (Sulich, 2017). The following definition is most relevant to this article, then was accepted as follow „entrepreneurship can be characterized as can be characterized as a socially conditioned process of creating opportunities for creating wealth and their creative use through the use of financial and material resources as well as human and social capital in an innovative way” (Klasik, 2006). Moreover, entrepreneurship refers to public and social activities.

In the scientific literature the environmental entrepreneurship definition was formulated (or green entrepreneurship), as a business activity with positive impact to natural environment. Green Entrepreneurship is just about taking conscious action to address environmental problems. All activities can be simple or more advanced (Ottman et. al., 2006):

- as simple as creating a recycle and reuse policy in the company for materials such as paper, plastic and others,
- as more advanced, as using new techniques that reduce emissions of gases on production or using cleaner energy from renewable sources.

Green (ecological) entrepreneurship is closely related with ecological innovations. Eco-innovation is an entirely new product, which assure values both for the client and business, and it reduces their negative impact on natural environment (James, 2001). The aim of ecological innovations are benefits for environment and reduction of negative impact of business activity on to natural environment. All these goals can be obtained due to energy saving machines, reduction of energy demand by systems and reduction of natural resources usage or reduction of dangerous substances emissions (Ottman et. al., 2006, p.48).

When discussing green entrepreneurship, also green jobs should be mentioned. For the purposes of this article, it was assumed that green jobs “include direct employment which reduces environmental impact, ultimately to levels that are sustainable” (Rutkowska-Podołowska et. al, 2016). This definition includes jobs “that help to reduce the consumption of energy and raw materials, decarbonizes the economy, protect and restore ecosystems and biodiversity and minimize the production of waste and pollution”. It is broader concept of “green jobs”, which might embrace any new job in a sector which as a smaller than average environmental footprint and contributes to improving overall performance, albeit perhaps only marginally” (ILO, 2008).

On the other hand, green businesses are gaining popularity as more opportunities arise for eco-entrepreneurs to invest in. This business is mainly driven by the demand of consumers who are interested in purchasing goods and services that incorporate eco-friendly manufacturing processes. For instance the giant Google has set up a project to create their own energy via renewable sources, like wind and sunlight. They even have a site created to promote the green concept, which you can check over here (Montes [online], 2011).

### 3. Problem Solution

For the purposes of this article it is assumed that entrepreneurship is “the capacity and willingness to develop, organize and manage a business venture along with any of its risks in order to make a profit. The most obvious example of entrepreneurship is the starting of new businesses. In economics, entrepreneurship combined with land, labour, natural resources and capital can produce profit. Entrepreneurial spirit is characterized by innovation and risk-taking, and is an essential part of a nation's ability to succeed in an ever changing and increasingly competitive global marketplace” (BusinessDictionary [online], 2018).

The article presents an analysis based on selected definition of green entrepreneurship of possible prevention unemployment in Poland and chosen EU countries (Ireland, Italy and Germany).

Thanks to the assets from the cohesion budget and the European Social Fund, the Irish government carried out the "Greenworks Ireland" - one year project which turned of 2010. This project was intended entirely dedicated for jobseekers, which could acquire skills in the fields related to natural construction technologies, ecotourism and responsible business. Special trainings covered almost two thousand people in Ireland. Non-governmental organizations were responsible for this programme implementation, including the Ecovillage in Cloughjordan, which brought its educational package to the project. These trainings mainly covered needs of young people and long-term unemployed people who already had some experience in construction and design.. The training objectives were twofold, namely:

- for many jobseekers it was an opportunity to strengthen their qualifications in the field of eco-technologies,
- other people gained new skills to help find the first job.

A large group of project participants were people from disadvantaged backgrounds, disabled people and immigrants. The trainings concerned such areas as: construction and building of houses from natural materials, the design of permaculture gardens (i.e. stable, non-invasive for the environment, agricultural ecosystems), renewable energy sources, or the implementation of sustainable development strategies in enterprises. As the result of the programme, over 16% who completed the courses found employment immediately, another 15% set up their own business, and as many as 17% decided to continue their education, strengthening their qualifications. The systemic approach of the Irish authorities to developing the skills needed for 'green jobs' evokes admiration and recognition. In Poland, this can be an inspiration to undertake and implement this issue was the implementation of social projects.

As part of the Support to the Implementation of Sustainable Development project of the United Nations Development Programme (UNDP) carried out a pilot project of similar design. Together with its partners - the Cohabitate group, pioneers of natural architecture, the Lodz Centre of Sociotherapy and private companies - UNDP showed that also in Poland the green jobs can lead to social inclusion. The Sociotherapy Centre has selected a few teenage boys from dysfunctional backgrounds. Cohabitate architects trained them in natural building, and private companies offered a professional internship, at which they could test the knowledge gained at the workshop. The companies were satisfied and there is a chance that teenagers after leaving the centre will find employment in this sector (Muzińska [online], 2011).

The Green Technology Centre project is a way of counteracting unemployment and support the development of local entrepreneurship using the natural assets of Podlasie region (Poland). This project allows to acquire new qualifications, change the profile of the company or acquire the necessary knowledge in the field of green technologies. As part of the training, participants improved their skills and became enriched with specialist knowledge. Thanks to this, owners

and employees of SMEs are able to increase their competitiveness on the market. An additional benefit is the creation of green jobs by them and the use of green technologies in their business activities which will bring environmental benefits in the form of improving its quality (nf.pl, [online], 2018).

The purpose of another green project, which received financial support from EU funds, under title "Let's get a job. Eco-chance" is combating unemployment and social exclusion through pro-ecological actions (Stańczak [online], 2018). Eco-chance (pol. *Eko-szansa*) is a programme where alternative sources of employment are created, the so-called "green jobs" and sources of income. The training aroused interest not only of representatives of offices, institutions of care, labour office, but also of organizations that aim to help people who cannot cope in life for various reasons, as well as farmers who have become interested in alternative sources of income. It gives an opportunity to social reintegration and increase the potential of people discriminated against or excluded from the labour market, creating alternative forms of employment in centres as well as green jobs for local communities adapted to the needs of this group. The project consists in creating and testing an integrated system of therapy, education and work, related to environmental protection and sustainable development in local communities. The project is implemented in treatment and rehabilitation centres for people addicted to psychoactive substances and infected with HIV. These centres have become a training base for project participants and the place of apprenticeship. The programme was aimed at acquiring skills and knowledge that would enable the return to the labour market. During vocational training, participants received new professions and practical skills acquired during apprenticeships. The effect of the project implementation was (Stańczak [online], 2018):

- creation of a tested model of an integrated therapy, education and work system for use in other facilities,
- created system of professional ecological training (agricultural biodiversity, biomass, hippotherapy and equestrianism, protection of old parks, herbalism, beekeeping, boatbuilding and eco-construction),
- the creation of an internal market for green jobs in centres and the offer of the local labour market will be widened,
- open access to the information society for patients of rehabilitation and re-adaptation centres, local communities and people living with HIV or AIDS in urban environments,
- increased level of beneficiaries' own potential, which will improve their quality of life and facilitate integration in the labour market,
- improved level of social acceptance of people living with HIV or AIDS and people with addictions,
- many good practices in the field of implementing sustainable development in local communities.

