

Evaluation of Apache Camel Karavan Implementation in Onsemi's Middleware Platform

- What do you think about the addition of a visual designer to the platform environment?

(Do you find it useful or beneficial in your workflow?)

I'm looking forward to it. I wasn't involved in this project, but I'm glad it's finally here. I think many users will be capable to adopt it and work on their own.

- How would you rate the user interface of Karavan?

Did you find it intuitive, or did you experience any difficulties while using it?

I think it's simple and intuitive, but I'm a bit skeptical about fully replacing our work on designing. We often work with really complex ~~task~~ or users that are less technically experienced.

- How was your experience working with the graphical designer for integrations?

Was it clear and easy to understand?

I don't think the design process is that simple. If we want to create a opportunity for users to work with it, we need to provide some online training or manual for Karavan, because I think it's still complex.

- Are there any features you feel are missing in Karavan?

What improvements or additions would you like to see in the future?

I think creating interface in dashboard and then continuing with empty placeholders is not ideal.

- Are there any kamelets you feel are missing that would help you create data integrations more efficiently?

Kamelets might be usefull in future, if there's wider adoption of the application, but it makes no sense in this stage.

- If you have previously worked with Camel DSL in another format (e.g., XML or Java), how was the transition to Karavan's visual designer for you?

I wasn't part of the team that used it in past, but I think it could be a nice feature for the system, althought primarily for middleware team.

- Have you experienced any performance or stability issues while using Apache Camel Karavan?

I haven't notice anything like that.

- Would you recommend using Karavan to your customers?
Yes / No - Please explain why.

I think we need a proper resources like video tutorials and training sessions. I'm not even capable to support them now.
