Katerina Vlckova

Paper Information

Abstract:

Achievement motivation in English as a foreign language became of great interest for teachers, parents, as well as researchers; as English became a common language for all developed countries. Empirical research in this area world-wide is quite rich. However, findings for Czech students are scarce. Our study uses logistic regression models to determine the relation between reported student achievement motivation measured by the need for achievement (NfA) and the need to avoid failure (NtAF) and grades and aspirations to further study. The probability research sample consisted of 462 students at the end of their compulsory education in the Czech Republic (9th grade). NfA was found to be a positive predictor and NtAF was a negative predictor of student final grade in English, receiving a final report card with honours, as well as aspiration to study at an elite upper secondary comprehensive school. The effect of NfA on grades and aspiration was, on average, lower for males than for females. The effect of NtAF for males was, on average, higher. In our further research, we are preparing an application of the anchoring vignette method to cope with possible differences in scale usage among respondents and test if the relations will be stronger.

Extended Summary:

Introduction

Modern sustainable, democratic societies build on active citizens who participate in and contribute to socio-economic development. As people cooperate across countries in a globalised world, the value of English as a lingua franca has increased. With the increased importance of English increases the cost of not speaking English (Education First, 2018). The learning and instruction of English as a foreign language (EFL) is of growing importance in all educational systems and English became a compulsory language in most of the developed countries.

Motivation is a key factor connected with successful EFL learning and is a central focus of the current research (Boo et al., 2015; Lamb, 2017). Motivation studies repeatedly show the connection of motivation to acquired EFL skills (Khodadady & Khajavy, 2013; Pae, 2008). They show that motivation differs based on gender, age, school type, and across countries (e.g., You & Dörnyei, 2016).

From the fifties until the beginning of the nineties, the motivation research was based on Gardner's socio-educational model of second language acquisition. According to this model, most of the learning outcomes were connected with the integrative motive (Gardner et al., 1976). In the nineties, cognitive theories were applied, e.g. self-determination theory differentiating between intrinsic and extrinsic motivation (Noels et al., 2000). Later, the focus shifted to contextual and dynamic aspects of motivation (Boo et al., 2015) and to the process model of EFL motivation (Dörnyei, 2005). Afterwards, L2 motivational self system, currently dominating EFL motivation theory, was introduced (Boo et al., 2015; Dörnyei, 2009). In the Czech Republic, the most widely used theory of achievement motivation (Hrabal & Pavelkova, 2010) is based on distinguishing between the need for achievement (NfA) and the need to avoid failure (NtAF).

Research aim

The identification of the level of student achievement motivation in EFL and its relationship to their grades and other indicators of achievement is an important research task. However, findings for Czech students are scarce (Vičková et al., 2014). Our study fills this gap by analysing the level of students' achievement motivation in EFL and its relationship to their grades and aspiration.

Methods

The sample was constructed by using the probability sampling of lower secondary schools in the Czech region of South Moravia and consisted of 26 schools (i.e., 25 9th grade classes, 462 students). In this analysis, 324 students were included (172 female) according to the analysed variables.

The Achievement Motivation Questionnaire (Hrabal & Pavelková, 2010) was used, measuring NfA (7 items) and NtAF (7 items) on a 5-point response scale. Examples of items: *When I should be examined, I am anxious* (NtAF); *I want to have good marks in English* (NfA).

The reported grade in English, receiving a final report card with honours, and aspiration to study at an upper secondary comprehensive school were measured by a questionnaire and analysed as dummy variables.

Data analysis included logistic regression models computed in software R (glm function with probit specification).

Findings

The need for achievement (NfA) in EFL was found to be a positive predictor and the need to avoid failure (NtAF) was found to be a negative predictor of student final grade in English, receiving a final report card with honours, and aspiration to study at an upper secondary comprehensive school. The effect of NfA on all three variables was, on average, lower for males than for females, and the effect of NtAF for males was, on average, higher.

Discussion

In accordance with previous studies (Khodadady & Khajavy, 2013; Pae, 2008), our findings confirm the relation between reported motivation in EFL and English achievement. Also, previous studies conclude that domain-specific instruments predict indicators of achievement in particular domains better than domain-general instruments (Michel et al., 2020). Our instrument measuring NfA and NtAF was successfully predicting not only English achievement, but also general learning achievement (i.e. receiving a final report card with honours) and aspiration to study at an elite upper secondary comprehensive school. Our further research will consider the scale usage differences among students by using the anchoring vignette method.

Acknowledgement

This study was funded by the Czech Science Foundation in a project "Analysing the determinants of self-reported English language knowledge and motivation for English language learning in Czech lower secondary students" (20-05484S).