The Eco-chance unleashed a willingness to act in many areas and was a real therapy for people treated for drug addiction. The programme helped especially those with scarred psyche, a broken system of values, and inability to experience higher feelings (Stańczak [online], 2018). Another project implemented in Poland was the project under title "Sudetes - a chance for young people". Its goal was sustainable mountain development, acceleration of the process of new development and improvement of existing methods of work, which would give young people new tools and a new approach to problems related to work in these fields, enabling the unemployed to get some funds for starting a business in areas such as: mountain farming, agritourism, regional product (i.e.: production, distribution, EU standards and promotion), hotel industry, regional gastronomy and management, help for women burdened with family

responsibilities in self-employment or in finding alternative sources of income, such as for example craftsmanship artistic jewellery. The project was directed to a group of 300-400 high school graduates and graduates of previous years (up to 35 years old) from 7 high schools with the following profile: agricultural, hotel, catering and tourist from Klodzko Valley and was implemented in 2004-2007. The result of the project was (Ekoprojekty.pl [online], 2018).:

- raising the qualifications of people primarily from villages and small towns,
- involvement of as many as possible citizens of the local community (including beneficiaries) in partnership work in building programmes to solve pressing unemployment problems,
- process orientation and action to improve existing and develop new methods, instruments and approaches to problems,
- inoculation of "good mountains practices" in mountainous regions,
- development of a new teaching model in schools, taking into account the evaluation of the "Graduates 2004 in Aosta" programme and starting the process of adapting the educational model to market needs.

Project titled "Fare impresa sociale nell'ambito delle fonti energetiche rinnovabili" was implemented in Italy. Its purpose was to apply solutions appropriate to the social economy in the renewable energy sector as a response to the problem of exclusion of discriminated people on the labour market and at the same time provide a qualified workforce to this sector of the economy, use experience of the industries traditionally belonging to the social economy in the growing sector of renewable energy as well as the definition of tools and methodologies supporting the social and professional integration of discriminated people (Stańczak [online], 2018). The strategy consists in introducing planned and integrated measures to promote renewable energy sources on the private and public markets as well as in households. The projects were directed to:

- Unemployed - men / women: 33.0% / 33.0%
- Employed - men / women: 17.0% / 17.0%
- Immigrants, ethnic minorities, etc. - men / women: 40.0% / 40.0%
- Non-immigrants and non-refugee refugees - men / women: 10.0% / 10.0%
- Physically handicapped - men / women: 25.0% / 25.0%
- Mentally impaired - men / women: 15.0% / 15.0%
- Patients with mental illness - men / women: 5.0% / 5.0%
- Non-disabled people - men / women: 5.0% / 5.0%
- Addicted people (alcohol, drugs) - men / women: 20.0% / 20.0%
- (Ex) prisoners - men / women: 20.0% / 20.0%
- No specific form of discrimination - men / women: 10.0% / 10.0%
- <25 years - men / women: 15.0% / 15.0%
- 26-50 years old - men / women: 35.0% / 35.0%

The project resulted in a series of trainings during which not only information on renewable energy sources and their application were transferred, but also, the skills of operational activities related to the activities carried out (distance learning instruments were also used). An important effect of the project was undoubtedly the establishment of permanent cooperation with local authorities - as a result of information and promotional activities, numerous city representatives (N=359) contacted the Partnership to join the experiment. The participation of local authorities was very significant and exceeded all expectations. The main innovation of the project concerns the strategic sector selected to create business activities, renewable energy sources. This included the creation of an integrated participation strategy with institutional, entrepreneurial, social and technological participants. Other innovative aspects concern cooperation networks between key private participants, territorial

development pacts, memoranda of understanding, local programming, training paths for specific vocational qualifications (eco-energy manager) in market sectors related to new sources of employment and the use of new technologies.

In Germany, a project called "Ecological Center Öko-Domäne Bobbe", which aim was to implement the tasks of ecological education, social policy and organic farming thanks to the creation of a multifunctional centre with an ecological school. The project was implemented by Öko-Domäne Bobbe, a non-profit organization that runs a multi-purpose centre with an ecological school, and partners and friendly non-governmental organizations. The result of the project is the adaptation of the rooms equipped for thematic activities: grinding grain into flour and baking bread, laboratory testing of water quality. There are also rooms for ceramic works with clay, for weaving wickerwork and a room for self-made paper from recycled paper. Groups of pupils come to the centre for a minimum of 1 day, during which classes are held at the ecological education centre and at the Eco-School. Teachers are pedagogues of general education schools who are delegated to the Eco-School 11 hours a week. Every year, the school is visited by about 5,000 children, and open days are organized, during which whole families and older people are particularly welcome. Owned units: hotel, horse farm, educational centre, eco-school and organic farm (Ekoprojekty.pl [online], 2018).

In Germany, a project called "Ecological Training Centre Lasker Hofe" aim was to integrate various social groups (including - young people, socially excluded and expatriates) - through the constructive educational activities that are possible in the Laser Hofe Center. As part of the project, an ecological reconstruction of an unused kindergarten for a training centre has been planned. The project was implemented by Ökologisches Bildungszentrum Lasker Hofe, which is involved in transferring professional qualifications that allow it to appear on the labour market and is involved in training and advisory activities for both young people and adults. The recipients of the project were people wishing to improve their professional and job-seeking qualifications, youth, socially excluded societies, and expatriates. The project was implemented in 2002-2005. The result of the project is a surface area of 4800 m<sup>2</sup>, ecological reclamation of 2350 m<sup>2</sup>, creation and animation of the training centre activities with a wide range of training to improve professional qualifications - both for young people and adults, and initiation of youth club activities (Ekoprojekty.pl [online], 2018).

#### **4. Conclusion**

The inspiration for many green entrepreneurship programmes were cross national experience exchange and cooperation in this field based on European funding. Although entrepreneurship is commonly associated with establishing a new companies, in this paper it was presented as form of activation of some groups of people endangered by exclusion from labour market.

The social dimension of listed in this article programmes can be recognized as one with the strongest element of European integration. Additionally the programmes are mostly dedicated to establish opportunities for excluded groups of society and to protect natural environment. In fact, most of the services and products being offered today have been greened, although many companies associate Green Entrepreneurship with a high costs. This economic aspects should be a subject of future research of social economy non-profit entities in aspect of jobs on the green economy background case.

### **Abstract**

*The foreign policy of the Slovak Republic was shortly after its inception in 1993 part of the dispute over the character of the state. Integration into the European Union was a significant political issue. In particular, nationally oriented political parties have at least been reluctant to integrate Slovakia into Euro-Atlantic structures. After the accession of Slovakia to the European Union, this question became irrelevant. However, with the current rise of political extremism, some political forces are proposing Slovakia to leave the European Union. Today's political reality needs to be re-examined also from the point of view of political parties. Parties are still important policy makers despite moods against them. The subject of this conference contribution will be the electoral programs of political parties and movements in the National Council of the Slovak Republic in 2016, for which content analysis will be used. The aim is to determine the degree of Euroscepticism among the relevant political parties in Slovakia.*

**Keywords:** elections program, euroscepticism, integration, political agenda, political parties

**JEL Classification:** H70, H77, N0, O10

### **1. Introduction**

The geographic location of Slovakia was a major geopolitical challenge already in the period of Great Moravia. The mighty empires in the west and east of Europe, with their ups and downs, tried to create a political arrangement in the center of Europe, which would in fact be either a buffer zone or a sort of predisposition for a future attack.

One of the first moments when the political rivalry of East and West in central Europe began in modern understanding was the 9th century. "King Louis the German in 863 forced his rebellious son Carloman to obedience, and Prince Rastislav continued to withstand the attempt of the French rulers to militarily conquer Great Moravia. During the process of christianization, he realized that along with the arriving Frankish clergy, Great Moravia also received cultural, and political influence of the powerful western neighbor." (Čaplovič, 2000) This is why in 862 Rastislav turned to the Byzantine Emperor Michael III., who sent missionaries Cyril and Methodius on the territory of Great Moravia. Their mission had its educational and cultural significance, which is at present emphasized in Slovakia by nationalist associations and Eastward-oriented individuals.

The above-mentioned historical contexts, which are part of the political ethos of Slovakia, partly indicate its relation to the idea of the European Union and the degree of its integration. Of course, *reductio ad absurdum* of this thesis is not useful. However, we would like to use it as a starting point of thinking about what does it mean to say that Slovakia is part of Central Europe and whether Central Europe is so called bridge between the East and the West (more

than 60% of the people agreed with this in the latest opinion poll) or whether it is part of the West (about 25% of people agreed) or it should be part of the East (more than 10% of people agreed).

In 2015, the European Union was hit, especially because of the conflict in Syria, with an event that has been called by the media the migration wave or the migration crisis. This showed a significant difference between the attitudes of top officials of the European Union and leaders of the national states. This migration wave has, among other things, led to linguistic disputes over the different concepts used with migration: "The use of the categories refugee and migrant to differentiate between those on the move and the legitimacy, or otherwise, of their claims to international protection has featured strongly during Europe's migration crisis and has been used to justify policies of exclusion and containment. Drawing on interviews with 215 people who crossed the Mediterranean to Greece in 2015, our paper challenges this categorical fetishism, arguing that the dominant categories fail to capture adequately the complex relationship between political, social and economic drivers of migration or their shifting significance for individuals over time and space."(Crawley, Heaven, Skleparis, Dimitris)

The theme of migration has become one of the key issues in the national parliamentary and presidential elections in the EU Member States over the next few years, as well as of UK referendum on leaving the EU. Slovak elections in March 2016 were no exception. The competing political parties and movements expressed their attitude to Slovakia's membership in the EU under the pressure of the migration wave. The relationship between acting of political parties and the European integration has been noticed by many experts, Tanja Boerzel and Thomas Risse: "Political controversies over the euro crisis have centred predominantly on questions of order, i.e., what constitutes Europe as a community and how much solidarity members of the community owe to each other under which conditions. The mass influx of migrants and refugees changed identity politics, since Eurosceptic populist parties framed the Schengen crisis in terms of borders, advocating for an exclusionary 'fortress Europe'." The theoretical interconnection of issues of political parties and European integration was published by Liesbet Hooghe and Gary Marks: "This article argues that the perforation of national states by immigration, integration and trade may signify a critical juncture in the political development of Europe no less consequential for political parties and party systems than the previous junctures that Lipset and Rokkan detect in their classic article"

On the political map of the European Union, an association of V4 countries emerged, and it was characterized by a negative attitude towards migration. "Migration is a phenomenon, which is relative to Slovakia not only because Slovakia is a part of the European Union or V4, and is also a bordering country, but also because its territory was heavily influenced by migration. Migrants entering into the V4 countries do not always use the legal process and mostly they enter illegally. The severity of irregular migration is the result of not only its range, but also of its links with organized crime and the associated security risks, including terrorism." (Horvát, 2016)

After the parliamentary elections of 2016, eight political parties reached parliament. We will further analyze their electoral programs in the article with chapters divided according to the criteria for participation in the current executive.

## **2. Governing Political Parties**

The parliamentary elections in 2016 took place after four years of government of one party - Smer - Social Democracy. The development of its voting preferences between 2012 and 2016 had a steadily declining trend. Therefore, it was generally expected that the coalition

government would emerge after the elections. Smer-SD as the winner of the election 2016 eventually put the government together with three other political subjects.

### **2.1 Smer – Social Democracy**

Slovak Social Democrats, who have been operating under the Direction - Social Democracy brand since the integration of the left side of Slovak political spectrum between 2002 and 2004, have always had a constant and specific attitude towards the European Union. Already at the time of the first parliamentary elections in 2002, in which Direction took part as the "Third Way", when its leaders preferred ideological pragmatism, through its large-scale advertising, its attitude to the ongoing integration into Western political structures was expressed by the slogan "Into the European Union ... but not with bare asses!". A year later, at the time of the referendum on the accession of Slovakia to the European Union, Direction officially participated in a campaign to promote entry, but "... on the basis of the April survey of UVVM at the Statistical Office of the SR it could be assumed that higher risk groups "(Veľšic, 2003) may be especially "younger age groups; both skilled and unqualified workers; inhabitants of small and medium-sized towns; inhabitants of Žilina Region and Banská Bystrica Region; sympathizers of the Smer, the HZDS or people who did not sympathize with any party." The higher risk groups in this context were perceived the voters who might not participate in the referendum or vote against membership in the EU.

In spite of a weaker pro-European orientation, the Smer - Social Democracy has become a member of the European Socialist Party as well as of the Socialist International. After the 2006 parliamentary elections, when social democrats created the government with the nationalist Slovak National Party (SNS) and the populist Movement for Democratic Slovakia (HZDS), Direction was temporarily suspended from the Party of European Socialists. It was another example of the fact that domestic politics and moods are a political priority for the Smer - Social Democracy over the relationship with the EU. This is also confirmed by the electoral program drafted in 2005, in which the European Union is mentioned out of 29 pages only at the final 14-lines: "Smer - Social Democracy considers foreign policy as one of the basic instruments of promoting national interests. It supports Slovakia's active involvement in European political and economic as well as transatlantic structures, as Slovakia is an integral part of Europe. There has been a lot of success in foreign policy, but on the other hand, Slovakia has lost a lot, for example when meeting the conditions for joining the EU, when Slovak diplomacy did not negotiate the optimal conditions."(SMEROM K ĽUĎOM Volebný program SMER – sociálna demokracia, 2005)

Thusly defined political line of Direction-SD towards the EU has not changed in any significant way in recent years. An equally ambivalent attitude has the Direction also taken on the financial problems of Greece and the creation of European Stability Mechanism in the period 2010-2012 as well as on the aforementioned migration crisis. The Slovak Socialists did not present any larger electoral program before the elections to the National Council of the SR 2016, merely several basic electoral theses, among which was a statement that "Smer - Social Democracy fundamentally refuses any attempts to force sovereign Slovakia into placing migrants on its territory. Smer - Social Democracy is ready to accept, on the principle of solidarity, financial, personnel and technical measures to protect the Schengen external borders from illegal migration." (www.strana-smer.sk, Cieľ účasti vo vláde, quot. 14. 2. 2018)

### **2.2 Slovak National Party (SNS)**

The Slovak National Party represents the oldest "brand" in the history of the political life of Slovaks. The party is proclaiming its history to go back to the 1870s, but it has to be said that

this is not an unambiguous historical continuity. Originally, it was a confessionally-oriented political party of the Slovak Protestants. For some time, at the turn of the 19th and 20th century, it had interconfessional character across the social strata and tried to act as a representative of Slovak cause in Hungarian political life. However, its influence was slowly weakened by natural political stratification, especially with the arrival of the first Czechoslovak Republic. During this period, the SNS became a small political party, which was a minor political partner, especially for the Hlinka's Slovak People's Party, which eventually absorbed it after 1938. The SNS had a similar political relevance after 1989, when it was mostly a coalition or opposition partner of populist parties, often using the potential of national and social populism. The top of its political agenda was the critique of the Roma issue, to which it has not produced any conceptual solution throughout its modern existence.

The relationship of the SNS to the European Union can be perceived on the same mental and intellectual level as the West and East was perceived by the representatives of this party in the 19th century. When the SNS emerged among other as a part of the intellectual legacy of the group around Ludovít Štúr which was expecting the national revival of the Slovaks with the help of the Czarist Russia and were skeptical to the West. The SNS retains similar thinking in the 21st century. Currently, the SNS's view on the EU is well illustrated by a party document entitled "Requests of Slovak Patriots towards Brussels" where the SNS complained, inter alia, "about permanently circumscribing the powers of the national parliaments, about loss of independence and about manipulating changes in the electoral system into the European Parliament. We express our dissatisfaction with the current stagnation of the European Union and its inability to respond to emerging and growing problems." In the Košice program theses for Slovakia of 2015, the words European Union are not even present.

### **2.3 Most-Híd**

Political party Bridge represents on the current political map of Slovakia a hybrid of ethnic and civic political party. It was formed in 2009 due to personal disputes in the Party of the Hungarian Coalition, which was for the previous decade the political representative of the Hungarian minority and was part of two coalition governments.

Bridge, with its storyline starting in the SMK environment, has a certain personal and organizational basis, which may lead to its characterization as a de facto ethnic party, but it must be added to its political profile that it deliberately focuses more on the civic issues, which also allows it to address Slovak voters. Its personal strategy is similar, resulting in the fact that Slovaks are deliberately also among its representatives.

The above-mentioned circumstances indicate that Most-Híd belongs among pro-European forces. Partially because it is a minority representative, this party is aware of the importance of human rights and freedoms as a political agenda. Currently, Bridge is self-proclaimed political force based on the position of the civic party, which means tolerant, respecting and protecting human rights and the pro-European orientation of the country and based on the position of its program Civil Vision. It continues to strengthen its core pillars: building and developing the rule of law institutions, developing regions and protecting minorities by strengthening the civil society principles. These three pillars were also the basis of the election campaign of the 2016 parliamentary elections. Bridge takes the support and sympathies of citizens as the support for these ideas. As a result, since the end of 2017, three expert-political cabinets exist - For the Rule of Law, under the leadership of Lucia Žitňanská; For Regional Development, under László Sólymos; and For the Protection of Minorities and the Development of Civil Society, under Ábel Ravasz.

Bridge offered an electoral program called Civil Vision for the elections to the National Council of the Slovak Republic 2016. It was an extensive document, divided into 12 main thematic chapters. The issue of Europeanness is the subject of the eleventh chapter called Foreign and Security Policy. Bridge has an abstract but positive approach towards the European Union: "The creation and existence of a strong and competent European Union that accepts regional and cultural diversity is of primary interest to Slovakia. That is why it is extremely important for every Slovak government to actively, and in the position of a partner, support the work of the European Council and the European Commission to support by its own proposals and initiatives strengthening of the EU's global position, increasing of the competitiveness of its economy and contributing to strengthening of EU security." (Občianska vízia, 2016) Overall, this part of the program is highly open to the world abroad. Apart from the obvious interest in good neighborly relations with Hungary, Bridge wanted, for example, to support the military activities of the French Republic or the military presence of Great Britain in Central Europe. On the contrary, Bridge identified the current Russian foreign policy as hostile.

## **2.4 Siet'**

The last political party that became part of the ruling coalition after the 2016 parliamentary election was Siet'. Its short and stormy political story had beginnings in the presidential election in 2014. Radoslav Procházka, the later founder and first chairman of Network was one of the more successful presidential candidates. If in Slovak political life after 1989 it was true that the fate of Slovak political parties is related to the rise and fall of their leaders, the fate of Siet' party fully confirms this.

Radoslav Procházka formally began his political activity in 2010 with Daniel Lipšic as a member of the Christian Democratic Movement (KDH) and its deputy in the National Council. After the fall of the government of Iveta Radičová in 2011, the early 2012 parliamentary elections and after the departure of Daniel Lipšic from KDH a year later, he at first pretended to be interested in cooperating on the creation of a new conservative-liberal entity to replace the so-called old right. Instead, he eventually preferred to candidate to the President of the Slovak Republic and subsequently transformed the public support and personnel equipment to establish his own political party Siet'.

Prior to the election, Siet' issued an electoral program specified to a number of policy areas, but it lacked expression on foreign and European policy. The actual foreign policy orientation of this now-defunct political party is therefore questionable. It is only partially reconstructable through interpretations of its representatives, but we do not consider it relevant for the professional purposes of this conference contribution.

## **3. Opposition Political Parties**

The results of all parliamentary elections after 1989 brought new political parties to the Slovak Parliament. In 2010, the five per cent limit exceeded the protest parties. In 2016, the situation was so high that parliamentary representation was also acquired by the fascist Kotleba ĽS-NS.

### **3.1 Sloboda a Solidarita (SaS)**

In 2009, similar to Most-Híd, the new liberal political party Sloboda a Solidarita, also emerged. Its key program element was economic liberalism. Its first and yet only Chairman, Richard Sulík, tried, prior to establishing the SaS, to publicly promote the so-called tax bonus that represents a major change in the social system in Slovakia.

Since spring 2009, activity of SaS has been based on the entry of public figures from the media and business world into the party. This, combined with modern marketing has helped it to gain an interesting result in the European Parliament elections. Subsequently it was successful in the 2009 regional elections, and with continuous and intensive political work until the 2010 parliamentary elections it became the third strongest political party in Slovakia and the second strongest government party in the cabinet of Iveta Radičová.

In relation to the European Union, SaS originally behaved as a so-called Eurorealist party. It considered the EU a good but too bureaucratic political project. At the time of the Greek financial crisis, which arose before the 2010 parliamentary elections, SaS clearly opposed Greece's European financial assistance, which helped its electoral result in the parliament.

Meanwhile, the European Stability Mechanism, which was to be approved by the national parliaments of euro area countries, was proposed at the European level to solve the Greek financial crisis. This was the formal reason for the fall of the government of Iveta Radičová, which combined the vote on the European Stability Mechanism with vote of confidence to the government. In addition to voting against the European Stability Mechanism, SaS members also voted against the government their party was part of. Consequently, the result of the early parliamentary elections in 2012 showed that this political tactic cost SaS nearly 2/3 of voter support compared to 2010 and the party actually only narrowly made to the parliament.

The SaS electoral program in the parliamentary elections 2016 mentioned the European agenda in the eleventh part of the program, which states: "Slovakia, together with other European countries, faces several crises. The debt crisis and the refugee crisis, linked to new security threats in Eastern Europe, are affecting the entire continent. These are linked to further dangerous increase in nationalism and populism. More and more European Union (EU) residents are starting to reject it as a failing institution. It is necessary to adapt our foreign and political activities in terms of being better partners and allies." (Volebný program SaS, 2016) About the incomplete decade of SaS, it can be said that in its political life, the key ups and downs have been linked to the European Union so far. Although the SaS reflects on fundamental issues that are strongly perceived by public opinion, Slovak liberals are in fact not sufficiently constructive in proposing and enacting the solutions. Other than the blunt refusal of the European Stability Mechanism in 2011 and of the migration quotas in 2015, they did not actually offer any practical solutions. The party, which initially inspired by its program, is now more about latent xenophobia and mitigating populism.

### **3.2 Obyčajní ľudia a nezávislé osobnosti (OĽaNO)**

Political movement Obyčajní ľudia a nezávislé osobnosti is a highly specific political entity. Its specificity can be shown on two circumstances: 1. OĽaNO defining itself as a confessional-conservative political party had its beginnings in liberal Freedom and Solidarity. Its four original members became MPs in 2010, but their interest in creating their own political party was evident already at the time when they accepted the offer to candidate for liberals. 2. According to the standard criteria of the theory of political parties OĽaNO is not a political party because it does not have a membership base. The absence of members (only 4, nor 12,

members simply do not constitute a political party) relates both to the past as to its future. The party chairman Igor Matovič keeps saying about himself that he is not a professional politician, and OĽaNO is not a classic political party.

Given the very unusual or informal nature of the party activity, the ideological and programmatic evaluation of the party is more complicated. Although the relationship of this movement to European integration can be identified from electoral programs or statements of its deputies, it is a ideologically broad movement and the number of cases in which OĽaNO expressed opinions in European issues inspires us to be analytically reserved.

Based on what it revealed about its European identity, it can be said that in the field of European politics, the OĽaNO is a "twin" of the liberal SaS. Its most recent electoral program states in its core: "The European Union project is weakened equally in relation to citizens and to national parliaments. In the solutions offered to solve Eurozone crisis since 2008, political leaders have mostly communicated using the financial vocabulary instead of highlighting the Union's political and value base. The popular trick was - and remains - to blame every mistake on Brussels. Large political parties are discredited in many countries, citizens remain dissatisfied and apathetic to democratic institutions. The unprecedented wave of populist and radical parties that have gained influence in the new European Parliament and strengthen their positions in several member states is the unfortunate result." (Zahraničná politika, Náš program pre Slovensko, hnutie OĽaNO)

### **3.3 Boris Kollár – Sme Rodina**

The interesting environment of the Slovak political parties concludes with another non-standard movement, which is represented by the tabloid celebrity and entrepreneur Boris Kollár. Political movement Boris Kollár – Sme rodina was created three months before the parliamentary elections of 2016. One of the co-founders was Milan Krajniak, whose political history ran to the beginnings of the Civic Democratic Youth and later to the Christian Democratic Movement, where he took care of political marketing.

After two years of existence of this movement, it can be described as a confessional-conservative and at the same time a protest party. Its predominant political themes are, in particular, the socio-economic problems of the population, aiming at people in poverty and low-income populations.

The program of the movement Boris Kollár – Smer rodina is dedicated to the aforementioned areas, and neither foreign nor European politics is concerning it. Its relationship to these issues can be partially expected according to ad hoc expressions on European issues. Publicly known were declarations of some of the representatives of the Sme rodina movement on migration, which was also the defining topic of the 2016 parliamentary elections.

### **3.4 Kotleba – Eudová Strana Naše Slovensko (Kotleba – ES NS)**

The performance of Smer – Social Democracy, the sole governmental political party between 2012 and 2016, which emerged from the democratic elections, aiming to advance social stability, combined with the 2015 migration crisis, were the strongest influences on the result of the 2016 parliamentary elections. Support was gained by not one, but several protest-oriented political parties. And for the first time in the democratic history the far-right political party of Marián Kotleba was one of them.

Its relationship to the European Union, but also to NATO and towards the West as a whole, is openly negative. The European Union, from ĽS NS's perspective, represents a form of slavery for Slovakia, and NATO is an aggressive military pact. Such assessment in its logical succession is leading ĽS NS to a simple conclusion - leaving both organizations. The far right-wing movement confirmed this in its electoral program 2016: " The ban on the production of classical light bulbs or mercury thermometers is just a small example of what Brussels is dictating to us all. As a result of this bullying, hundreds of Slovak companies have disappeared. Today we buy many products from abroad and overpriced. Bureaucrats try to silence the critic voices about European Union using children stories about European funds." (10 BODOV ZA NAŠE SLOVENSKO! Volebný program politickej strany).

The party also presented these electoral declarations as a parliamentary entity when in the summer of 2016 it launched a public petition for a referendum on leaving the EU and NATO. In almost two years, however, it was unable to initiate the referendum by a sufficient collection of signatures.

#### 4. Conclusion

The relationship of the Slovak public to the European Union is historically determined by political experience beginning in the Great Moravia. Cyril and Methodius were part of the geopolitical pressure of the political influence of the West and East in Central Europe. In the following centuries, Slovakia was part of the Habsburg monarchy, which had to cope with foreign policy of Western countries as well as the growing power of Russia since the 18th century. The existence of Czechoslovakia was even more marked by the clash of the West and the East.

In modern history after 1993, Slovakia's foreign policy was oriented towards accession to the European Union and NATO - thus integration into Western political, economic and defense communities. A key Slovak political decision on integration was made in the 1998 elections to the National Council of the Slovak Republic, when the government was taken over by primarily pro-Western orientated political parties. Similarly, pro-Western political entities prevailed in the 1998 to 2010 parliaments.

However, since 2010 the influence of the new political parties with protest and anti-system appeals has grown. After analyzing the electoral programs of the political parties and movements represented in the National Council after the 2016 elections, it can be concluded that pro-European political parties are represented only in the ruling coalition. The relationship towards European idea among the opposition parties is either rather neutral or openly negative. Therefore, it is hypothetically possible to assume that, if after the next parliamentary elections, political parties from the current opposition will be present, the future executive will be less pro-European. Consequently, this may affect the map of the future so-called European core.

# The EU Internal Market Regulation Through the Innovation Principle Perspective

**Jitka Savin**

## **Abstract**

*The Internal Market is a basic stone on which the building of the European Union stands. In recent years an emphasis on innovation as a way how to boost the EU competitiveness activated the process of simplifying the Union legal framework to make the Internal Market regulation more business-friendly. As a result, innovation principle represents a new approach how to strengthen “better regulation“ in the EU legislation. Any new or revised piece of legislation should be analyzed from its impact on innovations’ perspective. Both, the very close relation with the EU “better regulation“ approach and the innovation principle, should bring economic and social advantages and positive impacts into all of the EU common policies, including the Internal Market. This paper aims to illustrate different modalities, current state of play and to find the best way for its application within the business sector.*

**Keywords:** *better regulation, business sector, innovation principle, legislation, Internal Market*

**JEL Classification:** *D81, F15, K30*

## **1. Introduction**

In 2018 we celebrate the 25<sup>th</sup> anniversary of the creation of the EU Internal Market where free movement of persons, goods, services and capital is guaranteed. The EU Internal Market is probably the most visible success of the European integration. Today EU citizens take advantages given by the four EU Internal Market freedoms to move and live, study, work or do business anywhere within the EU as a common standard. Implementation of the four Internal Market freedoms among other benefits expanded labour mobility, stimulated trade, investments and reduced price differences. Common public procurement or competition rules encourage the entrepreneurial activity of all levels, including SMEs. Especially business sector benefited from lower trade costs, access to cross-border investment and innovation capacity for its further expansion and particularly decreasing of administrative obstacles, cultural barriers or regulatory diversity. But still, more work must be done to complete the Internal Market and adapt to new market realities such as globalization, new technologies and changing business models. At the same time, to render Internal Market more efficient, it is necessary to prevent the creation of new barriers to trade and investment.

Making the Union economy stronger and more competitive was one of the targets endorsed by the EU2020 Strategy (European Commission, 2010) where new approach to innovation policy was explicitly mentioned as the basic precondition for future EU economic growth, attractive place for investment and education and research opportunities. As a part of the smart industry concept an Innovation Principle was put into the center of this strategy.

## 2. Innovation Principle and its Definition

Innovation, coming from the Latin word *innovare* (“to restore”), means “the most important driver of growth..., [which] create[s] conditions in which investors, managers, and entrepreneurs are encouraged to take risks and hence create new sources of wealth and work” (ERF, 2015, p. 3). In a hand with accelerated social and technological development, innovation became an integral part of everyday life and changed the face of world significantly, in spite of the fact that not all inventions had a positive impact on humankind.

Innovation is one of the conditions required for sustainable economic growth in the European Union (Devlin, 2015, chapter 1). Despite the lack of a straightforward relationship between innovation and the regulatory framework, it is evident, however, that regulatory framework favourable to innovation is not only desirable but important. To support and develop innovation effectively, other measures including administrative, tax or investment planning should also be a part of the same direction as legislative measures. The Union legislation should aim to create a vital legal framework that enables businesses and citizens to benefit from the advantages of the Internal Market and to eliminate administrative burden. These premises inspired and stimulated the Commission to open the discussion about better regulation and future proof legislation.

The innovation principle is in general defined in Article 3 Treaty on European Union (TEU) where the EU obligation to promote scientific and technological advance is laid down in the context of industry policy. In Article 173 Treaty of the Functioning of the European Union (TFEU) innovation is explicitly mentioned as one of the pre-conditions of open and competitive markets in the same line with research and technological development. Article 179 TFEU also includes innovation when setting tasks for European research area by strengthening the scientific and technological bases as the way how to encourage Union, including its industry, to become more competitive.

As far as the innovation principle is concerned, the EU Charter of Fundamental Rights also has its place in relation to innovation, especially when the freedom of science (Article 13), freedom to choose an occupation and the right to engage to work (Article 15) and right to property, including intellectual (Article 17), of any individual has to be taken into account.

The innovation principle should be balanced with other basic principles arising from the TFEU. In this regard, environmental protection and especially the precautionary principle (Grmelová, 2016) plays the key role as we cannot deny that newly innovated technology or product would not harm human health or environment. Therefore, risk management and impact assessments should take their place in the process of qualification and quantification of possible costs and benefits arising from the (general) usage of innovated technology or product. It is evident that also consumer protection principle as defined in Article 12 TFEU should be taken into account, as it has as one of general principles, its influence on other Union policies and activities during the implementation phase of any Union policy. Finding the right balance will be, without any doubts, not an easy process and will require deep analysis and expert-based discussion. The set of instruments for supporting innovations is quite wide and covers principles of harmonization and mutual recognition, common standards and searching for alternatives, flexibility in relation to expected effects, right for exemptions, exchange of experience and sharing of best practices as well as other ways for promoting the Innovation Principle.

### **3. Better Regulation Agenda and the REFIT Platform**

Regulation can stimulate or act as barrier to innovation. As response to concerns about boosting regulation at the Union level, the European Commission has in recent years started to simplify the Union legal framework. The number of directives was reduced significantly in each area and New Legislative Framework for products also entailed reducing burdens on businesses in many fields (which together compose the EU Internal Market).

At the end of 2012 the Regulatory Fitness and Performance Programme (REFIT) was initiated and according to European Commission's own words this programme expresses "the Commission's ongoing commitment to a simple, clear, stable and predictable regulatory framework for businesses, workers and citizens". According to its intention the European Commission continued to apply measures which should simplify regimes for small and medium-sized enterprises (SMEs) and allow to apply exemptions or lighter regimes for micro-enterprises (e.g. fees for certain types of registration and permits in the sphere of chemicals, health protection and consumers' protection were reduced for micro-enterprises). The European Commission's target to achieve a vital and effective legal framework in full respect of the up-coming challenges led to a new legislative package which was presented by the European Commission on 19 May 2015 as a Better Regulation Package.

The Better Regulation Package consists of three legislative proposals, a set of inner instruments to facilitate better regulation, that was published together with the umbrella Communication called "Better Regulation for better results, an EU agenda" (European Commission, 2015a). Legislative proposals included a decision on the creation of the platform of Regulatory Fitness and Performance Programme (REFIT), a decision on the creation of an independent Regulatory Scrutiny Board and also a draft of a new Inter-Institutional Agreement on Better Law Making as an integral part of the package as well as new guidelines for impact assessments. The new Inter-Institutional Agreement (IIA) aims to simplify the Union regulatory environment, eliminate administrative burden and make the newly created Union legislation more effective and concentrated on spheres with the highest European added value. These goals should be - according to the proposal - achieved by the enhanced consultations and impacts assessments during the whole Union legislative process. However, critics of an excessive stress on impacts assessments (including the European Court of Auditors) claim that impact assessments do not constitute an exhaustive tool to improve the quality of EU legislation since "the amount of EU legislation that shall be enforced in 28 Member States renders any exhaustive study of the potential impacts impossible (Miscenic, Racciah, 2016, pp. 16-17)".

The European Commission took an obligation to explain more precisely what opinions stakeholders have and especially what impacts (environmental, social, economic) on competitiveness of SMEs are expected (the process on how impact assessments come into existence is described in van den Abelee, 2014, pp. 7-17). At the same time, each impact assessment should also contain a better justification in relation to the principles of proportionality and subsidiarity. To achieve this a new "Task Force on Subsidiarity, Proportionality and "Doing Less More Efficiently"" was created in November 2017 and it should help the European Commission to make recommendations on how to better apply the principles of subsidiarity and proportionality, to identify policy areas where work could be re-delegated or definitely returned to the national level of the EU Member States and to find ways to better involve regional and local authorities in EU policy-making and delivery (European Commission, 2018a). The Task Force has started its work in January 2018, consists of 9 members representing national parliaments, Committee of the Regions and the European Parliament. The Task Force is chaired by Frans Timmermans, European Commission First

Vice-President in charge of Better Regulation, Interinstitutional Relations, the Rule of Law and the Charter of Fundamental Rights. Interested parties are invited to comment on the working papers related to these topics. Results of the Task Force activities should be presented in July 2018 in a report addressed to the European Commission President Jean-Claude Juncker.

#### **4. The SME Test**

To make the work of screening and evaluation of the Union legislation unified and better concentrated on main problems the European Commission – according to the New Better Regulation Guidelines (European Commission, 2017a) - has developed a methodology covering a set of the most important aspects which becomes known as the Commission’s Better Regulation Toolbox (European Commission, 2018b - the toolbox is structured into 8 chapters and includes 59 individual tools covering all relevant aspects.). The Council of the European Union in its Competitiveness formation called on the European Commission to develop reduction targets specially taking into account the specific situation of SMEs. Therefore, the European Commission started to apply the “Think Small First“ principle when preparing new initiatives (as stated in its Better Regulation Package). Using such principle to make the legislation “more SMEs-friendly“ the Commission has developed the co-called SME Test. The SME Test requires that each of legislation proposals is checked for its compatibility with the needs and specificities of SMEs. The SME Test became part of the Commission Toolbox and its four defined points must be reflected in the Impact Assessment. The four points comprise (1) consultations of SMEs stakeholders, (2) identification of affected businesses, (3) measurement of the impact on SMEs and (4) assessment of alternative mechanisms and mitigating measures which cover other important areas, e.g. necessity of longer transitional period, reduced reporting requirements, reduced fees, simplified inspections regimes, risk-based approach and others. As mentioned above, the work still continues via inter-institutional discussion. In the up-coming period attention to broader use of digital tools would be possibly paid in the discussion and consultations with stakeholders.

#### **5. “Innovation Deals” and European Innovation Council**

The Internal Market Strategy includes specific focus on SMEs and start-ups in many of its initiatives, the Better Regulation Agenda is also aimed at the creation of more research and innovation friendly regulatory environment that can fluently adapt to new technologies and new forms of innovation, including the application of the Innovation Principle. Besides the EU2020 Strategy, the Horizon 2020 actively supports SMEs within the research policy field by providing direct financial support and indirect support concentrated mostly on support to research and innovation projects and the creation of favourable system for SME innovation and growth. From this point of view, an essential part of the discussion is constant support for start-ups and scales-ups where the EU as whole has reserves to be stimulated and used. Scholars investigating the impact of EU’s investment into research and development note, however, that “Europe is still far from achieving its full potential and has to overcome many impediments and barriers (Gretcherman, Schepers, 2016, p. 5).” Therefore, EU stakeholders “call for further simplification of application requirements, elimination of thematic restrictions and improvements in the evaluation process to allow for more bottom-up support for innovation. In addition, calls are heard for easier access to scientific information, embedding SMEs in knowledge exchange networks and increasing workforce skills to exploit innovations from elsewhere” (non-paper of the Slovak Presidency, 2016). Extensive discussion on the way how to improve the EU research and innovation system is underway and is currently closely linked to the newest European Commission’s initiative on start-ups and scale-ups (European

Commission, 2016a) and follows the Internal Market Strategy targets to create opportunities for consumers and businesses and, helping SMEs and start-ups to grow by removing barriers for start-ups to scale-ups in the Internal Market, creating better opportunities for partnership, commercial opportunities and skills and facilitating the access to finance.

Within the preparation of the mid-term review of the Horizon 2020 Programme, an idea of the European Innovation Council has appeared in the Commissioner Moedas's concept and is currently promoted by the European Commission as a platform from which the SMEs would benefit in any case (European Commission, 2016b). For the reasons already mentioned, the European Commission elaborated the new non-legislative approach called "Innovation Deals". The aim is to enable innovators and regulators to reach a joint understanding of how new technologies and innovations can be progressed in existing regulatory frameworks (European Commission, 2016b, preface, p. 3). The main idea of Innovation Deals is that it is not an approach to support 'normal' business activities but would be restricted to innovative initiatives that have only a recent and limited or even no access to the market with the potential of wide applicability. Through involvement of the European Commission and the relevant Member States authorities, together with stakeholders, Innovation Deals would seek to find ways to avoid potential innovation barriers arising from existing EU law or Member States implementation. The EU Member State authorities should monitor Innovation Deals realization according to national schemes (European Commission, 2016b, p. 12). The European Commission also announced (European Commission, 2015b) that such a new approach of Innovation Deals will be more precisely developed in the area of Circular Economy (European Commission, in the field of wastewater treatment, signed in April 2017). As it has expected effects, the Innovation Deals concept was extended into another area – on 12 March 2018 the second Innovation Deal in the area of electric vehicles was signed (European Commission, 2018c).

Another part of the same approach represents an intention to create a new body called European Innovation Council which should become a vehicle of further development by creating an integrated framework for the EU innovation in order to fully exploit Union's innovation capacity. In this regard, a European Association of Research and Technology Organisations (EARTO) study was presented in April 2016 (EARTO, 2016). EARTO identified three key priorities, such as the necessity of clarification of innovation targets among existing EU instruments, efficient using of available network infrastructure for further support of innovations and scale-ups and last, but not least, exploration of collaborative models in which the sufficient supporting instruments, including financial, would launch the innovative research-driven companies. Based on its study EARTO urged the European Innovation Council to manage smart and efficient use of EU funds (ESIF, EFSI) for innovation and to develop closer partnerships with the different programmes existing at the national or regional levels of Member States to reach the optimal results (EARTO, 2016, p. 4).

Also, the Council of the European Union takes its part of responsibility in this field. Alternatives and different approaches, searching for new ways for enhancing cooperation and reducing burdens within the Internal Market is a regular point at the agenda of its meetings. The Council of the European Union understands that the future of the Union depends on its ability to innovate and in such context it is vitally necessary to settle an environment ready to react to fast-changing world and to allow the SMEs to take their part in challenges the situation brings (European Commission, 2015c). Therefore, the discussion about better understanding the relationship between research and innovation, entrepreneurs, and economic development is currently on the table as well, including open access to necessary information, promotion of research and innovation novelties. The last formal and informal Competitiveness Council meetings were dedicated to opportunities the Internal Market opens for EU companies and

improvements the framework conditions for doing business (Council, 2016a, Council, 2016b). Now even more, as Kordoš (2014) also emphasizes, innovations and innovation policies and strategies implementations are one of the most important aspects of current international economics and business development issues, especially in industrial policy. The importance of the topic and support for an active approach also illustrates the first Council Conclusions dealing with a renewed EU Industrial Strategy (Council, 2017) which were followed by the second Council Conclusions adopted in March 2018 to highlight the need to monitor the implementation of the industrial policy objectives (Council, 2018).

## 6. Conclusion

European business environment which reacts positively to the European Commission's intentions, shares its views and arguments and actively cooperates with the EU institutions. Several studies from different business sector areas from the innovation principle's perspective are under way (BusinessEurope, 2016 – first results are collected in a joint paper prepared by the BusinessEurope, the European Risk Forum (ERF) and the European Round Table of Industrialists (ERT), the three leading entities in a EU business sector, in December 2016). For sure, their results are likely to trigger intensive discussions.

It was stressed previously that the EU approach to innovation policy must be integrated and comprehensive. As mentioned above, a fully functioning Internal Market with clear rules, stable regulatory environment and relevant access to circulating financial resources would help to stimulate competitiveness and jobs-creating growth. Small and medium-sized enterprises are part of the system.

Without any doubts, application of innovation principle could allow to enhance the EU law enforcement and strengthen the EU position in economic area. Innovation as a principle should be a stimulation for further EU development rather than a barrier.

As a novelty, the innovation principle has to find its place among other principles already settled in the Union legislative process. What needs to be clarified in detail, is its nature and balance with other Treaty-based principles.

### **Abstract**

*The SEPA project was launched in 2008. This paper analyzes and evaluates the contribution of implementing the SEPA (Single Euro Payment Area) project as a means of European integration in payment and payment services through the description and analysis method. The contribution analyzes the legal aspects of the project, both European and national, with a link to the Czech Republic. It remains to be implemented and defines its link to cross-border payment. The article further considers and evaluates the SEPA share of the interbank clearing of payments in EUR within EEA (European Economic Area) countries. It is based on the hypothesis that "SEPA was and still is a contribution to European integration". The submitted contribution points to and demonstrates its veracity.*

**Keywords:** cross-border payment, payment system, SEPA, SEPA instruments

**JEL Classification:** G21, G23, K15, O16

### **1. Introduction**

After the directive No 97/5 / EC on cross-border transfers incorporated into national legal systems of countries of the European Economic Area and applied EC Regulation 2560/2001 on cross-border payments in euros, significantly increased the need for harmonization of payment systems, not only the euro area but also product portfolio and still different business practices. In this situation, a new EPC (European Payment Council) initiative was launched in spring 2002, which clearly formulated the need for the creation of the Single Euro Payment Area (SEPA) by 2010. Its legal framework should be drawn up by market leaders under the leadership of the EPC in order to eliminate external "political" interventions in the future (Schlossberger, Soldánová, 2007). However, this intention has not been fully successful. The introduction of the cash euro on 1 January 2002 as the single currency of selected European Union (EU) countries directly triggered the need to standardize and, where appropriate, consolidate procedures for the processing and implementation of payment transactions and their instruments (E.g. Jančíková, 2014 or Schlossberger, O., 2012). However, or because of this, SEPA is seen as a key milestone in European integration. Creating a unified set of conditions, rights and obligations for payments in euro, regardless of their location, is the aim of this project, including enhancing the harmonization and efficiency of payments in euro, and for this reason contributing to the full use of Economic and Monetary Union (Vânia, 2016).

This paper focuses on assessing the importance of SEPA as one of the tools for European integration, especially in the financial markets. Using methods of description, analysis and deduction, the authors try to prove the validity of the hypothesis that „SEPA was and still is a contribution to European integration”.

## **2. Problem Formulation and Methodology**

Before writing this paper, the authors analyzed the selected available resources that match the topic. These are especially studies by Vânia (2016), Jancikova (2014), Jantón-Drozdowska (2017), Jílek (2013), Martikainen (2013) or Schlossberger (2012, 2016).

Vânia and the team dealt with analyses the effect of the implementation process SEPA project on credit transfer payments in euro area countries during the period between 2008 and 2013, not by direct debit.

Jančíková dealt with the development of SEPA, the legislation and institutions involved analysis of means of payment, which are used in SEPA, and was also analyzing the benefits that SEPA brings especially for corporations.

Schlossberger and his studies from 2016 dealt with the potential consequences of its implementation SEPA for the segment of small and medium-sized enterprises. However, the author focuses on the general issues of the theory and practice of payment services in which SEPA and its payment instruments are part (2012).

Martikainen and the team in their study dealt with the idea that financial integration in some segments of the financial markets started to deteriorate during the recent period of economic turmoil in Europe. The study examines whether this phenomenon also holds true for the European retail payments market. In comparison with other segments of the financial markets, the integration of the retail payments market has been more difficult to quantify, and the effects of recent developments – including the creation of the SEPA and the economic crisis – have been hard to evaluate using existing measures of integration. Financial integration in some segments of the financial markets started to deteriorate during the recent period of economic turmoil in Europe. Its paper examines whether this phenomenon also holds true for the European retail payments market. In comparison with other segments of the financial markets, the integration of the retail payments market has been more difficult to quantify, and the effects of recent developments – including the creation of the SEPA and the economic crisis – have been hard to evaluate using existing measures of integration.

In his extensive publication, Jílek addresses general globalization in financial markets, and also mentions the importance of SEPA for unifying European payments.

Jantón-Drozdowska and the team stated that the year 2016 ended the period of the migration from national payment services to the SEPA instruments. At the same time, however, it has become apparent that some problems remained unresolved. Overcoming them requires finding suitable technological solutions. The author can see that the potential of the distributed ledger technology (DLT) is currently being explored by the financial sector and its implementation may affect the SEPA schemes in a variety of dimensions.

The authors used the analysis of the above mentioned sources and own investigation as a basis for proving the established hypothesis. The authors' own contribution is that they compared SCT and SDD in the context of the volume and number of transactions compared to other euro transactions in the interbank clearing of EEA countries processed by the clearing systems processing euro payments.

Following a historical introduction and an emphasis on regulation by the EC, the authors defined the link of SEPA project on cross-border and domestic payments as well. Then the SEPA analysis of transfers itself follows as a tool to evaluate the hypothesis.

## 2.1 Historical Excursion

The SEPA project should be seen as an important contribution to financial integration in Europe. The introduction of the euro has created the necessary conditions for such integration. The success of the single currency would be incomplete if its introduction were not accompanied by integrated payment systems, monetary and capital markets and the financial sector that provides its services in the single market. Until the introduction of the single currency euro payment systems between EU countries was essentially not regulated. The first generally applicable legal standard appeared in 1997 in the form of Directive No 1997/5 / EC on cross-border transfers. This standard was the first document, which started some regulation of cross-border payments. For banks, this meant mainly clear definition of certain terms, which consisted of general information to their clients in the implementation of cross-border transfers. These were, for example, the following information before or after the transfer (Schlossberger, 2007):

- transfer price,
- duration of the transfer,
- day of writing off and the date of the transfer amount,
- value of the transfer value,
- course used to implement the transfer etc.

As the European Commission (EC) has stated that it will continue to pursue the regulation of the payment industry, the EU banking sector has decided that it would be appropriate to respond to this situation. Banks have said they would even want to take this initiative and act in accordance with the EC, but in the form of self-regulation. Thus, in March 2002, representatives of 42 European banks met and created an EPC body (Chuchvalcová, 2007). This idea was further supported by the fact that since 1999 the TARGET system, which was initially prepared as a clearing system for high-volume payments has been operating, since the number of transactions involved, retail payments were not and are certainly not negligible. That regulation, prepared by the above mentioned EC directive, has in fact affected the whole retail market segment.

This was followed by the publication of Regulation 2560/2001 / EC on cross-border payments in euro, which laid down mainly one condition that the cross-border payments in euro should not be subject to a higher charge than that applied to the same payment in domestic payment systems, 2001). The entire regulation was initiated so that payments within the EU sent by all citizens and realized by banks were as simple and as cheap as in the case of transfers between accounts in the same city of the country. As we already know, the legal definition continued with the publication of Regulation (EC) No 924/2009 of the European Parliament and of the Council on cross-border payments in the Community, which governs cross-border transfers but also directly affects SEPA (for example, some provisions on the collection refer to the SEPA project).

Banks set themselves the goal of creating SEPA by the end of 2010 at the latest. In 2004 within SEPA, there was an expansion of the participating countries on the newly acceding countries. Furthermore it was decided that the EPC, which until then was more a kind of interest association, institutionalized. On 17 June 2004, EPC was transformed into a public benefit corporation incorporated under Belgian law, whose members were representatives of the banking sector of the then 25 EU countries. To connect were also invited banks from EEA countries as well as Switzerland. Apart from Liechtenstein, all the countries addressed have joined. At the same time, EPC members became representatives of three European banking associations.

## 2.2 Current Legal Regulation

Given that the European Commission has stated that the actual implementation of SEPA basic products (SEPA Credit Transfer – SCT and SEPA Direct Debit – SDD) was not sufficient because the self-regulatory principle did not cause the banks more actively engage in the project – see e.g. the Preamble (EU, 2012), the Commission originally proposed three legal regulations to support the implementation, in particular SEPA products. These included:

- Directive 2007/64/EC of the EP and of the Council on payment services in the internal market (PSD I);
- Regulation (EC) No 924/2009 of the EP and of the Council on cross-border payments in the Community and repealing Regulation (EC) No 2560/2001 (Regulation No 924);
- Regulation (EU) No 260/2012 of the EP and of the Council establishing technical and business requirements for credit transfers and direct debits in euro and amending Regulation (EC) No 924/2009 (Regulation No 260).

The following ones were added to the above later:

- Regulation (EU) No 248/2014 of the EP and of the Council amending Regulation (EU) No 260/2012 as regards the migration to Union-wide credit transfers and direct debits (Regulation No 248);
- Regulation (EU) 2015/751 of the EP and of the Council on interchange fees for card-based payment transactions (Regulation No 751),
- Directive (EU) 2015/2366 of the EP and of the Council on payment services in the internal market (PSD II). Its transposition into national legal was carried out by January 13, 2018.

PSD I was implemented into national laws of the Member States, in the Czech Republic into Act No 284/2009 Coll., on payment system, with effect from 13 January 2018 is the Act No 370/2018 Coll., which, however, incorporates the implementation of the PSD II. The law must be applied to domestic (national payments) and cross-border payments, because under section 75(2), rights and obligations in payment service provision are to be in accordance with the law except when payments transactions are made by a provider of these services in a non-Member State (i.e., outside of the EEA) or in the case of a payment transaction which is not the currency of a Member State. The above Regulations then only apply to SCT and SDD, and Regulation No 751 regulates the area of interchange fee. SEPA Cards and their use are not otherwise regulated by EU law, except for the general application of PSD II.

Regulation No 924 further confirmed the principle of levies on cross-border credit transfers in euro not exceeding €50,000 equal to national levies, and stipulated an obligation to state account numbers in cross-border credit transfers in the IBAN format (International Bank Account Number). This requirement was fully consistent with SEPA standards. Regulation No 260 then stipulated reachability and interoperability for SCT and SDD with a final implementation date for EMU countries and other EEA countries. This is why this Regulation is sometimes referred to as the “End-date” Regulation. Regulation No 260 also abolished the upper €50,000 limit of regulation of implementation of the principle of equal levies. If we then apply the PSD I provisions regarding time limits for processing of cross-border credit transfers in euro, we get to the point that cross-border credit transfers in euro have the same regulatory framework as SEPA transfers of member banks of this project. This eliminated the differences between cross-border credit transfers in euro and SEPA transfers.

Publication of Regulations Nos 924 and 260 therefore caused that SEPA products on the basis of SCT and SDD in EMU countries became an obligation for all providers of these payment services and they have to be applied according to the schedule stipulated in Regulation No 260, or its amendment published by Regulation No 248. Until that time, participants, in particular banks as basic payment service providers, engaged in the SEPA project by signing a declaration of accession to the project, which attested the ability to meet the technical and legal conditions of the project. This possibility remains for now for non-EMU countries (Schlossberger, 2016).

### 3. Problem Solution

At this point, the authors will not characterize the nature of the single SEPA payment instruments. This issue has already been addressed by many authors (e.g. Vânia, 2016; Jančíková, 2014 or Martikainen, 2013 and others). The importance of the SEPA project for European integration will be examined by the authors based on the results of the analysis of the number of providers involved in these payment services and the proportionality of the number and volume of euro payments processed by the main payment systems currently processing euro payments. The authors have been following these facts for several years.
